Chapter 1: Introduction
About Adobe ColdFusion 10 documentation .............................................................. 1

Chapter 2: Reserved Words and Variables
Reserved words .................................................................................................................. 2
Scope-specific built-in variables ....................................................................................... 4
Custom tag variables ....................................................................................................... 5
ColdFusion tag-specific variables ..................................................................................... 6
CGI environment (CGI Scope) variables ........................................................................ 11

Chapter 3: ColdFusion Tags
New tags in ColdFusion 10 ............................................................................................... 15
Tag summary ..................................................................................................................... 15
Tags by function ............................................................................................................... 20
Tag changes since ColdFusion 5 ..................................................................................... 23
Tags a-b ........................................................................................................................... 33
Tags c .............................................................................................................................. 55
Tags d-e .......................................................................................................................... 108
Tags f ............................................................................................................................. 209
Tags g-h .......................................................................................................................... 293
Tags i ............................................................................................................................... 334
Tags j-l ........................................................................................................................... 394
Tags m-o ........................................................................................................................ 431
Tags p-q ........................................................................................................................ 483
Tags r-s .......................................................................................................................... 584
Tags t ................................................................................................................................ 658
Tags u-z .......................................................................................................................... 699

Chapter 4: ColdFusion Functions
New Functions in ColdFusion 10 .................................................................................... 726
Functions by category ...................................................................................................... 727
Function changes since ColdFusion 5 ............................................................................ 734
Functions a-b ................................................................................................................... 740
Functions c-d ................................................................................................................... 789
Functions e-g ................................................................................................................... 884
Functions h-im ................................................................................................................ 987
Functions in-k ................................................................................................................ 1067
Functions l ....................................................................................................................... 1120
Functions m-r .................................................................................................................. 1180
Functions s ....................................................................................................................... 1249
Functions t-z .................................................................................................................. 1351

Last updated 7/9/2012
Chapter 5: Ajax JavaScript Functions

Function summary .......................................................... 1405
ColdFusion.Ajax.submitForm ........................................... 1408
ColdFusion.Autosuggest.getAutosuggestObject .................. 1409
ColdFusion.Chart.getChartHandle ..................................... 1410
ColdFusion.FileUpload.cancelUpload ................................. 1411
ColdFusion.FileUpload.clearAllFiles ................................. 1412
ColdFusion.FileUpload.setUrl ......................................... 1413
ColdFusion.FileUpload.startUpload ................................. 1414
ColdFusion.getElementById .............................................. 1415
ColdFusion.grid.clearSelectedRows ................................... 1416
ColdFusion.Grid.getBottomToolbar ................................ 1419
ColdFusion.Grid.getGridObject ....................................... 1420
ColdFusion.Grid.hideBottomToolbar ................................ 1420
ColdFusion.grid.getSelectionModel ................................. 1421
ColdFusion.Grid.getTopToolbar ...................................... 1421
ColdFusion.Grid.hideTopToolbar ..................................... 1422
ColdFusion.Grid.refresh ............................................... 1422
ColdFusion.Grid.refreshBottomToolbar ............................. 1423
ColdFusion.Grid.refreshTopToolbar ................................. 1426
ColdFusion.Grid.showBottomToolbar ................................ 1426
ColdFusion.Grid.showTopToolbar .................................... 1427
ColdFusion.Grid.sort ....................................................... 1427
ColdFusion.JSON.decode ................................................. 1428
ColdFusion.JSON.encode ................................................ 1429
ColdFusion.Layout.collapseAccordion ............................... 1430
ColdFusion.Layout.collapseArea ....................................... 1431
ColdFusion.Layout.createAccordionPanel ......................... 1432
ColdFusion.Layout creaTab ............................................... 1434
ColdFusion.Layout.disableSourceBind ...................... 1436
ColdFusion.Layout.enableSourceBind ............................. 1438
ColdFusion.Layout.disableTab ....................................... 1440
ColdFusion.Layout.enableTab ......................................... 1441
ColdFusion.Layout.expandAccordion ....................... 1442
ColdFusion.Layout.expandArea ......................................... 1443
ColdFusion.Layout.getAccordionLayout ..................... 1443
ColdFusion.Layout.getBorderLayout ............................... 1444
ColdFusion.Layout.getTabLayout .................................... 1445
ColdFusion.Layout.hideAccordion ................................. 1445
ColdFusion.Layout.hideArea ........................................... 1446
ColdFusion.Layout.hideTab ............................................. 1447
ColdFusion.Layout.selectAccordion ....................... 1448
ColdFusion.Layout.selectTab .......................................... 1449
ColdFusion.Layout.showAccordion ............................. 1451
ColdFusion.Layout.showArea ......................................... 1451
ColdFusion.Layout.showTab ............................................ 1452
ColdFusion.Log.debug ............................................................... 1453
ColdFusion.Log.dump ............................................................ 1454
ColdFusion.Log.error ............................................................ 1455
ColdFusion.Log.info ............................................................. 1455
ColdFusion.Map.addEvent ....................................................... 1456
ColdFusion.Map.addMarker ..................................................... 1457
ColdFusion.Map.getLatitudeLongitude ..................................... 1458
ColdFusion.Map.getMapObject ................................................. 1459
ColdFusion.Map.hide ............................................................ 1460
ColdFusion.Map.refresh ......................................................... 1461
ColdFusion.Map.setCenter ....................................................... 1462
ColdFusion.Map.setZoomlevel .................................................. 1463
ColdFusion.Map.show ........................................................... 1464
ColdFusion.MediaPlayer.getPlayer ............................................ 1465
ColdFusion.MediaPlayer.getType ............................................... 1466
ColdFusion.MediaPlayer.logError ............................................. 1467
ColdFusion.MediaPlayer.resize ............................................... 1467
ColdFusion.MediaPlayer.setTitle .............................................. 1468
ColdFusion.MediaPlayer.setMute .............................................. 1469
ColdFusion.MediaPlayer.setSource .......................................... 1470
ColdFusion.MediaPlayer.setVolume ......................................... 1471
ColdFusion.MediaPlayer.startPlay .......................................... 1472
ColdFusion.MediaPlayer.stopPlay ............................................. 1473
ColdFusion.MessageBox.create ................................................ 1474
ColdFusion.MessageBox.show .................................................. 1476
ColdFusion.MessageBox.getMessageBoxObject ............................. 1477
ColdFusion.MessageBox.isMessageBoxDefined ............................. 1477
ColdFusion.MessageBox.update ............................................... 1478
ColdFusion.MessageBox.updateMessage .................................... 1480
ColdFusion.MessageBox.updateTitle ........................................ 1480
ColdFusion.navigate ............................................................ 1481
ColdFusion.ProgressBar.getProgressBarObject .......................... 1483
ColdFusion.ProgressBar.hide .................................................. 1484
ColdFusion.ProgressBar.reset ............................................... 1485
ColdFusion.ProgressBar.show ............................................... 1485
ColdFusion.ProgressBar.start ............................................... 1486
ColdFusion.ProgressBar.stop ................................................. 1487
ColdFusion.ProgressBar.update .............................................. 1487
ColdFusion.ProgressBar.updatestatus ...................................... 1488
ColdFusion.RichText.getEditorObject ....................................... 1489
ColdFusion.RichText.onComplete ............................................. 1489
ColdFusion.setGlobalErrorHandler ......................................... 1490
ColdFusion.Slider.disable ..................................................... 1491
ColdFusion.Slider.enable ....................................................... 1492
ColdFusion.Slider.getValue .................................................... 1493
ColdFusion.Slider.getSliderObject .......................................... 1494

Last updated 7/9/2012

Chapter 1: Introduction

The CFML Reference is your primary ColdFusion Markup Language (CFML) reference. Use this manual to learn about CFML tags and functions, ColdFusion expressions, and using JavaScript objects for WDDX in Adobe ColdFusion 9. It also provides detailed references for Java and C++ CFX interfaces.

About Adobe ColdFusion 10 documentation

The ColdFusion documentation is designed to provide support for the complete spectrum of participants.

Documentation set

The ColdFusion documentation set includes the following titles:

<table>
<thead>
<tr>
<th>Manual</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installing Adobe® ColdFusion® 10</td>
<td>Describes system installation and basic configuration for Windows®, Macintosh®, Solaris™, Linux®, and AIX®.</td>
</tr>
<tr>
<td>Configuring and Administering Adobe®</td>
<td>Describes how to perform ColdFusion administration tasks such as managing server settings, configuring datasources, managing security, deploying ColdFusion applications, caching, setting up CFX tags, monitoring server activity using the ColdFusion Server Monitor, and configuring web servers.</td>
</tr>
<tr>
<td>ColdFusion® 10</td>
<td></td>
</tr>
<tr>
<td>Developing Adobe® ColdFusion® 10 Applications</td>
<td>Describes how to develop your dynamic web applications. This book provides detailed information about using the CFML programming language and ColdFusion features, such as ColdFusion Web Services, ColdFusion Portlets, ColdFusion ORM, AJAX support, Flex and AIR integration, and integration with other products and technologies such as Microsoft Office, OpenOffice, and SharePoint.</td>
</tr>
<tr>
<td>Adobe® ColdFusion® 10 CFML Reference</td>
<td>Provides descriptions, syntax, usage, and code examples for all ColdFusion tags, functions, and variables.</td>
</tr>
</tbody>
</table>

Viewing online documentation

All ColdFusion documentation is available online in HTML and Adobe PDF files. Go to the ColdFusion Help and Support page at www.adobe.com/go/learn_cfu_support_en to view the online documentation. In addition to viewing the online documentation, you can also add and view comments to the documentation.
Chapter 2: Reserved Words and Variables

Adobe ColdFusion language includes reserved words and scope variables.

Reserved words

The following list indicates words you must not use for ColdFusion variables, user-defined function names, or custom tag names. Although you can safely use some of these words in some situations, you can prevent errors by avoiding them entirely.

- Any name starting with cf. However, when you call a CFML custom tag directly, you prefix the custom tag page name with cf_.
- Built-in function names, such as Now or Hash
- Scope names, such as Form or Session
- Operators, such as NE or IS
- The names of any built-in data structures, such as Error or File
- The names of any built-in variables, such as RecordCount or CGI variable names
- The following CFScript language element names:
  - for
  - default
  - continue
  - import
  - finally
  - local (inside function declaration)
  - interface
  - pageencoding

Remember that ColdFusion is not case sensitive. For example, all of the following are reserved words: IS, Is, iS, and is.

*Note: Keywords in the newly added statements, such as abort, rethrow, param, and so on are not reserved.*

Reserved words in forms

Do not create form field names that end in any of the following, except to specify a form field validation rule by using a hidden form field name.

- _integer
- _float
- _range
- _date
- _time
Reserved Words and Variables

- _eurodate

Reserved words in queries

The following table lists SQL keywords that are reserved in ColdFusion queries of queries. This list includes all reserved words in the SQL standard. Avoid them in variables used in all queries. Do not use these keywords as variable names in any queries.

Note: Many database management systems have additional reserved words that you cannot use as variable names in queries to their databases. For a detailed list, see your DBMS documentation.

Scope-specific built-in variables

ColdFusion returns variables, such as those returned in a cfdirectory or cfftp operation. A variable is usually referenced by scoping it according to its type: naming it according to the code context in which it is available; for example, Session.varname, or Application.varname. For more information on ColdFusion scopes, see Using ColdFusion Variables in the Developing ColdFusion Applications.

You use the cflock tag to limit the scope of CFML constructs that modify shared data structures, files, and CFXs, to ensure that modifications occur sequentially. For more information, see “cflock” on page 412, and Using Persistent Data and Locking in the Developing ColdFusion Applications.

Variable scope

ColdFusion supports the Variables scope. Unscoped variables created with the cfset tag acquire the Variables scope by default. For example, the variable created by the statement <CFSET linguist = Chomsky> can be referenced as #Variables.linguist#.

Caller scope

History
ColdFusion MX: The Caller scope is accessible as a structure. (In earlier releases, it was not.)

Last updated 7/9/2012
Reserved Words and Variables

CGI variables
see “CGI environment (CGI Scope) variables” on page 11

Client variables
The following client variables are reserved:

- Client.CFID
- Client.CFToken
- Client.HitCount
- Client.LastVisit
- Client.TimeCreated
- Client.URLToken

Server variables
Use the Server prefix to reference server variables, as follows:

- Server.ColdFusion.ProductName
- Server.ColdFusion.ProductVersion
- Server.ColdFusion.ProductLevel
- Server.ColdFusion.SerialNumber
- Server.ColdFusionSupportedContentLocales
- Server.ColdFusion.AppServer
- Server.ColdFusion.Expiration
- Server.ColdFusion.RootDir
- Server.OS.Name
- Server.OS.AdditionalInformation
- Server.OS.Version
- Server.OS.BuildNumber

Application and session variables
To enable application and session variables, use the cfapplication tag or Application.cfc. Reference them as follows:

- Application.myvariable
- Session.myvariable

To ensure that modifications to shared data occur in the intended sequence, use the cflock tag. For more information, see “cflock” on page 412.

ColdFusion provides the following predefined application and session variables:

- Application.ApplicationName
- Session.CFID
- Session.CFToken
- Session.URLToken

Custom tag variables
A ColdFusion custom tag returns the following variables:
A custom tag can set a Caller variable to provide information to the caller. Set the Caller variable as follows:

```cfset Caller.variable_name = "value"
```

The calling page can access the variable with the `cfoutput` tag, as follows:

```cfoutput>#variable_name#</cfoutput>
```

**Request variable**

Request variables store data about the processing of one page request. Request variables store data in a structure that can be passed to nested tags, such as custom tags, and processed once.

To provide information to nested tags, set a Request variable, as follows:

```CFSET Request.field_name1 = "value">
<CFSET Request.field_name2 = "value">
<CFSET Request.field_name3 = "value">
...
```

Each nested tag can access the variable with the `cfoutput` tag, as follows:

```CFOUTPUT>#Request.field_name1#</CFOUTPUT>
```

**Form variable**

ColdFusion supports the Form variable FieldNames. FieldNames returns the names of the fields on a form. You use it on the action page associated with a form, as follows:

```
Form.FieldNames
```

**ColdFusion tag-specific variables**

Some ColdFusion tags return data as variables. For example, the `cffile` tag returns file size information in the FileSize variable, referenced as `CFFILE.FileSize`.

The following tags return data that you can reference in variables:

- cfcatch
- cfdirectory
- cfferror
- cffile
- cfftp
- cfhttp
- cfindex
- cfldap
- cfpop
- cfquery
- cfregistry
- cfsearch
- cfstoredproc

Last updated 7/9/2012
ColdFusion query variables
A ColdFusion tag that returns a query object supports the following variables, where `queryname` is the value of the `name` attribute:

- `queryname.CurrentRow`
- `queryname.RecordCount`
- `queryname.ColumnList`

CFCATCH variables
Within a `cfcatch` block, the active exception properties can be accessed as the following variables:

- `CFCATCH.Type`
- `CFCATCH.Message`
- `CFCATCH.Detail`
- `CFCATCH.ErrNumber`
- `CFCATCH.NativeErrorCode`
- `CFCATCH.SQLState`
- `CFCATCH.LockName`
- `CFCATCH.LockOperation`
- `CFCATCH.MissingFileName`
- `CFCATCH.TagContext`
- `CFCATCH.ErrorCode`
- `CFCATCH.ExtendedInfo`

Within a `cfcatch` block, database exception properties can be accessed as the following variables:

- `CFCATCH.QueryError`
- `CFCATCH.SQL`
- `CFCATCH.Where`
- `CFCATCH.Datasource`

Within a `cfcatch` block, undefined variable exception properties can be accessed as the following variable:

- `CFCATCH.Name`

Within a `cfcatch` block, syntax and parsing exception properties can be accessed as the following variables:

- `CFCATCH.TokenText`
- `CFCATCH.Snippet`
- `CFCATCH.Column`
- `CFCATCH.KnownColumn`
- `CFCATCH.Line`
- `CFCATCH.KnownLine`

CFDIRECTORY variables
The `cfdirectory` tag, with `action=list`, returns a query object as follows, where `queryname` is the `name` attribute value:

- `queryname.Name`
- `queryname.Size`
- `queryname.Type`
- `queryname.DateLastModified`
- `queryname.Attributes`
- `queryname.Mode`
CFERROR variables

When cferror generates an error page, the following error variables are available if \texttt{type=}'request' or "exception".

\begin{itemize}
  \item \texttt{Error.Diagnostics}
  \item \texttt{Error.MailTo}
  \item \texttt{Error.DateTime}
  \item \texttt{Error.Browser}
  \item \texttt{Error.GeneratedContent}
  \item \texttt{Error.RemoteAddress}
  \item \texttt{Error.HTTPReferer}
  \item \texttt{Error.Template}
  \item \texttt{Error.QueryString}
\end{itemize}

The following error variables are available if \texttt{type=}'validation'.

\begin{itemize}
  \item \texttt{Error.ValidationHeader}
  \item \texttt{Error.InvalidFields}
  \item \texttt{Error.ValidationFooter}
\end{itemize}

Any cfcatch variable that applies to exception type can be accessed within the Error scope, as follows:

\begin{itemize}
  \item \texttt{Error.Type}
  \item \texttt{Error.Message}
  \item \texttt{Error.Detail}
  \item \texttt{Error.ErrNumber}
  \item \texttt{Error.NativeErrorCode}
  \item \texttt{Error.SQLState}
  \item \texttt{Error.LockName}
  \item \texttt{Error.LockOperation}
  \item \texttt{Error.MissingFileName}
  \item \texttt{Error.TagContext}
  \item \texttt{Error.ErrorCode}
  \item \texttt{Error.ExtendedInfo}
\end{itemize}

\textbf{Note:} You can substitute the prefix CFERROR for \texttt{Error}, if \texttt{type = } "Exception"; for example, CFERROR.Diagnostics, CFERROR.Mailto, or CFERROR.DateTime.

CFFILE ACTION=Upload variables

File variables are read-only. Use the CFFILE prefix to reference file variables, for example, CFFILE.ClientDirectory. The File prefix is deprecated in favor of the CFFILE prefix.
Reserved Words and Variables

CFFILE.AttemptedServerFile
CFFILE.ClientDirectory
CFFILE.ClientFile
CFFILE.ClientFileExt
CFFILE.ClientFileName
CFFILE.ContentSubType
CFFILE.ContentType
CFFILE.DateLastAccessed
CFFILE.FileExisted
CFFILE.FileSize
CFFILE.FileWasAppended
CFFILE.FileWasOverwritten
CFFILE.FileWasRenamed
CFFILE.FileWasSaved
CFFILE.OldFileSize
CFFILE.ServerDirectory
CFFILE.ServerFile
CFFILE.ServerFileExt
CFFILE.ServerFileName
CFFILE.TimeCreated
CFFILE.TimeLastModified

CFFTP error variables

When you use the cfftp stoponerror attribute, the following variables are populated:

CFFTP.Succeeded
CFFTP.ErrorCode
CFFTP.ErrorText

CFFTP ReturnValue variable

Some cfftp file and directory operations provide a return value, in the variable CFFTP.ReturnValue. Its value is determined by the results of the action attribute. When you specify any of the following actions, cfftp returns a value:

GetCurrentDir
GetCurrentURL
ExistsDir
ExistsFile
Exists

CFFTP query object columns

When you use the cfftp tag with the listdir action, cfftp returns a query object, where queryname is the name attribute value, and row is the row number of each file or directory entry:

queryname.Name[row]
queryname.Path[row]
queryname.URL[row]
queryname.Length[row]
queryname.LastModified[row]
queryname.Attributes
queryname.IsDirectory
queryname.Mode

Last updated 7/9/2012
**CFHTTP variables**

A `cfhttp` `get` operation can return text and binary files. Files are downloaded and the contents stored in a variable or file, depending on the MIME type, as follows:

- `CFHTTP.FileContent`
- `CFHTTP.MimeType`
- `CFHTTP.Header`
- `CFHTTP.ResponseHeader[http_hd_key]`
- `CFHTTP.StatusCode`

**CFLDAP variables**

The `cfldap` action=query tag returns information about the LDAP query, as follows:

- `queryname.CurrentRow`
- `queryname.RecordCount`
- `queryname.ColumnList`

**CFPOP variables**

The `cfpop` tag returns the following result columns, depending on the `action` attribute value and the use of other attributes, such as `attachmentpath`, where `queryname` is the `name` attribute value:

- `queryname.Date`
- `queryname.From`
- `queryname.Body`
- `queryname.Header`
- `queryname.MessageNumber`
- `queryname.ReplyTo`
- `queryname.Subject`
- `queryname.CC`
- `queryname.To`
- `queryname.CurrentRow`
- `queryname.RecordCount`
- `queryname.ColumnList`
- `queryname.Attachments`
- `queryname.AttachmentFiles`

**CFQUERY and CFSTOREDPROC variables**

The `cfquery` tag returns information about the query in this variable:

- `CFQUERY.ExecutionTime`

The `cfquery` tag uses the query name to scope the following data about the query:

- `queryname.CurrentRow`
- `queryname.RecordCount`
- `queryname.ColumnList`

The `cfstoredproc` tag returns the following variables:

- `CFSTOREDPROC.ExecutionTime`
- `CFSTOREDPROC.StatusCode`
Reserved Words and Variables

CFREGISTRY variables
The cfregistry tag returns a query record set that you can reference after executing the GetAll action, as follows, where queryname is the name attribute value:

queryname.Entry
queryname.Type
queryname.Value

CFSEARCH variables
A cfsearch operation returns the following variables, where searchname is the name attribute value:

searchname.URL
searchname.Key
searchname.Title
searchname.Score
searchname.Custom1 and Custom2
searchname.Summary
searchname.RecordCount
searchname.CurrentRow
searchname.RecordsSearched
searchname.ColumnList

CGI environment (CGI Scope) variables
When a browser makes a request to a server, the web server and the browser create environment variables. In ColdFusion, these variables are referred to as CGI environment variables. CGI Environment variables contain data about the transaction between the browser and the server, such as the IP Address, browser type, and authenticated username. The available CGI variables depend on the browser and server software.

The CGI variables are available to ColdFusion pages in the CGI scope. They take the CGI prefix regardless of whether the server uses a server API or CGI to communicate with the ColdFusion server. You can reference CGI environment variables for a given page request anywhere in the page. CGI variables are read-only.

By default, when you use the cfdump tag to display the CGI scope, or when you request debug output of the CGI scope, ColdFusion attempts to display a fixed list of standard CGI environment variables. Because the available variables depend on the server, browser, and the types of interactions between the two, not all variables are normally available. They are represented by empty strings in the debug output. You can request any CGI variable in your application code, including variables that are not in the list variables displayed by dump and debug output.

ColdFusion checks for the following variables for the cfdump tag and debug output:
The following sections describe how to test for CGI environment variables and provide information on some of the more commonly used CGI environment variables.

### Testing for CGI variables

Because some browsers do not support some CGI variables, ColdFusion always returns `true` when it tests for the existence of a CGI variable, regardless of whether the browser supports the variable. To determine if the CGI variable is available, test for an empty string, as the following example shows:
<cfif CGI.varname IS NOT "">
    CGI variable exists
<cfelse>
    CGI variable does not exist
</cfif>

**CGI server variables**

The following table describes common CGI environment variables that the server creates (some variables are not available with some servers):

<table>
<thead>
<tr>
<th>CGI server variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVER_SOFTWARE</td>
<td>Name and version of the information server software answering the request (and running the gateway). Format: name/version.</td>
</tr>
<tr>
<td>SERVER_NAME</td>
<td>Server's hostname, DNS alias, or IP address as it appears in self-referencing URLs.</td>
</tr>
<tr>
<td>GATEWAY_INTERFACE</td>
<td>CGI specification revision with which this server complies. Format: CGI/revision.</td>
</tr>
<tr>
<td>SERVER_PROTOCOL</td>
<td>Name and revision of the information protocol this request came in with. Format: protocol/revision.</td>
</tr>
<tr>
<td>SERVER_PORT</td>
<td>Port number to which the request was sent.</td>
</tr>
<tr>
<td>REQUEST_METHOD</td>
<td>Method with which the request was made. For HTTP, this is Get, Head, Post, and so on.</td>
</tr>
<tr>
<td>PATH_INFO</td>
<td>Extra path information, as given by the client. Scripts can be accessed by their virtual pathname, followed by extra information at the end of this path. The extra information is sent as PATH_INFO.</td>
</tr>
<tr>
<td>PATH_TRANSLATED</td>
<td>Translated version of PATH_INFO after any virtual-to-physical mapping.</td>
</tr>
<tr>
<td>SCRIPT_NAME</td>
<td>Virtual path to the script that is executing; used for self-referencing URLs.</td>
</tr>
<tr>
<td>QUERY_STRING</td>
<td>Query information that follows the ? in the URL that referenced this script.</td>
</tr>
<tr>
<td>REMOTE_HOST</td>
<td>Hostname making the request. If the server does not have this information, it sets REMOTE_ADDR and does not set REMOTE_HOST.</td>
</tr>
<tr>
<td>REMOTE_ADDR</td>
<td>IP address of the remote host making the request.</td>
</tr>
<tr>
<td>AUTH_TYPE</td>
<td>If the server supports user authentication, and the script is protected, the protocol-specific authentication method used to validate the user.</td>
</tr>
<tr>
<td>REMOTE_USER</td>
<td>If the server supports user authentication, and the script is protected, the username the user has authenticated as. (Also available as AUTH_USER.)</td>
</tr>
<tr>
<td>AUTH_USER</td>
<td>If the HTTP server supports RFC 931 identification, this variable is set to the remote username retrieved from the server. Use this variable for logging only.</td>
</tr>
<tr>
<td>CONTENT_TYPE</td>
<td>For queries that have attached information, such as HTTP POST and PUT, this is the content type of the data.</td>
</tr>
<tr>
<td>CONTENT_LENGTH</td>
<td>Length of the content as given by the client.</td>
</tr>
</tbody>
</table>

**CGI client variables**

The following table describes common CGI environment variables the browser creates and passes in the request header:
Reserved Words and Variables

CGI client variable | Description
---|---
HTTP_REFERER | The referring document that linked to or submitted form data.
HTTP_USER_AGENT | The browser that the client is currently using to send the request. Format: software/version library/version.
HTTP_IF_MODIFIED_SINCE | The last time the page was modified. The browser determines whether to set this variable, usually in response to the server having sent the `LAST_MODIFIED` HTTP header. It can be used to take advantage of browser-side caching.

**CGI client certificate variables**

ColdFusion makes available the following client certificate data. These variables are available when running Microsoft IIS 4.0 or Netscape Enterprise under SSL if your web server is configured to accept client certificates.

<table>
<thead>
<tr>
<th>CGI client certificate variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| CERT_SUBJECT | Client-specific information provided by the web server. This data typically includes the client’s name, e-mail address, and so on, for example: 
O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. by Ref.,LIAB.LTD(c)98", OU = Persona Not Validated, OU = Digital ID Class 1 - Microsoft, CN = Matthew Lund, E = mlund@.com |
| CERT_ISSUER | Information about the authority that provided the client certificate, for example: 
O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. by Ref.,LIAB.LTD(c)98", CN = VeriSign Class 1 CA Individual Subscriber-Persona Not Validated |
Chapter 3: ColdFusion Tags

ColdFusion Markup Language (CFML) includes a set of tags that you use in ColdFusion pages to interact with data sources, manipulate data, and display output. CFML tag syntax is similar to HTML element syntax.

The following categorized and alphabetical lists of the tags are followed by the detailed tag descriptions.

New tags in ColdFusion 10

The following table briefly describes CFML tags added in ColdFusion 10:

<table>
<thead>
<tr>
<th>CFML tag</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfexchangeconversation</td>
<td>Communications tags</td>
<td>Helps users organize and manage conversations from a Microsoft Exchange account.</td>
</tr>
<tr>
<td>cfexchangefolder</td>
<td>Communications tags</td>
<td>Allows you to perform various actions on the mail folder, such as get folder information, find folders, or create, copy, modify, move, delete, and empty the contents of a folder.</td>
</tr>
<tr>
<td>cfwebsocket</td>
<td>Web Socket tags</td>
<td>Lets you create the WebSocket object in your CFM template. The tag creates a reference to the WebSocket JavaScript object at the client-side.</td>
</tr>
</tbody>
</table>

Tag summary

The following table briefly describes CFML tags:

<table>
<thead>
<tr>
<th>CFML tag</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfabort</td>
<td>Flow-control tags</td>
<td>Stops the processing of a ColdFusion page at the tag location</td>
</tr>
<tr>
<td>cfajaximport</td>
<td>Internet protocol tags</td>
<td>Controls importation of JavaScript files used for ColdFusion AJAX-based features</td>
</tr>
<tr>
<td>cfajaxproxy</td>
<td>Internet protocol tags</td>
<td>Generates an AJAX proxy class on the client page for a ColdFusion component</td>
</tr>
<tr>
<td>cfapplet</td>
<td>Forms tags</td>
<td>Embeds Java applets in a cfform tag</td>
</tr>
<tr>
<td>cfapplication</td>
<td>Application framework tags</td>
<td>Defines an application name; activates client variables; specifies client variable storage mechanism</td>
</tr>
<tr>
<td>cfargument</td>
<td>Extensibility tags</td>
<td>Creates a parameter definition within a component definition; defines a function argument</td>
</tr>
<tr>
<td>cfassociate</td>
<td>Application framework tags</td>
<td>Enables subtag data to be saved with a base tag</td>
</tr>
<tr>
<td>cfbreak</td>
<td>Flow-control tags</td>
<td>Breaks out of a CFML looping construct</td>
</tr>
<tr>
<td>cfcache</td>
<td>Page processing tags</td>
<td>Caches ColdFusion pages</td>
</tr>
<tr>
<td>cfcalendar</td>
<td>Forms tags</td>
<td>Provides a calendar from which to select a date</td>
</tr>
<tr>
<td>cfcase</td>
<td>Flow-control tags</td>
<td>Used with the cfswitch and cfdefaultcase tags</td>
</tr>
<tr>
<td>CFML tag</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cfcatch</td>
<td>Exception handling tags, Flow-control tags</td>
<td>Catches exceptions in ColdFusion pages</td>
</tr>
<tr>
<td>cfchart</td>
<td>Data output tags</td>
<td>Generates and displays a chart</td>
</tr>
<tr>
<td>cfchartdata</td>
<td>Data output tags</td>
<td>Defines chart data points</td>
</tr>
<tr>
<td>cfchartseries</td>
<td>Data output tags</td>
<td>Defines style in which chart data displays</td>
</tr>
<tr>
<td>cfcol</td>
<td>Data output tags</td>
<td>Defines table column header, properties</td>
</tr>
<tr>
<td>cfcollection</td>
<td>Extensibility tags</td>
<td>Administers Solr collections</td>
</tr>
<tr>
<td>cfcomponent</td>
<td>Extensibility tags</td>
<td>Creates and defines a component object</td>
</tr>
<tr>
<td>cfcontent</td>
<td>Data output tags, Page processing tags</td>
<td>Defines content type and filename of a file to be downloaded by the current page</td>
</tr>
<tr>
<td>cfcontinue</td>
<td>Flow-control tags</td>
<td>Returns processing to the top of a loop; used within a cfloop tag.</td>
</tr>
<tr>
<td>cfcollection</td>
<td>Variable manipulation tags</td>
<td>Defines and sets cookie variables, including expiration and security options</td>
</tr>
<tr>
<td>cfdbinfo</td>
<td>Database manipulation tags</td>
<td>Lets you retrieve information about a data source</td>
</tr>
<tr>
<td>cfdefaultcase</td>
<td>Flow-control tags</td>
<td>Receives control if there is no matching cfcase tag value</td>
</tr>
<tr>
<td>cfdefaultcase</td>
<td>Flow-control tags</td>
<td>Receives control if there is no matching cfcase tag value</td>
</tr>
<tr>
<td>cfdirectory</td>
<td>File management tags</td>
<td>Performs typical directory-handling tasks from within a ColdFusion application</td>
</tr>
<tr>
<td>cfdiv</td>
<td>Display management tags</td>
<td>Creates an HTML tag with that is populated using a bind expressions.</td>
</tr>
<tr>
<td>cfdocument</td>
<td>Data output tags</td>
<td>Creates PDF or Adobe FlashPaper output from a text block that contains CFML and HTML</td>
</tr>
<tr>
<td>cfdocumentitem</td>
<td>Data output tags</td>
<td>Specifies action items, such as header, footer, and page break, for a PDF or FlashPaper document</td>
</tr>
<tr>
<td>cfdocumentsection</td>
<td>Data output tags</td>
<td>Divides a PDF or FlashPaper document into sections</td>
</tr>
<tr>
<td>cfdump</td>
<td>Debugging tags, Variable manipulation tags</td>
<td>Outputs variables for debugging</td>
</tr>
<tr>
<td>cfelse</td>
<td>Flow-control tags</td>
<td>Creates IF-THEN-ELSE constructs</td>
</tr>
<tr>
<td>cfelseif</td>
<td>Flow-control tags</td>
<td>Creates IF-THEN-ELSE constructs</td>
</tr>
<tr>
<td>cffile</td>
<td>Exception handling tags, Application framework tags</td>
<td>Displays custom HTML error pages when errors occur</td>
</tr>
<tr>
<td>cfexchangecalendar</td>
<td>Communications tags</td>
<td>Gets, creates, deletes, modifies, or responds to Microsoft Exchange calendar events</td>
</tr>
<tr>
<td>cfexchangeconnection</td>
<td>Communications tags</td>
<td>Opens or closes a persistent connection with an Exchange server</td>
</tr>
<tr>
<td>cfexchangecontact</td>
<td>Communications tags</td>
<td>Gets, creates, deletes, or modifies Exchange contacts</td>
</tr>
<tr>
<td>cfexchangeconversation</td>
<td>Communications tags</td>
<td>Helps users organize and manage conversations from a Microsoft Exchange account.</td>
</tr>
<tr>
<td>cfexchangefolder</td>
<td>Communications tags</td>
<td>Allows you to perform various actions on the mail folder, such as get folder information, find folders, or create, copy, modify, move, delete, and empty the contents of a folder.</td>
</tr>
<tr>
<td>cfexchangefilter</td>
<td>Communications tags</td>
<td>Sets filter conditions used in Exchange tag get operations</td>
</tr>
</tbody>
</table>
### ColdFusion Tags

<table>
<thead>
<tr>
<th>CFML tag</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfexchangemail</td>
<td>Communications tags</td>
<td>Gets and deletes Exchange mail messages and sets message properties</td>
</tr>
<tr>
<td>cfexchangetask</td>
<td>Communications tags</td>
<td>Gets, creates, deletes, or modifies an Exchange user task</td>
</tr>
<tr>
<td>cfexecute</td>
<td>Flow-control tags, Extensibility tags</td>
<td>Executes developer-specified process on server computer</td>
</tr>
<tr>
<td>cfexit</td>
<td>Flow-control tags</td>
<td>Aborts processing of executing CFML tag</td>
</tr>
<tr>
<td>cffeed</td>
<td>Communications tags, Internet protocol tags</td>
<td>Reads, creates, and converts Atom and RSS syndication feeds</td>
</tr>
<tr>
<td>cffile</td>
<td>File management tags</td>
<td>Performs typical file-handling tasks from within ColdFusion application</td>
</tr>
<tr>
<td>cfhttpupload</td>
<td>File management tags, Forms tags</td>
<td>Displays a dialog for uploading multiple files from the user’s system.</td>
</tr>
<tr>
<td>cffinally</td>
<td>Exception handling tags</td>
<td>Used inside a cftry tag</td>
</tr>
<tr>
<td>cfflush</td>
<td>Data output tags, Page processing tags</td>
<td>Flushes currently available data to client</td>
</tr>
<tr>
<td>cfform</td>
<td>Forms tags</td>
<td>Builds input form; performs client-side input validation</td>
</tr>
<tr>
<td>cfformgroup</td>
<td>Forms tags</td>
<td>Groups form control into a containing object</td>
</tr>
<tr>
<td>cfformitem</td>
<td>Forms tags</td>
<td>Adds text and dividing rules to Adobe® Flash® forms</td>
</tr>
<tr>
<td>cfftp</td>
<td>Forms tags, Extensibility tags, Internet protocol tags</td>
<td>Permits FTP file operations</td>
</tr>
<tr>
<td>cffunction</td>
<td>Extensibility tags</td>
<td>Defines function that you build in CFML</td>
</tr>
<tr>
<td>cfgrid</td>
<td>Forms tags</td>
<td>Displays tabular grid control, in cfform tag</td>
</tr>
<tr>
<td>cfgridcolumn</td>
<td>Forms tags</td>
<td>Used in cfform; defines columns in a cfgrid</td>
</tr>
<tr>
<td>cfgridrow</td>
<td>Forms tags</td>
<td>Defines a grid row; used with cfgrid</td>
</tr>
<tr>
<td>cfgridupdate</td>
<td>Forms tags</td>
<td>Directly updates ODBC data source from edited grid data</td>
</tr>
<tr>
<td>cfheader</td>
<td>Data output tags, Page processing tags</td>
<td>Generates HTTP headers</td>
</tr>
<tr>
<td>cfhtmlhead</td>
<td>Page processing tags</td>
<td>Writes text and HTML to HEAD section of page</td>
</tr>
<tr>
<td>cfhttp</td>
<td>Internet protocol tags</td>
<td>Performs GET and POST to upload file or post form, cookie, query, or CGI variable directly to server</td>
</tr>
<tr>
<td>cfhttpparam</td>
<td>Internet protocol tags</td>
<td>Specifies parameters required for a cfhttp POST operation; used with cfhttp</td>
</tr>
<tr>
<td>cfif</td>
<td>Flow-control tags</td>
<td>Creates IF-THEN-ELSE constructs</td>
</tr>
<tr>
<td>cfimage</td>
<td>Other tags</td>
<td>Creates a cfimage, a ColdFusion data type that can be operated by image functions.</td>
</tr>
<tr>
<td>cfimap</td>
<td>Communications tags, Internet protocol tags</td>
<td>Retrieves and manages e-mails and folders in IMAP servers</td>
</tr>
<tr>
<td>cfimport</td>
<td>Application framework tags</td>
<td>Imports JSP tag libraries into a CFML page</td>
</tr>
<tr>
<td>CFML tag</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cfinclude</td>
<td>Flow-control tags</td>
<td>Embeds references to ColdFusion pages</td>
</tr>
<tr>
<td>cfindex</td>
<td>Extensibility tags</td>
<td>Creates Solr search indexes</td>
</tr>
<tr>
<td>cfinput</td>
<td>Forms tags</td>
<td>Creates an input element (radio button, check box, text entry box); used in cfform</td>
</tr>
<tr>
<td>cfinsert</td>
<td>Database manipulation tags</td>
<td>Inserts records in a data source</td>
</tr>
<tr>
<td>cfinterface</td>
<td>Application framework tags, Extensibility tags</td>
<td>Defines an interface that a ColdFusion component can implement</td>
</tr>
<tr>
<td>cfinvoke</td>
<td>Extensibility tags</td>
<td>Invokes component methods from a ColdFusion page or component</td>
</tr>
<tr>
<td>cfinvokeargument</td>
<td>Extensibility tags</td>
<td>Passes a parameter to a component method or a web service</td>
</tr>
<tr>
<td>cflayout</td>
<td>Display management tags</td>
<td>Creates a region of its container with a specific layout behavior</td>
</tr>
<tr>
<td>cflayoutarea</td>
<td>Display management tags</td>
<td>Defines a display region within a cflayout tag body</td>
</tr>
<tr>
<td>cfldap</td>
<td>Internet protocol tags</td>
<td>Provides access to LDAP directory servers</td>
</tr>
<tr>
<td>cflocation</td>
<td>Flow-control tags</td>
<td>Controls execution of a page</td>
</tr>
<tr>
<td>cflock</td>
<td>Application framework tags</td>
<td>Ensures data integrity and synchronizes execution of CFML code</td>
</tr>
<tr>
<td>cflog</td>
<td>Data output tags, Other tags</td>
<td>Writes a message to a log file</td>
</tr>
<tr>
<td>cflogin</td>
<td>Security tags</td>
<td>Defines a container for user login and authentication code</td>
</tr>
<tr>
<td>cfloginuser</td>
<td>Security tags</td>
<td>Identifies an authenticated user to ColdFusion</td>
</tr>
<tr>
<td>cflogout</td>
<td>Security tags</td>
<td>Logs the current user out</td>
</tr>
<tr>
<td>cfloop</td>
<td>Flow-control tags</td>
<td>Repeats a set of instructions based on conditions</td>
</tr>
<tr>
<td>cfmail</td>
<td>Communications tags, Internet protocol tags</td>
<td>Assembles and posts an e-mail message</td>
</tr>
<tr>
<td>cfmailparam</td>
<td>Communications tags, Internet protocol tags</td>
<td>Attaches a file or adds a header to an e-mail message</td>
</tr>
<tr>
<td>cfmailpart</td>
<td>Communications tags, Internet protocol tags</td>
<td>Contains one part of a multipart mail message</td>
</tr>
<tr>
<td>cfmap</td>
<td>Other tags</td>
<td>Embeds a Google map within a ColdFusion web page</td>
</tr>
<tr>
<td>cfmapitem</td>
<td>Other tags</td>
<td>Creates markers on the map; a child tag of the cfmap tag</td>
</tr>
<tr>
<td>cfmediaplayer</td>
<td>Other tags</td>
<td>Creates an in-built media player that can play FLV files</td>
</tr>
<tr>
<td>cfmenu</td>
<td>Display management tags</td>
<td>Creates a top-level menu or a tool bar.</td>
</tr>
<tr>
<td>cfmenuitem</td>
<td>Display management tags</td>
<td>Defines an entry in a menu, including an item that is the head of a submenu.</td>
</tr>
<tr>
<td>cfmessagebox</td>
<td>Application framework tags</td>
<td>Defines a control for displaying pop-up messages</td>
</tr>
<tr>
<td>cfNTauthenticate</td>
<td>Security tags</td>
<td>Authenticates user information against an NT domain</td>
</tr>
<tr>
<td>cfobject</td>
<td>Extensibility tags</td>
<td>Creates COM, component, CORBA, Java, and web service objects</td>
</tr>
<tr>
<td>cfoBJECTcache</td>
<td>Database manipulation tags</td>
<td>Flushes the query cache</td>
</tr>
<tr>
<td>cfoutput</td>
<td>Data output tags</td>
<td>Displays the output of a database query or other operation</td>
</tr>
<tr>
<td>cfparam</td>
<td>Variable manipulation tags</td>
<td>Defines a parameter and its default value</td>
</tr>
</tbody>
</table>
## CFML Tags

<table>
<thead>
<tr>
<th>CFML Tag</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>cfpdf</strong></td>
<td>Forms tags</td>
<td>Manipulates existing PDF documents.</td>
</tr>
<tr>
<td><strong>cfpdfform</strong></td>
<td>Forms tags</td>
<td>Creates and manipulates PDF forms.</td>
</tr>
<tr>
<td><strong>cfpdfformparam</strong></td>
<td>Forms tags</td>
<td>Creates interactive fields on a PDF form.</td>
</tr>
<tr>
<td><strong>cfpdfparam</strong></td>
<td>Forms tags</td>
<td>Child tag of the <strong>cfpdf</strong> tag. Used only with the merge action to merge multiple pages or PDF documents into one file.</td>
</tr>
<tr>
<td><strong>cfpdfsubform</strong></td>
<td>Forms tags</td>
<td>Creates subforms within a PDF form.</td>
</tr>
<tr>
<td><strong>cfpod</strong></td>
<td>Display management tags</td>
<td>Creates a an area of the browser or layout area with an optional title bar and a body</td>
</tr>
<tr>
<td><strong>cfpop</strong></td>
<td>Communications tags, Internet protocol tags</td>
<td>Gets and deletes messages from POP mail server</td>
</tr>
<tr>
<td><strong>cfpresentation</strong></td>
<td>Data output tags</td>
<td>Creates a presentation dynamically from an HTML page or SWF files</td>
</tr>
<tr>
<td><strong>cfpresentationslide</strong></td>
<td>Data output tags</td>
<td>Creates a slide dynamically from an HTML page or SWF source files (child tag of the <strong>cfpresentation</strong> tag)</td>
</tr>
<tr>
<td><strong>cfpresenter</strong></td>
<td>Data output tags</td>
<td>Describes a presenter in a slide presentation</td>
</tr>
<tr>
<td><strong>cfprint</strong></td>
<td>Data output tags</td>
<td>Prints PDF documents. Used for automated print jobs</td>
</tr>
<tr>
<td><strong>cfprocessingdirective</strong></td>
<td>Data output tags</td>
<td>Suppresses white space and other output</td>
</tr>
<tr>
<td><strong>cfprocparam</strong></td>
<td>Database manipulation tags</td>
<td>Holds parameter information for stored procedure</td>
</tr>
<tr>
<td><strong>cfprocresult</strong></td>
<td>Database manipulation tags</td>
<td>Result set name that ColdFusion tags use to access result set of a stored procedure</td>
</tr>
<tr>
<td><strong>cfprogressbar</strong></td>
<td>Other tags</td>
<td>Defines a progress bar to indicate the progress of an activity</td>
</tr>
<tr>
<td><strong>cfproperty</strong></td>
<td>Extensibility tags</td>
<td>Defines components</td>
</tr>
<tr>
<td><strong>cfquery</strong></td>
<td>Database manipulation tags</td>
<td>Passes SQL statements to a database</td>
</tr>
<tr>
<td><strong>cfqueryparam</strong></td>
<td>Database manipulation tags</td>
<td>Checks data type of a query parameter</td>
</tr>
<tr>
<td><strong>cfregistry</strong></td>
<td>Other tags, Variable manipulation tags</td>
<td>Reads, writes, and deletes keys and values in a Windows system registry</td>
</tr>
<tr>
<td><strong>cfreport</strong></td>
<td>Exception handling tags</td>
<td>Embeds a ColdFusion Report Builder or Crystal Reports report</td>
</tr>
<tr>
<td><strong>cfreportparam</strong></td>
<td>Exception handling tags</td>
<td>Passes an input parameter to a ColdFusion Report Builder report</td>
</tr>
<tr>
<td><strong>cfrethrow</strong></td>
<td>Exception handling tags</td>
<td>Rethrows currently active exception</td>
</tr>
<tr>
<td><strong>cfreturn</strong></td>
<td>Extensibility tags</td>
<td>Returns results from a component method</td>
</tr>
<tr>
<td><strong>cfsavecontent</strong></td>
<td>Variable manipulation tags</td>
<td>Saves generated content inside tag body in a variable</td>
</tr>
<tr>
<td><strong>cfschedule</strong></td>
<td>Variable manipulation tags</td>
<td>Schedules page execution; optionally, produces static pages</td>
</tr>
<tr>
<td><strong>cfscript</strong></td>
<td>Application framework tags</td>
<td>Encloses a set of <strong>cfscript</strong> statements</td>
</tr>
<tr>
<td><strong>cfsearch</strong></td>
<td>Extensibility tags</td>
<td>Executes searches against data indexed in Solr collections, using <strong>cfindex</strong></td>
</tr>
<tr>
<td><strong>cfselect</strong></td>
<td>Forms tags</td>
<td>Creates a drop-down list box form element; used in <strong>cfform</strong> tag</td>
</tr>
<tr>
<td><strong>cfset</strong></td>
<td>Variable manipulation tags</td>
<td>Defines a variable</td>
</tr>
<tr>
<td><strong>cfsetting</strong></td>
<td>Other tags, Variable manipulation tags</td>
<td>Defines and controls ColdFusion settings</td>
</tr>
</tbody>
</table>
# ColdFusion Tags

The following tables list tags by their function or purpose.

<table>
<thead>
<tr>
<th>CFML tag</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfsharepoint</td>
<td>Extensibility tags</td>
<td>Invokes a SharePoint action from ColdFusion</td>
</tr>
<tr>
<td>cfsilent</td>
<td>Data output tags, Page processing tags</td>
<td>Suppresses CFML output within tag scope</td>
</tr>
<tr>
<td>cfslider</td>
<td>Forms tags</td>
<td>Creates slider control; used in cfform</td>
</tr>
<tr>
<td>cfspreadsheet</td>
<td>Extensibility tags</td>
<td>Manages Excel spreadsheet files</td>
</tr>
<tr>
<td>cfsprydataset</td>
<td>Internet protocol tags</td>
<td>Creates a spry data set</td>
</tr>
<tr>
<td>cfstoredproc</td>
<td>Database manipulation tags</td>
<td>Holds database connection information; identifies a stored procedure to execute</td>
</tr>
<tr>
<td>cfswitch</td>
<td>Flow-control tags</td>
<td>Evaluates passed expression; passes control to matching cfcase tag</td>
</tr>
<tr>
<td>cftable</td>
<td>Data output tags</td>
<td>Builds a table in a ColdFusion page</td>
</tr>
<tr>
<td>cftextarea</td>
<td>Forms tags</td>
<td>Puts a multiline text box in a form</td>
</tr>
<tr>
<td>cfthread</td>
<td>Application framework tags</td>
<td>Creates and manages ColdFusion threads, independent streams of execution.</td>
</tr>
<tr>
<td>cfthrow</td>
<td>Exception handling tags, Flow-control tags</td>
<td>Throws a developer-specified exception</td>
</tr>
<tr>
<td>cftimer</td>
<td>Debugging tags</td>
<td>Displays execution time for a block of code</td>
</tr>
<tr>
<td>cftooltip</td>

**Tags by function**

The following tables list tags by their function or purpose.
### Application framework tags

- `cfapplication`
- `cfassociate`
- `cferror`
- `cfimport`
- `cfinterface`
- `cflock`
- `cfscript`
- `cfthread`

### Communications tags

- `cfexchangecalendar`
- `cfexchangefilter`
- `cffeed`
- `cfmailpart`
- `cfexchangecollection`
- `cfexchangemail`
- `cfmail`
- `cfpop`
- `cfexchangetask`
- `cfmailparam`
- `cfimap`

### Database manipulation tags

- `cfdbinfo`
- `cfprocparam`
- `cfqueryparam`
- `cfupdate`
- `cfinsert`
- `cfprocresult`
- `cfstoredproc`
- `cfobjectcache`
- `cfquery`
- `cftransaction`

### Data output tags

- `cfchart`
- `cfchartdata`
- `cfchartseries`
- `cfcol`
- `cfcontent`
- `cfdocument`
- `cfdocumentitem`
- `cfdocumentsection`
- `cfflush`
- `cfheader`
- `cflog`
- `cfoutput`
- `cfpresentation`
- `cfpresentationitem`
- `cfpresentationslide`
- `cfprocessingdirective`
- `cfprint`
- `cfreport`
- `cfreportparam`
- `cfsilent`
- `cftable`

### Debugging tags

- `cfdump`
- `cferror`
- `cffinally`
- `cfrethrow`
- `cfthrow`
- `cftrace`

### Display management tags

- `cfdiv`
- `cflayout`
- `cflayoutarea`
- `cfmap`
- `cfmapitem`
- `cfmediaplayer`
- `cfmessagebox`
- `cfpod`
- `cfprogressbar`
- `cfprocessingdirective`
- `cfprint`
- `cfreport`
- `cfwindow`

### Exception handling tags

- `cfcatch`
- `cferror`
- `cffinally`
- `cfrethrow`
- `cftry`

<td>cfpop</td>
<td></td>
</tr>
</tbody>
</table>
Page processing tags

cfcache       cfheader       cfprocessingdirective

cfcontent     cfhtmlhead     cfsetting

cfflush       cfinclude      cfsilent

Security tags

cflogin       cfloginuser    cflogout    cfNTauthenticate

Variable manipulation tags

cfcookie      cfparam        cfsavecontent cfset

cfdump        cfregistry     cfschedule  cfsetting

Web Socket tags

cfwebsocket

Other tags

cfimage       cflog          cfregistry

Tag changes since ColdFusion 5

The following tables list tags, attributes, and values that have changed since ColdFusion 5, and indicate the specific release in which the change was made.

New tags, attributes, and values

This table lists tags, attributes, and attribute values that have been added since the ColdFusion MX release:

<table>
<thead>
<tr>
<th>Tag</th>

Tags a-b

cfabort

Description
Stops the processing of a ColdFusion page at the tag location. ColdFusion returns everything that was processed before the tag. The tag is often used with conditional logic to stop processing a page when a condition occurs.

Category
Flow-control tags

Syntax
<cfabort
     showError = "error message">

Note: You can specify this tag's attributes in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag's attribute names as structure keys.

See also
cfbreak, cfexecute, cfexit, cfif, cflocation, cfloop, cfswitch, cfthrow, cftry; cfabort and cfexit in the Developing ColdFusion Applications

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>showError</td>
<td>Optional</td>
<td>Error to display, in a standard ColdFusion error page, when tag executes.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

When you use the cfabort and cferror tags together, the cfabort tag halts processing immediately; the cferror tag redirects output to a specified page.

If this tag does not contain a showError attribute value, processing stops when the tag is reached and ColdFusion returns the page contents up to the line that contains the cfabort tag.

When you use this tag with the showError attribute, but do not define an error page using cferror, page processing stops when the cfabort tag is reached. The message in showError displays to the client.

When you use this tag with the showError attribute and an error page using cferror, ColdFusion redirects output to the error page specified in the cferror tag.

Note: When using cfabort, cflocation, or cfcontent tags, the OnAbort method is invoked instead on OnRequestEnd.

Example

This example shows the use of cfabort to stop processing. In the second example, where cfabort is used, the result never displays.
Example A: Let the instruction complete itself

```coldfusion
<!--- first, set a variable --->
<cfset myVariable = 3>
<!--- now, perform a loop that increments this value --->
<cfloop from = "1" to = "4" index = "Counter">
    <cfset myVariable = myVariable + 1>
</cfloop>
<p>The value of myVariable after incrementing through the loop #Counter# times is: #myVariable#</p>
```

Example B: Use cfabort to halt the instructions with showmessage attribute and cferror

```coldfusion
<!--- Reset the variable and show the use of cfabort. --->
<cfset myVariable = 3>
<!--- Now, perform a loop that increments this value. --->
<cfloop from = "1" to = "4" index = "Counter">
    <!--- On the second time through the loop, cfabort. --->
    <cfif Counter is 2>
        <!--- Take out the cferror line to see cfabort error processed by CF error page. --->
        <cferror type="request" template="request_err.cfm">
            cfabort showerror="CFABORT has been called for no good reason"
        </cferror>
    <cfelse>
        <cfset myVariable = myVariable + 1>
    </cfif>
</cfloop>
<p>The value of myVariable after incrementing through the loop#counter# times is: #myVariable#</p>
```

cfajaximport

Description
Controls the JavaScript files that are imported for use on pages that use ColdFusion AJAX tags and features.

Category
Internet protocol tags

Syntax
```
<cfajaximport
    cssSrc = "local URL path"
    params = "parameters"
    scriptSrc = "local URL path"
    tags = "comma-delimited list">
```

Note: You can specify this tag’s attributes in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag’s attribute names as structure keys.

Specifying client-side support files in the Developing ColdFusion Applications

History
ColdFusion 8: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cssSrc</td>
<td>Optional</td>
<td>scriptsrc/ajax</td>
<td>Specifies the URL, relative to the web root, of the directory that contains the CSS files used by ColdFusion AJAX features, with the exception of the rich text editor. This directory must have the same directory structure, and contain the same CSS files, and image files required by the CSS files, as the web_root/CFIDE/scripts/ajax/resources directory. This attribute lets you create different custom styles for ColdFusion AJAX controls in different applications.</td>
</tr>
<tr>
<td>params</td>
<td>Optional</td>
<td></td>
<td>This attribute allows you to specify parameters for the CFM page. Currently, the only parameter that you can specify is googlemapkey. You can specify the googlemapkey as follows: <code>&lt;cfajaximport params=#{googlemapkey=&quot;Map API Key&quot;}]&gt;</code></td>
</tr>
<tr>
<td>scriptSrc</td>
<td>Optional</td>
<td>scriptsrc setting in the Administrator; default path is /CFIDE/scripts/</td>
<td>Specifies the URL, relative to the web root, of the directory that contains the client-side script files used by ColdFusion. This directory includes the JavaScript files and the default location of the CSS files used for all AJAX features. If you use this attribute, the cfajaximport tag must precede all other ColdFusion AJAX tags on the page; that is, all tags that rely on the scripts. You can have only one scriptsrc attribute on a page, in a cfajaximport tag or a cfform tag. You can use a scriptsrc attribute in a cfajaximport tag to apply its value to all forms on a page.</td>
</tr>
<tr>
<td>tags</td>
<td>Optional</td>
<td></td>
<td>A comma-delimited list of tags or tag-attribute combinations for which to import the supporting JavaScript files on this page. If you use this attribute, it must specify all ColdFusion AJAX tags that you use on the page and on any pages specified in tag source attributes. For a list of valid attribute values and their purposes, see Usage.</td>
</tr>
</tbody>
</table>

Usage

Using the scriptsrc and cssSrc attributes
The scriptsrc attribute is useful if the JavaScript files are not in the default location. This attribute is required in some hosting environments and configurations that block access to the /CFIDE directory.

The default scriptsrc value is determined by the Default CFIFORM ScriptSrc Directory setting on the Server Settings > Settings page of the ColdFusion Administrator. For cfform tags, the tag’s scriptsrc attribute takes precedence over this attribute.

You can use this attribute only if the cfajaximport tag is on a top-level page; that is, a page that the client directly requests. You cannot use it, for example, on a page that is specified in a cfwindow tag source attribute.

When you use the cfajaximport tag with a scriptsrc attribute, the specified directory must have the same structure as the /CFIDE/scripts directory. For example, if you specify scriptsrc="/resources/myScripts", the JavaScript files used by AJAX must be in the /resources/myScripts/ajax directory.
This attribute specifies the folder that contains the ColdFusion client-side files for all subsequent tags on the current page, not just for AJAX-based tags. Therefore, the directory tree must include all ColdFusion client-side files used by those tags. For example, if a `cfform` tag on the page is in Flash or applet format, include the CF_RunActiveContent.js file in the directory specified by the `scriptsrc` attribute.

You use the `cssSrc` attribute to specify the location of the CSS files required by ColdFusion AJAX features. This attribute overrides the `scriptsrc/ajax/resources` directory for the current page. Therefore, if all pages that use a custom `scriptsrc` directory also use a custom `cssSrc` directory, you do not have to include the ColdFusion AJAX CSS files in the `scriptsrc` directory tree.

### Using the tags attribute or no attribute

If you do not use the `cfajaximport` tag on a page that contains ColdFusion tags with AJAX UI features, ColdFusion correctly imports the required JavaScript files in most cases. Use this tag to explicitly import JavaScript files in these cases:

- If you use a ColdFusion AJAX JavaScript function, such as `ColdFusion.navigate`, `ColdFusion.Ajax.submitForm`, or `ColdFusion.Log.info` on a page that does not otherwise import any AJAX JavaScript functions, use the `cfajaximport` tag with no attribute to import the base JavaScript functions only. For example, use this tag on a page that does not include any ColdFusion AJAX-based tags,

- If the following conditions are true:
  - You use any `source` attributes in `cflayoutarea`, `cfpod` or `cfwindow` tags, or bind attribute in `cfdiv` tag.
  - The file that the `source` or `bind` attribute specifies has any of the tags listed in the following table.
  - You do not use each of the listed tags on the top-level page.

  If these conditions are true, the top-level page must use the `cfajaximport` tag with a `tags` attribute that specifies the tags that only the other pages use. Otherwise, ColdFusion cannot identify that it will be using the tags and does not import the necessary JavaScript files.

You can specify any or all the following tag attribute values:

<table>
<thead>
<tr>
<th>Attribute value</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cfdiv</code></td>
<td><code>cfdiv</code> tags</td>
</tr>
<tr>
<td><code>cfform</code></td>
<td>Forms that are in <code>cfpod</code>, <code>cfwindow</code>, or <code>cflayoutarea</code> tag bodies</td>
</tr>
<tr>
<td><code>cfgrid</code></td>
<td>AJAX format <code>cfgrid</code> tags</td>
</tr>
<tr>
<td><code>cfinput-autosuggest</code></td>
<td><code>cfinput</code> tags that use the <code>autosuggest</code> attribute</td>
</tr>
<tr>
<td><code>cfinput-datefield</code></td>
<td>HTML format <code>cfinput</code> tags that use the <code>datefield</code> attribute</td>
</tr>
<tr>
<td><code>cflayout-border</code></td>
<td><code>cflayout</code> tags with a <code>type</code> attribute value of <code>border</code></td>
</tr>
<tr>
<td><code>cflayout-tab</code></td>
<td><code>cflayout</code> tags with a <code>type</code> attribute value of <code>tab</code></td>
</tr>
<tr>
<td><code>cfmenu</code></td>
<td><code>cfmenu</code> tags</td>
</tr>
<tr>
<td><code>cfpod</code></td>
<td><code>cfpod</code> tags</td>
</tr>
<tr>
<td><code>cfsprydataset-JSON</code></td>
<td><code>cfsprydataset</code> tags that generate Spry JSON data sets</td>
</tr>
<tr>
<td><code>cfsprydataset-XML</code></td>
<td><code>cfsprydataset</code> tags that generate Spry XML data sets</td>
</tr>
<tr>
<td><code>cftextarea</code></td>
<td>HTML format <code>cftextarea</code> tags</td>
</tr>
</tbody>
</table>
**Example**

The following cfajaximport tag example specifies separate custom locations for the scripts used for AJAX features and for the AJAX CSS files. It also imports all JavaScript files used for cftree, and cftooltip.

```cfml
<cfajaximport cssSrc="/collegeApp/application/cssFiles"
  scriptsrc="/collegeApp/ajaxScripts"
  tags="cftooltip, cfwindow">
```

**cfajaxproxy**

**Description**

Creates a JavaScript proxy for a ColdFusion component, for use in an AJAX client. Alternatively, creates a proxy for a single CFC method, JavaScript function, or URL that is bound to one or more control attribute values.

**Category**

Internet protocol tags

**Syntax**

```cfml
<cfajaxproxy
  cfc = "CFC name"
  jscclassname = "JavaScript proxy class name">
```

OR

```cfml
<cfajaxproxy
  bind = "bind expression"
  onError = "JavaScript function name"
  onSuccess = "JavaScript function name">
```

**Note:** You can specify this tag’s attributes in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag’s attribute names as structure keys.

**History**

ColdFusion 8: Added this tag
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind</td>
<td>A bind or cfc attribute is required</td>
<td>A bind expression that specifies a CFC method, JavaScript function, or URL to call. For detailed information about specifying bind expressions, see Binding data to form fields in the Developing ColdFusion Applications. You cannot use this attribute with the cfc attribute.</td>
<td></td>
</tr>
<tr>
<td>cfc</td>
<td>A bind or cfc attribute is required</td>
<td>The CFC for which to create a proxy. Specify a dot-delimited path to the CFC. The path can be an absolute filepath, or relative to location of the CFML page. For example, if the myCFC CFC is in the cfcs subdirectory of the ColdFusion page, specify cfcs.myCFC. If the CFC extends another CFC, the extended CFC methods are also available to the JavaScript proxy. On UNIX-based systems, the tag searches first for a file whose name or path corresponds to the specified name or path, but is in all lowercase. If it does not find it, ColdFusion then searches for a filename or path that corresponds to the attribute value exactly, with identical character casing. This attribute cannot be used with the bind attribute.</td>
<td></td>
</tr>
<tr>
<td>jsclassname</td>
<td>Optional</td>
<td>The value of the cfc attribute</td>
<td>The name to use for the JavaScript proxy class that represents the CFC. This attribute cannot be used with a bind attribute.</td>
</tr>
<tr>
<td>onError</td>
<td>Optional</td>
<td>The name of a JavaScript function to invoke when a bind, specified by the bind attribute fails. The function must take two arguments: an error code and an error message. This attribute cannot be used with a cfc attribute.</td>
<td></td>
</tr>
<tr>
<td>onSuccess</td>
<td>Optional</td>
<td>The name of a JavaScript function to invoke when a bind, specified by the bind attribute succeeds. The function must take one argument, the bind function return value. If the bind function is a CFC function, the return value is automatically converted to a JavaScript variable before being passed to the onSuccess function. This attribute cannot be used with a cfc attribute.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

Make sure that the Enable HTTP Status Codes option on the Server Settings > Settings page of the ColdFusion Administrator is selected. Otherwise, the proxy cannot determine if an error occurs in invoking the CFC function and cannot call the error handler.

A cfajaxproxy tag with a bind attribute does not refresh any control that is not specified in the bind expression.

If you specify a URL in the bind attribute, the HTTP response must consist of a single JSON representation of an object, array, or simple value, corresponding to the onSuccess argument.

Creating a CFC proxy

The cfajaxproxy tag with a cfc attribute generates a JavaScript proxy that represents a CFC on the web client. The tag and the proxy it generates have the following characteristics:

- The proxy provides one function that corresponds to each CFC remote function. Calling these functions in your client-side JavaScript code remotely calls the CFC functions on the server.
- The proxy provides several functions that you call to configure the interaction between the client and the server. These functions set the HTTP method and synchronization mode of the XMLHttpRequest call that the proxy uses to interact with the server. The functions also can specify a JavaScript callback handler and an error handler for asynchronous calls.
Because JavaScript is case sensitive, ensure that you match the case of the keys in any ColdFusion structure or scope that you send to the client. By default, ColdFusion sets variable names and structure element names to all-uppercase. (You can create structure element names with lowercase characters by specifying the names in associative array notation, for example, myStruct["myElement"]="value"). The keys for the two arrays in the JSON object that the ColdFusion serializeJSON tag generates to represent a query are COLUMNS and DATA, for example, not columns and data.

For detailed information on using AJAX CFC proxies, see Using ColdFusion Ajax CFC proxies in Using Ajax Data and Development Features in the Developing ColdFusion Applications.

**Note:** The proxy passes a _CF_NODEBUG Boolean argument to called CFC functions. ColdFusion checks this value, and when it is true, does not append to the response any debugging information that it normally would send. This behavior ensures that the JSON responses to AJAX requests do not include any non-JSON (i.e., debug information) text.

### CFC proxy utility functions

When you use the cfc option, the JavaScript proxy object provides the following functions that you can use to control interaction with the server:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setAsyncMode()</td>
<td>Sets the call mode to asynchronous. The calling thread (the Java thread of the client system that is processing the page) is not blocked when you make a call to a proxy function, so page processing can continue while waiting for a response from the server. The proxy invokes the function specified by the setCallbackHandler function with the response from the server. If an error occurs, the proxy invokes the error handler specified by the setErrorHandler function.</td>
</tr>
<tr>
<td>setCallbackHandler(function)</td>
<td>Specifies the callback handler for an asynchronous call. The function parameter is the JavaScript function to invoke as an argument. The callback function must take one parameter, the return value from the CFC that the proxy has deserialized from JSON to a JavaScript representation. This method automatically sets the call mode to asynchronous.</td>
</tr>
</tbody>
</table>
| setErrorHandler(function) | Sets the error handler that the proxy invokes if there is an error in an asynchronous call. The function parameter is the JavaScript function to invoke. The error handler function must take two parameters:  
  • An HTTP error code  
  • A status message  
  This method automatically sets the call mode to asynchronous. |
| setForm(ID)             | Adds names and values of the fields in the form specified by the ID attribute to the arguments passed by a proxy function that is called immediately after this function. For more information, see Submitting data to a CFC in the Developing ColdFusion Applications. |
| setHTTPMethod("method") | Sets the HTTP method to use for the call. The method parameter is a case-insensitive string, and must have one of the following values:  
  • GET (the default method)  
  • POST  
  |
Example
The following example uses a remote CFC method to populate a drop-down list of employees. When you select a name from the list, it uses a call to the CFC method to get information about the employee, and displays the results.

The application page has the following lines:

```html
<!---- The cfajaxproxy tag creates a client-side proxy for the emp CFC. View the generated page source to see the resulting JavaScript. The emp CFC is in the components subdirectory of the directory that contains this page. --->
<cfajaxproxy cfc="components.emp" jsclassname="emp">  

<html>
<head>
<script type="text/javascript">
  // Function to find the index in an array of the first entry with a specific value. It is used to get the index of a column in the column list.
  Array.prototype.findIndex = function(value){
    for (var i=0; i < this.length; i++) {
      if (this[i] == value) {
        return i;
      }
    }
  }
</script>
  
```
// Use an asynchronous call to get the employees for the
// drop-down employee list from the ColdFusion server.
var getEmployees = function(){
  // create an instance of the proxy.
  var e = new emp();
  // Setting a callback handler for the proxy automatically makes
  // the proxy’s calls asynchronous.
  e.setCallbackHandler(populateEmployees);
  e.setErrorHandler(myErrorHandler);
  // The proxy getEmployees function represents the CFC
  // getEmployees function.
  e.getEmployees();
}

// Callback function to handle the results returned by the
// getEmployees function and populate the drop-down list.
var populateEmployees = function(res)
{
  with(document.simpleAJAX)
  {
    var option = new Option();
    option.text='Select Employee';
    option.value='0';
    employee.options[0] = option;
    for(i=0;i<res.DATA.length;i++)
    {
      var option = new Option();
      option.text=res.DATA[i][res.COLUMNS.findIdx('FIRSTNAME')] + ' ' + res.DATA[i][res.COLUMNS.findIdx('LASTNAME')];
      option.value=res.DATA[i][res.COLUMNS.findIdx('EMP_ID')];
      employee.options[i+1] = option;
    }
  }
}

// Use an asynchronous call to get the employee details.
// The function is called when the user selects an employee.
var getEmployeeDetails = function(id)
{
  var e = new emp();
  e.setCallbackHandler(populateEmployeeDetails);
  e.setErrorHandler(myErrorHandler);
  // This time, pass the employee name to the getEmployees CFC
  // function.
  e.getEmployees(id);
}

// Callback function to display the results of the getEmployeeDetails
// function.
var populateEmployeeDetails = function(employee)
{
  empData.innerHTML = '
    <span style="width:100px">Employee Id:</span>
    ' + employee.DATA[0][0] + '</span>'
}
The following component, which gets the data from the data source, must be in a file named emp.cfc in the components subdirectory of the application directory. The CFC uses the cfdocexamples data source that is installed with ColdFusion if you install the documentation.
<cfset this.dsn = "cfdocexamples">
<cffunction name="getEmployees" access="remote" returnFormat="json">
<cfargument name="empid" required="no" type="string" default="0">
<cfquery name="qryEmp" datasource="#this.dsn#">
select * from Employees
<cfif empid neq 0>
where Emp_ID = #empid#
</cfif>
</cfquery>
<cfreturn qryEmp>
</cffunction>
</cfcomponent>

**cfapplet**

**Description**
This tag references a registered custom Java applet. To register a Java applet, in the ColdFusion Administrator, select Extensions > Java Applets.

Using this tag within a **cfform** tag is optional. If you use it within **cfform**, and the **method** attribute is defined in the Administrator, the return value is incorporated into the form.

**Category**
Forms tags

**Syntax**
<cfapplet
appletSource = "applet name"
name = "form variable name"
align = "alignment option"
height = "height in pixels"
hSpace = "space on each side in pixels"
notSupported = "message to display for non-Java browser"
param_1 = "applet parameter name"
param_2 = "applet parameter name"
param_n = "applet parameter name"
vSpace = "space above and below in pixels"
width = "width in pixels">

**Note:** You can specify this tag's attributes in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag's attribute names as structure keys.

**See also**
cfform, cfformgroup, cfformitem, cfgrid, cfinput, cfobject, cfselect, cfslider, cftextarea, cftree

**History**
ColdFusion MX:
- Removed the requirement that you use this tag within a **cfform** tag.
• Changed the behavior when this tag is used within a \texttt{cform} tag; if the \texttt{method} attribute is defined in the Administrator, the return value of the applet’s method is incorporated into the form.

<td></td>
</tr>
<tr>
<td>\texttt{notSupported}</td>
<td>Optional</td>
<td>See description</td>
<td></td>
</tr>
</tbody>
</table>
|            |         | Text to display if a page that contains a Java applet-based \texttt{cform} control is opened by a browser that does not support Java or has Java support disabled, for example: \begin{verbatim}
\texttt{notSupported = "<b>Browser must support Java to view ColdFusion Java Applets!</b>"
\end{verbatim}

Default value:
\begin{verbatim}
<b>Browser must support Java to<br>view ColdFusion Java Applets!</b>
\end{verbatim}|
| param_n    | Optional | Registered parameter for applet. Specify only to override values for applet in ColdFusion Administrator. |
| vSpace     | Optional | Space above and below applet, in pixels.       |
| width      | Optional | Width of applet, in pixels.                    |

### Usage

You can specify the \texttt{applet method} attribute only in the Administrator, Java Applets view. For other attributes, you can accept the default values in the Administrator view, or specify values in this tag and override the defaults.

If Java applet components are stored in a JAR file, enter the information in the J2EE Archives > ColdFusion Administrator. For more information, see Embedding Java applets in the \textit{Developing ColdFusion Applications}.
Example
<p>cfapplet lets you reference custom Java applets that have been registered using the ColdFusion Administrator.  
To register a Java applet, open the ColdFusion Administrator and click "Applets" link under "extensions" section.  
This example applet copies text that you type into a form. Type some text, and then click "copy" to see the copied text.
</p>
<pre><cfform action = "index.cfm">
  <cfapplet appletsource = "copytext" name = "copytext">
  </cfform>
</pre>

cfapplication

Description
Defines the scope of a ColdFusion application; enables and disables storage of Client variables; specifies the Client variable storage mechanism; enables Session variables; and sets Application variable time-outs.

Category
Application framework tags

Syntax
<pre><cfapplication
datasource="data_source_name"
name = "application name"
applicationTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
clientManagement = "yes|no"
clientStorage = "data_source_name|Registry|Cookie"
loginStorage = "cookie|session"
googeMapKey = "map key"
scriptProtect = "none|all|list"
serverSideFormValidation = "yes|no"
sessionManagement = "yes|no"
sessionTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
setClientCookies = "yes|no"
setDomainCookies = "yes|no">
</cfapplication>
</pre>

Note: You can specify this tag's attributes in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag's attribute names as structure keys.

<cfassociate,cferror,cflock,cfmessagebox;Application.CFC Reference;Designing and Optimizing a ColdFusion Application and Integrating J2EE and Java Elements in CFML Applications in the Developing ColdFusion Applications

History
ColdFusion 9: Added datasource, googleMapKey, and serverSideFormValidation attribute
ColdFusion 8: Added secureJSON and SecureJSONPrefix attributes
ColdFusion MX 7: Added scriptProtect attribute
ColdFusion MX 6.1: Added loginStorage attribute
ColdFusion MX:

- Changed how persistent scopes are available: Server, Session, and Application scope variables are stored in memory as structures. In earlier releases, only Session and Application scope variables were stored this way. You cannot access the UDF function scope as a structure.

- Changed the algorithm for setting the CFTOKEN variable value: if the registry key UUIDToken is a nonzero value, ColdFusion uses a number constructed from the UUID plus a random number. Otherwise, ColdFusion sets the CFTOKEN variable default value using a positive random integer. (In earlier releases, ColdFusion always used a number constructed from the UUID plus a random number.)

<td>Lifespan of application variables. CreateTimeSpan function and values in days, hours, minutes, and seconds, separated by commas.</td>
</tr>
</tbody>
</table>
| clientManagement  | Optional  | no         | • yes: enables client variables.  
• no |
| clientStorage     | Optional  | registry   | How client variables are stored:  
• datasource_name: in ODBC or native data source. Create storage repository in the Administrator.  
• registry: in the system registry.  
• cookie: on client computer in a cookie. Scalable. If client disables cookies in the browser, client variables do not work. |
| exchangeServerVersion | Optional | 2007       | Specifies the Microsoft Exchange Server version. The values are:  
• 2003  
• 2007  
• 2010  
If you do not specify the details, 2007 is taken by default. |
| googleMapKey      | Optional  |            | The Google Maps API key required to embed Google Maps in your web pages. |
| loginStorage      | Optional  | cookie     | • cookie: store login information in the Cookie scope.  
• session: store login information in the Session scope. |
### ColdFusion Tags

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| scriptProtect      | Optional| Determined by ColdFusion Administrator Enable Global Script Protection setting | Specifies whether to protect variables from cross-site scripting attacks  
• none: do not protect variables  
• all: protect Form, URL, CGI, and Cookie variables  
• comma-delimited list of ColdFusion scopes: protect variables in the specified scopes.  
For more information, see Usage. |
| secureJSON         | Optional| Administrator value              | A Boolean value that specifies whether to add a security prefix in front of any value that a ColdFusion function returns in JSON-format in response to a remote call.  
The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings > Settings page (which defaults to false). You can override this variable value in the cffunction tag.  
For more information see Improving security in the Developing ColdFusion Applications. |
| serverSideFormValidation | Optional | yes                             | If no, disables validation on cfform fields when the form is submitted. |
| secureJSONPrefix   | Optional| Administrator value              | The security prefix to put in front of the value that a ColdFusion function returns in JSON-format in response to a remote call if the secureJSON setting is true.  
The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings > Settings page (which defaults to //, the JavaScript comment character).  
For more information see Improving security in the Developing ColdFusion Applications. |
| sessionCookie      | Optional|                                  | Struct containing ColdFusion session cookie related properties. |
| sessionManagement  | Optional| no                               |  
• yes: enables session variables.  
• no |
| sessionTimeout     | Optional| Specified in Variables page of ColdFusion Administrator | Life span of session variables. The CreateTimeSpan function and values in days, hours, minutes, and seconds, separated by commas. |
| setClientCookies   | Optional| yes                              |  
• yes: enables client cookies.  
• no: ColdFusion does not automatically send CFID and CFTOKEN cookies to client browser; you must manually code CFID and CFTOKEN on the URL for every page that uses Session or Client variables. |
| setDomainCookies   | Optional| no                               |  
• yes: uses domain cookies for CFID and CFTOKEN cookies and for all Client variables when using cookies for client variable storage. Required for applications running on clusters.  
• no: uses host-specific cookies for CFID, CFTOKEN, and all client variable cookies. |

### Usage

This tag is typically used in the Application.cfm file, to set defaults for a ColdFusion application.
**Note:** You can also set the application defaults in the Application.cfc file. For more information, see "Application variables" on page 1568.

This tag enables application variables, unless they are disabled in the ColdFusion Administrator. The Administrator setting also overrides the `sessionManagement` attribute. For more information, see Configuring and Administering ColdFusion.

If ColdFusion is running on a cluster, specify `clientStorage = "cookie"` or a data source name; you cannot specify "registry".

ColdFusion generates an error if the application name is longer than 64 characters.

The CFTOKEN variable is 8 bytes in length. Its range is 10000000 —99999999.

**Note:** If you specify `ClientStorage=cookie`, any Client scope variables set following a `cfflush` tag are not saved in the Client browser.

### Protecting variables from cross-site scripting attacks

The `ScriptProtect` attribute lets you protect one or more variable scopes from cross-site scripting attacks, where a client attempts to get your application to send malicious code back to a user’s browser. In these attacks, user input (for example, from form fields or from URL variables) sets a CF variable which is destined for user output. The submitted data includes malicious code, such as JavaScript or an applet or object reference, which then executes on the user’s system.

**Note:** The ColdFusion Administrator Settings page Enable Global Script Protection option determines the default script protection setting. You can use the `scriptProtect` attribute to override the Administrator setting. You can also use the Application.cfc initialization code to set the protection value.

The ColdFusion cross-site scripting protection operation is done when ColdFusion processes the application settings at the beginning of a request. Thus, it can process the URL, and Cookie, CGI, and Form variables in a user’s request. By default, it replaces occurrences of the following HTML tag names with the text `InvalidTag`: `object`, `embed`, `script`, `applet`, and `meta`. It allows these names in plain text, and replaces the words if they are used as tag names.

You can specify any or all ColdFusion scopes for protection, but only the Form, URL, CGI, and Cookie scopes have variables that are often provided by unknown sources. Also, protecting a scope requires additional processing. For these reasons, the `all` attribute value applies protection to only the four scopes.

The script protection mechanism applies a regular expression that is defined in the `cf_root/lib/neo-security.xml` file in the server configuration, or the `cf_root/WEB-INF/cfusion/lib/neo-security.xml` file in the J2EE configuration to the variable value. You can customize the patterns that ColdFusion replaces by modifying the regular expression in the `CrossSiteScriptPatterns` variable.

### Locking server, application, and session variables

When you set or update variables in the server, application, and session scopes, use the `cflock` tag with the `scope` attribute set to the following value:

- For server variables, specify `server`
- For application variables, specify `application`
- For session variables, specify `session`

In some cases, you must also lock code that reads variables in these scopes. For information about locking scopes, see “cflock” on page 412.
Example

<!--- This example shows how to use cflock to prevent race conditions during data updates to variables in Application, Server, and Session scopes. --->
<h3>cfapplication Example</h3>
<p>cfapplication defines scoping for a ColdFusion application and enables or disables application and/or session variable storage. This tag is placed in a special file called Application.cfm that automatically runs before any other CF page in a directory (or subdirectory) where the Application.cfm file appears.</p>
<cfapplication name = "ETurtle"
    sessionTimeout = #CreateTimeSpan(0, 0, 0, 60)#
    sessionManagement = "Yes">
    <!--- Initialize session and application variables used by E-Turtleneck. --->
    <cfparam name="application.number" default="1">
    <cfparam name="session.color" default="">
    <cfparam name="session.size" default="">

    <!--- Use the application scope for the application variable to prevent race condition. This variable keeps track of total number of turtlenecks sold. --->
    <cfif IsDefined("session.numPurchased") AND IsNumeric(trim(session.cartTotal))>
        <cflock scope = "Application" timeout = "30" type = "Exclusive">
            <cfset application.number = application.number + session.numPurchased>
        </cflock>
    </cfif>

    <cfoutput>
        E-Turtleneck is proud to say that we have sold #application.number# turtlenecks to date.
    </cfoutput>
</cfapplication>

<cfoutput>
    E-Turtleneck is proud to say that we have sold #application.number# turtlenecks to date.
</cfoutput>

<!--- End of Application.cfm --->

<cfargument>
<cfargument name="string" default="default value"
    displayname="descriptive name"
    hint="extended description"
    required="yes|no"
    type="data type">

<td></td>
<td></td>
<td>* no</td>
</tr>
</tbody>
</table>
### Attribute: restArgSource

- **Optional**

- **Default:**

  - One of the following:
    - **path:** Extracts parameters from the resource URL. URI path parameters are extracted from the request URL, and the parameter names correspond to the URI path template variable names specified in the `restPath` specified in `cffunction`. The default value cannot be used with path param.
    - **query:** Extracts parameters from URL query parameters. Mostly used with HTTP `GET` method. When using `GET` method to send data, the parameters and values are encoded into the URL. `QueryParam` is used to extract these values and assign them to the appropriate variables.
    - **form:** Extracts parameters from a form submission. It is used with HTTP `POST` method.
    - **cookie:** Extracts values from a cookie.
    - **header:** Extracts parameters from HTTP header.
    - **matrix:** Extracts parameters from matrix URL. For details, see [http://www.w3.org/DesignIssues/MatrixURIs.html](http://www.w3.org/DesignIssues/MatrixURIs.html)

  If no value is specified, parameters are taken from the body of the request.

  Using `cfhttp`, you can send arguments in either form or body. For form parameter, the argument is consumed if you specify form as the value for `restArgSource` and for body parameter, if you do not specify `restArgSource`.

  While calling the service, if you pass the argument in body, in some scenarios, it is accepted as form. For example, `<cfhttpparam type="body" value="arg-somevalue">`. This is because, when you pass the form name-value pair through `cfhttp` or the body as `name=value`, the body content is same, due to which REST service is not able to detect what is passed.

  In the service, if you expect body argument but while accessing the service through `cfhttp`, no argument in the body is passed, you will still receive the body argument as empty string.

  If you use this attribute, but do not specify the type attribute, string is considered by default as the type.

### Attribute: restArgName

- **Optional**

- **Default:**

  - The name that can be mapped to the argument name.

  While calling functions, arguments are extracted from the incoming request. If `restArgName` is provided, it is searched in the `restArgSource` scope of the request to populate the argument. If not specified, argument name is searched.

  If specified, then argument name has no impact. You can specify correct argument name so that it corresponds to the appropriate parameter.

  If the argument name passed to a REST service is not a valid Java identifier, for example, the name has hyphen (say `arg-name`), then you can use this attribute to map the argument name.
### Usage

This tag must be in a `<cffunction>` tag, before any other tags in the `<cffunction>` tag body.

Arguments that are passed when a method is invoked can be accessed from the method body in the following ways:

- **With shorthand syntax:** `#myargument#`
  
  (This example accesses the argument `myargument`.)

- **Using the arguments scope as an array:** `#arguments[1]#`
  
  (This example accesses the first defined argument in the `<cffunction>`.)

- **Using the arguments scope as a struct:** `#arguments.myargument#`
  
  (This example accesses the argument `myargument` in the array.)

<td>· a component name: if the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</td>
</tr>
</tbody>
</table>
Example

```cfc
<!--- This example defines a function that takes a course number parameter and returns the course description. --->
<cffunction name="getDescription">
  <!--- Identify argument. --->
  <cfargument name="Course_Number" type="numeric" required="true">
  <!--- Use the argument to get a course description from the database. --->
  <cfquery name="Description" datasource="cfdocexamples">
    SELECT Description
    FROM Courses
    WHERE Number = '#Course_Number#'
  </cfquery>
  <!--- Specify the variable that the function returns. --->
  <cfreturn Description.Descript>
</cffunction>
```

cfassociate

Description

Allows subtag data to be saved with a base tag. Applies only to custom tags.

Category

Application framework tags

Syntax

```cfc
<cfassociate
    baseTag = "base tag name"
    dataCollection = "collection name">
</cfassociate>
```

Note: You can specify the attributes of this tag in an attributeCollection whose value is a structure. Specify the structure name in the attributeCollection and use the tag's attribute names as structure keys.

See also

`cfapplication`, `cferror`, `cflock`, `cfmessagebox`; High-level data exchange in the Developing ColdFusion Applications.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseTag</td>
<td>Required</td>
<td></td>
<td>Base tag name.</td>
</tr>
<tr>
<td>dataCollection</td>
<td>Optional</td>
<td>AssocAttribs</td>
<td>Structure in which base tag stores subtag data.</td>
</tr>
</tbody>
</table>

Usage

Call this tag within a subtag, to save subtag data in the base tag.

When ColdFusion passes subtag attributes back to the base tag, it saves them in a structure whose default name is AssocAttribs. To segregate subtag attributes (in a base tag that can have multiple subtags), specify a structure name in the dataCollection attribute. The structure is appended to an array whose name is thisTag.collectionName.
In the custom tag code, the attributes passed to the tag by using the `cfmodule` tag `attributeCollection` attribute are saved as independent values, with no indication that they are grouped into a structure by the custom tag’s caller. Therefore, in the called tag, if you assign a value to a specific attribute, it replaces the value passed in the `attributeCollection` attribute that you used when calling the subtag.

**Example**

```cfc
<!--- Find the context. --->
<cfif thisTag.executionMode is "start">
  <!--- Associate attributes. --->
  <cfassociate baseTag = "CF_TAGBASE">

  <!--- Define defaults for attributes. --->
  <cfparam name = "attributes.happy" default = "yes">
  <cfparam name = "attributes.sad" default = "no">
...
```

**cfauthenticate**

**Description**

This tag is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications.

**History**

ColdFusion MX: This tag is obsolete. It does not work in ColdFusion MX and later releases.

**cfbreak**

**Description**

Used within a `cfloop` tag. Breaks out of a loop.

**Category**

Flow-control tags

**Syntax**

```cfc
<cfbreak>
```

**See also**

Example

<!--- This shows the use of cfbreak to return processing to the top of a loop. --->
<!--- Select courses; use cfloop to find a condition; then break the loop. ---->
<!--- Check that number is numeric. --->
<cfif IsDefined("form.course_number")>
  <cfif Not IsNumeric(form.course_number)>
    <cfabort>
  </cfif>
</cfif>
<cfquery name="GetCourses" datasource="cfdocexamples">
  SELECT *
  FROM COURSES
  ORDER by NUMBER
</cfquery>
<p> This example uses CFLOOP to cycle through a query to find a value. (In our example, a list of values corresponding to courses in the cfdocexamples datasource). When the conditions of the query are met, CFBREAK stops the loop. </p>
<p> Please enter a Course Number, and hit the "submit" button: </p>
<cfform>
  <cfselect name="courseNum">
    <cfoutput query="GetCourses">
      <option value="#NUMBER#">#NUMBER#</option>
    </cfoutput>
  </cfselect>
  <cfinput type="Submit" name="" value="Search on my Number">
</cfform>
<!--- If the courseNum variable is not defined, don't loop through the query.--->
<cfif IsDefined("form.courseNum") IS "True">
  <!--- Loop through query until value found, then use CFBREAK to exit query.---->
  <cfloop query="GetCourses">
    <cfif GetCourses.NUMBER IS form.courseNum>
      <cfoutput>
        <h4>Your Desired Course was found:</h4>
        <pre>#NUMBER# #DESCRIPT#</pre>
      </cfoutput>
      <cfbreak>
    </cfif>
    <cfelse>
      <br> Searching...
    </cfif>
  </cfloop>
</cfif>

Tags c

cfcache

Description
Stores a copy of a page on the server and/or client computer, to improve page rendering performance. To do this, the tag creates temporary files that contain the static HTML returned from a ColdFusion page.

Use this tag if it is not necessary to get dynamic content each time a user accesses a page.
You can use this tag for simple URLs and for URLs that contain URL parameters.

**Category**

Page processing tags

**Syntax**

```cfcache
action = "action"
dependsOn = "variable name list"
directory = "directory path"
expireURL = "wildcarded URL reference"
id = "object identifier"
idleTime = "decimal number of days"
metadata = "variable name"
name = "variable name"
password = "password"
port = "port number"
protocol = "http://|https://"
region = "region_name"
stripWhiteSpace = "false|true"
throwOnError = "false|true"
timespan = "decimal number of days"
useCache = "true|false"
usequeryString = "false|true"
username = "username"
value = "value"

The page fragment to be cached, if any.
```

```</cfcache>```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

cfflush, cfheader, cfhtmlhead, cfsetting, cfsilent, Cache functions

**History**

ColdFusion 10: Added the attribute region

ColdFusion 9:

- Added support for the following features:
  - Caching in memory. Memory is now the default cache location.
  - Caching page fragments.
  - Caching specific objects, including the ability to put, get, and flush cached objects.
  - Setting cache dependencies.
  - Setting an idle timeout.
  - Getting metadata about cached objects.
  - The ability to strip white space from cached page fragments.
- The ability to throw an exception if an error occurs when flushing a cached object.
- Added `get` and `put` values of the `action` attribute. These values support caching of objects.
- Added `dependsOn`, `id`, `idleTime`, `key`, `metadata`, `name`, `stripWhiteSpace`, `throwOnError`, `useCache`, `useQueryString`, and `value` attributes.

**ColdFusion MX:**
- Deprecated the `cachedirectory` and `timeout` attributes. They might not work, and might cause an error, in later releases.
- Added the `timespan` attribute.
- Changed how pages are cached: the default `action` attribute value, `cache`, caches a page on the server and the client. (In earlier releases, this option cached a page only on the server.)
- Changed the source of the `protocol` and `port` values: the default `protocol` and `port` values are now taken from the current page URL. (In earlier releases, they were "http" and "80", respectively.)
- Changed how session state is handled when caching a page: this tag can cache pages that depend on session state, including pages that are secured with a ColdFusion login. (In earlier releases, the session state was cleared when caching the page, causing authentication to be lost.)
- Changed how files are cached: this tag uses a hash() of the URL for the filename to cache a file. (In earlier releases, ColdFusion used the `cfcache.map` file.)

</tr>
</tbody>
</table>
| idleTime     | cache, serve rCache, clienCache, opti mal, flush, put | Optional | No idle timeout | Flushes the cached item if it is not accessed for the specified time span:  
- A decimal number of days, for example: ".25", for one-fourth day (6 hours); "1", for one day; "1.5", for one and one half days  
- A return value from the CreateTimeSpan function, for example, 
  "#CreateTimeSpan(0,6,0,0)#". |
| metadata     | get           | Optional |          | The name of a structure variable in which to put object metadata. The get operation returns the following data:  
- timespan: The time span during which the cached item is valid; the value of the timespan attribute for the cached item.  
- createdtime: The time when the cache was created  
- lasthit: The time when the cached item was most recently used.  
- hitnumber: Number of times the cached item has been used.  
- missnumber: Number of misses |
| name         | get           | Required |          | The name of the variable in which to put the retrieved object. |
| password     | cache, serve rCache, clienCache, opti mal, flush | Optional |          | A password. Provide this if the page requires authentication at the web-server level. |
| port         | cache, serve rCache, clienCache, opti mal, flush | Optional | The port for the current page | Port number of the web server from which the URL for the cached page is requested. In the internal call from cfcache to cfhttp, ColdFusion resolves each URL variable in the page; this ensures that links in the page remain functional. |
| protocol     | cache, serve rCache, clienCache, opti mal, flush | Optional | The current page protocol | Protocol that is used to create URL from cache.  
- http://  
- https:// |
| region       |               | Optional |          | Name that you assign to a cache region |
| stripWhiteSpa ce | cache, serve rCache, opti mal | Optional | false | Specifies whether to strip any unnecessary white space characters from a cached page fragment. Does not have any effect on cached pages or objects. |
| throwOnError | flush with id attribute | Optional | false | A Boolean value specifying whether to throw an error if the flush action encounters an error. Otherwise the action does not generate an error if it fails. If this attribute is true you can handle the error in a cfcatch block, for example, if a specified id value is invalid. |
ColdFusion Tags

Usage

Page fragments: To cache a page fragment, put the fragment in the body of the tag, between the begin tag and the end tag. Do not use a tag body to cache full pages or objects.

flush: The flush action can have two formats: One uses the ExpireURL attribute to specify the page to flush, the other uses the id attribute to specify the object to flush. When you flush an object, ColdFusion ignores errors by default. If you specify a throwError attribute with a true value, the action throws the errors, and you can use a catch block to handle them. This is useful to determine if you use invalid cache ID values.

User-defined cache: To create user-defined cache,

1 Add the following snippet to the ehcache.xml (in the CF_root\lib):

```xml
<cache name="cf9"
    maxElementsInMemory="10000"
    eternal="false"
    timeToIdleSeconds="86400"
    timeToLiveSeconds="86400"
    overflowToDisk="true"
    diskSpoolBufferSizeMB="30"
    maxElementsOnDisk="10000000"
    diskPersistent="true"
    diskExpiredThreadIntervalSeconds="3600"
    memoryStoreEvictionPolicy="LRU"/>
```

2 To reference the user-defined cache, use the key attribute as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Actions</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| timespan        | cache, serve, rCache, clien ntCache, optimal, flush, put | Optional | See Description | The interval until the item is flushed from the cache.  
|                 |                          |         |         | • A decimal number of days, for example: "2.5", for one-fourth day (6 hours); "1", for one day; "1.5", for one and one half days  
|                 |                          |         |         | • A return value from the CreateTimeSpan function, for example,  
|                 |                          |         |         | "#CreateTimeSpan(0, 6, 0, 0)#".  
|                 |                          |         |         | The default action is to flush the item when it is idle for the time specified by the idleTime attribute, or cfcache action="flush" executes. |
| useCache        | cache, serve, rCache, optimal | Optional | true   | Specifies whether to use caching for a page. This attribute can be useful during development. For example, you could use a function to predict when to use a cache, based on the application state. |
| usequerystring  |                          | Optional | false  | If true, generates a template cache ID that includes the query string. This means that a new template cache is created whenever the query string changes.  
|                 |                          |         |         | If set to true, the attribute dependson considers the URL parameters defined in the query string as well to generate template caches.  
|                 |                          |         |         | Also see the Usage section |
| username        | cache, serve, rCache, clientCache, optimal, flush | Optional |         | A username. Provide this if the page being cached or flushed requires authentication at the web server level. |
| value           | put                      | Required |        | The object to cache. |

Last updated 7/9/2012
By default, caching is memory-based and not disk-based. For each application, the default setting is 10000 object caches and 10000 template caches. It is important to note the limit imposed on the number of objects/templates that can be cached.

Disk overflow for caching by default is false. To enable disk caching, set `overflowToDisk` as true in the `ehcache.xml`. To make the cached data available on server restart, set `diskPersistent` to true.

For further details of the properties in the `ehcache.xml`, refer to the documentation available at the following URL: http://ehcache.org/

From ColdFusion 8 and earlier

The following remaining information for this tag also applied to previous releases.

Use this tag in pages whose content is not updated frequently. Taking this action can greatly improve the performance of your application.

The output of a cached page is stored in a file on the client browser and/or the ColdFusion server. Instead of regenerating and downloading the output of the page each time it is requested, ColdFusion uses the cached output. ColdFusion regenerates and downloads the page only when the cache is flushed, as specified by the `timespan` attribute, or by invoking `cfcache action=flush`.

To enable a simple form of caching, put a `cfcache` tag, specifying the `timespan` attribute, at the top of a page. Each time the specified time span passes, ColdFusion flushes (deletes) the copy of the page from the cache and caches a new copy for users to access.

You can specify client-side caching or a combination of client-side and server-side caching (the default), using the `action` attribute. The advantage of client-side caching is that it requires no ColdFusion resources; the browser stores pages in its own cache, improving performance. The advantage of combination caching is that it optimizes server performance; if the browser does not have a cache of the page, the server can get data from its own cache. (Adobe recommends that you use combination caching, and do not use server-side only caching.)

If a page contains personalized content, use the `action = "clientcache"` option to avoid the possibility of caching a personalized copy of a page for other users.

Debug settings have no effect on `cfcache` unless the application page enables debugging. When generating a cached file, `cfcache uses cfsetting showDebugOutput = "no"`. The `cfcache` tag evaluates each unique URL, including URL parameters, as a distinct page, for caching purposes. For example, the output of the http://server/view.cfm?id=1 and the output of http://server/view.cfm?id=2 are cached separately.

The `cfcache` tag uses the `cfhttp` tag to get the contents of a page to cache. If there is an HTTP error accessing the page, the contents are not cached. If a ColdFusion error occurs, the error is cached.

For more information, see Caching ColdFusion pages that change infrequently in the Developing ColdFusion Applications.

Change in behaviour

Till ColdFusion 9, the request query string was automatically used as part of the page identifier, so that pages with different query strings (URL parameters) are cached independent of each other. However, you must now specify the new optional attribute `useQueryString` with value set to true, to achieve the older behavior.

Last updated 7/9/2012
Example

<!--- This example produces as many cached files as there are URL parameter permutations. You can see that the page is cached when the timestamp doesn't change.--->

<cfcache
timespan="#createTimeSpan(0,0,10,0)#">
<body>
<h3>This is a test of some simple output</h3>
<cfoutput>
This page was generated at #now()#<br>
</cfoutput>
<cfparam name = "URL.x" default = "no URL parm passed">
<cfoutput>The value of URL.x = # URL.x #</cfoutput>
</cfparam>
<cfoutput>The value of URL.x = # URL.x #</cfoutput>
</body>
</cfcache>

<cfparam name = "URL.x" default = "no URL parm passed">
<cfoutput>The value of URL.x = # URL.x #</cfoutput>
</cfparam>
<cfoutput>The value of URL.x = # URL.x #</cfoutput>

<cfcalendar>

Description

Puts an interactive Flash format calendar in an HTML or Flash form. Not supported in XML format forms. The calendar lets a user select a date for submission as a form variable.

Category

Forms tags

Syntax

<cfcalendar

name = "name of calendar"
dayNames = "days of the week labels"
disabled = "yes|no|no attribute value"
enabled = "yes|no"
endRange = "last disabled date"
height = "height"
mask = "character pattern"
monthNames = "month labels"
onBlur = "ActionScript to invoke"
onChange = "ActionScript to invoke"
onFocus = "ActionScript to invoke"
selectedDate = "date"
startRange = "first disabled date"
style="Flash ActionScript style"
tooltip = "text"
visible = "yes|no"
width = "width">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<td>0</td>
<td>Integer in the range 0-6 specifying the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday.</td>
</tr>
<tr>
<td>height</td>
<td>Optional</td>
<td>Determined by Flash</td>
<td>The vertical dimension of the calendar specified in pixels.</td>
</tr>
</tbody>
</table>
| mask      | Optional| MM/DD/YYYY | A pattern that specifies the format of the submitted date. Mask characters are:

• D = day; can use 0–2 mask characters
• M = month; can use 0–4 mask characters
• Y = year; can use 0, 2, or 4 characters
• E = day in week; can use 0–4 characters
• Any other character = put the character in the specified location

For more information on masking, see “Masking input data” in the cfinput reference page. |
| monthNames | Optional| January, February, March, April, May, June, July, August, September, October, November, December | A comma-delimited list of the month names that are displayed at the top of the calendar. |
| onBlur    | Optional| ActionScript that runs when the calendar loses focus. |
| onChange  | Optional| ActionScript that runs when the user selects a date. |
| onFocus   | Optional| ActionScript that runs when the calendar gets focus. |
| selectedDate | Optional| None (Flash shows the current month) | The date that is initially selected. It is highlighted in a color determined by the form skin. Must be in mm/dd/yyyy or dd/mm/yyyy format, depending on the current locale. (Use the setlocale function to set the locale, if necessary.) |
Usage

The `cfcalendar` tag displays a calendar month, showing the month, the year, a grid of the days of the month, and headings for the days of the week. The calendar contains forward and back arrow buttons to let you change the month and year that are displayed.

If you include a value for the `selectedDate` attribute, that date is highlighted in green and determines the month and year that display initially. Changing the month and year display does not change the selected date. A user can change the selected date by clicking a different date on the calendar. The `onChange` attribute can specify an ActionScript event handler function that runs when the user selects a date.

The current date is highlighted in reverse (that is, a white number on a black background). If the selected date is in a different month or year, however, the current date does not appear unless you move to it by clicking the forward or back arrows.

The `mask` attribute lets you specify the format of the selected date that is returned to the application.

You can use the keyboard to access and select dates from a `cfcalendar` control:

- Use the Up, Down, Left, and Right Arrow keys to change the selected date.
- Use the Home and End keys to reach the first and last enabled date in a month, respectively.
- Use the Page Up and Page Down keys to reach the previous and next month, respectively.

*Note:* The `cfcalendar` tag is not supported in XML format forms.

Example

This example produces a 200-pixel by 150-pixel calendar with a Flash haloBlue skin. It displays abbreviated month names and two-character days of the week. It initially displays today's date as determined by the `selectedDate` attribute. When you click the Save button, the form submits back to the current page, which displays the submitted information.

The example also has three `dateField` controls that let the user change the initial selected date that displays on the calendar and a blocked-out date range. The initial blocked-out date is a four-day period immediately preceding today's date.

*Note:* This example must be modified to work in locales that do not use mm/dd/yyyy date formats. To do so, use the `LSDateFormat` function in place of the `DateFormat` function and a mask that is appropriate for your locale, such as `dd/mm/yyyy`.

<cfcase>

Description
Used only inside the cfswitch tag body. Contains code to execute when the expression specified in the cfswitch tag has one or more specific values.

Category
Flow-control tags

Syntax
<cfcase
    value = "value|delimited set of values"
    delimiters = "delimiter characters">

See also
cfdefaultcase, cfswitch; cfswitch, cfcase, and cfdefaultcase in the Developing ColdFusion Applications

Last updated 7/9/2012
History
ColdFusion 8: Changed the way ColdFusion parses cfcase values. Previously, cfcase tags with numeric value dates did not return expected results. For example, `<cfcase value="00"> and `<cfcase value="0A` were both evaluated to 0. The value "0A" was treated as a date and converted to 0 number of days from 12/30/1899. The value "00" was also evaluated to the value 0. This caused the exception "Context validation error for tag CFCASE. The CFSWITCH has a duplicate CFCASE for value "0.0"." The cfswitch tag now returns the expected result.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Required</td>
<td></td>
<td>The value or values that the expression attribute of the cfswitch tag must match. To specify multiple matching values, separate the values with the delimiter character. The value or values must be simple constants or constant expressions, not variables.</td>
</tr>
<tr>
<td>delimiters</td>
<td>Optional</td>
<td>, (comma)</td>
<td>Specifies the delimiter character or characters that separate multiple values to match. If you specify multiple delimiter characters, you can use any of them to separate the values to be matched.</td>
</tr>
</tbody>
</table>

Usage
The contents of the cfcase tag body executes only if the expression attribute of the cfswitch tag evaluates to a value specified by the value attribute. The contents of the cfcase tag body can include HTML and text, and CFML tags, functions, variables, and expressions. You do not have to explicitly break out of the cfcase tag, as you do in some languages.

One cfcase tag can match multiple expression values. To do this, separate the matching values with the default value of the delimiter character. For example the following line matches "red", "blue", or "green":

```
<cfcase value="red,blue,green">
```

You can use the delimiter attribute to specify one or more delimiters to use in place of the comma. For example, the following line matches "cargo, live", "cargo, liquid", and "cargo, solid":

```
<cfcase value="cargo, live;cargo, liquid-cargo, solid" delimiters=";-">
```

Example
The following example displays a grade based on a 1-10 score. Several of the cfcase tags match more than one score. For simplicity, the example sets the score to 7.
<cfset score="7"> <cfswitch expression="#score#"> <cfcase value="10"> <cfset grade="A"> </cfcase> <cfcase value="9;8" delimiters=";"> <cfset grade="B"> </cfcase> <cfcase value="7;6" delimiters=";"> <cfset grade="C"> </cfcase> <cfcase value="5;4;" delimiters=";"/> <cfset grade="D"> </cfcase> <cfdefaultcase> <cfset grade="F"> </cfdefaultcase> </cfswitch> <cfoutput> Your grade is #grade# </cfoutput>

cfcatch

Description
Used inside a cftry tag. Together, they catch and process exceptions in ColdFusion pages. Exceptions are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

Category
Exception handling tags

Syntax
<cfcatch type = "exception type"> Exception processing code here</cfcatch>

See also
cftry, cferror, cffinally, cfrethrow, cffthrow, onError; Handling Errors in the Developing ColdFusion Applications

History
ColdFusion 10: Added the sessionCookie and authCookie attributes.
ColdFusion MX:
• Changed SQLSTATE value behavior: the SQLSTATE return value in a cfcatch tag depends on the database driver type:
  • Type 1 (JDBC-ODBC bridge): the value is the same as in ColdFusion 5.
  • Type 4 (100% Java, no native methods): the value might be different.
If your application depends on SQLSTATE values for flow control, the application might produce unexpected behavior with ColdFusion MX.

Last updated 7/9/2012
• Changed the behavior of this tag when type="any": it is not necessary, when you include a cfcatch tag with type="any", to do so in the last cfcatch tag in the block, to ensure that all other tests are executed before it. ColdFusion finds the best-match cfcatch block.
• Changed the behavior of the cfscript tag: it includes try and catch statements that are equivalent to the cftry and cfcatch tags.
• Changed object modification: you cannot modify the object returned by cfcatch.
• Changed thrown exceptions: the cfcollection, cfindex, and cfsearch tags can throw the SEARCHENGINE exception. In earlier releases, an error in processing these tags threw only an UNKNOWN exception.

Attributes

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
| type      | Optional| Any     | * application: catches application exceptions  
* database: catches database exceptions  
* template: catches ColdFusion page exceptions  
* security: catches security exceptions  
* object: catches object exceptions  
* missingInclude: catches missing include file exceptions  
* expression: catches expression exceptions  
* lock: catches lock exceptions  
* custom_type: catches the specified custom exception type that is defined in a cfthrow tag  
* searchengine: catches Solr search engine exceptions  
* any: catches all exception types |

Usage

You must code at least one cfcatch tag within a cftry block. Put cfcatch tags at the end of a cftry block. ColdFusion tests cfcatch tags in the order in which they appear. This tag requires an end tag.

If type="any", ColdFusion catches exceptions from any CFML tag, data source, or external object. To get the exception type use code such as the following:

```
#cfcatch.type#
```

Applications can use the cfthrow tag to throw developer-defined exceptions. Catch these exceptions with any of these type options:

• "custom_type"
• "Application"
• "Any"

The custom_type type is a developer-defined type specified in a cfthrow tag. If you define a custom type as a series of strings concatenated by periods (for example, "MyApp.BusinessRuleException.InvalidAccount"), ColdFusion can catch the custom type by its character pattern. ColdFusion searches for a cfcatch tag in the cftry block with a matching exception type, starting with the most specific (the entire string), and ending with the least specific.
For example, you could define a type as follows:

```cfc
cfthrow type = "MyApp.BusinessRuleException.InvalidAccount"
```

If you have the following `cfcatch` tag, it handles the exception:

```cfc
cfcatch type = "MyApp.BusinessRuleException.InvalidAccount"
```

Otherwise, if you have the following `cfcatch` tag, it handles the exception:

```cfc
cfcatch type = "MyApp.BusinessRuleException"
```

Finally, if you have the following `cfcatch` tag, it handles the exception:

```cfc
cfcatch type = "MyApp"
```

You can code `cfcatch` tags in any order to catch a custom exception type.

If you specify `type = "Application"`, the `cfcatch` tag catches only custom exceptions that have the `Application` type in the `cfthrow` tag that defines them.

The `cfinclude`, `cfmodule`, and `cfserror` tags throw an exception of `type = "template"`.

An exception that is thrown within a `cfcatch` block cannot be handled by the `cftry` block that immediately encloses the `cfcatch` tag. However, you can rethrow the currently active exception with the `cfrethrow` tag.

The `cfcatch` variables provide the following exception information:

<table>
<thead>
<tr>
<th>cfcatch variable</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfcatch.type</td>
<td>Type: Exception type, as specified in <code>cfcatch</code>.</td>
</tr>
<tr>
<td>cfcatch.message</td>
<td>Message: Exception's diagnostic message, if provided; otherwise, an empty string; in the <code>cfcatch.message</code> variable.</td>
</tr>
<tr>
<td>cfcatch.detail</td>
<td>Detailed message from the CFML interpreter or specified in a <code>cfthrow</code> tag. When the exception is generated by ColdFusion (and not <code>cfthrow</code>), the message can contain HTML formatting and can help determine which tag threw the exception.</td>
</tr>
<tr>
<td>cfcatch.tagcontext</td>
<td>An array of tag context structures, each representing one level of the active tag context at the time of the exception.</td>
</tr>
<tr>
<td>cfcatch.NativeErrorCode</td>
<td>Applies to <code>type = &quot;database&quot;</code>. Native error code associated with exception. Database drivers typically provide error codes to diagnose failing database operations. Default value is -1.</td>
</tr>
<tr>
<td>cfcatch.SQLState</td>
<td>Applies to <code>type = &quot;database&quot;</code>. SQLState associated with exception. Database drivers typically provide error codes to help diagnose failing database operations. Default value is -1.</td>
</tr>
<tr>
<td>cfcatch.Sql</td>
<td>Applies to <code>type = &quot;database&quot;</code>. The SQL statement sent to the data source.</td>
</tr>
<tr>
<td>cfcatch.queryError</td>
<td>Applies to <code>type = &quot;database&quot;</code>. The error message as reported by the database driver.</td>
</tr>
<tr>
<td>cfcatch.where</td>
<td>Applies to <code>type = &quot;database&quot;</code>. If the query uses the <code>cfqueryparam</code> tag, query parameter name-value pairs.</td>
</tr>
<tr>
<td>cfcatch.ErrNumber</td>
<td>Applies to <code>type = &quot;expression&quot;</code>. Internal expression error number.</td>
</tr>
<tr>
<td>cfcatch.MissingFileName</td>
<td>Applies to <code>type = &quot;missingInclude&quot;</code>. Name of file that could not be included.</td>
</tr>
<tr>
<td>cfcatch.LockName</td>
<td>Applies to <code>type = &quot;lock&quot;</code>. Name of affected lock (if the lock is unnamed, the value is &quot;anonymous&quot;).</td>
</tr>
<tr>
<td>cfcatch.LockOperation</td>
<td>Applies to <code>type = &quot;lock&quot;</code>. Operation that failed (Timeout, Create Mutex, or Unknown).</td>
</tr>
<tr>
<td>cfcatch.ErrorCode</td>
<td>Applies to <code>type = &quot;custom&quot;</code>. String error code.</td>
</tr>
<tr>
<td>cfcatch.ExtendedInfo</td>
<td>Applies to <code>type = &quot;application&quot;</code> and &quot;custom&quot;. Custom error message; information that the default exception handler does not display.</td>
</tr>
</tbody>
</table>
Example

<!--- The cfcatch example that uses TagContext to display the tag stack. --->

<!--- Open a cftry block. --->

<cftry>

<!--- Notice misspelled tablenam... --->

<cfquery name = "TestQuery" dataSource = "cfdocexamples">
  SELECT *
  FROM employees
</cfquery>

<!--- Other processing goes here. --->

<!--- Specify the type of error for which we search. --->

<cfcatch type = "Database">

<!--- The message to display. --->

<h3>You've Thrown a Database <b>Error</b></h3>

<cfoutput>

<!--- The diagnostic message from ColdFusion. --->

<p>#cfcatch.message#</p>
<p>Caught an exception, type = #CFCATCH.TYPE#</p>
<p>The contents of the tag stack are:</p>
</cfoutput>
</cfcatch>
</cftry>

cfchart

Description

Generates and displays a chart.

Category

Data output tags, Extensibility tags
Syntax

<!--- This syntax uses a JSON file to specify the chart style. --->

cfchartdata, cfchartseries, cfdocument, Controlling chart appearance in the Developing ColdFusion Applications

History

ColdFusion 10: Added the following new attributes: alpha, arrows, aspect3D, background, bevel, border, crosshair, fill, format, height, ID, labels, legend, plot, plotarea, preview, refresh, renderer, scales, type, tooltip, width, xaxis, axis2, xaxisvalues, yaxis, yaxis2, yaxisvalues, zoom

ColdFusion 8:

• Added the new attribute showLegend to the chart style files, which are the XML files located in the charting\styles directory. This attribute displays an entry for each point and is applicable only to charts that contain a single series. By default, the value of showLegend is set to true. To turn off this feature, you can either modify the setting in all the chart style files, or use a custom style file.

ColdFusion MX 7.01: Changed documentation to state that the fontSize attribute can accept a number that is not an integer.

ColdFusion MX 7:

• Added style and title attributes.

• Added support for eight-digit hexadecimal values to specify RGB color and transparency.

• Removed the rotated attribute.

ColdFusion MX 6.1:

• Added the xAxisType and yAxisType attributes.

• Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.
### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha</td>
<td>Optional</td>
<td></td>
<td>Alpha (transparency) level of the background. Valid values range from 0 (transparent) to 1 (opaque).</td>
</tr>
<tr>
<td>arrows</td>
<td>Opt</td>
<td></td>
<td>Creates an arrow for pointing out data or other chart items. JSON string representation of array of structs that contain values such as to, from, size, and label.</td>
</tr>
<tr>
<td>aspect3D</td>
<td>Opt</td>
<td></td>
<td>JSON string representation of struct that defines the angle of 3D aspect. The valid struct keys are &quot;angle&quot; and &quot;depth&quot;.</td>
</tr>
</tbody>
</table>
| background   | Opt     |         | A struct of keys related to background such as:
|              |         |         | • color: Sets the background color(s) |
|              |         |         | • color-1: Sets the first background color for the arrow |
|              |         |         | • color-2: Sets the second background color for the arrow (used with gradients) |
|              |         |         | • transparent: Set the transparency of a background image so that underlying colors or chart can show. |
|              |         |         | • fit: Defines the width/height to fit area of background. |
|              |         |         | • repeat: Defines type of image repeat. |
|              |         |         | • image: Defines the path to the background image. |
|              |         |         | • position: Defines the position of the background image. |
| backgroundColor | Optional|         | Color of the area between the data background and the chart border, around labels and around the legend. Hexadecimal value or supported named color; see the name list in Usage. For a hexadecimal value, use the form "#xxxxxxx" or "##xxxxxxxx", where x = 0-9 or A-F; use two number signs or none. |
| bevel        | Opt     |         | A struct of keys related to bevel such as:
|              |         |         | • color: Defines the color of the bevel. |
|              |         |         | • blur-x: Defines the sharpness/smoothness of the bevel edges in the x-direction. |
|              |         |         | • blur-y: Defines the sharpness/smoothness of the bevel edges in the y-direction. |
|              |         |         | • angle: Defines the angle of the bevel. |
|              |         |         | • distance: Distance in # | #px indicating the distance from the object the bevel should be displayed. |
| border       | Opt     |         | A struct of keys related to border such as:
<p>|              |         |         | • color: Sets the color of the border. |
|              |         |         | • radius: Defines the radius of rounded corners. |
|              |         |         | • width: Defines the width of the border. |
| chartHeight  | Optional| 240     | Chart height; integer number of pixels. |
| chartWidth   | Optional| 320     | Chart width; integer number of pixels. |</p>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>

<td></td>
<td></td>
<td></td>
<td>• date</td>
</tr>
<tr>
<td>legend</td>
<td>Opt</td>
<td></td>
<td>A struct used to define the legend attributes, for example, background-color or margin-top.</td>
</tr>
<tr>
<td>markerSize</td>
<td>Optional</td>
<td>(Automatic)</td>
<td>Size of data point marker in pixels; integer.</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td>Page variable name; string. Generates the graph as binary data and assigns it to the specified variable. Suppresses chart display. You can use the name value in the cffile tag to write the chart to a file.</td>
<td></td>
</tr>
<tr>
<td>pieSliceStyle</td>
<td>Optional</td>
<td>sliced</td>
<td>Applies to the cfchartseries type pie.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• solid: displays pie as if unsliced.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• sliced: displays pie as if sliced.</td>
</tr>
<tr>
<td>plot</td>
<td>Opt</td>
<td></td>
<td>A struct of keys such as animation, aspect, margin, and marker used to style the plotting.</td>
</tr>
<tr>
<td>plotarea</td>
<td>Opt</td>
<td></td>
<td>A struct of keys such as position and margin used to style the plotarea.</td>
</tr>
<tr>
<td>preview</td>
<td>Opt</td>
<td></td>
<td>A struct of keys such as visible and margin to control chart preview.</td>
</tr>
<tr>
<td>refresh</td>
<td>Opt</td>
<td></td>
<td>A struct of keys such as type, url, and interval to create dynamic charts.</td>
</tr>
<tr>
<td>renderer</td>
<td>Opt</td>
<td>canvas if format is html</td>
<td>Specify the rendering method. Applies only if format is html. The supported values are canvas, flash, svg, and vml.</td>
</tr>
<tr>
<td>scaleFrom</td>
<td>Optional</td>
<td>Determined by data</td>
<td>Y-axis minimum value; integer.</td>
</tr>
<tr>
<td>scales</td>
<td>Opt</td>
<td></td>
<td>Comma-separated list of axis against which to plot the chart, for example, x, y2.</td>
</tr>
<tr>
<td>scaleTo</td>
<td>Optional</td>
<td>Determined by data</td>
<td>Y-axis maximum value; integer.</td>
</tr>

</tbody>
</table>
### ColdFusion Tags

#### tipStyle

**Optional**

Default: `mouseOver`

Determines the action that opens a pop-up window to display information about the current chart element.

- `mouseDown`: display if the user positions the cursor at the element and clicks the mouse. Applies only to Flash format graph files. (For other formats, this option functions the same as `mouseOver`.)
- `mouseOver`: displays if the user positions the cursor at the element.
- `none`: suppresses display.

#### tooltip

**Optional**

A struct of keys used to style the tool tip such as `background`, `font`, or `border`.

#### type

**Optional**

Type of chart.

#### url

**Optional**

URL to open if the user clicks item in a data series; the `onClick` destination page.

You can specify variables within the URL string; ColdFusion passes current values of the variables.

- `$VALUE$`: the value of the selected row. If none, the value is an empty string.
- `$ITEMLABEL$`: the label of the selected item. If none, the value is an empty string.
- `$SERIESLABEL$`: the label of the selected series. If none, the value is an empty string, for example:
  
  ```javascript
  "somepage.cfm?item=$ITEMLABEL$&series=$SERIESLABEL$&value=$VALUE$
  ```
- `javascript:...`: executes a client-side script.

#### width

**Optional**

Default: 320

Width of the Chart in pixels.

#### xAxis

**Optional**

A struct of keys used to style x axis such as `format`, `guide`, `item`, and `label`.

#### xAxis2

**Optional**

A struct of keys used to style second x axis such as `format`, `guide`, `item`, and `label`, which is on the top of the chart.

#### xAxisTitle

**Optional**

Title that appears on the x axis; text.

#### xAxisType

**Optional**

Default: `category`

Whether the x axis indicates data or is numeric:

- `category`: The axis indicates the data category. Data is sorted according to the `sortXAxis` attribute.
- `scale`: The axis is numeric. All `cfchartdataitemattribute` values must be numeric. The x axis is automatically sorted numerically.

#### xAxisValues

**Optional**

An array of values to be displayed on x axis.

#### xOffset

**Optional**

Default: 0.1

Number of units by which to display the chart as angled, horizontally. Applies if `show3D="yes"`. The number can be between -1 and 1, where "-1" specifies 90 degrees left and "1" specifies 90 degrees right.

#### yAxis

**Optional**

A struct of keys used to style y axis such as `format`, `guide`, `item`, and `label`.

#### yAxis2

**Optional**

A struct of keys used to style second y axis such as `format`, `guide`, `item`, and `label`, which is on the top of the chart.

#### yAxisTitle

**Optional**

Title of the y axis; text.

#### yAxisType

**Optional**

Default: `category`

Currently has no effect, as the y axis is always used for data values.
Usage

The cfchart tag defines a container in which a graph displays: its height, width, background color, labels, and so on. The cfchartseries tag defines the chart style in which data displays: bar, line, pie, and so on. The cfchartdata tag defines a data point.

Data is passed to the cfchartseries tag in the following ways:

- As a query
- As data points, using the cfchartdata tag

For the font attribute value ArialUnicodeMS, the following rules apply:

- In Windows, to permit Flash charts (type = "flash") to render a double-byte character set, select this value.
- In UNIX, for all type values, to render a double-byte character set, select this value.
- If this value is selected, the fontBold and fontItalic attributes have no effect.

The following table lists W3C HTML 4 named color value or hexadecimal values that the color attribute accepts:

<table>
<thead>
<tr>
<th>Color name</th>
<th>RGB value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aqua</td>
<td>#00FFFF</td>

</tbody>
</table>
For all other color values, enter the hexadecimal value. You can enter a six-digit value, which specifies the RGB value, or an eight-digit value, which specifies the RGB value and the transparency. The first two digits of an eight-digit hexadecimal value specify the degree of transparency, with FF indicating opaque and 00 indicating transparent. Values between 00 and FF are allowed.

For more color names that are supported by popular browsers, go to www.w3.org/TR/css3-color.

You can specify whether charts are cached in memory, the number of charts to cache, and the number of chart requests that ColdFusion can process concurrently. To set these options in the ColdFusion Administrator, select Server Settings > Charting.

For client-side charting, the following attributes are not supported: format, labelformat, seriesplacement with percent as the value, sort, xaxis, tipsstlye, url, xAxisType, xoffset, yaxistype, and yoffset.

Example

<!--- The following example analyzes the salary data in the cfdocexamples database and generates a bar chart showing average salary by department. The body of the cfchartseries tag includes one cfchartdata tag to include data that is not available from the query. --->

<!--- Get the raw data from the database. --->
<cfquery name="GetSalaries" datasource="cfdocexamples">
    SELECT Departmt.Dept_Name,
          Employee.Dept_ID,
          Employee.Salary
    FROM Departmt, Employee
    WHERE Departmt.Dept_ID = Employee.Dept_ID
</cfquery>

<!--- Use a query of queries to generate a new query with statistical data for each department. --->
<!--- AVG and SUM calculate statistics. --->
<!--- GROUP BY generates results for each department. --->
<cfquery dbtype = "query" name = "DataTable">
    SELECT Dept_Name,
          AVG(Salary) AS avgSal,
          SUM(Salary) AS sumSal
    FROM GetSalaries
    GROUP BY Dept_Name
</cfquery>

<!--- Reformat the generated numbers to show only thousands. --->

Last updated 7/9/2012
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
   <cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
   <cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!--- Bar graph, from Query of Queries --->
<cfchart format="flash"
   xaxistitle="Department"
   yaxistitle="Salary Average">
<cfchartseries type="bar"
   query="DataTable"
   itemcolumn="Dept_Name"
   valuecolumn="avgSal">
<cfchartdata item="Facilities" value="35000">
</cfchartseries>
</cfchart>

cfchartdata

Description
Used with the cfchart and cfchartseries tags. This tag defines chart data points. Its data is submitted to the cfchartseries tag.

Category
Data output tags, Extensibility tags

Syntax
<cfchartdata
   item = "text"
   value = "number">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

    </cfchartseries>
</cfchart>

<cfchartseries>
</cfchart>

**cfchartseries**

**Description**

Used with the cfchart tag. This tag defines the chart style in which the data displays: bar, line, pie, and so on.
Category
Data output tags, Extensibility tags

Syntax
`<cfchartseries`
- `alpha = "Integer between 0 and 1"`
- `animate = "JSON string representation"`
- `aspect = "text"`
- `background = "JSON string representation"`
- `bevel = "JSON string representation"`
- `border = "JSON string representation"`
- `color = "text"`
- `data = "JSON string representation"`
- `hovermarker = "JSON string representation"`
- `marker = "JSON string representation"`
- `type="type"`
- `itemColumn = "query column"`
- `label = "text"`
- `valueColumn = "query column"`
- `colorlist = "list"`
- `dataLabelStyle = "style"`
- `markerStyle = "style"`
- `paintStyle = "plain|raise|shade|light"
- `query = "query name"`
- `scales = "comma-seperated list of axes"
- `shadow = "JSON string representation"
- `seriesColor = "hexadecimal value|web color"
- `seriesLabel = "label text"`
- `toolTip = "JSON string representation"
- `zColumn = "query column"
- `type="type"
- `itemColumn = "query column"
- `valueColumn = "query column"
- `colorlist = "list"
- `dataLabelStyle = "style"
- `markerStyle = "style"
- `paintStyle = "plain|raise|shade|light"
- `query = "query name"
- `seriesColor = "hexadecimal value|web color"
- `seriesLabel = "label text"
`</cfchartseries>

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

`cfchart`, `cfchartdata`; Creating Charts and Graphs in the *Developing ColdFusion Applications*

History
ColdFusion 10: Added the following attributes: alpha, animate, aspect, background, bevel, border, marker, color, label, hoverMarker, data, scales, shadow, tooltip, zcolumn

ColdFusion MX 7:
- Added the `dataLabelStyle` attribute.

Last updated 7/9/2012
• Added the horizontalbar value of the type attribute.

ColdFusion MX 6.1: Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha</td>
<td>Optional</td>
<td></td>
<td>Alpha (transparency) level of the background. Valid values range from 0 (transparent) to 1 (opaque).</td>
</tr>
<tr>
<td>animate</td>
<td>Opt</td>
<td></td>
<td>A struct of keys to define the animation such as effect and speed. An empty struct results in default animation with appear effect.</td>
</tr>
<tr>
<td>aspect</td>
<td>Opt</td>
<td></td>
<td>Defines the variations of a chart type, for example line, area, and dots in a radar chart.</td>
</tr>
</tbody>
</table>
| background| Opt     |         | A struct of keys related to background such as:  
  • color: Sets the background color(s)  
  • color-1: Sets the first background color for the arrow  
  • color-2: Sets the second background color for the arrow (used with gradients)  
  • transparent: Set the transparency of a background image so that underlying colors or chart can show.  
  • fit: Defines the width/height to fit area of background.  
  • repeat: Defines type of image repeat.  
  • image: Defines the path to the background image.  
  • position: Defines the position of the background image. |
| bevel     | Opt     |         | A struct of keys related to bevel such as:  
  • color: Defines the color of the bevel.  
  • blur-x: Defines the sharpness/smoothness of the bevel edges in the x-direction.  
  • blur-y: Defines the sharpness/smoothness of the bevel edges in the y-direction.  
  • angle: Defines the angle of the bevel.  
  • distance: Distance in # | #px indicating the distance from the object the bevel should be displayed. |
| border    | Opt     |         | A struct of keys related to border such as:  
  • color: Sets the color of the border.  
  • radius: Defines the radius of rounded corners.  
  • width: Defines the width of the border. |
<p>| marker    | Opt     |         | A struct of keys used to style the marker such as size, border, background, and bevel. |</p>

<tr>
<td>seriesLabel</td>
<td>Optional</td>
<td></td>
<td>Text of the data series label</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Usage
The following attributes are not supported for Client side charting:

- `paintStyle`
- The following values for `markerstyle`: `letterx`, `mcross`, `snow`, and `rcross`.

A new attribute `zvalue` added to `cfchartdata`: Applicable if chart takes a third dimension in addition to x and y.

For a pie chart, ColdFusion sets pie slice colors as follows:

- If the `seriesColor` attribute is omitted, ColdFusion automatically determines the colors of the slices.
- If the `seriesColor` attribute is specified, ColdFusion automatically determines the colors of the slices after the first one, starting with the specified color for the first slice.

Limitations
The following server-side charting features are not available with client-side charting:

- Linking charts to URL
- Writing charts to a variable

Example 1

<!--- The following example analyzes the salary data in the cfdocexamples database and generates a bar chart showing average salary by department. -->

<!--- Get the raw data from the database. --->
<cfquery name="GetSalaries" datasource="cfdocexamples">
  SELECT Departmt.Dept_Name,
          Employee.Dept_ID,
          Employee.Salary
  FROM Departmt, Employee
  WHERE Departmt.Dept_ID = Employee.Dept_ID
</cfquery>

<!--- Use a query of queries to generate a new query with --->
<!--- statistical data for each department. --->
<!--- AVG and SUM calculate statistics. --->
<!--- GROUP BY generates results for each department. --->
<cfquery dbtype = "query" name = "DataTable">
  SELECT
    Dept_Name,
    AVG(Salary) AS avgSal,
    SUM(Salary) AS sumSal
  FROM GetSalaries
</cfquery>
GROUP BY Dept_Name
</cfquery>

<!--- Reformat the generated numbers to show only thousands. --->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>

<!--- Bar graph, from Query of Queries --->
<cfchart format="flash"
xaxistitle="Department"
yaxistitle="Salary Average">
<cfchartseries type="bar"
query="DataTable"
itemcolumn="Dept_Name"
valuecolumn="avgSal" />
</cfchart>

Example 2
The following is a basic example of using client side charting.

<cfchart format ="html" type="pie">
  <cfchartseries>
    <cfchartdata item="New car sales" value="50000">
    <cfchartdata item="Used car sales" value="25000">
    <cfchartdata item="Leasing" value="30000">
    <cfchartdata item="Service" value="40000">
  </cfchartseries>
</cfchart>

Example 3
This example showcases how you can create a simple bubble chart by specifying zcolumn.

<cfchart format ="html" type="bubble" query="ChartQuery" showlegend="false">
<cfchartseries query="ProdQuery" type="bubble" itemcolumn="title" valuecolumn="total_days"
zcolumn="rem_days" label="Total_Days">
</cfchart>

Example 4
This is an example that specifies labels as a struct.

<cfchart format ="html" type="bubble" query="ChartQuery" showlegend="false">
<cfchartseries type="bubble" label="Total_Days" labels=#"text="Hello Label","hook":{"node:plot=0,index=2,offset-x=-10,offset-y=-90"}#>
<cfchartdata item=1 value=10 zvalue=40>
<cfchartdata item=2 value=20 zvalue=30>
<cfchartdata item=3 value=30 zvalue=20>
<cfchartdata item=4 value=20 zvalue=35>
<cfchartdata item=5 value=40 zvalue=10>
</cfchartseries>
</cfchart>
**cfcol**

**Description**
Defines table column header, width, alignment, and text. Used within a cftable tag.

**Category**
Data output tags

**Syntax**
```html
<cfcol
   header = "column header text"
   text = "column text"
   align = "left|right|center"
   width = "number that indicates width of column">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfcontent, cfoutput, cftable; Performing file operations with cfftp in the Developing ColdFusion Applications

**History**
ColdFusion MX: Added the ability to construct dynamic cfcol statements.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>Required</td>
<td></td>
<td>Column header text. To use this attribute, you must also use the cftablecolHeaders attribute.</td>
</tr>
<tr>
<td>text</td>
<td>Required</td>
<td></td>
<td>Double-quotation mark-delimited text; determines what to display. Rules: same as for cfoutput sections. You can embed hyperlinks, image references, and input controls.</td>
</tr>
<tr>
<td>align</td>
<td>Optional</td>
<td>left</td>
<td>Column alignment:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• left</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• right</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• center</td>
</tr>
<tr>
<td>width</td>
<td>Optional</td>
<td>20</td>
<td>Column width. If the length of data displayed exceeds this value, data is truncated to fit. To avoid this, use an HTML table tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If the surrounding cftable tag includes the htmltable attribute, width specifies the percent of the table width and it does not truncate text; otherwise, width specifies the number of characters.</td>
</tr>
</tbody>
</table>

**Usage**
At least one cfcol tag is required within the cftable tag. You must put cfcol and cftable tags adjacent in a page. The only tag that you can nest within the cftable tag is the cfcol tag. You cannot nest cftable tags.

To display the cfcolheader text, specify the cfcolheader and the cftablecolHeader attribute. If you specify either attribute without the other, the header does not display. No error is thrown.
Example

<!--- This example shows the use of cfcol and cftable to align information returned from a query. --->
<!--- Query selects information from cfdocexamples data source. --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>
<html>
<body>
<h3>cfcol Example</h3>
<!--- Uses the HTMLTable attribute to display cftable as an HTML table, rather than PRE formatted information --->
<cftable
    query = "GetEmployees"
    startRow = "1" colSpacing = "3"
    HTMLTable colheaders>
    <!--- Each cfcol tag sets the width of a column in the table, the header information, and the text/CFML for the cell. --->
    <cfcol header = "<b>ID</b>"
        align = "Left"
        width = 2
        text= 
    <cfcol header = "<b>Name/Email</b>"
        align = "Left"
        width = 15
        text= 
    <cfcol header = "<b>Phone Number</b>"
        align = "Center"
        width = 15
        text= 
</cftable>

<cfcollection>

Description
Creates and administers Solr search engine collections.

Category
Extensibility tags
Syntax

cfcollection supports script style syntax:

new collection().CREATE(collection="<collection_name>", engine="solr", path="<path to the solr directory>"ToDate);

<cfcollection
    action = "action"
    categories = "yes|no"
    collection = "collection name"
    engine = "solr"
    language = "language"
    name = "query name"
    path = "c">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfexecute, cfindex, cfobject, cfreport, cfsearch, cfwddx

History

ColdFusion 9: Added the engine attribute (required for Solr support).

ColdFusion MX 7:

- Starting with ColdFusion MX 7, you cannot use the cfcollection tag to create alias names for existing collections. Because Verity maintains all the collection information, you cannot have two names point to the same collection.
- Removed reference to external collections.
- Deprecated the map and repair options of the action attribute. They might not work, and might cause an error, in later releases.
- Added categories attribute and categorylist action.
- Added CATEGORIES, SIZE, DOCCOUNT, and LASTMODIFIED to list of variables returned by the list action.
- Marked as obsolete the MAPPED, ONLINE, and REGISTERED variables returned by the list action.

ColdFusion MX:

- Changed the requirements for the action attribute: it is now required.
- Added the action attribute list value. It is the default.
- Changed the requirements for the action attribute value map: it is not necessary to specify the action attribute value map. (ColdFusion detects collections and creates maps collections as required.)
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed thrown exceptions: this tag can throw the SEARCHENGINE exception.
## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action    | Required; see Usage | list | • categorylist: Retrieves categories from the collection and indicates how many documents are in each one. Returns a structure of structures in which the category representing each substructure is associated with a number of documents. For a category in a category tree, the number of documents is the number at or below that level in the tree.  
• create: registers the collection with ColdFusion. If the collection is present, the tag creates a map to it. If the collection is not present, the tag creates it.  
• delete: unregisters a collection and deletes its directories.  
• list: returns a query result set, named from the name attribute value, of the attributes of the collections that are registered by ColdFusion. If you have Solr collections and omit the engine attribute, ColdFusion lists information for both types of collections.  
• map: creates a map to a collection. If the action is create and the collection exists, ColdFusion also creates a map to the collection.  
• optimize: optimizes the structure and contents of the collection for searching; recovers space. Causes collection to be taken offline, preventing searches and indexing.  
• repair: deprecated. Does nothing. |
| categorie s | See Usage | no | Used only for creating a collection:  
• yes: this collection includes support for categories.  
• no: this collection does not support categories. |
| collection | See Usage | | • A collection name. The name can include spaces. |
| engine | Optional | Solr | The search engine for the collection:  
• solr: the Apache Lucene open source search engine  
For the create and map actions, the default is Solr. For the list action, the default is to list all collections, Solr. For all other actions ColdFusion determines the collection type. |
| language | See Usage | English | For a list of options, see Usage. |
| name | See Usage | | Name for the query results returned by the list and categorylist actions. |
| path | See Usage | | Absolute path to a collection.  
To map an existing collection, specify a fully qualified path to the collection (not including the collection name); for example, "C:\MyCollections\". |

## Usage

With this tag you can

- Create Solr collections.
- Administer Solr collections created by this tag or the ColdFusion Administrator.

The following table shows the dependence relationships among this tag’s attribute values:
The following examples show the structures returned by the `categorylist` action:

**CATEGORIES**

<table>
<thead>
<tr>
<th>Category</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>blue</td>
<td>10</td>
</tr>
<tr>
<td>green</td>
<td>3</td>
</tr>
<tr>
<td>magenta</td>
<td>3</td>
</tr>
<tr>
<td>purple</td>
<td>2</td>
</tr>
</tbody>
</table>

**CATEGORYTREES**

<table>
<thead>
<tr>
<th>Path</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>a/</td>
<td>10</td>
</tr>
<tr>
<td>a/b</td>
<td>10</td>
</tr>
<tr>
<td>a/b/c</td>
<td>10</td>
</tr>
<tr>
<td>a/b/c/subdir</td>
<td>3</td>
</tr>
</tbody>
</table>

The list action returns the following information in a result set that contains one row per collection:

<table>
<thead>
<tr>
<th>Column</th>
<th>Contents</th>
</tr>
</thead>
</table>
| CATEGORIES | • yes: the collection has category support enabled.  
|            | • no: the collection does not have category support enabled.  
| CHARSET    | The character set of the collection.  
| CREATED    | The date and time that the collection was created.  
| DOCCOUNT   | The number of documents in this collection.  
| EXTERNAL   | • yes: the collection is external.  
|            | • no: the collection is not external.  
|            | • not found: the collection is registered but is not available in the defined path.  
| LANGUAGE   | The locale setting of the collection.  
|            | This information is not available for K2Server collections.  
| LASTMODIFIED | The date and time that the collection was last changed.  
| MAPPED     | Obsolete.  

Last updated 7/9/2012
You can also specify uni to enable support for multiple languages.

To determine whether a collection exists, use code, such as the following, to execute a query of queries:

```cfmx
<cfcollection action="list" name="myCollections" >
<cfquery name="qoq" dbtype="query">
   SELECT * from myCollections
   WHERE myCollections.name = 'myCollectionName'
</cfquery>
<cfif qoq.recordcount GT 0>
   <!--- Collection exists --->
   <cfdump var="#qoq#"/>
</cfif>
```

To determine whether a Solr collection exists, you must specifically add the attribute `engine` and provide the value as `solr`. For example,

```cfmx
<cfcollection action="list" name="myCollections" engine="solr" >
```

To get a result set with values for all the collections that are registered with the search server, use code such as the following:

```cfmx
<cfcollection action="list" name="myCollections">
<cfoutput query="myCollections">
   #name#<br>
</cfoutput>
```

To add content to a collection, use `cfindex`. To search a collection, use `cfsearch`.

Restart the ColdFusion Search Service for this change to take effect.

For Solr collections, the `language` attribute of this tag supports the following options:

<table>
<thead>
<tr>
<th>Brazilian</th>
<th>cjk (Chinese, Japanese, Korean)</th>
<th>French</th>
<th>Russian</th>
</tr>
</thead>
<tbody>
<tr>
<td>Czech</td>
<td>Dutch</td>
<td>German</td>
<td>Thai</td>
</tr>
<tr>
<td>Chinese</td>
<td>English</td>
<td>Greek</td>
<td></td>
</tr>
</tbody>
</table>

### cfcomponent

**Description**

Creates and defines a component object; encloses functionality that you build in CFML and enclose in `cffunction` tags. This tag contains one or more `cffunction` tags that define methods. Code within the body of this tag, other than `cffunction` tags, is executed when the component is instantiated.

A component file has the extension CFC and is stored in any directory of an application.
A component method is invoked in the following ways:

- In the `cfinvoke` tag in a ColdFusion page
- In a URL that calls a CFC file and passes a method name as a URL parameter
- In the `cfscript` tag
- As a web service
- From Flash code

### Syntax

```cfcomponent
<cfcomponent
    accessors = "yes|no"
    autoIndex = "yes|no"
    alias = "ActionScript 3 type alias"
    bindingname = "binding element name"
    displayname = "string"
    extends = "component name"
    hint = "string"
    implements = "ColdFusion interface"
    indexable = "yes|no"
    indexLanguage = "language"
    mappedSuperClass = "yes|no"
    namespace = "default service namespace"
    output = "no value|no|yes"
    porttypename = "port type element name"
    Serializable = "yes|no"
    serviceaddress = "service URL"
    serviceportname = "port element name"
    style = "rpc|document|wrapped"
    wsVersion = "1|2"
    wsdlfile = "path"
>
variable declarations
<cffunction ...
    ...
</cffunction>

<cffunction ...
    ...
</cffunction>
</cfcomponent>
```

### See also

### History

**ColdFusion 10:** rest, restPath, httpMethod, produces, consumes, indexable, indexLanguage, autoIndex, wsVersion

**ColdFusion 9.0.1:** Added the attribute `mappedSuperClass`
ColdFusion 9: Added the attributes `serializable` and `accessors`.

ColdFusion 8:
- Added the `implements` and `serviceaddress` attributes.
- Added support for the `onMissingMethod` function.

ColdFusion MX 7:
- Added support for publishing document-literal style web services.
- Added the `style`, `namespace`, `serviceportname`, `porttypename`, `wsdlfile`, `bindingname`, and `output` attributes.
- Extended functionality for the `hint` and `displayname` attributes when publishing document-literal style web services.

ColdFusion MX: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessors</td>
<td>Optional</td>
<td>yes (for persistent CFC) no for others</td>
<td>If set to <code>yes</code>, lets you invoke implicit getters and setters. For persistent CFC, <code>accessors</code> is always enabled.</td>
</tr>
<tr>
<td>alias</td>
<td>Optional</td>
<td></td>
<td>Specifies the <code>type</code> label to give the object when it is converted from CFML to ActionScript 3. It matches the <code>alias</code> attribute of AS3 types. This attribute applies only to Flash Remoting and LiveCycle Data Services value objects, and lets you work with typed objects in both ColdFusion and Flash.</td>
</tr>
<tr>
<td>autoIndex</td>
<td>Optional</td>
<td>yes</td>
<td>If no, auto-indexing of CFC does not occur. That is, indexing occurs only in offline mode.</td>
</tr>
<tr>
<td>bindingname</td>
<td>Optional</td>
<td></td>
<td>Specifies the <code>binding</code> attribute of the <code>port</code> element in the WSDL. If you don’t specify this attribute, ColdFusion derives the value from the CFC class name.</td>
</tr>
<tr>
<td>consumes</td>
<td>optional</td>
<td><em>/</em></td>
<td>Comma-separated list of acceptable MIME types, for example <code>consumes=&quot;text/plain,text/html&quot;</code>. Searches for the Content-Type header in the HTTP request; if the value is, for example HTML or XML, ColdFusion finds the appropriate method which can handle the request and invoke the method. Used to specify which MIME media types of representation a resource can accept or consume, from the client. If this attribute is used at the component level (and not at the function level), all the response methods accept the specified MIME types by default. If no function in a CFC can consume the MIME type in a client request, the following error occurs: 415 Unsupported Media Type. If no value is specified, <code>*/</code> is taken by default, which means, all MIME types are consumed.</td>
</tr>
<tr>
<td>displayname</td>
<td>Optional</td>
<td></td>
<td>A string that displays when you use introspection to show information about the CFC. The information appears on the heading, following the component name.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Req/Opt</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------</td>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>extends</td>
<td>Optional</td>
<td>WEB-INF.cftags.component</td>
<td>Name of parent component from which to inherit methods and properties. You can use the keyword component to specify the default value.</td>
</tr>
<tr>
<td>hint</td>
<td>Optional</td>
<td></td>
<td>Text that displays when you use introspection to show information about the CFC. The hint attribute value appears below the component name heading. Use this attribute to describe the purpose of the parameter.</td>
</tr>
<tr>
<td>httpMethod</td>
<td>optional</td>
<td></td>
<td>The HTTP method to use, must be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• GET: Requests information from the server. Any data that the server requires to identify the requested information must be in the URL or in cfhttpparam type=&quot;URL&quot; tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• POST: Sends information to the server for processing. Requires one or more cfhttpparam tags. Often used for submitting form-like data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• PUT: Requests the server to store the message body at the specified URL. Use this method to send files to the server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• DELETE: Requests the server to delete the specified URL.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• HEAD: Identical to the GET method, but the server does not send a message body in the response. Use this method for testing hypertext links for validity and accessibility, determining the type or modification time of a document, or determining the type of server. If you have not specified HEAD, by default, GET method is called. However, message body is not sent in the response.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• OPTIONS: A request for information about the communication options available for the server or the specified URL. This method enables the ColdFusion application to determine the options and requirements associated with a URL, or the capabilities of a server, without requesting any additional activity by the server. If you have not specified OPTIONS, then ColdFusion sends a response. Based on the request method, the corresponding function is invoked. For example, if a GET request is sent to the server, then a function with httpMethod as GET is invoked. If this value is not specified at the function level, then the value you define here is used. So all functions for which httpMethod is not specified are assigned this value.</td>
</tr>
<tr>
<td>implements</td>
<td>Optional</td>
<td></td>
<td>Name of the ColdFusion interface or interfaces that this component implements. If the component implements an interface, it must define all the functions in the interface, and the function definitions must conform to the definitions specified in the interface. For more information, see cfinterface. A component can implement any number of interfaces. To specify multiple interfaces, use a comma-delimited list with the format interface1,interface2.</td>
</tr>
<tr>
<td>indexable</td>
<td>Optional</td>
<td>no</td>
<td>If yes, enables indexing for the component.</td>
</tr>
<tr>
<td>indexLanguage</td>
<td>Optional</td>
<td>english</td>
<td>Specify the language that is used to index and search. The value you set overrides the value defined in the Application.cfc.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Req/Opt</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------</td>
<td>---------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mappedSuperClass</td>
<td>Optional</td>
<td>no</td>
<td>If set to yes on a non-persistent CFC, child CFCs can inherit its properties. For example, you can define a base CFC with common properties such as ID, version, or createdOn which all other persistent CFCs would extend and thus get one common behavior. mappedSuperClass cannot be set to yes on a persistent CFC.</td>
</tr>
<tr>
<td>namespace</td>
<td>Optional</td>
<td>class name</td>
<td>Specifies the namespace used in the WSDL for a CFC that is invoked as a web service. If you don't specify this attribute, ColdFusion derives the value from the CFC class name.</td>
</tr>
</tbody>
</table>
| output               | Optional| Component body displayable text that is processed as standard CFML | Specifies whether constructor code in the component can generate HTML output; does not affect output in the body of cffunction tags in the component.  
  • yes: Constructor code is processed as if it were within a cfoutput tag. Variable names surrounded by number signs (#) are automatically replaced with their values.  
  • no: Constructor code is processed as if it were within a cfsilent tag.  
  • If you do not specify this attribute, constructor code is processed as standard CFML. Any variables must be in cfoutput tags. |
| porttypename          | Optional| | Specifies the name attribute of the porttype element in the WSDL. If you don't specify this attribute, ColdFusion derives the value from the CFC class name. |
| produces             | optional | *//* | Comma-separated list of acceptable MIME types, for example produces="text/plain, text/html".  
  Searches for the Accept header in the HTTP request or extension in the URL (valid extensions are .xml and .json); if the value is, for example HTML, JSON, or XML, ColdFusion finds the appropriate method that can handle the request and invoke the method.  
  Used to specify the MIME media types or representations a CFC can produce and send back to the client.  
  If specified at the component level (and not at the function level) , all the functions in a CFC can produce the specified MIME types by default.  
  If no methods in a CFC can produce the MIME type in a client request, the following error occurs: 406 Not Acceptable.  
  If no value is specified, *//* is taken by default, which means, all MIME types are produced. |
| rest                 | Optional| true if RestPath is specified | If true, the CFC is REST-enabled. |
### ColdFusion Tags

#### restPath

**Attribute:** restPath  
**Req/Opt:** Optional  
**Default:**  
**Description:** You can access the REST resource either by providing a REST path or CFC path. So specify if you want to use a path other than the CFC path. If rest="true" and you do not specify this attribute, path to the CFC is used.

Path to the CFC should be from the directory registered as a REST service. Also, you should include the CFC name in the path.

For example, if you have a folder college that is registered as RestTest, and you want to publish student.cfc which is in a sub-folder department (in the folder college), then the URL used to access student.cfc is as follows:

The restPath in this case is department/student.

The path is case-sensitive. Also, it is preferable to avoid special character in the path.

At CFC level, specify the path as follows:

```cfml
restPath="restService" or restPath="test/restService"
```

You can specify templates as value of restPath. For example, restPath="/\{name\}". This means, all URLs in the format `<Base URL>/rest/<service_mapping>/<any string without slash>` matches the restPath. For example, http://localhost:8500/rest/service1/abc.

The value in place of template can be accessed using the restargsource value path. For details, see the attribute details of cfargument.

The attribute can have complex expressions as values. For example, restpath="/customers/{firstname}-{lastname}". This matches URLs such as ”/customers/paul-bensen” but not ”/customers/paulbensen”.

Also restPath can include regular expressions such as restpath="/customers/{id : \d+}". Here, id is an integer that can match ”/customers/123111” but not ”/customers/asd” or ”/customers/123/122”.

If you have two methods with different path attribute values and if the paths are ambiguous, then there are precedence rules for finding the match. For example, restpath="/customers/{id : .+}". This expression matches any stream of characters after /customer. It matches ”/customers/123”, ”/customers/asd”, and ”/customers/123/12/asdfa”, but not ”/customers”.

You can also have expressions such as restPath="/customers/{id : .+}/address", the URL ”/customers/123/asd/address” is matched with both URLs. In such scenarios, the precedence rules are used to find the match.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restPath</td>
<td>Optional</td>
<td></td>
<td>You can access the REST resource either by providing a REST path or CFC path. So specify if you want to use a path other than the CFC path. If rest=&quot;true&quot; and you do not specify this attribute, path to the CFC is used. Path to the CFC should be from the directory registered as a REST service. Also, you should include the CFC name in the path. For example, if you have a folder college that is registered as RestTest, and you want to publish student.cfc which is in a sub-folder department (in the folder college), then the URL used to access student.cfc is as follows: <a href="http://localhost:8500/rest/RestTest/department/student">http://localhost:8500/rest/RestTest/department/student</a>. The restPath in this case is department/student. The path is case-sensitive. Also, it is preferable to avoid special character in the path. At CFC level, specify the path as follows: restPath=&quot;restService&quot; or restPath=&quot;test/restService&quot; You can specify templates as value of restPath. For example, restPath=&quot;/{name}&quot;. This means, all URLs in the format <code>&lt;Base URL&gt;/rest/&lt;service_mapping&gt;/&lt;any string without slash&gt;</code> matches the restPath. For example, <a href="http://localhost:8500/rest/service1/abc">http://localhost:8500/rest/service1/abc</a>. The value in place of template can be accessed using the restargsource value path. For details, see the attribute details of cfargument. The attribute can have complex expressions as values. For example, restpath=&quot;/customers/{firstname}-{lastname}&quot;. </tr>
</tbody>
</table>

#### serializable

**Attribute:** serializable  
**Req/Opt:** Optional  
**Default:** true  
**Description:** Specifies whether this component can be serialized. If you set this value to false, the component and the data in the component’s This and Variables scopes cannot be serialized, so they are not retained on session replication, and the component is in its default state.

Last updated 7/9/2012
ColdFusion Tags

Usage

If you specify the `extends` attribute, the data and methods of the parent component are available to CFC methods as if they were parts of the current component. If the managerCFC component extends the employeeCFC component, and the employeeCFC component has a `getEmployeeName` method, you can call this method by using the managerCFC, as follows:

```
<cfinvoke component="managerCFC" method="getEmployeeName" returnVariable="managerName"
  EmployeeID=#EmpID#>
```

This tag requires an end tag.

If you specify `style="document"`, ColdFusion publishes the CFC as a document-literal style web service. For more information, see Publishing document-literal style web services in the Developing ColdFusion Applications.

CFCs support an `onMissingMethod` function. By defining an `onMissingMethod` function in the `cfcomponent` tag body in the CFC, you can handle calls to methods that are not implemented in the CFC. If an application calls a function that is not defined in the CFC, ColdFusion calls the `onMissingMethod` function and passes it the requested method’s name and arguments. If you do not define an `onMissingMethod` function, a call to a method that is not defined in the CFC causes ColdFusion to throw an error that must be handled in the calling code.

The `onMissingMethod` function is useful for several purposes:

- To handle errors directly in the component, instead of requiring that each instance of code that calls the component handles them.
- To create a dynamic proxy, an object that can take arbitrary calls and dynamically determines the correct action.

The `onMissingMethod` function must have the following format:

```
ServiceComponentName.onMissingMethod(functionName, arg1, arg2, ..., argN)
```

Table: ColdFusion Tags

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceaddress</td>
<td>Optional</td>
<td>URL of the CFC</td>
<td>Specifies the SOAP URL of the web service. If you don’t specify this attribute, ColdFusion uses the URL of the CFC in the WSDL service description. Use this attribute to specify the protocol, for example, by specifying a URL that starts with <code>https://</code>. This attribute applies only for web services.</td>
</tr>
<tr>
<td>serviceportname</td>
<td>Optional</td>
<td></td>
<td>Specifies the <code>name</code> attribute of the <code>port</code> element in the WSDL. If you don’t specify this attribute, ColdFusion derives the value from the CFC class name.</td>
</tr>
<tr>
<td>style</td>
<td>Optional</td>
<td>rpc</td>
<td>Specifies whether a CFC used for web services uses RPC-encoded style or document-literal style:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>rpc</code>: RPC-encoded style</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>document</code>: Document-literal style</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>wrapped</code>: If you are setting <code>wsVersion</code> as 2, the default value is <code>wrapped</code> and if it is 1, then the default value is <code>rpc</code>.</td>
</tr>
<tr>
<td>wsdlfile</td>
<td>Optional</td>
<td></td>
<td>A properly formatted WSDL file to be used instead of WSDL generated by ColdFusion.</td>
</tr>
<tr>
<td>wsVersion</td>
<td>Optional</td>
<td></td>
<td>If you specify 2, CFC is deployed using Axis 2 engine. The value you specify overrides the value you specify at application or server level.</td>
</tr>
</tbody>
</table>
<cffunction name="onMissingMethod">
    <cfargument name="missingMethodName" type="string">
    <cfargument name="missingMethodArguments" type="struct">
        code to handle call to nonexistent method
    </cffunction>

    Note: The argument name for onMissingMethod must not change.

Example 1
<cfcomponent>
    <cffunction name="getEmp">
        <cfquery name="empQuery" datasource="cfdocexamples">
            SELECT FIRSTNAME, LASTNAME, EMAIL
            FROM tblEmployees
        </cfquery>
        <cfreturn empQuery>
    </cffunction>

    <cffunction name="getDept">
        <cfquery name="deptQuery" datasource="cfdocexamples">
            SELECT *
            FROM tblDepartments
        </cfquery>
        <cfreturn deptQuery>
    </cffunction>
</cfcomponent>

cfcontent

description
Does either or both of the following:

- Sets the MIME content encoding header for the current page; if the encoding information includes a character encoding, sets the character encoding of generated output.
- Sends the contents of a file, or of a variable that contains binary data, as the page output.

To restrict this tag, use the settings in the ColdFusion Administrator > Security > Sandbox Security. For more information, see the Administrator online Help.

category
Data output tags

Syntax
<cfcontent
    deleteFile = "yes|no"
    file = "filename"
    reset = "yes|no"
    type = "file type"
    variable = "variable name">

    Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.
See also
cfcol, cfheader, cfhttp, cfoutput, cftable

History
ColdFusion 8: Changed the behavior of the tag if the type attribute is not specified and the file attribute is specified. Previously, ColdFusion assumed a default file type of text/html. Now, ColdFusion attempts to get the content type from the file.

ColdFusion MX 7: Added the variable attribute.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| deleteFile | Optional | no | Applies only if you specify a file with the file attribute.  
- yes: deletes the file on the server after sending its contents to the client.  
- no: leaves the file on the server. |
| file      | Optional | Name of an on-disk or in-memory file whose contents provide the page output. The filename must start with a drive letter and a colon, or a forward or backward slash. When using ColdFusion in a distributed configuration, the file attribute must refer to a path on the system on which the web server runs. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client. |
Usage
To set the character encoding (character set) of generated output, including the page HTML, use code such as the following:

```xml
<cfcontent type="text/html; charset=ISO-8859-1">
```

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| reset     | Optional| yes     | If you specify a file or variable attribute, this attribute has no effect; otherwise, it does the following:  
  • yes: discards output that precedes call to cfcontent  
  • no: preserves output that precedes call to cfcontent. In this case, all output is sent with the specified type. |
| type      | Optional|         | The MIME content type of the page, optionally followed by a semicolon and the character encoding. By default, ColdFusion sends pages as text/html content type in the UTF-8 character encoding. However, if the file attribute is specified, ColdFusion attempts to get the content type from the file.  
  The content type determines how the browser or client interprets the page contents.  
  The following are some of the content type values that you can use:  
  • text/html  
  • text/plain  
  • application/x-shockwave-flash  
  • application/msword  
  • image/jpeg  
  The following list includes commonly used character encoding values:  
  • utf-8  
  • iso-8859-1  
  • windows-1252  
  • us-ascii  
  • shift_jis  
  • iso-2022-jp  
  • euc-jp  
  • euc-kr  
  • big5  
  • euc-cn  
  • utf-16  
  For example:  
  type = "text/html"  
  type = "text/html; charset=ISO-8859-1" |
| variable  | Optional|         | Name of a ColdFusion binary variable whose contents can be displayed by the browser, such as the contents of a chart generated by the cfchart tag or a PDF or Excel file retrieved by a cffile action="readBinary" tag. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client. |
When ColdFusion processes an HTTP request, it determines the character encoding to use for the data it returns in the HTTP response. By default, ColdFusion returns character data using the Unicode UTF-8 format, regardless of the value of an HTML meta tag in the page. You can use the cfcontent tag to override the default character encoding of the response. For example, to tell ColdFusion to return the page using Japanese EUC character encoding, use the type attribute, as follows:

```xml
<cfcontent type="text/html; charset=EUC-JP">
```

If you call the cfcontent tag from a custom tag, and you do not want the tag to discard the current page when it is called from another application or custom tag, set reset = "no".

If a file delete operation is unsuccessful, ColdFusion throws an error.

Do not use this tag after the cfflush tag on a page, it has no effect or ColdFusion throws an error.

The following tag can force most browsers to display a dialog box that asks users whether they want to save the contents of the file specified by the cfcontent tag using the filename specified by the filename value. If the user selects to open the file, most browsers open the file in the related application, not the browser window.

```xml
<cfheader name="Content-Disposition" value="attachment; filename=filename.ext">
```

Some file types, such as PDF documents, do not use executable code and can display directly in most browsers. To request the browser to display the file directly, use a cfheader tag similar to the following:

```xml
<cfheader name="Content-Disposition" value="inline; filename=name.ext">
```

You can use any value for the filename part of the filename attribute, but the ext part must be the standard Windows extension for the file type.

For file types that might contain executable code, such as Microsoft Excel documents, most browsers always ask before opening the document. For these file types, the inline content disposition specification requests the browser to display the file directly if the user selects to open the file.

For more information on character encodings, see the following web pages:

- The page at [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encodings and the web, and has several useful links.
- The page at [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- ColdFusion uses the Java JCE for encoding support. The page at [http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html](http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html) lists the character encodings that JCE 6, and therefore ColdFusion, can interpret. This list uses Java internal names, not the IANA character encoding names that you use in the SetEncoding charset parameter and other ColdFusion attributes and parameters.

For a complete list of media types used on the Internet, see [www.iana.org/assignments/media-types/](http://www.iana.org/assignments/media-types/).

**Note:** When using cfabort, cflocation, or cfcontent tags, the OnAbort method is invoked instead on OnRequestEnd.
Example

<!--- CFCONTENT Example 1
This example shows the use of cfcontent to return the contents of the CF Documentation page dynamically to the browser. You might need to change the path and/or drive letter depending on how ColdFusion is installed on your system. Notice that the graphics do not display and the hyperlinks do not work, because the html page uses relative filename references. The root of the reference is the ColdFusion page, not the location of the html page. --->

<cfcontent type = "text/html"
    file = "C:\ColdFusion9\wwwroot\cfdocs\dochome.htm"
    deleteFile = "no">

<!--- CFCONTENT Example 2
This example shows how the Reset attribute changes text output. Notice how the first text section ("This example shows how the Reset attribute changes output for text reset = "Yes":123) does NOT print out to the screen. --->

<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "Yes": 123 <BR> <cfcontent type = "text/html" reset = "Yes">456</p>
<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "No": 123 <BR> <cfcontent type = "text/html" reset = "No">456</p>

<!--- CFCONTENT Example 3
This example triggers a download of an Excel file. The user is prompted with an option to save the file or open it in the browser. --->

<cfheader name="Content-Disposition" value="inline; filename=acmesales03.xls">
    <cfcontent type="application/vnd.ms-excel" file="c:\temp\acmesales03.xls">

<!--- CFCONTENT Example 4
This example triggers a download of a Word document then deletes the original from the "temp" directory. The user is prompted with an option to save the file or open it in the browser. --->

<cfheader name="Content-Disposition" value="inline; filename=temp.doc">
    <cfcontent type="application/msword" file="c:\temp\Cable.doc" deletefile="yes">

<!--- CFCONTENT Example 5
This example causes the browser to treat the HTML table as Excel data. Excel interprets the table format. Because Excel can include executable code, the browser prompts the user whether to save the file or open it in a browser. --->

<cfheader name="Content-Disposition" value="inline; filename=acmesalesQ1.xls">
    <cfcontent type="application/vnd.msexcel">

<table border="2">
<tr><td>Month</td><td>Quantity</td><td>$ Sales</td></tr>
<tr><td>January</td><td>80</td><td>$245</td></tr>
<tr><td>February</td><td>100</td><td>$699</td></tr>
<tr><td>March</td><td>230</td><td>$2036</td></tr>
<tr><td>Total</td><td>=Sum(B2..B4)</td><td>=Sum(C2..C4)</td></tr>
</table>
**cfcontinue**

**Description**
Used within a `cfloop` tag. Returns processing to the top of a loop.

**Category**
Flow-control tags

**Syntax**
```
<cfcontinue>
```

**See also**
`cfabort, cfbreak, cfexecute, cfi, cflocation, cfloop, cfthrow, cftry`;
cfloop and cfbreak in the *Developing ColdFusion Applications*

**History**
ColdFusion 9: Added the tag.

**Example**
```
<!--- This shows the use of to return processing to the top of a loop when a condition is met. --->
<!--- Select courses; use cfloop to find a condition; then break the loop. --->
<!--- Check that number is numeric. --->
<cfif IsDefined("form.course_number")>
  <cfif Not IsNumeric(form.course_number)>
    <cfabort>
  </cfif>
</cfif>
<cfquery name="GetCourses" datasource="cfdocexamples">
  SELECT *
  FROM Courses
  ORDER by course_number
</cfquery>
<p> This example uses CFLOOP to cycle through a query to find a value. (In our example, a list of values corresponding to courses in the cfdocexamples datasource). When the conditions of the query are met, CFBREAK stops the loop. </p>
<p> Please enter a Course Number, and hit the "submit" button: </p>
<form action="cfbreak.cfm" method="POST">
  <select name="courseNum">
    <cfoutput query="GetCourses">
      
    </cfoutput>
  </select>
</form>
```
<option value="#course_number#">#course_number#
</cfoutput>
</select>
<input type="Submit" name="" value="Search on my Number">
</form>
<!--- If the courseNum variable is not defined, don't loop through the query.--->
<cfif IsDefined ("form.courseNum") IS "True">
<!--- Loop through query until value found, then use CFBREAK to exit query.--->
<cfloop query="GetCourses">
  <cfif GetCourses.course_number IS form.courseNum>
    <cfoutput>
      <h4>Your Desired Course was found:</h4>
      <pre>#course_number# #descript#</pre>
    </cfoutput>
    <cfbreak>
  </cfif>
  <cfelse>
    <br> Searching...
  </cfif>
</cfloop>
</cfif>

**cfcookie**

**Description**
Defines web browser cookie variables, including expiration and security options.

**Category**
Forms tags, Variable manipulation tags

**Syntax**
<cfcookie
name = "cookie name"
domain = ".domain"
expires = "period"
httponly = "yes|no"
path = "URL"
secure = "yes|no"
value = "text">

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

**See also**
cfdump, cfparam, cfregistry, cfsavecontent, cfschedule, cfset

**History**
ColdFusion 10: Added the `preserveCase` and `encodeValue` attributes.
ColdFusion MX 6.1:
- Changed the `expires` attribute: it now accepts a date time object.
- Cookie names can include all ASCII characters except commas, semicolons, or whitespace characters.
ColdFusion 9:

- Added the attribute `httponly`.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Name of cookie variable. ColdFusion converts cookie names to all-uppercase. Cookie names set using this tag can include any printable ASCII characters except commas, semicolons, or white space characters.</td>
</tr>
<tr>
<td>domain</td>
<td>Required if path attribute is specified. Optional otherwise</td>
<td></td>
<td>Domain in which cookie is valid and to which cookie content can be sent from the user's system. By default, the cookie is only available to the server that set it. Use this attribute to make the cookie available to other servers. Must start with a period. If the value is a subdomain, the valid domain is all domain names that end with this string. This attribute sets the available subdomains on the site on which the cookie can be used. For a domain value that ends in a country code, the specification must contain at least three periods; for example, &quot;.mongo.state.us&quot;. For top-level domains, two periods are required; for example, &quot;*.mgm.com&quot;. You cannot use an IP address as a domain.</td>
</tr>
<tr>
<td>encodevalue</td>
<td>Optional</td>
<td></td>
<td>Specify if cookie value should be encoded</td>
</tr>
<tr>
<td>expires</td>
<td>Optional</td>
<td>session only</td>
<td>Expiration of cookie variable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- The cookie expires when the user closes the browser, that is, the cookie is &quot;session only&quot;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A date or date/time object (for example, 10/09/97).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A number of days (for example, 10, or 100).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- now:deletes cookie from client cookie.txt file (but does not delete the corresponding variable the Cookie scope of the active page).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- never:The cookie expires in 30 years from the time it was created (effectively never in web years).</td>
</tr>
<tr>
<td>httponly</td>
<td>Optional</td>
<td></td>
<td>If yes, sets cookie as httponly so that it cannot be accessed using JavaScripts. Note that the browser must have httponly compatibility.</td>
</tr>
<tr>
<td>path</td>
<td>Optional</td>
<td></td>
<td>URL, within a domain, to which the cookie applies; typically a directory. Only pages in this path can use the cookie. By default, all pages on the server that set the cookie can access the cookie.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>path = &quot;/services/login&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To specify multiple URLs, use multiple <code>cfcookie</code> tags.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If you specify path, also specify domain.</td>
</tr>
<tr>
<td>preserveCase</td>
<td>Optional</td>
<td>False</td>
<td>Specify if cookie name should be case-sensitive.</td>
</tr>
<tr>
<td>secure</td>
<td>Optional</td>
<td></td>
<td>If browser does not support Secure Sockets Layer (SSL) security, the cookie is not sent. To use the cookie, the page must be accessed using the https protocol.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- yes:Variable must be transmitted securely.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- no</td>
</tr>
<tr>
<td>value</td>
<td>Optional</td>
<td></td>
<td>Value to assign to cookie variable. Must be a string or variable that can be stored as a string.</td>
</tr>
</tbody>
</table>
Usage
If this tag specifies that a cookie is saved beyond the current browser session, the client browser writes or updates the
cookie in its local cookies file. Until the browser is closed, the cookie resides in browser memory. If the expires
attribute is not specified, the cookie is not written to the browser cookies file.

If you use this tag after the cfflush tag on a page, ColdFusion does not send the cookie to the browser; however, the
value you set is available to ColdFusion in the Cookie scope during the browser session.

Note: You can also create a cookie that expires when the current browser session expires by using the cfset tag or a
CFScript assignment statement to set a variable in the Cookie scope, as in <cfset Cookie.mycookie = "sugar">. To
get a cookie’s value, refer to the cookie name in the Cookie scope, as in <cfif Cookie.mycookie is "oatmeal">.

You can use dots in cookie names, as the following examples show:

<cfcookie name="person.name" value="wilson, john">
<cfset cookie.person.lastname = "Santiago”>

To access cookies, including cookies that you set and all cookies that are sent by the client, use the Cookie scope. For
example, to display the value of the person.name cookie set in the preceding code, use the following line:

<cfoutput>#cookie.person.name#</cfoutput>

Example
<![This example shows how to set/delete a cfcookie variable. ]>
<![Select users who have entered comments into a sample database. ]>
<cfquery name = "GetAolUser" dataSource = "cfdocexamples">
    SELECT EMail, FromUser, Subject, Posted
    FROM Comments
</cfquery>
<html>
<body>
<h3>cfcookie Example</h3>
<cfif IsDefined("url.delcookie") is True>
    <cfcookie name = "TimeVisited" value = "#Now()#" expires = "NOW">
</cfif>
<cfelse>
    <!-- Otherwise, loop through list of visitors; stop when you match
    the string aol.com in a visitor’s e-mail address. -->
    <cfloop query = "GetAolUser">
        <cfif FindNoCase("aol.com", Email, 1) is not 0>
            <cfcookie name = "LastAOLVisitor" value = "#Email#"
ColdFusion Tags

Tags d-e

cfdinfo

Description
Lets you retrieve information about a data source, including details about the database, tables, queries, procedures, foreign keys, indexes, and version information about the database, driver, and JDBC.

Category
Database manipulation tags

Syntax
<cfdinfo
    datasource="data source name"
    name="result name"
    type="dbnames|tables|columns|version|procedures|foreignkeys|index"
    dbname="database name"
    password="password"
    pattern="filter pattern"
    table="table name"
    username="username">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<td>Name of the table.</td>
</tr>
<tr>
<td></td>
<td>TABLE_TYPE</td>
<td>Type of the table, including view, table, synonym, and system table.</td>
</tr>
<tr>
<td></td>
<td>REMARKS</td>
<td>Remarks of the table.</td>
</tr>
<tr>
<td>columns</td>
<td>COLUMN_NAME</td>
<td>Name of the column.</td>
</tr>
<tr>
<td></td>
<td>TYPE_NAME</td>
<td>SQL data type of the column.</td>
</tr>
<tr>
<td></td>
<td>IS_NULLABLE</td>
<td>Whether the column allows nulls.</td>
</tr>
<tr>
<td></td>
<td>IS_PRIMARYKEY</td>
<td>Whether the column is a primary key.</td>
</tr>
<tr>
<td></td>
<td>IS_FOREIGNKEY</td>
<td>Whether the column is a foreign key.</td>
</tr>
<tr>
<td></td>
<td>REFERENCED_PRIMARYKEY</td>
<td>If the column is a foreign key, the name of the table it refers to.</td>
</tr>
<tr>
<td></td>
<td>REFERENCED_PRIMARYKEY_TABLE</td>
<td>If the column is a foreign key, the key name it refers to.</td>
</tr>
<tr>
<td></td>
<td>COLUMN_SIZE</td>
<td>Size of the column</td>
</tr>
<tr>
<td></td>
<td>DECIMAL_DIGITS</td>
<td>Number of digits to the right of the decimal point.</td>
</tr>
<tr>
<td></td>
<td>COLUMN_DEFAULT_VALUE</td>
<td>Default value of column.</td>
</tr>
<tr>
<td></td>
<td>CHAR_OCTET_LENGTH</td>
<td>Maximum length in bytes of a character or integer data type column.</td>
</tr>
<tr>
<td></td>
<td>ORDINAL_POSITION</td>
<td>Ordinal position of the column.</td>
</tr>
<tr>
<td></td>
<td>REMARKS</td>
<td>Remarks of the column.</td>
</tr>
<tr>
<td>version</td>
<td>DATABASE_VERSION</td>
<td>Version of the database management system.</td>
</tr>
<tr>
<td></td>
<td>DATABASE_PRODUCTNAME</td>
<td>Name of the database management system.</td>
</tr>
<tr>
<td></td>
<td>DRIVER_VERSION</td>
<td>Version of the database driver.</td>
</tr>
<tr>
<td></td>
<td>DRIVER_NAME</td>
<td>Name of the database driver.</td>
</tr>
<tr>
<td></td>
<td>JDBC_MAJOR_VERSION</td>
<td>Major version number of the driver.</td>
</tr>
<tr>
<td></td>
<td>JDBC_MINOR_VERSION</td>
<td>Minor version number of the driver.</td>

<td>UPDATE_RULE</td>
<td>Specifies what action to take when you update a record that has dependent records.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Example

```cfset datasrc = "oratest">
<cfdbinfo
type="dbnames"
datasource="#datasrc#"
name="dbdata">
<cfoutput>
The #datasrc# data source has the following databases:<br />
</cfoutput>
<table border="1">
<tr>
<th valign="top" align="left">Database name</th><th>Type</th>
</tr>
<cfoutput query="dbdata">
<tr>
<td>#dbdata.DATABASE_NAME#</td><td>#dbdata.TYPE#</td>
</tr>
</cfoutput>
</table>

<cfdefaultcase>

Description
Used only inside the cfswitch tag body. Contains code to execute when the expression specified in the cfswitch tag does not match the value specified by a cfcase tag.

Category
Flow-control tags

Syntax
<cfdefaultcase>
ColdFusion Tags

See also
cfcase, cfswitch; cfswitch, cfcase, and cfdefaultcase in the Developing ColdFusion Applications

History
ColdFusion MX: Changed placement requirements: this tag does not have to follow all cfcase tags in the cfswitch tag body.

Usage
The contents of the cfdefaultcase tag body executes if the expression attribute of the cfswitch tag does not match any of the values specified by the cfcase tags in the cfswitch tag body. The contents of the cfdefaultcase tag body can include HTML and text, and CFML tags, functions, variables, and expressions.

You can specify only one cfdefaultcase tag within a cfswitch tag. You can put the cfdefaultcase tag at any position within a cfswitch statement; it is not required to be the last item, but it is good programming practice to put it last.

Example
<!--- The following example displays a grade based on a 1-10 score. Several of the cfcase tags match more than one score. For simplicity, the example sets the score to 7. --->
<cfset score="7">
<cfswitch expression="#score#">
<cfcase value="10">
<cfset grade="A">
</cfcase>
<cfcase value="9;8" delimiters=";">
<cfset grade="B">
</cfcase>
<cfcase value="7;6" delimiters=";">
<cfset grade="C">
</cfcase>
<cfcase value="5;4;" delimiters=";">
<cfset grade="D">
</cfcase>
<cfdefaultcase>
<cfset grade="F">
</cfdefaultcase>
</cfswitch>
<cfoutput>
Your grade is #grade#
</cfoutput>

cdirectory

Description
Manages interactions with directories.

Category
File management tags
Syntax

```
<cfdirectory
    directory = "directory name"
    action = "list|copy|create|delete|rename"
    destination = "full pathname"
    filter = "list filter"
    listInfo = "name|all"
    name = "query name"
    newDirectory = "new directory name"
    recurse = "yes|no"
    sort = "sort specification"
    storeACL = "S3_premissions"
    storeLocation = "location"
    type = "file|dir|all">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cffile

History

ColdFusion 10: Added the action copy and the attribute destination.

ColdFusion 9.0.1: Added the storeACL and storeLocation attributes.

ColdFusion 8: Added the listinfo and type attributes.

ColdFusion MX 7: Added the recurse attribute and directory result-set column.

ColdFusion MX:

❖ Changed behavior for action = "list":

- On Windows, cfdirectory action = "list" no longer returns the directory entries "." (dot) or ".." (dot dot), which represent "the current directory" and "the parent directory."
- On Windows, cfdirectory action = "list" no longer returns the values of the Archive and System attributes.
- On UNIX and Linux, cfdirectory action = "list" does not return any information in the mode column.
### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Required</td>
<td></td>
<td>Absolute pathname of directory against which to perform action. You can use an IP address, as in the following example: &lt;cfdirectory directory=&quot;//12.3.123.123/c_drive/&quot; name=&quot;dirQuery&quot; action=&quot;LIST&quot;&gt;</td>
</tr>
</tbody>
</table>
| action      | Optional| list    | list: returns a query record set of the files in the specified directory. The directory entries "." (dot) and "." (dot dot), which represent the current directory and the parent directory, are not returned.  
|             |         |         | • create  
|             |         |         | • delete  
|             |         |         | • rename  
|             |         |         | • copy    |
| destination | Required if action = "copy" |         | Path of the destination directory. If not an absolute path, it is relative to the source directory. |
| filter      | Optional if action = "list" |         | File extension filter applied to returned names, for example, *.cfm. One filter can be applied. |
| listinfo    | Optional| all     | • all: includes all information in the result set.  
|             |         |         | • name: includes only filenames in the result set.  |
| mode        | Optional|         | Used with action = "create". Permissions. Applies only to UNIX and Linux. Octal values of chmod command. Assigned to owner, group, and other, respectively, for example:  
|             |         |         | • 644: assigns read/write permission to owner; read permission to group and other.  
|             |         |         | • 777: assigns read/write/execute permission to all.  |
| name        | Required if action = "list" |         | Name for output record set. |
| newDirectory| Required if action = "rename" |         | New name for directory. |
| recurse     | Optional| no      | Whether ColdFusion performs the action on subdirectories:  
|             |         |         | • yes  
|             |         |         | • no  
|             |         |         | Valid for action="list" and action="delete". |
| sort        | Optional if action = "list" | ASC     | Query columns by which to sort a directory listing. Delimited list of columns from query output.  
|             |         |         | To qualify a column, use one of the following values:  
|             |         |         | • asc: ascending (a to z) sort order.  
|             |         |         | • desc: descending (z to a) sort order.  
|             |         |         | For example:  
|             |         |         | sort = "directory ASC, size DESC, datelastmodified" |
Usage

If you put ColdFusion applications on a server that is used by multiple customers, you must consider the security of files and directories that could be uploaded or otherwise manipulated with this tag by unauthorized users. For more information about securing ColdFusion tags, see Configuring and Administering ColdFusion.

If `action = "list"`, `cfdirectory` returns the following result columns, which you can reference in a `cfoutput` tag:

- `name`: Directory entry name. The entries "." and "." are not returned.
- `directory`: Directory that contains the entry.
- `size`: Directory entry size.
- `type`: File type: `file`, for a file; `dir`, for a directory.
- `dateLastModified`: The date that an entry was last modified.
- `attributes`: File attributes, if applicable.
- `mode`: Empty column; retained for backward compatibility with ColdFusion 5 applications on UNIX.

Use the following result columns in standard CFML expressions, preceding the result column name with the query name:

```cfoutput```
#mydirectory.name#
#mydirectory.directory#
#mydirectory.size#
#mydirectory.type#
#mydirectory.dateLastModified#
#mydirectory.attributes#
#mydirectory.mode#
```

**Note:** If the `cfdirectory` tag does not appear to work, for example, if a list operation returns an empty result set, make sure that you have correct permissions to access the directory. For example, if you run ColdFusion as a service on Windows, it operates by default as System, and cannot access directories on a remote system or mapped drive; to resolve this issue, do not run ColdFusion using the local system account.

The `filter` attribute specifies a pattern of one or more characters. All names that match that pattern are included in the list. On Windows systems, pattern matching ignores text case, on UNIX and Linux, pattern matches are case-sensitive.
The following two characters have special meaning in the pattern and are called metacharacters:

- The asterisk (*) matches any zero or more characters.
- The question mark (?) matches any single character.

The following table shows examples of patterns and filenames that they match:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Matches</th>
</tr>
</thead>
<tbody>
<tr>
<td>foo.*</td>
<td>Any file called foo with any extension; for example, foo.html, foo.cfm, and foo.xml.</td>
</tr>
<tr>
<td>*html</td>
<td>All files with the suffix .html, but not files with the suffix .htm.</td>
</tr>
<tr>
<td>??</td>
<td>All files with two-character names.</td>
</tr>
</tbody>
</table>

Example

<!--- EXAMPLE 1: Creating and Renaming
Check that the directory exists to avoid getting a ColdFusion error message. --->
<cfset newDirectory = "otherNewDir" />
<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) & "newDir">
<!--- Check whether the directory exists. --->
<cfif DirectoryExists(currentDirectory)>
<!--- If yes, rename the directory. --->
  <cfdirectory action = "rename" directory = "#currentDirectory#"
  newDirectory = "#newDirectory#" >
  <cfoutput>
    <p>The directory existed and the name has been changed to: #newDirectory#</p>
  </cfoutput>
</cfif>
<!--- If no, create the directory. --->
<cfelse>
  <cfdirectory action = "create" directory = "#currentDirectory#"
  <cfoutput>
    <p>Your directory has been created.</p>
  </cfoutput>
</cfif>

<!--- EXAMPLE 2: Deleting a directory
Check that the directory exists and that files are not in the directory to avoid getting ColdFusion error messages. --->
<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) & "otherNewDir">
<!--- Check whether the directory exists. --->
<cfif DirectoryExists(currentDirectory)>
<!--- If yes, check whether there are files in the directory before deleting. --->
  <cfdirectory action="list" directory="#currentDirectory#"
  name="myDirectory"><cfif myDirectory.recordcount gt 0>
  <!--- If yes, delete the files from the directory. --->
    <cfoutput>
      <p>Files exist in this directory. Either delete the files or code something to do so.</p>
    </cfoutput>
  </cfif>
</cfif>
<!--- Directory is empty - just delete the directory. --->
  <cfdirectory action = "delete" directory = "#currentDirectory#"
  <cfoutput>
    <p>The directory existed and has been deleted.</p>
  </cfoutput>
</cfif>
<cfelse>
  <!--- If no, post message or do some other function. --->
  <cfoutput><p>The directory did NOT exist.</p></cfoutput>
</cfif>

<!---EXAMPLE 3: List directories--->
The following example creates both an array of directory names and a query that contains entries for the directories only. --->

<cfdirectory directory="C:/temp" name="dirQuery" action="LIST">

<!--- Get an array of directory names. --->
<cfset dirsArray=arraynew(1)>
<cfset i=1>
<cfloop query="dirQuery">
  <cfif dirQuery.type IS "dir">
    <cfset dirsArray[i]=dirQuery.name>
    <cfset i = i + 1>
  </cfif>
</cfloop>
<cfdump var="#dirsArray#">
<br>
<!--- Get all directory information in a query of queries.--->
<cfquery dbtype="query" name="dirsOnly">
  SELECT * FROM dirQuery
  WHERE TYPE='Dir'
</cfquery>
<cfdump var="#dirsOnly#">

cfdiv

Description
Creates an HTML div tag or other HTML container tag and lets you use asynchronous form submission or a bind expression to dynamically control the tag contents.

Category
Display management tags

Syntax
<cfdiv
  bind = "bind expression"
  bindOnLoad = "true|false"
  ID = "HTML tag ID"
  onBindError = "JavaScript function name"
  tagName = "HTML tag name"
/>

OR

<cfdiv
  ID = "HTML tag ID"
  tagName = "HTML tag name">
  tag body contents
</cfdiv>
If the tag does not have a body and end tag, close it with /> character combination.

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute name as structure key.

**See also**
cfajaximport, cflayout, cfpod, cfwindow

**History**
ColdFusion 8: Added this tag

**Attributes**
The following table lists attributes that ColdFusion uses directly. The tag passes any other attributes that you specify directly as tag attributes to the generated HTML tag.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind</td>
<td>Optional</td>
<td></td>
<td>A bind expression that returns the container contents. If you specify this attribute the cfdiv tag cannot have a body.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> If a CFML page specified in this attribute contains tags that use AJAX features, such as cfform, cfgrid, and cfwindow, you must use a cfajaximport tag on the page with the cfdiv tag. For more information, see cfajaximport.</td>
</tr>
<tr>
<td>bindOnLoad</td>
<td>Optional</td>
<td>true</td>
<td>• true: executes the bind attribute expression when first loading the tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false: does not execute the bind attribute expression until the first bound event.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To use this attribute, also specify a bind attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For more information, see Using the bindOnLoad attribute in Using Ajax User Interface Components and Features in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>ID</td>
<td>Optional</td>
<td></td>
<td>The HTML ID attribute value to assign to the generated container tag.</td>
</tr>
<tr>
<td>onBindError</td>
<td>Optional</td>
<td>See Description</td>
<td>The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If you omit this attribute, and have specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), it displays the error message; otherwise a default error pop-up window appears.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To use this attribute, also specify a bind attribute.</td>
</tr>
<tr>
<td>tagName</td>
<td>Optional</td>
<td>DIV</td>
<td>The HTML container tag to create.</td>
</tr>
</tbody>
</table>

**Usage**
By default, the cfdiv tag creates a div HTML element. You can use standard HTML and CSS techniques to control the position and appearance of the element and its contents.

Use the tagName attribute to create and populate an HTML content element, such as span or b. Use the cfdiv tag to create tags that can take HTML markup content directly in the body, such as span, i, b, or p, and not for tags that cannot, such as input, option, and frameset.

If you submit a form that is inside a cfdiv tag (including in HTML returned by a bind expression), the form submits asynchronously, and the response from the form submission populates the cfdiv region.
If you specify a bind attribute, the tag dynamically populates the element using a bind expression. The bind expression can specify a CFC function, a JavaScript function, a URL, or a string that contains bind parameters. An animated icon and the text "Loading..." appears while the contents are being fetched. For detailed information on using the bind attribute and bind expressions, see Using Ajax Data and Development Features in the Developing ColdFusion Applications.

Example
The following simple example shows how you can use the cfdiv tag. It uses binding to display the contents of a text input field in an HTML DIV region.

The cfdivtag.cfm file, the main application file, has the following contents.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>cfdiv Example</title>
</head>

<body>
  <cfform>
    <cfinput name="tinput1" type="text">
  </cfform>

  <h3> using a div</h3>
  <cfdiv bind="url:divsource.cfm?InputText={tinput1}" ID="theDiv"
       style="background-color:##CCffFF; color:red; height:350"/>

</body>
</html>
```

The divsource.cfm file that defines the contents of the div region has the following code:

```html
<h3>Echoing main page input:</h3>
<cfoutput>
  <cfif isdefined("url.InputText") AND url.InputText NEQ ">
    #url.InputText#
  <cfelse>
    No input
  </cfif>
</cfoutput>
```

To test the code, run the cfdivtag.cfm page, enter some text, and tab out of the text box or click outside the text box. The div region appears with a light blue background and red text, and when you exit the text box, it shows the text you entered.

**cfdocument**

Description
Creates PDF or FlashPaper output from a text block containing CFML and HTML.

Category
Data output tags
Syntax
<cfdocument
    format = "PDF|FlashPaper"
    authPassword = "authentication password"
    authUser = "authentication user name"
    backgroundVisible = "yes|no"
    bookmark = "yes|no"
    encryption = "128-bit|40-bit|none"
    filename = "filename"
    fontEmbed = "yes|no"
    formfields = "yes|no"
    formsType = "FDF|PDF|HTML|XML"
    localUrl = "yes|no"
    marginBottom = "number"
    marginLeft = "number"
    marginRight = "number"
    marginTop = "number"
    mimeType = "text/plain|application/xml|image/jpeg|image/png|image/bmp|image/gif"
    name = "output variable name"
    openPassword = "password to open protected documents"
    orientation = "portrait|landscape"
    overwrite = "yes|no"
    ownerPassword = "password"
    pageHeight = "page height in inches"
    pageType = "page type"
    pageWidth = "page width in inches"
    pdfa = "yes|no"
    permissions = "permission list"
    permissionsPassword = "password to access restricted permissions"
    proxyHost = "IP address or server name for proxy host"
    proxyPassword = "password for the proxy host"
    proxyPort = "port of the proxy host"
    proxyUser = "user name for the proxy host"
    saveAsName = "PDF filename"
    scale = "percentage less than 100"
    src = "URL|pathname relative to web root"
    srcfile = "absolute pathname to a file"
    tagged = "yes|no"
    unit = "in|cm"
    userAgent = "HTTP user agent identifier"
    userPassword = "password">
    HTML and CFML code
</cfdocument>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

cfdocumentitem, cfdocumentsection, cfform, cfpdf, cfpdfform, cfpresentation, cfprint, cfreport

History
ColdFusion 9: Add ppt support to the srcFile attribute.
Added the following attributes to support conversion of a Word document to PDF or HTML using OpenOffice libraries:

- formfields attribute
- formsType attribute
- openpassword attribute
- permissionspassword attribute
- pdfa attribute
- tagged attribute

ColdFusion 8: Added the following attributes and variables:

- bookmark attribute
- localUrl attribute

- Ability to embed existing PDF forms by using the `cfpdfform` tag in the `cfdocument` tag.
- ColdFusion determines the MIME type of a source file based on the source filename, if the `mimeType` attribute is not specified.
- Ability to pass a PDF variable created with the `cfdocument` tag as the source for the `cfpdf` tag.
- `authPassword`, `authUser`, `proxyHost`, `proxyPassword`, `proxyPort`, `proxyUser`, and `userAgent` attributes
- `saveAsName` attribute
- `totalsectionpagecount` and `currentsectionpagenumber` scope variables.

ColdFusion MX 7.01: Added the `src`, `srcfile`, and `mimetype` attributes.

ColdFusion MX 7: Added this tag.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authPassword</td>
<td>Optional</td>
<td></td>
<td>Password sent to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.</td>
</tr>
<tr>
<td>authUser</td>
<td>Optional</td>
<td></td>
<td>User name sent to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.</td>
</tr>
</tbody>
</table>
| backgroundVisible | Optional| no | Specifies whether the background prints when the user prints the document:
  - yes: includes the background when printing.
  - no: does not include the background when printing. |
| bookmark        | Optional| no | Specifies whether bookmarks are created in the document:
  - yes: creates bookmarks.
  - no: does not create bookmarks. |

</tbody>
</table>
Usage

Use the \texttt{cfdocument} tag to render HTML and CFML output into PDF or FlashPaper format. ColdFusion does not return HTML and CFML outside of the \texttt{<cfdocument>}/\texttt{<cfdocument>} pair.

The \texttt{cfdocument} tag can render HTML that supports the following standards:

- HTML 4.01
- XML 1.0
- DOM Level 1 and 2
- CSS1 and CSS2 (For more information, see the “Supported CSS styles” section).

The \texttt{cfdocument} tag does not support the Internet Explorer-specific HTML generated by Microsoft Word.

Use the following syntax in the \texttt{filename} attribute to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

\texttt{ram://filepath}

The filepath can include directories, for example \texttt{ram:///petStore/tracking/ordersummary.pdf}. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the \textit{Developing ColdFusion Applications}.

You can use the \texttt{src}, \texttt{srcfile}, and \texttt{mimeType} attributes to create PDF or FlashPaper output from a specified file or URL. Use the \texttt{src} and \texttt{srcfile} attributes instead of using the \texttt{cfhttp} tag to display the result in the \texttt{cfdocument} tag. When you specify the \texttt{src} or \texttt{srcfile} attributes, do not include any other content inside the \texttt{cfdocument} tag. ColdFusion ignores the additional content.
The PDF or FlashPaper document returned by the `cfdocument` tag overwrites any previous HTML in the input stream and ignores any HTML after the `</cfdocument>` tag.

You cannot embed a `cfreport` tag in a `cfdocument` tag.

**Note:** If you notice that the header text is cropped in the `cfdocument` tag output, increase the value of the `marginTop` attribute.

### Supported CSS styles
The `cfdocument` tag supports the following CSS styles:

<table>
<thead>
<tr>
<th>background</th>
<th>background-attachment</th>
<th>background-color</th>
<th>background-image</th>
</tr>
</thead>
<tbody>
<tr>

### Using an image file URL
For optimal performance and reliability, Adobe recommends that you specify a local file URL for images stored on the server. In the following example, the `cfdocument` tag requests the server for images over HTTP even though the image files are stored locally:
<cfdocument format="PDF">
    <table>
        <tr>
            <td>bird</td>
            <td><image src="images/bird.jpg"></td>
        </tr>
        <tr>
            <td>fruit</td>
            <td><image src="images/fruit.jpg"></td>
        </tr>
        <tr>
            <td>rose</td>
            <td><image src="images/rose.jpg"></td>
        </tr>
    </table>
</cfdocument>

Also, in some applications, the browser displays a Red X image error instead of the image in the browser. For better performance, and to avoid Red X image errors, set the localUrl attribute to yes:

<cfdocument localUrl="yes" format="PDF">
    <table>
        <tr>
            <td>bird</td>
            <td><image src="images/bird.jpg"></td>
        </tr>
        <tr>
            <td>fruit</td>
            <td><image src="images/fruit.jpg"></td>
        </tr>
        <tr>
            <td>rose</td>
            <td><image src="images/rose.jpg"></td>
        </tr>
    </table>
</cfdocument>

Scope variables
When you use the cfdocument tag, ColdFusion creates a scope named cfdocument. This scope contains the following variables:

- currentpagenumber
- totalpagecount
- totalsectionpagecount
- currentsectionpagenumber

ColdFusion lets you use the scope variables inside any expression within a cfdocumentitem tag.

For example, you can use the currentpagenumber variable to place the section name on even pages and the chapter name on odd pages in the header, as follows:
If you define the cfdocumentsection tag within the cfdocument tag, then specify the totalsectionpagecount variable as follows:

```cfdocument format="pdf">
<cfdocumentitem type="header" evalatprint="true">
  <cfif (cfdocument.currentpagenumber mod 2) is 0>
    <cfoutput>#cfdocument.totalpagecount#</cfoutput>
  <cfelse>
    <cfoutput>#cfdocument.currentpagenumber#</cfoutput>
  </cfif>
</cfdocumentitem>

<cfoutput>cfdocument.currentpagenumber :#cfdocument.currentpagenumber#</cfoutput>
<cfoutput>cfdocument.totalpagecount :#cfdocument.totalpagecount#</cfoutput>
<cfoutput>cfdocument.totalsectionpagecount :#cfdocument.totalsectionpagecount#</cfoutput>
<cfoutput>cfdocument.currentsectionpagenumber :#cfdocument.currentsectionpagenumber#</cfoutput>
</cfdocumentitem>
<cfdocumentitem type="footer" evalatprint="true">
  <cfif ! (cfdocument.currentpagenumber mod 2) is 0>
    <cfoutput>if#cfdocument.totalpagecount#</cfoutput>
  <cfelse>
    <cfoutput>else#cfdocument.currentpagenumber#</cfoutput>
  </cfif>
</cfdocumentitem>
<cfdocumentsection>Example Text</cfdocumentsection>
</cfdocument>

**Bookmarks**

ColdFusion 9 supports bookmarks. In the cfdocument tag, set the bookmark attribute to yes. Then specify the bookmark name for each cfdocumentsection tag.

The following example shows how to specify bookmarks for document sections:

```cfdocument format="pdf" bookmark="yes">
  <cfdocumentsection name="Section 1">
  <!--- Insert HTML content here. --->
  </cfdocumentsection>
  <cfdocumentsection name="Section 2">
  <!--- Insert HTML content here. --->
  </cfdocumentsection>
</cfdocument>
```

**Example**

Example 1
<!--- This example creates generates a FlashPaper document. --->
<cfdocument format="flashpaper">
<p>This is a document rendered by the cfdocument tag.</p>
<table width="50%" border="2" cellspacing="2" cellpadding="2">
  <tr>
    <td><strong>Name</strong></td>
    <td><strong>Role</strong></td>
  </tr>
  <tr><td>Bill</td><td>Lead</td></tr>
  <tr><td>Susan</td><td>Principal Writer</td></tr>
  <tr><td>Adelaide</td><td>Part Time Senior Writer</td></tr>
  <tr><td>Thomas</td><td>Full Time for 6 months</td></tr>
  <tr><td>Michael</td><td>Full Time for 4 months</td></tr>
</table>
</cfdocument>

Example 2

<!--- The following example shows how to use the cfdocument scope variables to generate section numbers and page numbers. --->
<cfdocument format="pdf">
<cfdocumentitem type="header" evalatprint="true">
  <table width="100%" border="0" cellspacing="0" cellpadding="0">
    <tr><td align="right"><cfoutput>#cfdocument.currentsectionpagenumber# of #cfdocument.totalsectionpagecount#</cfoutput></td></tr>
  </table>
</cfdocumentitem>

<cfdocumentitem type="footer" evalatprint="true">
  <table width="100%" border="0" cellspacing="0" cellpadding="0">
    <tr><td align="center"><cfoutput>#cfdocument.currentpagenumber# of #cfdocument.totalpagecount#</cfoutput></td></tr>
  </table>
</cfdocumentitem>

<cfdocumentsection>
  <h1>Section 1</h1>
  <cfloop from=1 to=50 index="i">

</cfloop>
</cfdocumentsection>
</cfdocument>

cfdocumentitem

Description
Specifies action items for a PDF or FlashPaper document created by the cfdocument tag. Action items include the following:
- header
- footer
- pagebreak

Category
Data output tags

Syntax
<cfdocument ...>
  <cfdocumentitem
type = "pagebreak|header|footer"
evalAtPrint = "true"
  header/footer text</cfdocumentitem>
</cfdocument>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.
See also
cfreport, cfdocument, cfdocumentsection

History
ColdFusion 9: Added the evalAtPrint attribute.

ColdFusion 8: Added support for cfdocument.currentpagenumber, cfdocument.totalpagecount
_cfdocument.totalsectionpagecount, and cfdocument.currentsectionpagenumber scopevariables.

ColdFusion MX 7.01: Added the src, srcfile, and mimetype attributes.

ColdFusion MX 7: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Required</td>
<td></td>
<td>Specifies the action:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- pagebreak: starts a new page at the location of the tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- header: uses the text between the &lt;cfdocumentitem&gt; and &lt;/cfdocumentitem&gt; tags as the running header.</td>
</tr>
<tr>
<td>evalAtPrint</td>
<td>Optional</td>
<td>false</td>
<td>A Boolean value that determines if the contents of the cfdocumentitem tag body has to be evaluated at the time of printing the document.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- true: evaluates the contents of the cfdocumentitem tag body only at the time of printing the document.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- false: evaluates the contents of the cfdocumentitem tag body immediately.</td>
</tr>
</tbody>
</table>

Usage

Use the evalAtPrint tag to evaluate the contents of the document before printing and to also accept additional attributes.

Use the cfdocumentitem tag to control the formatting of a PDF or FlashPaper report. This tag must be wrapped inside a <cfdocument></cfdocument> pair.

Write code for one cfdocumentitem tag for each page break, running header, or running footer.

ColdFusion has added support for cfdocument scope variables within the cfdocumentitem tag. You can use the cfdocument scope variable, cfdocument.currentpagenumber, to display the current page number in a header or footer. You can also use cfdocument.totalpagecount to display the total number of pages, for example:

```
...  
  <cfdocumentitem type= "footer">
      #cfdocument.currentpagenumber# of #cfdocument.totalpagecount#
  </cfdocumentitem>
```

For an example that uses the cfdocument.totalsectionpagecount and cfdocument.currentsectionpagenumber scope variables, see cfdocument.

You can use cfdocumentitem tags with or without the cfdocumentsection tag, as follows:

**Without cfdocumentsection**  The cfdocumentitem attribute applies to the entire document, as follows:

- If the tag is at the top of the document, it applies to the entire document.

Last updated 7/9/2012
• If the tag is in the middle of the document, it applies to the rest of the document.
• If the tag is at the end of the document, it has no affect.

**With cfdocumentsection tags**  The cfdocumentitem attribute applies only to the section and overrides previously specified header and footer specifications.

**Example**

```cfml
<cfquery datasource="cfdocexamples" name="parksQuery">
    SELECT parkname, suptmgr from parks
</cfquery>

<cfdocument format="PDF">
    <cfdocumentitem type="header">National Parks Report</cfdocumentitem>
    <!--- Use a footer with current page of totalpages format. --->
    <cfdocumentitem type="footer">
        <cfoutput>Page #cfdocument.currentpagenumber# of #cfdocument.totalpagecount#</cfoutput>
    </cfdocumentitem>
    <h1>Park list</h1>
    <table width="95%" border="2" cellspacing="2" cellpadding="2">
        <tr>
            <th>Park</th>
            <th>Manager</th>
        </tr>
        <cfoutput query="parksQuery">
            <tr>
                <td><font size="-1">#parkname#</font></td>
                <td><font size="-1">#suptmgr#</font></td>
            </tr>
        </cfoutput>
    </table>
</cfdocument>
```

**cfdocumentsection**

**Description**
Divides a PDF or FlashPaper document into sections. By using this tag in conjunction with a cfdocumentitem tag, each section can have unique headers, footers, and page numbers.

**Category**
Data output tags
Syntax

```cfc
cfdocument ...
  cfdocumentsection
    authPassword = "authentication password"
    authUser = "authentication user name"
    marginBottom = "number"
    marginLeft = "number"
    marginRight = "number"
    marginTop = "number"
    mimeType = "text/plain|application/xml|image/jpeg|image/png|image/bmp|image/gif"
    name = "bookmark for the section"
    src = "URL|path relative to web root"
    srcfile = "absolute path of file"
    userAgent = "HTTP user agent identifier"
  </cfdocumentsection>
</cfdocument>
```

Note: You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

See also
cfreport, cfdocument, cfdocumentitem

History

ColdFusion 8: Added the name, authPassword, authUser, and userAgent attributes.

ColdFusion MX 7.01: Added the src, srcfile, and mimeType attributes.

ColdFusion MX 7: Added this tag and the `marginTop`, `marginBottom`, `marginLeft`, `marginRight` attributes.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authPassword</td>
<td>Optional</td>
<td></td>
<td>Password sent to the target URL for Basic Authentication. Combined with username to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.</td>
</tr>
<tr>
<td>authUser</td>
<td>Optional</td>
<td></td>
<td>User name sent to the target URL for Basic Authentication. Combined with password to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>Optional</td>
<td></td>
<td>Bottom margin in inches (default) or centimeters. To specify the bottom margin in centimeters, include the <code>unit=&quot;cm&quot;</code> attribute in the parent <code>cfdocument</code> tag.</td>
</tr>
<tr>
<td>marginLeft</td>
<td>Optional</td>
<td></td>
<td>Left margin in inches (default) or centimeters. To specify the left margin in centimeters, include the <code>unit=&quot;cm&quot;</code> attribute in the parent <code>cfdocument</code> tag.</td>
</tr>
<tr>
<td>marginRight</td>
<td>Optional</td>
<td></td>
<td>Right margin in inches (default) or centimeters. To specify the right margin in centimeters, include the <code>unit=&quot;cm&quot;</code> attribute in the parent <code>cfdocument</code> tag.</td>
</tr>
<tr>
<td>marginTop</td>
<td>Optional</td>
<td></td>
<td>Top margin in inches (default) or centimeters. To specify the top margin in centimeters, include the <code>unit=&quot;cm&quot;</code> attribute in the parent <code>cfdocument</code> tag.</td>
</tr>
</tbody>
</table>
Usage

Use the `cfdocumentsection` tag to divide a report into sections. Within each `cfdocumentsection` tag, you can use one or more `cfdocumentitem` tags to specify unique headers and footers for each section.

When using `cfdocumentsection`, ColdFusion ignores HTML and CFML not enclosed within `cfdocumentsection` tags.

The margin attributes override margins specified in previous sections or in the parent `cfdocument` tag. If you specify margin attributes, the units are controlled by the `unit` attribute of the parent `cfdocument` tag; the `unit` attribute has a default value of inches. The `cfdocumentsection` tag forces a page break so that each section starts on a new page.

ColdFusion has added the `name` attribute to support bookmarks. Bookmarks defined at the `documentsection` tag level are children of the `cfdocument` root.

Example

Example 1
Example 2: Bookmarks

<!--- This example uses the name attribute to define bookmarks in a PDF document at the section level. --->
<cfdocument format="pdf" bookmark="yes">
  <cfdocumentsection name="section 1">
    <!--- Insert some HTML content here. --->
  </cfdocumentsection>
  <cfdocumentsection name="section 2">
    <!--- Insert some HTML content here. --->
  </cfdocumentsection>
</cfdocument>
cfdump

Description
Use the cfdump tag to get the elements, variables, and values of most kinds of ColdFusion objects. Useful for debugging. You can display the contents of simple and complex variables, objects, components, user-defined functions, and other elements. The cfdump now shows component properties defined by cfproperty when you dump a CFC. A new key called PROPERTIES has been added in the component dump, which is expanded, by default. The text format of cfdump also provides this information.

Category
Debugging tags, Variable manipulation tags

Syntax
<cfdump
    var = "#variable#">
    output = "browser|console|file"
    format = "text|html"
    abort = "true|false">
    label = "text"
    metainfo = "yes|no"
    top = "number of rows|number of levels"
    show = "columns|keys"
    hide = "columns|keys"
    keys = "number of keys to display for structures"
    expand = "yes|no"
    showUDFs = "yes|no">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

See also
cfcookie, cfparam, cfsavecontent, cfschedule, cfset, cftimer, cfwddx

History
- ColdFusion 9: Added the attribute abort.
- ColdFusion 8: Added the show, format, hide, keys, metainfo, output, and showUDFs attributes.
- ColdFusion MX 7: Added the top attribute.
- ColdFusion MX 6.1: Added the ability to dump COM objects; it displays the methods and Get and Put properties typeinfo information for the object.

Last updated 7/9/2012

<tr>
<td>hide</td>
<td>Optional</td>
<td>all</td>
<td>For a query, this is a column name or a comma-delimited list of column names. For a structure, this is a key or a comma-delimited list of keys. If you specify a structure element that doesn’t exist, ColdFusion ignores it and does not generate an error.</td>
</tr>
<tr>
<td>keys</td>
<td>Optional</td>
<td>9999</td>
<td>For a structure, the number of keys to display.</td>
</tr>
<tr>
<td>label</td>
<td>Optional</td>
<td></td>
<td>A string; header for the dump output. Ignored if the value of the var attribute is a simple types.</td>
</tr>
<tr>
<td>metainfo</td>
<td>Optional</td>
<td>yes for query</td>
<td>For use with queries and persistence CFCs. Includes information about the query in the cfdump results, including whether the query was cached, the execution time, and the SQL. Specify metainfo=&quot;no&quot; to exclude this information from the query result. For persistence CFCs, if metainfo=&quot;yes&quot;, returns property attributes such as getters and setters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>no for persistence CFCs</td>
<td></td>
</tr>
<tr>
<td>output</td>
<td>Optional</td>
<td>browser</td>
<td>Where to send the results of cfdump. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• browser</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• console</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• filename</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The filename must include the full pathname of the file. You can specify an absolute path, or a path that is relative to the ColdFusion temporary directory. You can use the GetTempDirectory() function to determine the ColdFusion temporary directory.</td>
</tr>
<tr>
<td>show</td>
<td>Optional</td>
<td>all</td>
<td>For a query, this is a column name or a comma-delimited list of column names. For a structure, this is a key or a comma-delimited list of keys.</td>
</tr>
</tbody>
</table>
Usage
The expand/contract display capability is useful when working with large structures, such as XML document objects, structures, and arrays.

To display a construct, use code such as the following, in which myDoc is a variable of type XmlDocument:

```cfif IsXmlDoc(mydoc) is "yes">
  <cfdump var="#mydoc#">
</cfif>

The tag output is color-coded according to data type.

If a table cell is empty, this tag displays "[empty string]".

Example
<!--- This example shows how to use this tag to display the CGI scope as a structure: --->
<cfdump var="#cgi#"> <!--- This displays information about file objects. --->
<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
</cfscript>
myfile refers to:
<cfdump var="#myfile/filepath#">

**cfelse**

Description
Used as the last control block in a **cfif** tag block to handle any case not identified by the **cfif** tag or a **cfelseif** tag.

Category
Flow-control tags

Syntax
```html and CFML tags
<cfif expression>
  HTML and CFML tags<cfelseif expression>
  HTML and CFML tags
  <cfelse>
    HTML and CFML tags
  </cfelse>
</cfif>
```

See also

Last updated 7/9/2012
Usage
If the values of the expressions in the containing cfif tag and all cfelseif tags are no, ColdFusion processes the code between this tag and the cfif end tag. This tag must be inside a cfif tag block. It does not require an end tag.

For more information and an example, see cfif.

cfelseif

Description
Used as a control block in a cfif tag block to handle any case not identified by the cfif tag or a cfelseif tag.

Category
Flow-control tags

Syntax
<cfif expression>
  HTML and CFML tags<cfelseif expression>
  HTML and CFML tags <cfelse>
  HTML and CFML tags</cfelse>
</cfif>

See also
cfif, cfelse, cfabort, cfbreak, cfexecute, cfexit, cflocation, cffloop, cfswitch, cfthrow, cftry

Usage
If the value of the expression in this tag is yes, and the values of the expressions in the containing cfif tag and preceding cfelseif tags are no, ColdFusion processes the code between this tag and a following cfelseif or cfelse tag, or the cfif end tag and then skips to the code following the cfif end tag. Otherwise, ColdFusion skips the code.

This tag must be inside a cfif tag block. It does not require an end tag.

For more information and an example, see “cfif” on page 334.

cferror

Description
Displays a custom HTML page when an error occurs. This lets you maintain a consistent look and feel among an application’s functional and error pages.

Category
Exception handling tags, Extensibility tags, Application framework tags

Syntax
<cferror
  template = "template path"
  type = "exception|validation|request"
  exception = "exception type"
  mailTo = "e-mail address">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.
See also

cfrethrow, cfthrow, cftry, Handling Errors in the Developing ColdFusion Applications.

History
ColdFusion MX: Deprecated the monitor option of the exception attribute. It might not work, and might cause an error, in later releases.

<td>• missingInclude: missing include file exceptions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• expression: expression exceptions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• lock: lock exceptions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• custom_type: developer-defined exceptions, defined in the cfthrow tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• any: all exception types.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For more information on exception types, see cftry.</td>
</tr>
<tr>
<td>mailTo</td>
<td>Optional</td>
<td></td>
<td>An e-mail address. This attribute is available on the error page as the variable error.mailto. ColdFusion does not automatically send anything to this address.</td>
</tr>
</tbody>
</table>

Usage

Use this tag to provide custom error messages for pages in an application. This lets you maintain a consistent look and feel within the application, even when errors occur.

You generally embed this tag in your Application CFC or Application.cfm file to specify error-handling responsibilities for an entire application. You must put it in one of these files if you specify type="validation"; ColdFusion ignores it on any other page.

The cftry and cfcatch tags provide a more interactive way to handle ColdFusion errors within a ColdFusion page than the cferror tag, but the cferror tag is a good safeguard against general errors.

Last updated 7/9/2012
To ensure that error pages display successfully, avoid using the `cfencode` utility to encode pages that include the `cferror` tag.

### Page types

The following table describes the types of errors you can specify and code you can use on the pages that handle these error type:

<table>
<thead>
<tr>
<th>Page type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exception</td>
<td>Dynamically invoked by the CFML language processor when it detects an unhandled exception condition. Uses the full range of CFML tags. Error variables must be in <code>cfoutput</code> tags.</td>
<td>Can handle specific exception types or display general information for exceptions.</td>
</tr>
<tr>
<td>Request</td>
<td>Includes the error variables described in the Error variables section. Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#error.MailTo#</code>.</td>
<td>Use as a backup error handler to other error handling methods, including exception type.</td>
</tr>
<tr>
<td>Validation</td>
<td>Handles data input validation errors that occur when submitting a form that uses hidden form-field validation or onSubmit validation. Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#Error.InvalidFields#</code>. Specify the validation error handler in the Application.cfc or Application.cfm file.</td>
<td>Handles hidden form-field or onSubmit format validation errors only.</td>
</tr>
</tbody>
</table>

### Error variables

The exception-handling page specified in the `cferror` tag `template` attribute contains one or more error variables. ColdFusion substitutes the value of the error variable when an error displays.

The following table lists error variables:

<table>
<thead>
<tr>
<th>Page type</th>
<th>Error variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validation only</td>
<td>error.validationHeader</td>
<td>Validation message header text.</td>
</tr>
<tr>
<td></td>
<td>error.invalidFields</td>
<td>Unordered list of validation errors.</td>
</tr>
<tr>
<td></td>
<td>error.validationFooter</td>
<td>Validation message footer text.</td>
</tr>
<tr>
<td>Request and Exception</td>
<td>error.diagnostics</td>
<td>Detailed error diagnostics from ColdFusion.</td>
</tr>
<tr>
<td></td>
<td>error.mailTo</td>
<td>E-mail address (same as value in <code>cferror.MailTo</code>).</td>
</tr>
<tr>
<td></td>
<td>error.dateTime</td>
<td>Date and time when error occurred.</td>
</tr>
<tr>
<td></td>
<td>error.browser</td>
<td>Browser that was running when error occurred.</td>
</tr>
<tr>
<td></td>
<td>error.remoteAddress</td>
<td>IP address of remote client.</td>
</tr>
<tr>
<td></td>
<td>error.HTTPReferer</td>
<td>Page from which client accessed link to page where error occurred.</td>
</tr>
<tr>
<td></td>
<td>error.template</td>
<td>Page executing when error occurred.</td>
</tr>
<tr>
<td></td>
<td>error.generatedContent</td>
<td>The content generated by the page up to the point where the error occurred.</td>
</tr>
<tr>
<td></td>
<td>error.queryString</td>
<td>URL query string of client's request.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Note: If type = "exception", you can substitute the prefix cferror for Error; for example, cferror.diagnostics, cferror.mailTo, or cferror.dateTime.

Example

```html
<h3>cferror Example</h3>

<!-- Example of cferror call within a page. NOTE: If you use cferror type="VALIDATION" you MUST put it in Application.cfc or Application.cfm --><!--
<cferror type = "REQUEST"
template = "request_err.cfm"
mailTo = "admin@mywebsite.com">
<!-- This query calls a non-existent datasource, triggering an error to be handled. --><!--
<cfquery name="testQuery" datasource="doesNotExist">
select * from nothing
</cfquery>

<!-- Example of the page (request_err.cfm) to handle this error. --><!--
<html>
<head>
<title>We're sorry -- An Error Occurred</title>
</head>
<body>
<h2>We're sorry -- An Error Occurred</h2>
<p>If you continue to have this problem, please contact #error.mailTo# with the following information: </p>
<p>
<ul>
<li>Your Location: #error.remoteAddress#</li>
<li>Your Browser: #error.browser#</li>
<li>Page You Came From: #error.HTTPReferer#</li>
<li>Message Content</li>
</ul>
</p>
</body>
</html>
```
**cfexchangecalendar**

**Description**
Creates, deletes, modifies, gets, and responds to Microsoft Exchange calendar events, and gets calendar event attachments.

**History**
ColdFusion 10: getUserAvailability, getRooms, getRoomsList
- Added the attribute serverVersion.
ColdFusion 8: Added this tag.

**Category**
Communications tags

**Syntax**

```xml
create
cfexchangecalendar
required
action = "create"
event = "#event information structure#"
optional
connection = "connection ID"
result = "variable for event UID">
```

```xml
delete
cfexchangecalendar
required
action = "delete"
uid = "event UID,event UID, ..."
optional
connection = "connection ID"
message = "string"
notify = "yes|no">
```

```xml
deleteAttachments
cfexchangecalendar
required
action = "deleteAttachments"
uid = "event UID"
optional
connection = "connection ID">
```

```xml
get
cfexchangecalendar
required
action = "get"
name = "query identifier"
optional
connection = "connection ID">
```

```xml
getAttachments
cfexchangecalendar
```
required
action = "getAttachments"
name = "query identifier"
uid = "event UID"

optional
attachmentPath = "directory path"
connection = "connection ID"
generateUniqueFileNames = "no|yes"

generateUniqueFilenames = "no|yes"

getRooms
<cfexchangecalendar
action = "getRooms"
emailAddress = "e-mail address"
name = "name"
connection = "connection ID"
/>

getRoomsList
<cfexchangecalendar
action = "getRoomList"
name = "name"
connection = "connection ID"
/>

getUserAvailability
<cfexchangecalendar
action = "getUserAvailability"
attendees = "attendee list"
connection = "connection ID"
startDate = "date"
endDate = "date"
dataRequestType = "freeBusy|suggestions|freeBusyandSuggestions"
name = "name" />

modify
<cfexchangecalendar
required
action = "modify"
event = "#event information structure#"
uid = "event UID"

optional
connection = "connection ID"
/>

respond
<cfexchangecalendar
required
action = "respond"
responseType = "accept|decline|tentative"
uid = "event UID"

optional
connection = "connection ID"
message = "string">
notify = "yes|no">

Note: For all actions, see cfexchangeconnection for additional attributes that you use if you do not specify the connection attribute. If you omit the connection attribute, create a temporary connection by specifying cfexchangeconnection tag attributes in the cfexchangecalendar tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the cfexchangeconnection tag open action.

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<td>The name of a variable that contains the UID of the event that is created. You use the UID value in the uid attribute of actions other than create to identify the event to be acted on.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Usage

The `cfexchangecalendar` tag manages calendar events on the Exchange server. Use the `cfexchangecalendar` to do the following actions:

- Create an appointment or meeting event. You can create all-day events.
- Delete one or more events.
- Get one or more events that conform to an optional set of filter specifications, such as the subject, sender or recipient ID, time received, and so on.
- Get the attachments for a specific event.
- Modify an existing event.
- Respond to an event.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the Exchange server, such as if you are creating several contact records, use the `cfexchangeconnection` tag to create a persistent connection. Then specify the connection identifier in each `cfexchangecalendar` tag, or in any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or mail. Doing this eliminates the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangecalendar` tag. To do this, specify the connection attributes directly in the `cfexchangecontact` tag. For details on the connection attributes, see the `cfexchangeconnection` tag.

`Note`: To create an Exchange calendar appointment, create a calendar event and do not specify any required or optional attendees.

The create action

When you specify the `create` action, the `event` attribute must specify a structure that contains the information that defines the events. The structure can have the following entries:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>serverVersion</td>
<td>Optional</td>
<td>2007</td>
<td>Specifies the Microsoft Exchange Server version.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2003</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2007</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2010</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If you do not specify the details, 2007 is taken by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The value you specify overrides the value that you specify at the application level.</td>
</tr>
<tr>
<td>startDate</td>
<td>getUserAvailability</td>
<td>Required</td>
<td>A string that ColdFusion can interpret as a date-time value.</td>
<td></td>
</tr>
<tr>
<td>uid</td>
<td>delete</td>
<td>Required</td>
<td>Case-sensitive Exchange UID value or values that uniquely identify</td>
<td></td>
</tr>
<tr>
<td></td>
<td>getAttachments</td>
<td></td>
<td>the event or events on which to perform the action.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>modify</td>
<td></td>
<td>For the delete action, this attribute can be a comma-delimited list of UID values.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>respond</td>
<td></td>
<td>The deleteAttachments, getAttachments, modify, and respond actions allow only a single UID value.</td>
<td></td>
</tr>
</tbody>
</table>
### ColdFusion Tags

The following table lists the elements that you use to specify the event recurrence if you set the `IsRecurring` field to a `yes` value. For a detailed description of how to specify event recurrence, see Specifying Calendar recurrence in the Developing ColdFusion Applications.

<table>
<thead>
<tr>
<th>Element</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllDayEvent</td>
<td>no</td>
<td>A Boolean value that indicates whether this is an all-day event.</td>
</tr>
<tr>
<td>Attachments</td>
<td></td>
<td>One or more paths to the files to send as attachments. Separate filepaths with semicolons (;) for Windows, and colons (:) for UNIX and Linux. Paths to the attachments must be absolute. If you specify one or more attachments for a modify action, the specified attachments are added to any existing attachments; the pre-existing attachments are not deleted.</td>
</tr>
<tr>
<td>Categories</td>
<td></td>
<td>A comma-delimited list of categories. The filter searches for events that match all the categories in the list.</td>
</tr>
<tr>
<td>Duration</td>
<td></td>
<td>The duration of the event in minutes.</td>
</tr>
<tr>
<td>EndTime</td>
<td></td>
<td>The end time of the event, in any valid ColdFusion date-time format.</td>
</tr>
<tr>
<td>Importance</td>
<td>normal</td>
<td>One of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* high</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* normal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* low</td>
</tr>
<tr>
<td>IsRecurring</td>
<td></td>
<td>A Boolean value that indicates whether this event repeats. If yes, specify a RecurrenceType element and elements to specify the recurrence details. For information on the recurrence fields, see the next table.</td>
</tr>
<tr>
<td>Location</td>
<td></td>
<td>A string that specifies the location of the event.</td>
</tr>
<tr>
<td>Message</td>
<td></td>
<td>A string that contains a message about the event. The string can include HTML formatting.</td>
</tr>
<tr>
<td>OptionalAttendees</td>
<td></td>
<td>A comma-delimited list of mail IDs.</td>
</tr>
<tr>
<td>Organizer</td>
<td></td>
<td>A string that specifies the name of the meeting organizer.</td>
</tr>
<tr>
<td>Reminder</td>
<td></td>
<td>The time, in minutes before the event, at which to display a reminder message.</td>
</tr>
<tr>
<td>RequiredAttendees</td>
<td></td>
<td>A comma-delimited list of mail IDs.</td>
</tr>
<tr>
<td>Resources</td>
<td></td>
<td>A comma-delimited list of mail IDs for Exchange scheduling resources, such as conference rooms and display equipment.</td>
</tr>
<tr>
<td>Sensitivity</td>
<td></td>
<td>The valid values are normal, company-confidential, personal, and private.</td>
</tr>
<tr>
<td>StartTime</td>
<td></td>
<td>The start time of the event, in any valid ColdFusion date-time format.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you specify a date and time in this attribute and specify a YEARLYRecurrenceType with no other recurrence attributes, the event recurs yearly at the day and time specified in this attribute.</td>
</tr>
<tr>
<td>Subject</td>
<td></td>
<td>A string that describes the event subject.</td>
</tr>
<tr>
<td>Element</td>
<td>Type</td>
<td>Default</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------</td>
<td>---------</td>
</tr>
<tr>
<td>RecurrenceType</td>
<td>all</td>
<td>DAILY</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>RecurrenceNoEndDate</td>
<td>all</td>
<td>yes</td>
</tr>
<tr>
<td>RecurrenceCount</td>
<td>all</td>
<td></td>
</tr>
<tr>
<td>RecurrenceEndDate</td>
<td>all</td>
<td></td>
</tr>
<tr>
<td>RecurrenceFrequency</td>
<td>all</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>RecurEveryWeekDay</td>
<td>DAILY</td>
<td></td>
</tr>
<tr>
<td>RecurrenceDays</td>
<td>WEEKLY</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The delete action
When you specify the delete action, specify a uid attribute with a comma-delimited list of one or more Exchange UIDs that identify the events to delete. Use the get action, with an appropriate filter expression, to determine the UID values to specify.

If all UIDs that you specify are invalid, the cfexchangecalendar tag generates an error. If at least one UID is valid, the tag ignores any invalid UIDs and deletes the items specified by the valid UID.

The get action
When you specify the get action, use child cfexchangefilter tags to specify the messages to get. For detailed information on filters, see cfexchangefilter.

When the tag completes processing, the query object specified by the name attribute contains one record for each retrieved message. Each record has the following columns:

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecurrenceDay</td>
<td>MONTHLY, YEARLY</td>
<td>The day of the week on which the event occurs. Must be one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MON&lt;br&gt;• TUE&lt;br&gt;• WED&lt;br&gt;• THU&lt;br&gt;• FRI&lt;br&gt;• SAT&lt;br&gt;• SUN</td>
</tr>
<tr>
<td>RecurrenceWeek</td>
<td>MONTHLY, YEARLY</td>
<td>The week of the month or year on which the event recurs. The valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• first&lt;br&gt;• second&lt;br&gt;• third&lt;br&gt;• fourth&lt;br&gt;• last</td>
</tr>
<tr>
<td>RecurrenceMonth</td>
<td>YEARLY</td>
<td>The month of the year on which the event recurs. The valid values are JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC.</td>
</tr>
</tbody>
</table>
The following table describes the From, HtmlMessage, Message, and UID fields. For detailed information on the other fields, see the table in the create action description.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>The Exchange ID of the person who created the event.</td>
</tr>
<tr>
<td>HtmlMessage</td>
<td>An HTML-formatted version of the message about the event.</td>
</tr>
<tr>
<td>Message</td>
<td>A plain-text version of the message about the event.</td>
</tr>
<tr>
<td>UID</td>
<td>The Exchange unique identifier for the mail event. Use this value to identify the event in the delete, getAttachments, and modify actions.</td>
</tr>
</tbody>
</table>

**The getAttachments action**

When you use the getAttachments action, specify a single UID and a name attribute. The cfexchangecalendar tag populates a query object with the specified name. Each record has the following information about an attachment to the event specified by the UID:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentFileName</td>
<td>The filename of the attachment.</td>
</tr>
<tr>
<td>attachmentFilePath</td>
<td>The absolute path of the attachment file on the server. If you omit the attachmentPath attribute, this column contains the empty string.</td>
</tr>
<tr>
<td>CID</td>
<td>The content-ID of the attachment. Typically used in HTML img tags to embed images in a message.</td>
</tr>
<tr>
<td>mimeType</td>
<td>The MIME type of the attachment, such as text/html.</td>
</tr>
<tr>
<td>isMessage</td>
<td>A Boolean value that specifies whether the attachment is a message.</td>
</tr>
<tr>
<td>size</td>
<td>The attachment size in bytes.</td>
</tr>
</tbody>
</table>

The tag places the attachments in the directory specified by the attachmentPath attribute. If you omit the attachmentPath attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the event’s attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory attachmentPath directory. In-memory files are not written to disk and speed processing of transient data.

```cfml
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example ram:///petStore/orders/messageAttachments. Create all directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The getAttachments action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

**The modify action**

When you specify the modify action, you select the event to modify by specifying a uid attribute with single event UID; multiple UIDs are not allowed. You populate the event structure with only the fields that you are changing. For a detailed description of the fields and their valid values, see the table in the create action.

If an event has attachments and you specify attachments when you modify the event, the new attachments are added to the previous attachments; they do not replace them. Use the deleteAttachments action to remove any attachments.
The respond action

You use the respond action to respond to a meeting notification that you received by using the `cfexchangemail` tag. A meeting does not appear in your calendar, and cannot be accessed by using the `cfexchangecalendar` tag, until you respond to the mail message and accept or tentatively accept the request.

When you specify the respond action, specify the UID, from the notification mail message, of the event to which you are responding. Also specify the response type; that is, whether you are accepting, rejecting, or tentatively accepting the event. You can optionally specify a message to include in the response and set a flag whether to notify the creator of the event of your response.

For detailed information on using the respond action, see Working with meeting notices and requests in the Developing ColdFusion Applications.

Suggestions struct values

<table>
<thead>
<tr>
<th>Struct values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Suggested day for the meeting.</td>
</tr>
<tr>
<td>quality</td>
<td>The quality of the suggested day, if Excellent, Good, Fair or Poor.</td>
</tr>
<tr>
<td>TimeSuggestion</td>
<td>An array of struct that contains the following values:</td>
</tr>
<tr>
<td></td>
<td>• MeetingDate: Suggested meeting time.</td>
</tr>
<tr>
<td></td>
<td>• Quality: The quality of the time. It can be Excellent, Good, Fair, or Poor.</td>
</tr>
<tr>
<td></td>
<td>• array of conflicts: The conflicts at the suggested time. This is a struct that contains the following values:</td>
</tr>
<tr>
<td></td>
<td>• ConflictType (the type of conflict, which can be individualAttendeeConflict, which is a conflict with an attendee, GroupConflict which is a conflict with at least one member of a group, GroupTooBigConflict which is a conflict with at least one member of a group, but the group was too big for detailed information to be returned, and UnknownAttendeeConflict which is a conflict with an unresolvable attendee or an attendee that is not a user, group, or contact).</td>
</tr>
<tr>
<td></td>
<td>• FreeBusyStatus: Gets the free/busy status of the conflicting attendee. Only meaningful when ConflictType is equal to IndividualAttendee. The values are Free, Tentative, Busy, OOF (time slot associated with the appointment appears as Out of Office) or NoData (no free/busy status is associated with the appointment).</td>
</tr>
<tr>
<td></td>
<td>• NoOfMembers: Gets the number of users, resources, and rooms in the conflicting group. Only meaningful when ConflictType is equal to GroupConflict.</td>

Values of the struct attendeeavailability

<table>
<thead>
<tr>
<th>Struct values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CalendarEvent</td>
<td>A struct that contains the following values:</td>
</tr>
<tr>
<td></td>
<td>• startTime: The start date and time of the event.</td>
</tr>
<tr>
<td></td>
<td>• endTime: The end date and time of the event.</td>
</tr>
<tr>
<td></td>
<td>• freeBusyStatus: The free/busy status associated with the event. It can have following values: Free, tentative, busy, OOF (Out of Office), or NoData (no free/busy status is associated with the appointment).</td>
</tr>
<tr>
<td></td>
<td>• details: The details of the calendar event; details is null if the user who requests for details does not have the appropriate rights. details is a struct that contains the following values: location (calendar location), eventstoreId (store ID of the calendar event), and Subject (can be isException which is a boolean value that indicates if the calendar event is an exception in a recurring series, isMeeting which is a boolean value that indicates if the calendar event is a meeting, isPrivate which is a boolean value that indicates if the calendar event is private, isRecurring which is a boolean value that indicates if the calendar event is recurring, and isRemainderSet which is a boolean value that indicates if the calendar event has a reminder set).</td>
</tr>
</tbody>
</table>
Exchange UID value
For all the cfexchangecalendar actions, the value of the attribute uid is as follows:

- If exchangeServerVersion is set to 2003 or 2007: The uid indicates the ID of the appointment in the mailbox of the organizer.
- If exchangeServerVersion is set to 2010: The uid indicates the ID of the received appointment in the mailbox of the attendee.
In the case of interaction with Microsoft Exchange server 2003 or 2007, whenever an appointment is created, the UID of the organizer can be used by the attendee for any operation such as responding, deleting, or getting attachments. In the case of Microsoft Exchange server 2010, the behavior is different. If attendees have to perform appointment-related actions, they have to first search for the appointment in their mailbox and then use the UID of that appointment.

Example 1
The following example lets you create, and then modify a calendar event. When you first submit the form, ColdFusion creates the calendar event and redisplay the form with the data you entered. Accept the event before you modify the form and resubmit it. When you submit the form a second time, ColdFusion sends the modification information. For more information, see Working with meetings and appointments in the Developing ColdFusion Applications.

This example resends all the event data (to limit the example length), but you could change the example so that it only sends modified data.

<!---- Create a structure to hold the event information. --->
<!---- A self-submitting form for the event information --->
<!---- This example omits recurrence to keep the code relatively simple --->
<cfparam name="form.eventID" default="0">

<!---- If the form was submitted, populate the event structure from it. --->
<cfif isDefined("Form.Submit")>
<cfscript>
sEvent.AllDayEvent="no";
sEvent=StructNew();
sEvent.Subject=Form.subject;
if (IsDefined("Form.allDay")) {
  sEvent.AllDayEvent="yes";
  sEvent.StartTime=createDateTime(Year(Form.date), Month(Form.date),
    Day(Form.date), 8, 0, 0);
} else {
  sEvent.StartTime=createDateTime(Year(Form.date), Month(Form.date),
    Day(Form.date), Hour(Form.startTime), Minute(Form.startTime), 0);
  sEvent.EndTime=createDateTime(Year(Form.date), Month(Form.date),
    Day(Form.date), Hour(Form.endTime), Minute(Form.endTime), 0);
}
sEvent.Location=Form.location;
sEvent.RequiredAttendees=Form.requiredAttendees;
sEvent.OptionalAttendees=Form.optionalAttendees;
//sEvent.Resources=Form.resources;
if (Form.reminder NEQ "") {
  sEvent.Reminder=Form.reminder;
} else {
  sEvent.Reminder=0;
}
sEvent.Importance=Form.importance;
sEvent.Sensitivity=Form.sensitivity;
sEvent.message=Form.Message;
</cfscript>

<!---- If this is the first time the form is being submitted
Create a new event. --->

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action                           | all          | Required |          | The action to take. Must be one of the following values:  
• open: Open a new persistent named connection  
• close: Close a named connection  
• getSubfolders: Get information about the subfolders of a specific folder. |
| connection                       | all          | Required for open and close actions |          | The name of the connection. You can specify this ID in any tag that you use with the open connection. |
| ExchangeApplicationName          | open         | Optional | exchange | The name of the Exchange application to use in the URL that accesses the server. Specify this attribute if your IIS server does not use the default name for your Exchange application. |
|                                 | getSubfolders|          |         |             |
| ExchangeServerLanguage           | open         | Optional | english  | The language of the Exchange server. If you are not sure, you can specify the empty string. For all values except english, including the empty string, the tag tries to get folder names from the server in the client’s local language. In some cases, such as when there is a large amount of data on the server, it might take significant time to get folder names from Exchange server in the local language. |
|                                 | getSubfolders|          |         |             |
| folder                           | getSubfolders| Optional | The root of the mailbox | The forward slash (/) delimited path from the root of the mailbox to the folder for which to get subfolders.  
If a folder name contains a forward slash, use the _xF8FF_ escape sequence to specify the character in the name. |
<p>| formBasedAuthentication          | open         | Optional | no       | A Boolean value that specifies whether to display a login form and use form based authentication when making the connection. If the attribute value is no (the default), and the Exchange server returns a 440 error status when ColdFusion tries to connect, ColdFusion displays the login form and attempts to use form based authentication. Therefore, you can safely omit this attribute if you do not know if the server requires form based authentication. |
|                                 | getSubfolders|          |         |             |</p>

<td>• false: get information on all levels of subfolders of the specified folder.</td>
</tr>
</tbody>
</table>
Note: If you specify the `getSubfolders` action, you can specify the attributes that are listed as working for both the `open` and `getSubfolders` actions only if you do not specify a connection attribute.

Usage

The `cfexchangeconnection` tag can open or close a persistent connection with an Exchange server. If you use the `cfexchangeconnection` to open a connection before you use any `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, or `cfexchangetask` tags, you can use multiple tags to interact with the Exchange server without incurring the overhead of creating a connection for each tag.

Note: To establish any connection, the Exchange server must grant you Outlook Web Access. For information on how to enable this access, see Enabling access to the Exchange server in the Developing ColdFusion Applications. Also, you cannot establish a connection to an Exchange server if you require a special authentication step, such as requiring a VPN PIN or performing biometric authentication, on a server that is outside your firewall, and the authentication server then routes the messages to your Exchange server inside the firewall.

Use the `cfexchangeconnection` tag to close a persistent connection when you are finished accessing the Exchange server. If you do not close the connection, it remains open and does not time out.

The `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, and `cfexchangetask` tags also let you specify the `open` action connection attributes (but not the `connection` attribute) to create a temporary connection that lasts for the duration of the single tag’s activities, without requiring you to use the `cfexchangeconnection` tag to create the connection. In this case, ColdFusion automatically closes the connection when the tag completes processing.

The `getSubfolders` action can get information about the immediate subfolders of a specified folder (or of the top level of the mailbox), or information about all levels of subfolders. You must have a persistent connection to get the subfolders.

The query returned by the `getSubfolders` action has the following columns:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>open, getSubfolders</td>
<td>Required</td>
<td></td>
<td>The IP address or URL of the server that is providing access to Exchange.</td>
</tr>
<tr>
<td>serverVersion</td>
<td></td>
<td>Optional</td>
<td>2007</td>
<td>Specifies the Microsoft Exchange Server version.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2003</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2007</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2010</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If you do not specify the details, 2007 is taken by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The value you specify overrides the value that you specify at the application level.</td>
</tr>
<tr>
<td>username</td>
<td>open, getSubfolders</td>
<td>Required</td>
<td></td>
<td>The Exchange user ID.</td>
</tr>
</tbody>
</table>
Note: The ColdFusion exchange tags, including cfexchangeconnection use WebDAV to connect to the exchange server. HTTP access must be enabled on the exchange server to use the tags.

Example
The following example opens a connection, gets all mail sent from spamsource.com, and deletes the messages from the Exchange server:

```coldfusion
<cfexchangeConnection
    action="open"
    username="#user1#"
    password="#password1#"
    server="#exchangeServerIP#"
    connection="testconn1">
<cfexchangemail action="get" name="spamMail" connection="testconn1">
    <cfexchangefilter name="fromID" value="spamsource.com">
</cfexchangemail>
<cfloop query="spamMail">
    <cfexchangeMail action="delete" connection="testconn1" uid="#spamMail.uid#">
</cfloop>
<cfexchangeConnection
    action="close"
    connection="testconn1">
```

cfexchangecontact

description
Creates, deletes, modifies, and gets Microsoft Exchange contact records, and gets contact record attachments.

History
ColdFusion 10: Added the attribute serverVersion.
ColdFusion 8: Added this tag.

<td></td>
<td>Attachments<code>, </code>getAttachments<code>, and </code>modify` actions allow only a single</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>UID value.</td>
</tr>
</tbody>
</table>

When you specify the `create` or `modify` action, the `contact` attribute must specify a structure that contains information that defines the events. The structure can have the following elements. Include only the elements that you are setting or changing.

<table>
<thead>
<tr>
<th>Assistant</th>
<th>Attachments</th>
<th>BusinessAddress</th>
<th>BusinessFax</th>
</tr>
</thead>
<tbody>
<tr>
<td>BusinessPhoneNumber</td>
<td>Categories</td>
<td>Company</td>
<td>Department</td>
</tr>
<tr>
<td>Description</td>
<td>DisplayAs</td>
<td>Email1</td>
<td>Email2</td>
</tr>
<tr>
<td>Email3</td>
<td>FirstName</td>
<td>HomeAddress</td>
<td>HomePhoneNumber</td>
</tr>
<tr>
<td>JobTitle</td>
<td>LastName</td>
<td>MailingAddressType</td>
<td>Manager</td>
</tr>
<tr>
<td>MiddleName</td>
<td>MobilePhoneNumber</td>
<td>NickName</td>
<td>Office</td>
</tr>
<tr>
<td>OtherAddress</td>
<td>OtherPhoneNumber</td>
<td>Pager</td>
<td>Profession</td>
</tr>
<tr>
<td>SpouseName</td>
<td>WebPage</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All fields except the `BusinessAddress`, `HomeAddress`, and `OtherAddress` fields contain text; the three address fields must contain structures with the following text fields:

- Street
- City
- State
- Zip
• Country

The **Attachments** field must contain the pathnames of any attachments to include in the contact. To specify multiple files, separate filepaths with semicolons (;) for Windows, and colons (:) for UNIX and Linux. Use absolute paths.

If you specify one or more attachments for a **modify** action, they are added to any existing attachments; the pre-existing attachments are not deleted.

The **Categories** field can have a comma-delimited list of the contact’s categories.

If you do not specify a **DisplayAs** field, Exchange sets the display name to **FirstName**, **LastName**.

**Usage**

The **cfexchangecontact** tag manages contact records on the Exchange server. Use the **cfexchangecontact** tag to perform the following actions:

- Create a contact.
- Delete one or more contacts.
- Get one or more contact records that conform to an optional set of filter specifications, such as the last name, job title, or home phone number, and so on.
- Get the attachments for a specific contact record.
- Modify an existing contact.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the Exchange server, such as if you are creating several contact records, use the **cfexchangeconnection** tag to create a persistent connection. You then specify the connection identifier in each **cfexchangecontact**, or any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or mail. Doing this eliminates the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single **cfexchangecontact** tag. To do this, you specify the connection attributes directly in the **cfexchangecontact** tag. For details on the connection attributes, see the **cfexchangeconnection** tag open action.

**attachmentPath attribute**

Use the following syntax to specify an in-memory **attachmentPath** directory. In-memory files are not written to disk and speed processing of transient data.

```attachmentpath = "ram:///filepath"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the *Developing ColdFusion Applications*.

**The delete action**

When you specify the delete action you must specify a **uid** attribute with a comma-delimited list of one or more Exchange UIDs that identify the contacts to delete. You can use the get action, with an appropriate filter expression, to determine the UID values to specify.

If all UIDs that you specify are invalid, the **cfexchangecontact** tag generates an error. If at least one UID is valid, the tag ignores any invalid UIDs and deletes the items specified by the valid UID.
The get action
When you specify the `get` action, the query object specified by the `name` attribute contains one record for each retrieved contact. The query object has columns with the same names and data formats as the fields listed for the `contact` attribute structure, with the following changes:

- The query object has a Boolean `HasAttachment` column, and does not have an `Attachments` column. If the `HasAttachment` field is `yes`, use the `getAttachments` action to retrieve the attachments.
- The query object has an additional `UID` column with the unique identifier for the contact record in the Exchange server. Use this value in the `uid` attribute of the `getAttachments`, `delete`, and `modify` actions to identify the required record.
- The query object has an additional `HtmlDescription` column. The `Description` column has a plain-text version of the description, and the `HtmlDescription` column text includes the description's HTML formatting.

You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see `cfexchangefilter`.

The `getAttachments` action
When you use the `getAttachments` action, specify a single UID and a `name` attribute. The `cfexchangecontact` tag populates a query object with the specified name. Each record has the following information about an attachment to the contact specified by the UID:

<table>
<thead>
<tr>
<th>Column name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentFileLength</td>
<td>The length of the attachment file.</td>
</tr>
<tr>
<td>attachmentFilePath</td>
<td>The absolute path of the attachment file on the server. If you omit the attachmentPath attribute, this column contains the empty string.</td>
</tr>
<tr>
<td>CID</td>
<td>The content-ID of the attachment. Typically used in HTML img tags to embed images in a message.</td>
</tr>
<tr>
<td>mimeType</td>
<td>The MIME type of the attachment, such as text/html.</td>
</tr>
<tr>
<td>isMessage</td>
<td>A Boolean value specifying whether the attachment is a message.</td>
</tr>
<tr>
<td>size</td>
<td>The attachment size in bytes.</td>
</tr>
</tbody>
</table>

The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

The modify action
If you specify the `modify` action, the `uid` attribute must specify a single Exchange UID. The `contact` structure must specify only the fields that you are changing. Any fields that you do not specify remain unchanged.
If a contact has attachments and you specify attachments when you modify the contact, the new attachments are added to the previous attachments, and do not replace them. Use the `deleteAttachments` action to remove any attachments.

**Example**

The following example lets a user enter information in a form and creates a contact on the Exchange server with the information:

```cfml
<!--- Create a structure to hold the contact information. --->
<cfset sContact="#StructNew()#">

<!--- A self-submitting form for the contact information --->
<cfform format="flash" width="550" height="460">
  <cfformitem type="html"><b>Name</b></cfformitem>
  <cfformgroup type="horizontal" label="">
    <cfinput type="text" label="First" name="firstName" width="200">
    <cfinput type="text" label="Last" name="lastName" width="200">
  </cfformgroup>
  <cfformgroup type="VBox">
    <cfformitem type="html"><b>Address</b></cfformitem>
    <cfinput type="text" label="Company" name="Company" width="435">
    <cfinput type="text" label="Street" name="street" width="435">
    <cfinput type="text" label="City" name="city" width="200">
    <cfselect name="state" label="State" width="100">
      <option value="CA">CA</option>
      <option value="MA">MA</option>
      <option value="WA">WA</option>
    </cfselect>
    <cfinput type="text" label="Country" name="Country" width="200" Value="U.S.A.">
  </cfformgroup>
  <cfformitem type="html"><b>Phone</b></cfformitem>
  <cfinput type="text" validate="telephone" label="Business" name="businessPhone" width="200">
  <cfinput type="text" validate="telephone" label="Mobile" name="cellPhone" width="200">
  <cfinput type="text" validate="telephone" label="Fax" name="fax" width="200">
  </cfformitem>
  <cfformitem type="html"><b>Email</b></cfformitem>
  <cfinput type="text" validate="email" name="email" width="200">
</cfform>

<!--- If a form was submitted, populate the contact structure from it. --->
<cfif isDefined("Form.Submit")>
  <cfscript>
    sContact.FirstName=Form.firstName;

</cfif>
</cfif>

cfexchangeconversation

Description
Helps users organize and manage conversations from a Microsoft Exchange account.

The following actions are supported:
• Finds the required conversations in folder/subfolders based on filters.
• Status of the conversation; if read
• Copy, move, or delete conversation

History
ColdFusion 10: Added this tag.

Category
Communications tags
Syntax
get
<cfexchangeconversation
    action = "get"
    connection = "connection_ID"
    folderID = "Exchange folder UID"
    name = "query name"
</cfexchangeconversation>

setReadState
<cfexchangeconversation
    action = "setReadState"
    connection = "connection_ID"
    folderID = "Folder_UID"
    UID = "conversation_UID"
    isRead = true|false
</cfexchangeconversation>
copy
<cfexchangeconversation
    action = "copy"
    connection = "connection_ID"
    FolderID = "conversation_folder_UID"
    UID = "conversation_UID"
    destinationFolderID = "destination_folder_UID"
</cfexchangeconversation>
move
<cfexchangeconversation
    action = "move"
    connection = "connection_ID"
    folderID = "conversation_folder_UID"
    UID = "conversation_UID"
    destinationFolderID = "destination_folder_UID"
</cfexchangeconversation>
delete
<cfexchangeconversation
    action = "delete"
    connection = "connection_ID"
    folderID = "conversation_folder_UID"
    UID = "conversation_UID"
    deleteType = harddelete|softdelete|movetodeleteditems
</cfexchangeconversation>

### Filter parameters for cfexchangeconversation action="get"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxRows</td>
<td>Specify the maximum number of conversations that have to be returned. Default is 100, and if -1 is specified, all conversations are returned.</td>
</tr>
<tr>
<td>categories</td>
<td>A comma-separated list of categories stamped on messages in the conversation (only in the current folder).</td>
</tr>
<tr>
<td>flagStatus</td>
<td>The flag status for the conversation, calculated by aggregating individual message flag status in the current folder. It can have the following values:</td>
</tr>
<tr>
<td></td>
<td>* NotFlagged</td>
</tr>
<tr>
<td></td>
<td>* Flagged</td>
</tr>
<tr>
<td></td>
<td>* Complete</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GlobalCategories</td>
<td>A comma-separated list that summarizes the categories stamped on messages in the conversation, across all folders in the mailbox.</td>
</tr>
</tbody>
</table>
| GlobalFlagStatus      | The flag status for the conversation, calculated by aggregating individual message flag status across all folders in the mailbox. It can have the following values.  
  - NotFlagged  
  - Flagged  
  - Complete |
| GlobalHasAttachments  | A value that indicates if at least one message in the conversation, across all folders in the mailbox, has an attachment. |
| GlobalImportance      | The importance of this conversation, calculated by aggregating individual message's importance across all folders in the mailbox. It can have having values:  
  - Low  
  - Normal  
  - High |
| GlobalItemClasses     | A comma-separated list that summarizes the classes of the items in the conversation, across all folders in the mailbox. |
| GlobalItemIds         | A comma-separated list of IDs of the messages in the conversation, across all folders in the mailbox. |
| GlobalLastDeliveryTime| The delivery time of the message that was last received in the conversation across all folders in the mailbox. |
| GlobalMessageCount    | The total number of messages in the conversation across all folders in the mailbox. |
| GlobalSize            | The size of the conversation, calculated by adding the sizes of all messages in the conversation across all folders in the mailbox. |
| GlobalUniqueRecipients| A comma-separated list of recipients in the conversation across all folders in the mailbox. |
| GlobalUniqueSenders   | A comma-separated list of senders in the conversation across all folders in the mailbox. |
| GlobalUniqueUnreadSenders | A comma-separated list of senders whose messages are currently unread in the conversation across all folders in the mailbox. |
| GlobalUnreadCount     | The total number of unread messages in the conversation across all folders in the mailbox. |
| HasAttachments        | Boolean value that indicates if at least one message in the conversation, in the current folder only, has an attachment. |
| UId                   | UID of the conversation.                                                     |
| Importance            | The importance of the conversation, calculated by aggregating individual message's importance (only in the current folder). It can have following values:  
  - Low  
  - Normal  
  - High |
Example
The following example shows how you can perform the actions get, setReadState, copy, move, and delete on conversations:

```
<cfexchangeconnection action="open" username="conv" password="Password" server="IP_Address"
serverversion="2010" connection="conn1">
<!--- Finding information about Inbox --->
<cfexchangefolder action="getextendedinfo" connection="conn1" name="result"
folderpath="Inbox">
<cfexchangefolder action="getextendedinfo" connection="conn1" name="result1"
folderpath="Drafts">
<cfexchangeconversation action="get" folderid="#result.uid#" name="conversations"
connection="conn1">
<cfexchangefilter name="topic" value="testcfexchnage3">
<cfexchangefilter name="categories" value="Yellow Category">
</cfexchangeconversation>
<cfdump var="#conversations#">
<cfset myArray = ArrayNew(1)>
<cfloop query="conversations">
<cfset temp = ArrayAppend(myArray, "#UID#")>
</cfloop>
<!--- Copy the conversation to Drafts --->
<cfexchangeconversation action="copy" UID="#myArray[1]#" folderid="#result.uid#"
destinationfolderid="#result1.uid#" connection="conn1">
<!--- Getting the detail about the conversation --->
<cfexchangeconversation action="get" folderid="#result1.uid#" name="conversations1"
connection="conn1">
<cfexchangefilter name="topic" value="testcfexchnage3">
<cfexchangefilter name="categories" value="Yellow Category">
</cfexchangeconversation>
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ItemClasses</td>
<td>A comma-separated list of classes of the items in the conversation (only in the current folder).</td>
</tr>
<tr>
<td>ItemIds</td>
<td>A comma-separated list of IDs of the messages in the conversation (only in the current folder). It is an array of ItemId objects.</td>

**cfxchangefilter**

**Description**

Specifies filter parameters that control the actions of `cfexchangemail`, `cfexchangecalendar`, `cfexchangetask`, and `cfexchangecontact`, `get` operations.

**History**

ColdFusion 8: Added this tag.

**Category**

Communications tags

**Syntax**

```cftags
<cfexchangefilter
 name = "filter type"
 value = "filter value">
```

**OR**

```cftags
<cfexchangefilter
 name = "filter type"
 from = "date/time"
 to = "date/time">
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>The type of filter to use.</td>
</tr>
<tr>
<td>from</td>
<td>Optional</td>
<td></td>
<td>The start date or date/time combination of the range to use for filtering. Cannot be used with the value attribute. If you specify a from attribute without a to attribute, the filter selects for all entries on or after the specified date or time. The value can be in any date/time format recognized by ColdFusion, but must correspond to a value that is appropriate for the filter type.</td>
</tr>
<tr>
<td>to</td>
<td>Optional</td>
<td></td>
<td>The end date or date/time combination for the range used for filtering. Cannot be used with the value attribute. If you specify a to attribute without a from attribute, the filter selects for all entries on or before the specified date or time. The value can be in any date/time format recognized by ColdFusion, but must correspond to a value that is appropriate for the filter type.</td>
</tr>
<tr>
<td>value</td>
<td>Optional</td>
<td></td>
<td>The filter value for all filters that do not take a date or time range. Cannot be used with the from and to attributes. ColdFusion generates an error if you specify this attribute with an empty contents. Therefore, you cannot use the empty string to search for empty values. If you set this attribute to the empty string (&quot;&quot;), ColdFusion searches for entries where the specified field is empty. 6.07</td>
</tr>
</tbody>
</table>

The cfexchangeCalendar tag filters can have the following name attributes and associated value, or to and from attributes that you use to specify the filter parameters for the specified action:

<table>
<thead>
<tr>
<th>name attribute</th>
<th>Specification attributes</th>
<th>Valid specification attribute values</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxRows</td>
<td>value</td>
<td>A positive integer specifying the maximum number of matching rows to return. By default, the maximum number of rows is 100. You can also specify -1 to return all matching rows.</td>
</tr>
<tr>
<td>allDayEvent</td>
<td>value</td>
<td>A Boolean value.</td>
</tr>
<tr>
<td>duration</td>
<td>value</td>
<td>An integer number of minutes.</td>
</tr>
<tr>
<td>endTime</td>
<td>from to</td>
<td>A string that ColdFusion can interpret as a date-time value.</td>
</tr>
<tr>
<td>fromID</td>
<td>value</td>
<td>An Exchange user ID.</td>
</tr>
<tr>
<td>hasAttachment</td>
<td>value</td>
<td>A Boolean value.</td>
</tr>
<tr>
<td>importance</td>
<td>value</td>
<td>One of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• high</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• normal</td>

| homePhoneNumber | A string. |
| jobTitle      | A string. |
### ColdFusion Tags

**ColdFusion Tags**

The `cfexchangemail` tag filters can have the following **name** attributes and associated **value** attributes, **or** to and **from** attributes that you use to specify the filter parameters for the specified action:

<table>
<thead>
<tr>
<th>name attribute</th>
<th>value attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>lastName</td>
<td>A string.</td>
</tr>
<tr>
<td>mailingAddressType</td>
<td>One of the following values: Home, Business, Other.</td>
</tr>
<tr>
<td>manager</td>
<td>A string.</td>
</tr>
<tr>
<td>middleName</td>
<td>A string.</td>
</tr>
<tr>
<td>mobilePhoneNumber</td>
<td>A string.</td>
</tr>
<tr>
<td>nickName</td>
<td>A string.</td>
</tr>
<tr>
<td>office</td>
<td>A string.</td>
</tr>
<tr>
<td>otherAddress</td>
<td>A structure with the following fields: Street, City, State, Zip, Country.</td>
</tr>
<tr>
<td>otherPhoneNumber</td>

</tr>
<tr>
<td>message</td>
<td>value</td>
<td>A string.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
The `cfexchangetask` tag filters can have the following `name` attributes and associated `value`, `or to` and `from` attributes that you use to specify the filter parameters for the specified action:

<table>
<thead>
<tr>
<th>name attribute</th>
<th>Specification attributes</th>
<th>Specification attribute values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MessageType</code></td>
<td>value</td>
<td>One of the following values: Mail, Meeting, Meeting_Cancel, Meeting_Request, Meeting_Response, or All. If you omit this attribute, the filter gets messages of all types. The <code>Meeting</code> attribute gets messages with Meeting_Cancel, Meeting_Request, and Meeting_Response types.</td>
</tr>
<tr>
<td><code>MeetingUID</code></td>
<td>value</td>
<td>A case-sensitive Exchange calendar event UID. Meeting UIDs are used in Meeting_request or Meeting_response message types only. Do not specify this field if you specify a <code>MessageType</code> field value of Mail.</td>
</tr>
<tr>
<td><code>sensitivity</code></td>
<td>value</td>
<td>One of the following values: normal, personal, private, confidential</td>
</tr>
<tr>
<td><code>subject</code></td>
<td>value</td>
<td>A string.</td>
</tr>
<tr>
<td><code>timeReceived</code></td>
<td>from to</td>
<td>A string that ColdFusion can interpret as a date-time value.</td>
</tr>
<tr>
<td><code>timeSent</code></td>
<td>from to</td>
<td>A string that ColdFusion can interpret as a date-time value.</td>
</tr>
<tr>
<td><code>toID</code></td>
<td>value</td>
<td>A comma-delimited list of Exchange or web e-mail addresses.</td>
</tr>
<tr>
<td><code>uid</code></td>
<td>value</td>
<td>A case-sensitive Exchange message UID.</td>
</tr>
<tr>
<td><code>mail_ID</code></td>
<td>value</td>
<td>A comma-delimited list of Exchange mail IDs. This filter value is useful if the connection user has delegate rights for multiple users and you want to select the tasks of a limited number of those users.</td>
</tr>
<tr>
<td><code>message</code></td>
<td>value</td>
<td>A string.</td>
</tr>
</tbody>
</table>
Usage

The `cfexchangefilter` tag specifies the conditions to match when ColdFusion gets mail messages, calendar entries, tasks, or contacts. Only those entries that match the specified filter conditions are returned in the structure specified by the parent tag's `name` attribute. If the filter specifies a field that takes a text string, such as `Message` and or `Subject`, ColdFusion returns items that contain the exact phrase that you specify in the `value` attribute.

The `cfexchangefilter` tag must be a child tag of a `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, or `cfexchangetask` tag with an action attribute value of `get`.

If you specify multiple `cfexchangefilter` tags in the body of a ColdFusion exchange tag, such as `cfexchangemail`, the specified filters are cumulative, and the selected records match the conditions specified in all the `cfexchangefilter` tags. If you specify multiple `cfexchangefilter` tags with the same `name` attribute value, the last tag with that attribute specifies the filter conditions.

Example

The following example gets the mail messages that were sent to a user during the last week from any e-mail address that includes adobe.com. To focus on getting messages, rather than on displaying data, the example uses the `cfdump` tag to show the results.

<table>
<thead>
<tr>
<th>name attribute</th>
<th>Specification attributes</th>
<th>Specification attribute values</th>
</tr>
</thead>
<tbody>
<tr>
<td>mileage</td>
<td>value</td>
<td>A string.</td>
</tr>
<tr>
<td>percentCompleted</td>
<td>value</td>
<td>A number between 0 and 100.</td>
</tr>
<tr>
<td>priority</td>
<td>value</td>

Result struct values for cfexchangefolder action = "getExtendedInfo"

For the action getExtendedInfo, the result is a struct that contains the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChildFolderCount</td>
<td>The number of child folders that the parent folder has.</td>
</tr>
<tr>
<td>displayName</td>
<td>The display name of the folder.</td>
</tr>
<tr>
<td>folderClass</td>
<td>The folder class.</td>
</tr>
<tr>
<td>FolderPath</td>
<td>Path to the exchange server folder.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ManagedFolder</td>
<td>Struct that contains the following properties:</td>
</tr>
<tr>
<td></td>
<td>* canDelete: Boolean value that indicates if the user can delete objects in the folder.</td>
</tr>
<tr>
<td></td>
<td>* canRenameOrMove: Boolean value that indicates if the user can rename or move objects in the folder.</td>
</tr>
<tr>
<td></td>
<td>* mustDisplayComment: Boolean value that indicates if the client application must display the comment property to the user.</td>
</tr>
<tr>
<td></td>
<td>* HasQuota: Boolean value that indicates if the folder has a quota.</td>
</tr>
<tr>
<td></td>
<td>* IsManagedFoldersRoot: Boolean value that indicates if the folder is the root of the managed folder hierarchy.</td>
</tr>
<tr>
<td></td>
<td>* ManagedFolderId: The ID of the managed folder.</td>
</tr>
<tr>
<td></td>
<td>* comment: The comment that is associated with the folder.</td>
</tr>
<tr>
<td></td>
<td>* StorageQuota: The storage quota of the folder.</td>
</tr>
<tr>
<td></td>
<td>* FolderSize: The size of the folder.</td>
</tr>
<tr>
<td></td>
<td>* HomePage: The home page associated with the folder.</td>
</tr>
<tr>
<td>mustDisplayComment</td>
<td>Boolean value that indicates if the client application must display the comment property to the user.</td>
</tr>
<tr>
<td>ParentFolderId</td>
<td>The ID of the folder’s parent folder.</td>
</tr>
</tbody>
</table>
Result struct values for `cfexchangefolder action = "getInfo"`

For the action `getInfo`, the result is a struct that contains the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ChildFolderCount</td>
<td>The number of child folders this folder has</td>
</tr>
<tr>
<td>displayName</td>
<td>The display name of the folder</td>
</tr>
<tr>
<td>folderClass</td>
<td>Folder class</td>
</tr>
<tr>
<td>folderPath</td>
<td>Path to the exchange server folder.</td>
</tr>
<tr>
<td>UID</td>
<td>ID of the folder</td>
</tr>
</tbody>
</table>
Filter parameters for `cfexchangefolder` action = “findSubFolders”

For the action `findSubFolders`, the result is a query that contains details of the subfolders. The values are same as that of `cfexchangefolder` action = "getInfo".

Example

The following code shows how you can perform the actions `getExtendedInfo`, `findSubFolders`, `getInfo`, `copy`, `delete`, `modify`, `move`, and `create`.

```cfml
<cfexchangeconnection action="open" username="folder" password="Password" server="IP_Address" serverversion="2010" connection="conn1">
  <cfexchangefolder action="getextendedinfo" connection="conn1" name="result" folderpath="Drafts">
    <cfexchangefolder action="getextendedinfo" connection="conn1" name="result3" folderpath="Inbox">
      <!--- Checking if the folder is already present.. If it is present then delete it --->
      <cfexchangefolder action="findsubfolders" connection="conn1" name="final" uid="#result3.uid#">
        <cfexchangefilter name="displayname" value="folder1">
        </cfexchangefolder>
      </cfexchangefolder>
      <cfexchangefolder action="findsubfolders" connection="conn1" name="final1" uid="#result.uid#">
        <cfexchangefilter name="displayname" value="folder1">
        </cfexchangefolder>
      </cfexchangefolder>
      <cfif (#final.displayname# EQ "folder1")>
        <cfexchangefolder action="delete" connection="conn1" uid="#final.uid#" deletetype="harddelete">
          <cfscript>
            sleep(1000);
          </cfscript>
        </cfexchangefolder>
      </cfif>
      <cfset newfolder = structnew()>
        <cfset newfolder.displayname = "folder1">
        <cfset newfolder.folderclass = "IPF.Note">
        <cfexchangefolder action="create" connection="conn1" parentfolderid="#result.uid#" folder="#newfolder#" result="result1">
        </cfexchangefolder>
      </cfif>
      <cfelseif (#final1.displayname# EQ "folder1")>
        <cfexchangefolder action="delete" connection="conn1" uid="#final1.uid#" deletetype="harddelete">
          <cfscript>
            sleep(1000);
          </cfscript>
        </cfexchangefolder>
      </cfelseif>
    </cfif>
  </cfexchangeconnection>
</cfml>
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

cfexchangemail

Description
Gets mail messages and attachments, deletes messages, and sets properties for messages on a Microsoft Exchange server.

History
ColdFusion 10: Added the attribute serverVersion and folderID.
ColdFusion 8: Added this tag.

Category
Communications tags

Last updated 7/9/2012
ColdFusion Tags

Syntax

delete
<cfexchangemail
  required
  action = "delete"
  uid = "message UID, message UID,..."
  optional
  connection = "connection ID"
  folder = "Exchange folder path">

deleteAttachments
<cfexchangemail
  required
  action = "deleteAttachments"
  uid = "message UID"
  optional
  connection = "connection ID"
  folder = "Exchange folder path">

get
<cfexchangemail
  required
  action = "get"
  name = "query identifier"
  optional
  connection = "connection ID"

  optional
  connection = "connection ID"
  folder = "Exchange folder path"
  folderID = "Exchange folder UID"

  <cfexchangefilter name = "filter type" value = "filter value">
  <cfexchangefilter name = "filter type" value = "filter value">
  ...
</cfexchangemail>

set
<cfexchangemail
  required
  action = "set"
  message = "#structure with values to set#"
  uid = "message UID"
  optional
  connection = "connection ID"
  folder = "Exchange folder path"
  folderID = "Exchange folder UID"

Note: If you omit the connection attribute, create a temporary connection by specifying cfexchangeconnection tag attributes in the cfexchangemail tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the cfexchangeconnection tag open action.

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

Attributes
Note: If an attribute, such as folder or destinationFolder takes a folder path, and the folder name contains forward slashes (/), specify the folder name by using the _xF8FF_ escape character to prevent exchange from interpreting the character as a path delimiter.

<td>If not specified, folder is used. If either folder or folderID are not specified, the inbox is used as the default folder to perform the operation.</td>
</tr>
</tbody>
</table>
Usage

The `cfexchangemail` tag performs mail actions on an Exchange server that you cannot do by using the `cfmail` tag. (You must use the `cfmail` tag to send, forward, and reply to mail messages.) Use the `cfexchangemail` tag to perform the following actions:

- Permanently delete one or more mail messages from the server.
- Get the attachments for a specific message.
• Get one or more messages that conform to an optional set of filter specifications, such as the subject, sender or recipient ID, time received, and so on.

• Get the attachments for a specific message.

• Get detailed information about a meeting for which you have a notification, such as a meeting request or cancellation notice.

• Move one or more messages from one folder to another, including to the Deleted Items folder.

• Set the properties of a specific mail message.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the exchange server, such as if you are creating several contact records, use the `cfexchangeconnection` tag to create a persistent connection. You then specify the connection identifier in each `cfexchangemail` tag, or any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or connections. Doing this saves the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangemail` tag. To do this, you specify the connection attributes directly in the `cfexchangemail` tag. For details on the connection attributes, see the `cfexchangeconnection` tag.

The delete action
The delete action permanently deletes a message from the server, and is equivalent to the Outlook Shift-Delete keystroke action. Use the move action to move a message to the Deleted Items folder, which is equivalent to the Outlook Delete keystroke action.

When you specify the delete action you must specify a `uid` attribute with a comma-delimited list of one or more Exchange UIDs that identify the tasks that you want to delete. You can use the get action, with an appropriate filter expression, to determine the UID values to specify.

If all UIDs that you specify are invalid, the `cfexchangemail` tag generates an error. If at least one UID is valid, the tag ignores any invalid UIDs and deletes the items specified by the valid UID.

The get action
When you specify the get action, you use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see `cfexchangefilter`. When the tag completes processing, the query object specified by the `name` attribute contains one record for each matching message that was found. Each record has the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCC</td>
<td>A comma-delimited list of Exchange user IDs or web e-mail.</td>
</tr>
<tr>
<td>CC</td>
<td>A comma-delimited list of Exchange user IDs or web e-mail addresses.</td>
</tr>
<tr>
<td>Folder</td>
<td>The forward slash (/) delimited path from the root of the Exchange mailbox to the mail folder containing the message.</td>
</tr>
<tr>
<td>FromID</td>
<td>An Exchange user IDs or web e-mail addresses.</td>
</tr>
<tr>
<td>HasAttachment</td>
<td>A Boolean value that indicates whether the message has at least one attachment.</td>
</tr>
<tr>
<td>HTMLMessage</td>
<td>A string containing a HTML-formatted version of the message.</td>
</tr>
<tr>
<td>IsRead</td>
<td>A Boolean value.</td>
</tr>
<tr>
<td>Message</td>
<td>A string with a plain-text version of the message contents.</td>
</tr>
</tbody>
</table>
Note: An invitation sender can get a meeting request message only if the sender is on the attendee list.

The getAttachments action
When you use the getAttachments action, specify a single UID and a name attribute. The cfexchangecontact tag populates a query object specified by the name attribute with one record for each attachment. Each record has the following information about the mail attachment specified by the UID:

<table>
<thead>
<tr>
<th>Column name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentFileName</td>
<td>The filename of the attachment.</td>
</tr>
<tr>
<td>attachmentFilePath</td>
<td>The absolute path of the attachment file on the server. If you omit the attachmentPath attribute, this column contains the empty string.</td>
</tr>
<tr>
<td>CID</td>
<td>The content-ID of the attachment. Used in HTML img tags to embed images in a message.</td>
</tr>
<tr>
<td>mimeType</td>
<td>The MIME type of the attachment, such as text/html.</td>
</tr>
<tr>
<td>isMessage</td>
<td>A Boolean value that specifies whether the attachment is a message.</td>
</tr>
<tr>
<td>size</td>
<td>The attachment size in bytes.</td>
</tr>
</tbody>
</table>

The tag places the attachments in the directory specified by the attachmentPath attribute. If you omit the attachmentPath attribute, ColdFusion does not get any attachments; it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.
If a message has multiple attachments with the same name, the attachment information structure always lists the attachments with their original, duplicate, names, even if you specify `generateUniqueFilenames="yes"`. The `generateUniqueFilenames` attribute only affects the names of the files on disk.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```cfc
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

### The `getMeetingInfo` action

You use the `getMeetingInfo` action to get meeting-specific information, such as the meeting start and end times, location, and so on, about a meeting for which you have received a notification message, such as an invitation request or cancellation notice. This information is not available directly in the notification message query object that is returned by the `get` action.

**Note:** At the time of publication, the following information does not completely reflect the behavior of the `getMeetingInfo` action. For updated information, see `cfexchangemail` in the ColdFusion documentation available online in HTML on the Adobe website.

When you specify the `getMeetingInfo` action, you specify a `meetingUID` attribute with the UID of the meeting. You get this UID value from the query record that is returned by the `get` action. You can optionally specify a `messageUID` attribute with the UID of the specific message that contains the notification; if you receive multiple messages about a single meeting, you can use this attribute to select a single notification message.

When the tag completes processing, the query object specified by the `name` attribute contains one record for each matching message that was found. Each record has the following columns:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllDayEvent</td>
<td>A Boolean value that indicates whether this is an all day event.</td>
</tr>
<tr>
<td>Duration</td>
<td>The duration of the event in minutes.</td>
</tr>
<tr>
<td>EndTime</td>
<td>The end time of the event, in ColdFusion ODBC date-time format.</td>
</tr>
<tr>
<td>From</td>
<td>The mail ID of the person who sent the meeting notification.</td>
</tr>
<tr>
<td>HasAttachment</td>
<td>A Boolean value that indicates whether this event has attachments.</td>
</tr>
<tr>
<td>Importance</td>
<td>One of the following values:</td>
</tr>
<tr>
<td></td>
<td>* high</td>
</tr>
<tr>
<td></td>
<td>* normal</td>
</tr>
<tr>
<td></td>
<td>* low</td>
</tr>
<tr>
<td>IsRecurring</td>
<td>A Boolean value that indicates whether this event repeats.</td>
</tr>
<tr>
<td>Location</td>
<td>A string that specifies the location of the event.</td>
</tr>
<tr>
<td>MeetingUID</td>
<td>The UID of the event in the calendar.</td>
</tr>
<tr>
<td>Message</td>
<td>A string that contains a message about the event.</td>
</tr>
</tbody>
</table>
The move action
Use the `move` action to move one or more messages from one folder to another folder. You can use this action to move messages to the Deleted Items folder, which is equivalent to the Outlook Delete keystroke action.

When you specify the `move` action you specify the destination folder, and optionally the folder containing the messages to move. (The default source folder is the Inbox). You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see `cfexchangefilter`.

The set action
When you specify the `set` action, the structure specified by the `message` attribute contains key-value pairs that specify the message properties to set. The following table lists the key names and their valid values:

<table>
<thead>
<tr>
<th>Key name</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsRead</td>
<td>yes, no</td>
</tr>
<tr>
<td>Importance</td>
<td>high, normal, low</td>
</tr>
<tr>
<td>Sensitivity</td>
<td>normal, company-confidential, personal, private</td>
</tr>
</tbody>
</table>

Example
The following example gets the attachments to all mail messages in the Inbox from docuser2 in the last week. It puts each message’s attachments in a directory with a unique name. It cannot use the UID as a filename because, for each message with attachments, the UID can contain the application reports of the UID, directory path, subject, date, and sender of the message, followed by a table that lists the message’s attachments. The table includes the attachment name, size, and MIME type.
<!--- Index for message attachment directory --->
<cfset i=1>
<!--- Dates for date range --->
<cfset rightNow = Now()>
<cfset lastWeek = DateAdd("d","-7", rightNow)>

cfexchangetask

Description
Creates, deletes, modifies, and gets Microsoft Exchange tasks, and gets task attachments.

Note: For all actions, see cfexchangeconnection for additional attributes that you use if you do not specify the connection attribute.
History
ColdFusion 10: Added the attribute serverVersion.
ColdFusion 8: Added this tag.

Category
Communications tags

Syntax
create
<cfexchangetask
  required
  action = "create"
  task = "#task information structure#"
  optional
  connection = "connection ID"
  result = "variable for event UID">

delete
<cfexchangetask
  required
  action = "delete"
  uid = "task UID,task UID, ..."
  optional
  connection = "connection ID">

deleteAttachments
<cfexchangetask
  required
  action = "deleteAttachments"
  uid = "task UID"
  optional
  connection = "connection ID">

get
<cfexchangetask
  required
  action = "get"
  name = "query identifier"
  optional
  connection = "connection ID"
getAttachments
cfexchangetask
  required
    action = "getAttachments"
    name = "query identifier"
    uid = "task UID"
  optional
    attachmentPath = "directory path"
    connection = "connection ID"
    generateUniqueFilenames = "no|yes"

modify
cfexchangetask
  required
    action = "modify"
    task = "#task information structure#"
    uid = "task UID"
  optional
    connection = "connection ID"

Note: If you omit the connection attribute, create a temporary connection by specifying cfexchangeconnection tag attributes in the cfexchangetask tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the cfexchangeconnection tag open action.

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

Attributes
The following table provides detailed information about each attribute. It lists the attribute name, the actions (action attribute values) to which it applies, whether it is required or optional for those actions, and its default value, if any, and provides a detailed description of the attribute and its valid values.
### ColdFusion Tags

<tr>
<td>Message</td>
<td>A string containing the task description.</td>
</tr>
<tr>
<td>Mileage</td>
<td>A string.</td>
</tr>
</tbody>
</table>
Usage
The `cfexchangetask` tag manages task records on the Exchange server. Use the `cfexchangetask` tag to perform the following actions:

- Create a task.
- Delete one or more tasks.
- Get one or more task records that conform to an optional set of filter specifications, such as the last name, job title, or home phone number, and so on.
- Get the attachments for a specific task record.
- Modify an existing task.

### ColdFusion Tags

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
</table>
| PercentCompleted | A number in the range 0–100. If you set this field to 100, the following values are set:  
  - The Status value is set to Completed.  
  - If the DateCompleted is not set, it is set to the current date. If you set this field to a number with a value less than 100, the following values are set:  
  - If Status is or was set to Completed, the Status is set to In_Progress.  
  - The DateCompleted value is cleared. |
| Priority      | One of the following values:  
  - low  
  - normal  
  - high |
| ReminderDate  | A string in a date format that is valid in ColdFusion. |
| StartDate     | A string in a date format that is valid in ColdFusion. When you create a task, the default value is the current date. |
| Status        | The following values are valid: Not_Started, In_Progress, Completed, Waiting, or Deferred. If you omit this field and the PercentCompleted is less than 100, the Status value is set to In_Progress. If you set this field to Completed, the following values are set:  
  - The PercentCompleted is set to 100.  
  - If the DateCompleted is not set, it is set to the current date. If you set this field to a value other than Completed, the following values are also set:  
  - If the PercentCompleted is or was 100, the PercentCompleted is reset to 0.  
  - The DateCompleted value is set to 0. |
| Subject       | A string. |
| TotalWork     | A number in minutes. Cannot be less than zero. |
To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the exchange server, such as if you are creating several task records, use the `cfexchangeconnection` tag to create a persistent connection. You then specify the connection identifier in each `cfexchangetask`, or any other ColdFusion Exchange tag, if you are also accessing calendar entries, contacts, or mail. Doing this saves the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangetask` tag. To do this, you specify the connection attributes directly in the `cfexchangetask` tag. For details on the connection attributes, see the `cfexchangeconnection` tag.

The delete action
When you specify the `delete` action, specify a `uid` attribute with a comma-delimited list of one or more Exchange UIDs that identify the tasks to delete. You can use the `get` action, with an appropriate filter expression, to determine the UID values to specify.

If all UIDs that you specify are invalid, the `cfexchangetask` tag generates an error. If at least one UID is valid, the tag ignores any invalid UIDs and deletes the items specified by the valid UID.

The get action
When you specify the `get` action, the query object specified by the `name` attribute contains one record for each retrieved task. The query object has columns with the same names and data formats as the fields listed for the `task` attribute structure, with the following differences:

- The query object has a Boolean `HasAttachment` column, and does not have an `Attachments` column. If the `HasAttachment` field value is `yes`, use the `getAttachments` action to retrieve the attachments.
- The query object has an additional `UID` column with the unique identifier for the task in the Exchange server. You can use this value in the `uid` attribute of the `getAttachments`, `delete`, and `modify` actions to identify the required task.
- The query object has an additional `HtmlMessage` column. The `Message` column has a plain-text version of the task description, and the `HtmlMessage` column text includes the description’s HTML formatting.

You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see `cfexchangefilter`.

The getAttachments action
When you use the `getAttachments` action, specify a single UID and a `name` attribute. The `cfexchangetask` tag populates a query object specified by the `name` attribute with the specified name. Each record has the following information about an attachment to the specified task:

<table>
<thead>
<tr>
<th>Column name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentFileName</td>
<td>The filename of the attachment.</td>
</tr>
<tr>
<td>attachmentFilePath</td>
<td>The absolute path of the attachment file on the server. If you omit the attachmentPath attribute, this column contains the empty string.</td>
</tr>
<tr>
<td>CID</td>
<td>The content-ID of the attachment. Typically used in HTML img tags to embed images in a message.</td>
</tr>
<tr>
<td>mimeType</td>
<td>The MIME type of the attachment, such as text/html</td>
</tr>
<tr>
<td>isMessage</td>
<td>A Boolean value that specifies whether the attachment is a message.</td>
</tr>
<tr>
<td>size</td>
<td>The attachment size, in bytes.</td>
</tr>
</tbody>
</table>
The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```plaintext
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

**The modify action**

If you specify the `modify` action, the `uid` attribute must specify a single Exchange UID. The `task` structure must specify only the fields that you are changing. Any fields that you do not specify remain unchanged. For a detailed description of the contents of the task structure, see the Attributes section.

If a task has attachments and you specify attachments when you modify the task, the new attachments are added to the previous attachments, and do not replace them. Use the `deleteAttachments` action to remove any attachments.

**Example**

The following example uses a transient connection to create a single task:

```html
<!--- Create a structure with the task fields --->
<cfscript>
stask=StructNew();
stask.Priority="high";
stask.Status="Not_Started";
stask.DueDate="3:00 PM 09/14/2007";
stask.Subject="My New Task";
stask.PercentCompleted=0;
Message="Do this NOW!";
</cfscript>

<!--- Create the task using a transient connection. --->
<cfexchangetask action="create"
username="#user1#"
password="#password1#"
server="#exchangeServerIP#"
task="#stask#"
result="theUID">  
</cfexchangetask>

<!--- display the UID to confirm that the action completed. ---->
<cfdump var="#theUID#">  
</cfexecute>

**Description**

Executes a ColdFusion developer-specified process on a server computer.
Category
Extensibility tags, Flow-control tags

Syntax
<cfexecute
    name = "application name"
    arguments = "command line arguments"
    outputFile = "output filename"
    timeout = "timeout interval"
    variable = "variable name">
...
</cfexecute>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcollection, cfindex, cfobject, cfreport, cfsearch, cfwddx

History
ColdFusion MX 6.1:
- Added the variable attribute.
- Changed filepath behavior for the outputFile attribute: if you do not specify an absolute filepath in the outputFile attribute, the path is relative to the ColdFusion temporary directory.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td>Absolute path of the application to execute. On Windows, specify an extension, for example, C:\myapp.exe.</td>
<td></td>
</tr>
<tr>
<td>arguments</td>
<td>Optional</td>
<td>Command-line variables passed to application. If specified as string, it is processed as follows:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Windows: passed to process control subsystem for parsing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>UNIX: tokenized into an array of arguments. The default token separator is a space; you can delimit arguments that have embedded spaces with double-quotation marks.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If passed as array, it is processed as follows:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Windows: elements are concatenated into a string of tokens, separated by spaces. Passed to process control subsystem for parsing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>UNIX: elements are copied into an array of exec) arguments.</td>
<td></td>
</tr>
</tbody>
</table>
Usage
Do not put other ColdFusion tags or functions between the start and end tags of `cfexecute`. You cannot nest `cfexecute` tags.

Exceptions
Throws the following exceptions:

- If the application name is not found: `java.io.IOException`
- If the effective user of the ColdFusion executing thread does not have permissions to execute the process: a security exception

The time-out values must be between zero and the longest time-out value supported by the operating system.

Example
```cfexecute`
This example executes the Windows NT version of the netstat network monitoring program, and places its output in a file.
```n
cfexecute name = "C:\WinNT\System32\netstat.exe"
 arguments = "-e"
 outputFile = "C:\Temp\output.txt"
 timeout = "1"
`/cfexecute`

`cfexit`

Description
This tag aborts processing of the currently executing CFML custom tag, exits the page within the currently executing CFML custom tag, or re-executes a section of code within the currently executing CFML custom tag.
Category
Debugging tags, Flow-control tags

Syntax
<cfexit
    method = "method">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| method    | Optional| exitTag | - exitTag: aborts processing of currently executing tag.  
- exitTemplate: exits page of currently executing tag.  
- loop: re-executes body of currently executing tag. |

Usage
If this tag is encountered outside the context of a custom tag, for example in the base page or an included page, it executes in the same way as cfabort. The cfexit tag can help simplify error checking and validation logic in custom tags.

The cfexit tag function depends on its location and execution mode:

<table>
<thead>
<tr>
<th>Method value</th>
<th>Location of cfexit call</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>exitTag</td>
<td>Base page</td>
<td>Terminate processing</td>
</tr>
<tr>
<td></td>
<td>Execution mode = Start</td>
<td>Continue after end tag</td>
</tr>
<tr>
<td></td>
<td>Execution mode = End</td>
<td>Continue after end tag</td>
</tr>
<tr>
<td>exitTemplate</td>
<td>Base page</td>
<td>Terminate processing</td>
</tr>
<tr>
<td></td>
<td>Execution mode = Start</td>
<td>Continue from first child in body</td>
</tr>
<tr>
<td></td>
<td>Execution mode = End</td>
<td>Continue after end tag</td>
</tr>
<tr>
<td>loop</td>
<td>Base page</td>
<td>Error</td>
</tr>
<tr>
<td></td>
<td>Execution mode = Start</td>
<td>Error</td>
</tr>
<tr>
<td></td>
<td>Execution mode = End</td>
<td>Continue from first child in body</td>
</tr>
</tbody>
</table>
Example

Example
cfexit can be used to abort the processing of the currently executing CFML custom tag. Execution resumes following the invocation of the custom tag in the page that called the tag.

Usage of cfexit

cfexit is used primarily to perform a conditional stop of processing inside a custom tag. cfexit returns control to the page that called that custom tag, or in the case of a tag called by another tag, to the calling tag.

<!--- cfexit can be used within a CFML custom tag, as follows: --->
<!--- Place this code (uncomment the appropriate sections) within the customtags directory. --->
<!--- MyCustomTag.cfm --->
<!--- This simple custom tag checks for the existence of myValue1 and myValue2. If they are both defined, the tag adds them and returns the result to the calling page in the variable "result". If either or both of the expected attribute variables is not present, an error message is generated, and cfexit returns control to the calling page. --->

<!--- <cfif NOT IsDefined("attributes.myValue2")> --->
<!--- <cfset caller.result = "Value2 is not defined"> --->
<!--- cfexit method = "exitTag"> --->
<!--- elseif NOT IsDefined("attributes.myValue1")> --->
<!--- cfset caller.result = "Value1 is not defined"> --->
<!--- cfexit method = "exitTag"> --->
<!--- else> --->
<!--- cfset value1 = attributes.myValue1> --->
<!--- cfset value2 = attributes.myValue2> --->
<!--- cfset caller.result = value1 + value2> --->
<!--- /cfif> --->
<!--- End MyCustomTag.cfm --->

<!--- Place this code within your page --->

<!--- <p>The call to the custom tag, and then the result: </p> --->
<cf_myCustomTag myvalue2 = 4> --->
<cfoutput>#result#</cfoutput> --->
<p> If cfexit is used outside a custom tag, it functions like a cfabort. For example, the text after this message is not processed: </p> --->
<cfexit> --->
<p> This text is not executed because of the cfexit tag above it. </p>

Tags f
cffeed

**Description**

Reads or creates an RSS or Atom syndication feed. This tag can read RSS versions 0.90, 0.91, 0.92, 0.93, 0.94, 1.0, and 2.0, and Atom 0.3 or 1.0. It can create RSS 2.0 or Atom 1.0 feeds.
Category
Communications tags, Internet protocol tags

Syntax
create

required
<cffeed

<td>Text to put in the HTTP User-Agent request header field. Used to identify the request client software.</td>
</tr>
<tr>
<td>xmlVar</td>
<td>See Note</td>
<td></td>
<td>A variable in which to save the read or created feed as XML text.</td>
</tr>
</tbody>
</table>
Usage

Specifying file and directory attributes
Use the following syntax to specify an in-memory file or directory. In-memory files are not written to disk and speed processing of transient data.

`ram:///filepath`

A filepath can include multiple directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

Setting and getting feed information
The `cffeed` tag lets you specify and save feed data in many, flexible ways.

Usage
Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

`ram:///filepath`

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

When you create a feed

- You specify the feed data in either of the following ways:
  - By putting all metadata and entry or item data in a single structure specified by the `name` attribute.
  - By putting the metadata in a structure specified by the `properties` structure and the entries or items as rows in a query object specified by the `query` attribute.
- You save the resulting feed XML in one or both of the following places:
  - A file specified by the `OutputFile` attribute. The `cffeed` tag saves the data in UTF-8 encoding.
  - An variable specified by the `xmlVar` attribute

When you read a feed
You can save the feed data in any combination of the following forms:

- By saving all entry or item data and metadata in a single structure specified by the `name` attribute
- By saving entries or items as rows in a query object specified by the `query` attribute
- By saving the metadata in a structure specified by the `properties` structure
- By writing the feed XML in a file specified by the `OutputFile` attribute. The `cffeed` tag saves the data in UTF-8 encoding.
- By saving the feed XML in a ColdFusion XML variable specified by the `xmlVar` attribute

When you save feed data, you do not have to save both the metadata and the entry or item data. You can specify only the `properties` attribute, or only the `query` attribute.
Name and properties structure rules
The `name` and `properties` structures must conform to the following rules. For more information on requirements for specific metadata entries, see the section Representing feed metadata.

- All structure key names must be identical to the corresponding feed element names, with the exception of the `version` and `encoding` fields. Also, the key names for Dublin Core and Apple® iTunes extension elements start with `DC_` and `ITUNES_` respectively.
- The `properties` structure fields are identical to the metadata fields in the `name` structure.
- When you read a feed, the structure contains only those elements and attribute values that exist in the feed. For requirements for the `create` action, see the section Creating feeds.
- If the feed can have multiple elements of the same type (such as `entry`, `item`, or `link`), the `name` or `property` structure has a single entry that contains the data for all of the elements. The structure entry has the following format:
  - The key is the element name (for example, `item`)
  - The value is an array of structures
  - Each structure in the array represents one element.

ColdFusion uses an array even if there is only a single element. If an Atom feed has only one `link` element, for example, you must specify that element in a `name` attribute structure by using the following format:

```coldfusion
structureName.link[1]
```

For example, to specify a `link` metadata entry in an Atom 1.0 feed, you could use the following code:

```coldfusion
<cfset meta.link = arrayNew(1)>
<cfset meta.link[1] = structNew()>
<cfset meta.link[1].href = "http://www.myCo.com"/>
```

- If an element can have multiple attributes, or can have at least one attribute and a value, the element is represented as a structure, even if the element specifies only one attribute or only a value.
- If an element has one or more attributes and a value (body), the value is in a field of the element structure named `value`. For example, the text of the `summary` element for the third `entry` in an Atom feed would go in a field whose name has the following format:

```coldfusion
structureName.entry[3].summary.value.
```

- When the `cffeed` tag reads a feed, it reports dates as follows:
  - Atom: W3C date format, such as `2006-07-11T18:19:00Z`.
  - RSS: in RFC 822 Format, such as `Thu, 05 Oct 2006 18:19:00 GMT`.
- When the `cffeed` tag creates a feed, you can use W3C or RFC 822 formats for both feed types. You can also use any standard date or date/time format accepted by ColdFusion.

Query object rules
The query object specified by the `query` attribute conforms to the following rules:

- The query object format supports multiple feed formats, and many feeds do not include all optional feed attributes or elements. As a result:
  - When you read a feed, the returned query object contains entries for all standard RSS and Atom fields, even for fields that are not supported by the feed type. Any columns that are not used by the feed format, or are not used in that specific feed, contain empty strings or undefined values.
When you read a feed, the query object contains all iTunes extension fields if the feed contains any iTunes extension elements, and the query object contains all Dublin Core extension fields if the feed contains any Dublin Core extension elements. Otherwise, the query results do not contain any of the extension fields.

When you create a feed, the query that you define requires only those columns that contain data for your feed; you can omit unused columns.

If a feed entry or item has multiple child elements with the same name, the query column represents the element values as a comma-delimited list. RSS 2.0 items can have multiple category elements. Atom 1.0 entries can have multiple category, author, contributor, and link elements. The Dublin Core extensions allow all multiples of all element types.

Many entry or item elements that can have multiple instances have multiple attributes, not all of which are required for any particular element instance. If an entry or item has multiple instances of an element, and any of those elements omit attributes, ColdFusion represents the omitted attribute in the lists by a space. In XML, an Atom entry, for example, might contain three author elements, as follows:

```
<author>
  <person>Anthony</person>
  <url>http://www.MyCo.com</url>
  <email>Tony@MyCo.com</email>
</author>
<author>
  <person>Beverly</person>
</author>
<author>
  <person>Cathy</person>
  <email>cathy@MyCo.com</email>
</author>
```

The ColdFusion query represents these columns as follows:

<table>
<thead>
<tr>
<th>AUTHOR_PERSON</th>
<th>AUTHOR_URI</th>
<th>AUTHOR_EMAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anthony,Beverly,Cathy</td>
<td><a href="http://www.MyCo.com">http://www.MyCo.com</a>,</td>
<td><a href="mailto:Tony@MyCo.com">Tony@MyCo.com</a>,,<a href="mailto:cathy@MyCo.com">cathy@MyCo.com</a></td>
</tr>
</tbody>
</table>

The following table lists the columns of the standard query object specified by the `query` attribute. If an RSS feed includes either Dublin Core extensions or iTunes extensions, the query includes additional columns. For information on these fields, see the sections Dublin Core Extensions and Apple iTunes Extensions.

<table>
<thead>
<tr>

</table>
Representing feed metadata

When you create a feed, the name and properties structures can represent all standard metadata for RSS 2 or Atom 1 feeds, in the format described in the Name and properties structure rules section. Similarly, when you read a feed, the structures represent all received metadata. The following rules apply to specific feed metadata fields in the name and properties structures:

- The version field identifies or specifies the feed version in the form format_versionNumber. For the create action, specify atom_1.0 or rss_2.0. When you read an RSS 0.91 feed, the version field value is rss_0.91U, not rss_0.91.

- The feedExtension field identifies whether the feed includes iTunes or Dublin Core extension content. Valid values are itunes and DublinCore. You do not have to specify this field when you create a feed with iTunes extensions; ColdFusion automatically determines that you have specified extension fields. (You cannot create a feed with Dublin Core extensions.)

- For the read action, an encoding field identifies the XML encoding attribute, such as iso-8859-1. Do not specify an encoding field for a create action. Currently, ColdFusion generates all feeds in UTF-8 format and ignores any encoding value that you specify.

- For RSS feeds, the skiphours field contains a comma-delimited list of up to 24 numbers in the range 0–23, specifying hours of the day when aggregators should not read the feed. The hour beginning at midnight is hour zero. Your application can use the field to decide when to read the feed.

- For RSS feeds, the skipdays field contains a comma-delimited list of up to seven day-name values, specifying days of the week when aggregators must not read the feed. The valid names are Monday, Tuesday, Wednesday, Thursday, Friday, Saturday and Sunday. Your application can use the field to decide when to read the feed.

Dublin Core Extensions

Dublin Core extension elements provide additional metadata about the feed or an item. You can use the cffeed tag to read feeds that include elements that conform to the Dublin Core Metadata Element Set specification as metadata (channel elements) or as item elements. For detailed information Dublin Core extension elements, see the Dublin Core Metadata Element Set specification. At the time this topic was written, this specification was available at http://dublincore.org/documents/dces/.

ColdFusion support for Dublin Core extensions has the following limitations:

- You cannot create feeds containing these elements.

- You cannot get Dublin Core extension elements that are contained in a top-level (metadata) image element. ColdFusion ignores these elements.

- ColdFusion supports only the Dublin Core Metadata Element Set. It does not support the additional Dublin Core Metadata Initiative elements and element refinements.

When feed items include the Dublin Core extensions, the query specified by a query attribute includes all of the columns listed in the following table. If the feed does not include any Dublin Core extension elements, the query does not include the columns. With the exception of the DC_SUBJECT_TAXONOMURI and DC_SUBJECT_VALUE columns, each column name (without the DC_ prefix) corresponds directly to a Dublin Core extension element name.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DC_CONTRIBUTOR</td>
<td>The people or organizations responsible for contributing to the resource</td>
</tr>
<tr>
<td>DC_COVERAGE</td>
<td>The extent of the content in the resource</td>
</tr>
<tr>
<td>DC_Creator</td>
<td>The person or organization responsible for creating this resource</td>
</tr>
<tr>
<td>DC_DATE</td>
<td>A date or date and time associated with this resource</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
When you get data for a feed that includes Dublin Core elements as a structure, the element names are identical to the query column names listed above, with the exception of the representation of the Dublin Core subject element. The structure format represents the subject element as a dc_subject entry, which consists of an array of structures. The structures in the array have keys with the names value, for the element value, and taxonomyURI, for the taxonomyURI attribute.

**Apple iTunes Extensions**

You can use the cffeed tag to create or read feeds that contain elements defined in the Apple iTunes RSS podcast specification. For detailed information on iTunes extension format, see the Apple iTunes RSS specification. At the time this topic was written, this specification was available at [http://www.apple.com/itunes/store/podcaststechspecs.html](http://www.apple.com/itunes/store/podcaststechspecs.html).

You can create feeds with only a subset of the iTunes RSS extensions. When you read a feed, ColdFusion ignores all iTunes extension elements that are not in the supported subset.

The following table lists the names of structure entries or query column names for the supported elements. (These names consist of the ITUNES_ prefix followed by the iTunes extension element name.) The table also indicates which elements are used in the metadata, which are used in the individual items, and which can be used in both:

<table>
<thead>
<tr>
<th>Element</th>
<th>Used in</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ITUNES_AUTHOR</td>
<td>Both</td>
<td>Artist name</td>
</tr>
<tr>
<td>ITUNES_BLOCK</td>
<td>Both</td>
<td>A value of yes requests to prevent the podcast or item (episode) from appearing. When ColdFusion reads a feed your application must determine this field’s value and take any appropriate action.</td>
</tr>
<tr>
<td>ITUNES_DURATION</td>
<td>Item</td>
<td>The length of the item in second, or in HH:MM:SS format.</td>
</tr>
<tr>
<td>ITUNES_EXPLICIT</td>
<td>Both</td>
<td>A string indicating whether the item or items contain explicit material. Valid values are yes, no, and clean.</td>
</tr>
<tr>
<td>ITUNES_KEYWORDS</td>
<td>Both</td>
<td>A comma-delimited list of words or phrases used when searching in the iTunes music store.</td>
</tr>
<tr>
<td>ITUNES_SUBTITLE</td>
<td>Both</td>
<td>Short description text, usually only a few words.</td>
</tr>
<tr>
<td>ITUNES_SUMMARY</td>
<td>Both</td>
<td>A longer description (up to 4000 characters)/</td>
</tr>
</tbody>
</table>
You can also use the following channel elements in the `name` or `properties` structures.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>itunes_category</td>
<td>A structure that specifies the iTunes Music Store category. The structure has two fields:</td>
</tr>
<tr>
<td></td>
<td>* category</td>
</tr>
<tr>
<td></td>
<td>* subcategory</td>
</tr>
<tr>
<td></td>
<td>Notice that these element names do not have the <code>itunes_prefix</code>.</td>
</tr>
<tr>
<td>itunes_image</td>
<td>The URL of the artwork for the podcast.</td>
</tr>
<tr>
<td>itunes_owner</td>
<td>A structure that contains contact information about the owner of the podcast for communication. The structure has two fields:</td>
</tr>
<tr>
<td></td>
<td>* itunes_email</td>
</tr>
<tr>
<td></td>
<td>* itunes_mail</td>
</tr>
</tbody>
</table>

Creating feeds

When you create a feed, you specify the feed contents in a `name` structure or in the combination of a `query` object and a `properties` structure. The `cffeed` tag generates the feed XML and saves it to the variable specified by the `xmlVar` attribute, the file specified by the `outputFile` attribute, or both.

To create an RSS 2.0 feed you must specify the following metadata fields in a `name` structure or in a `properties` structure. All other RSS2.0 metadata fields, and all item fields, are optional.

- title
- link
- description
- version (must be "rss_2.0")

The `cffeed` tag does not enforce any rules on the Atom feed structure that it creates. You are responsible for ensuring that the feed is valid.

In most cases, a database table uses column names that differ from the column names you must use to create the feed. Therefore, use the `columnmap` attribute to map the input query column names to the required column names. The attribute is a structure whose keys are the column names required by the `cffeed` tag and whose values are the corresponding input query columns.

**Note:** Always capitalize the input query column names irrespective of whether the database column names are capitalized or not.

The following example creates a feed using the `cfartgallery` data source’s `orders` table. It maps the `orders` table `ORDERDATE` column to the query `publishedate` column, the `ADDRESS` column to the `content` column, and so on. The sample code then displays the generated query XML to show the results.
<!---- Get the feed data as a query from the orders table. ---->
<cfquery name="getOrders" datasource="cfartgallery">
    SELECT * FROM orders
</cfquery>

<!---- Map the orders column names to the feed query column names. ---->
<cfset columnMapStruct = StructNew()>
<cfset columnMapStruct.publisheddate = "ORDERDATE">
<cfset columnMapStruct.content = "ADDRESS">
<cfset columnMapStruct.title = "CUSTOMERFIRSTNAME">
<cfset columnMapStruct.rsslink = "ORDERID">

<!---- Set the feed metadata. ---->
<cfset meta.title = "Art Orders">
<cfset meta.link = "http://feedlink">
<cfset meta.description = "Orders at the art gallery">
<cfset meta.version = "rss_2.0">

<!---- Create the feed. ---->
<cffeed action="create"
    query="#getOrders#"
    properties="#meta#"
    columnMap="#columnMapStruct#"
    xmlvar="rssXML">

<cfdump var="#XMLParse(rssXML)#">

Reading feeds
The <cffeed> tag does not validate the feeds that it reads. It can read invalid or loosely formatted feeds, but ignores some or all of the invalid content. For example, if you put more than one <rights> element in the Atom feed (which invalidates the feed), the <cffeed> tag ignores the elements after the first one, and doesn’t generate an error.

Dates and times in feeds that are being read must be in W3C or RFC 822 format. ColdFusion can also read iTunes extension dates in the format normally used by the iTunes music store.

Example
The following example creates an RSS feed. Enter fields for the feed title, link, and description elements. Also enter title, link, and description fields for one item. A second item is optional. The application saves the feed in a createRSSOutput.xml file in the feedTest subdirectory of the directory that contains the CFML page.
<!--- Generate the feed when the user submits a filled in form. --->
<cfif isDefined("Form.Submit")>
  <cfscript>
    // Create the feed data structure and add the metadata.
    myStruct = StructNew();
    mystruct.link = form.link;
    myStruct.title = form.title;
    mystruct.description = form.description;
    mystruct.pubDate = Now();
    mystruct.version = "rss_2.0";

    /* Add the feed items. A more sophisticated application would use dynamic variables
     and support varying numbers of items. */
    myStruct.item = ArrayNew(1);
    myStruct.item[1] = StructNew();
    myStruct.item[1].description = StructNew();
    myStruct.item[1].description.value = form.item1text;
    myStruct.item[1].link = form.item1link;
    myStruct.item[1].pubDate = Now();
    myStruct.item[1].title = form.item1title;
    myStruct.item[2] = StructNew();
    myStruct.item[2].description = StructNew();
    myStruct.item[2].description.value = form.item2text;
    myStruct.item[2].link = form.item2link;
    myStruct.item[2].pubDate = Now();
    myStruct.item[2].title = form.item2title;
  </cfscript>

<!--- Generate the feed and save it to a file and variable. --->
<cffeed action = "create"
  name = "#myStruct#"
  outputFile = "feedTest/createRSSOutput.xml"
  overwrite = "yes"
  xmlVar = "myXML">
</cfif>

<!--- The user input form. --->
<cfform format="xml" preservedata="yes" style="width:500" height="700">
  <cfiformitem type = "text"> Enter The Feed Metadata</cfiformitem>
  <cfinput type = "text" label = "title" name = "title"
    style = "width:435" required = "yes"> <br />
  <cfinput type = "text" label = "link" name = "link"
The following application is a simple feed reader that handles RSS and Atom feeds. It displays the feed title; for each item or entry, it shows the title as a link, and shows the published date and the item or entry contents. To use this example to read the feed created by the first application, enter the URL for the file the application created, for example, http://localhost:8500/cffeed/feedTest/createRSSOutput.xml.

<!--- Process the feed data if the user submitted the form --->
<cfif isDefined("Form.Submit")>
<cffeed source="#theURL#"
properties="#myProps#"
query="#myQuery#">
<!--- Display the feed output.
Use conditional logic for to handle different feed formats. --->
<cfoutput>
<h2>#myProps.title#</h2>
<cfoutput query="#myQuery#">
<cfif #myProps.version# IS "atom_1.0">
<h3><a href="#linkhref#">#title#</a></h3>
<p><b>Published:</b> #DateFormat(publisheddate)#</p>
<cfelse>
<h3><a href="#rsmlink#">#title#</a></h3>
<p><b>Published:</b> #publisheddate#</p>
</cfif>
<p>#content#</p>
</cfoutput>
</cffeed>
</cfif>

<!--- The form for specifying the feed URL or file --->
<cfform name="SetFeed" preserveData = "yes">
Enter Feed URL:
<cfinput type = "text" size = "60" name = "theURL"/><br><br>
<cfinput type = "Submit" name = "submit" value = "Submit" />
</cfform>
cfile

Description
Manages interactions with server files.

The following sections describe the actions of the cfile tag:

- `cfile action = "append"
- `cfile action = "copy"
- `cfile action = "delete"
- `cfile action = "move"
- `cfile action = "read"
- `cfile action = "readBinary"
- `cfile action = "rename"
- `cfile action = "upload"
- `cfile action = "uploadAll"
- `cfile action = "write"

*Note:* To execute, this tag must be enabled in the ColdFusion Administrator. For more information, see Configuring and Administering ColdFusion.

If your ColdFusion applications run on a server used by multiple customers, consider the security of the files that could be uploaded or manipulated by cfile. For more information, see Configuring and Administering ColdFusion.

Category
File management tags

Syntax
The tag syntax depends on the `action` attribute value. See the following sections.

See also
cfdirectory

History
ColdFusion 10: Modifications to the attribute accept

ColdFusion 9: uploadAll action

ColdFusion 8: Support for reading and writing cfimages.

ColdFusion MX 7:
- Added the `result` attribute, which allows you to specify an alternate variable in which to receive result parameters. Used for `action="upload"` action.
- Added the `fixnewline` attribute for `action = "append"` and `action = "write"` actions.

ColdFusion MX 6.1:
- Changed file path requirements: if you do not specify an absolute file path, the path is relative to the ColdFusion temporary directory, which is returned by the `GetTempDirectory` function.

Last updated 7/9/2012
• Changed behavior for action="read": if the file starts with a byte order mark (BOM) ColdFusion uses it to determine the character encoding.

• Changed behavior for action="upload" nameConflict="MakeUnique" ColdFusion now makes filenames unique by appending an incrementing number, 1 for the first file, 2 for the second and so on, to the name. In ColdFusion, filenames were made unique by appending an additional ‘1’ for each file, as in 1, 11, 111, and so on.

ColdFusion MX:

• Changed use of slashes in paths: you can use forward (/) or backward (\) slashes in paths on both UNIX and Windows systems.

• Changed file hierarchy requirements: ColdFusion does not require that you put files and directories that you manipulate with this tag below the root of the web server document directory.

• Changed directory path requirements for the destination attribute: a directory path that you specify in the destination attribute does not require a trailing slash.

• Deprecated the system value of the attributes attribute.

• Deprecated the temporary value of the attributes attribute. In ColdFusion, it is a synonym for normal. It might not work in later releases.

• Changed the action attribute options read, write, append and move: they support a new attribute, charset.

• The archive value of the attributes attribute is obsolete and has no effect.

**Provide file content in the tag body**

For cffile action = "append" and cffile action = "write", you can provide file content in the tag body. If you provide file content in both the tag body and the output attribute, it results in an error.

In the following example, the text provided in the body is written to myfile.txt in the current directory.

Now assume that the file does not exist, then a new file myfile.txt is created. If the file exists, it is overwritten.

<!--- In this case, file content is passed via both - output attribute and inside tag body. Tag body will get preference --->
<cfset filename = expandpath('./myfile.txt')>
<cftry>
  <cffile action="write" file="#filename#">
    some tag body
  </cffile>
  <cfset content = FileRead(filename)>
  <cfoutput>File Length = #Len(content)#</cfoutput>
</cfcatch type="any">
  <cfoutput>
    #cfcatch.message#
    <br>#cfcatch.detail#
    <br>
  </cfoutput>
</cftry>

Similarly, if you use cffile action="append", the tag body content is appended to the contents of the file myfile.txt.

To create an empty file, you have to provide at least a blank line in the tag body as shown in the following code:

<cffile action="write" file="#filename#">
  <!--- Leave a blank line here---->
</cffile>
Modifications to the attribute `accept` in ColdFusion 10

The attribute `accept` takes comma-separated list of any or all extensions, MIME type, or list of MIME types as values. Specify the extensions with a . prefix. That is, only `.txt` is supported and not `txt`, `*.txt`, or `.*`. However, you can use `*` as a wildcard to accept all files.

- **If you specify filename extension as value**, the file is checked, only to ensure if it matches the list of extensions you specified in comma-separated list. If it matches, the file is uploaded.

- **If the value is MIME type or list of MIME types** and the attribute `strict` is set to `true`, then the first few bytes of the file are read to determine the MIME type. If MIME type matches with what you have specified, upload occurs, else results in an error. The default value of `strict` is `false`.

- **If you specify both filename extensions and MIME types** and if `strict` is set to `false`, the verification is based on the order in which you have specified the values. For example, if the first value is `.txt`, then the `.txt` file is uploaded.

  If `strict` is set to `true`, extensions are ignored.

**Example: Using the attribute accept to verify the filename extension**

`upload.cfm`

```cfc`
<cftry>
  <cfset variables.URL = "http://#cgi.server_name#:#cgi.server_port##getDirectoryFromPath(cgi.script_name)#_upload.cfm">
  <cfhttp method="Post" url="#variables.URL#">
    <cfhttpparam type="FILE" name="myfile" file="#expandpath('./sample.txt')#">
  </cfhttp>
  <cfoutput>#cfhttp.filecontent#</cfoutput>
</cfcatch>
<cfcatch>
  <cfoutput>
    #CFCATCH.message#
    <br>#CFCATCH.detail#
    <br>
  </cfoutput>
</cfcatch>
<cftry>
  _upload.cfm
```
<cfset uploadDirectory = "#GetTempDirectory()#cf_upload">
<!-- create upload directory --->
<cfif not directoryExists(uploadDirectory)>
    <cfdirectory action="create" directory="#uploadDirectory#">
</cfif>
<cftry>
    <cffile action="UPLOAD" destination="#uploadDirectory#" filefield="form.myFile"
        nameconflict="MAKEUNIQUE" accept=".txt">
    <cfcatch>
        <cfoutput>
            #CFCATCH.message#
            <br>#CFCATCH.detail#
            <br>
        </cfoutput>
    </cfcatch>
</cftry>
<!-- read directory --->
<cfdirectory action="LIST" directory="#uploadDirectory#" name="qFileList">
    <cfoutput>
        #qFileList.recordcount#
        file(s) uploaded
        <br>
    </cfoutput>
</cfoutput>
<!-- delete all the uploaded files--->
<!-- delete directory --->
<cfloop query="qFileList">
    <cffile action="delete" file="#uploadDirectory#/#Name#">
</cfloop>
<!-- delete directory --->
<!-- delete directory --->
<cfdirectory action="delete" directory="#uploadDirectory#">

In this example, accept is set to .txt and strict is not specified (and therefore is false by default). So, only files with .txt extensions are considered for upload.

Even if the file is originally a PDF (sample.pdf) renamed as sample.txt, the file is uploaded (since strict is not set to true).

If you specify strict=true, then if the file is originally a .txt (and not renamed from some other type) the file is uploaded only if the correct MIME type is specified. That is, strict=true requires MIME type to be specified in the accept attribute. So, you should explicitly say accept="text/plain" in _upload.cfm.

Example 2: Using MIME type
Modify the Example 1 by specifying accept="application/pdf" in _upload.cfm as follows:

<cffile action="UPLOAD"
    destination="#uploadDirectory#"
    filefield="form.myFile"
    nameconflict="MAKEUNIQUE"
    accept="application/pdf"
    strict=true>

Since strict = true, only files of type PDF are considered for upload.

To use a different file, modify the following section of upload.cfm:
<cfhttpparam type="FILE" name="myfile" file="#expandpath('./sample.txt')#"/>
Example 3: Using both extension and MIME type
Modify the Example 1 by specifying the following in _upload.cfm:

```html
<cffile 
    action="UPLOAD"
    destination="#uploadDirectory#"
    filefield="form.myFile"
    nameconflict="MAKEUNIQUE"
    accept=".txt, application/pdf"
    strict=true>
```

Only PDF files are uploaded because `strict = true`.

If you set `strict` as `false`, then both the files are uploaded.

To use a different file, modify the following snippet of upload.cfm:

```html
<cfhttpparam type="FILE" name="myfile" file="#expandpath('./sample.txt')#">
```

Example
<!--- This shows how to write, read, update, and delete a file using CFFILE.
This is a view-only example. --->
<!---
<cfif IsDefined("form.formsubmit") is "Yes">
<!--- The form has been submitted, now do the action. --->

cffile action = "append"

Description
Appends text to a text file on the server.

Syntax
<cffile
  action = "append"
  file = "full pathname"
  output = "string"
  addNewLine = "yes|no"
  attributes = "file attributes list"
  charset = "charset option"
  fixnewline = "yes|no"
  mode = "mode">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

Example
This example copies the keymemo.doc file to the c:\files\backup\ directory:

```html
<cffile action = "copy" source = "c:\files\upload\keymemo.doc"
  destination = "c:\files\backup\"/>
```
**cfile action = "delete"**

**Description**  
Deletes a file on the server.

**Syntax**  
```cftags`
cfcase action = "delete"
  file = "full pathname">
Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

</tbody>
</table>
Example
The following example moves the keymemo.doc file from the c:\files\upload\ directory to the c:\files\memo\ directory in Windows:

```
<cffile
    action = "move"
    source = "c:\files\upload\keymemo.doc"
    destination = "c:\files\memo\">
```

In this example, the destination directory is “memo.”

cffile action = "read"

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

Description
Reads a text file on the server. The file is read into a dynamic, local variable that you can use in the page. For example:

- Read a text file; insert the file’s contents into a database
- Read a text file; use the find and replace function to modify the file’s contents

Note: This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because this can bring down the server.

Syntax
```
<cffile
    action = "read"
    file = "full pathname"
    variable = "variable name"
    charset = "character set option">
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td></td>
<td>Type of file manipulation that the tag performs.</td>
</tr>
</tbody>
</table>
Usage
The following example creates a variable named Message for the contents of the file message.txt:

```cfc
<cffile action = "read"
   file = "c:\web\message.txt"
   variable = "Message">
```

The variable Message can be used in the page. For example, you could display the contents of the message.txt file in the final web page as follows:

```cfc
<cfoutput>#Message#</cfoutput>
```

ColdFusion supports functions for manipulating the contents of text files. You can also use the variable that is created by a `cffile action = "read"` operation in the `ArrayToList` and `ListToArray` functions.

**Note:** If you use this tag to read a file that is encoded using the Windows Cp1252 (windows-1252) encoding of the Latin-1 character set on a system whose default character encoding is Cp1252, and the files has characters encoded in the Hex 8x or 9x range, specify `charset="windows-1252"` attribute, even though this is the default encoding. Otherwise, some characters in the Hex8x and 9x ranges that do not map correctly and display incorrectly.
**cffile action = "readBinary"**

*Note:* You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**Description**

Reads a binary file (such as an executable or image file) on the server, into a binary object parameter that you can use in the page. To send it through a web protocol (such as HTTP or SMTP) or store it in a database, first convert it to Base64 using the `ToBase64` function.

*Note:* This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because they can bring down the server.

**Syntax**

```cffile
<cffile
  action = "readBinary"
  file = "full pathname"
  variable = "variable name">
```

cfindex

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td>Type of file manipulation that the tag performs.</td>
<td></td>
</tr>
<tr>
<td>file</td>
<td>Required</td>
<td>Pathname of a binary fine to read. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the GetTempDirectory function.</td>
<td></td>
</tr>
<tr>
<td>variable</td>
<td>Required</td>
<td>Name of variable to contain contents of binary file.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

You convert the binary file to Base64 to transfer it to another site.

ColdFusion supports reading an image file as a binary and passing the result to a `cfimage`, for example:

```cfc
<!--- Convert a JPG image to a binary object. --->
<cffile action="readBinary" file="maxwell05.jpg" variable="binaryObject">
<!--- Create a cfimage from the binary object variable. --->
<cfset myImage=ImageNew(binaryObject)>
```

**Example**

The following example reads the binary file `somewhere.jpg`, writes it to a different folder as `somewhereB.jpg`, and then displays the new file:

```cfc
```

Last updated 7/9/2012
<cffile action = "readBinary" file = "C:\inetpub\wwwroot\cfdocs\getting_started\photos\somewhere.jpg" variable = "aBinaryObj">

<!--- Output binary object to JPEG format for viewing. --->
<cffile action="write" file = "c:\files\updates\somewhereB.jpg" output = "#toBinary(aBinaryObj)#">

<!--- HTML to view image. --->
<img src="C:\files\updates\somewhereB.jpg">

**cffile action = "rename"**

**Description**
Renames or moves a file on the server.

**Syntax**
<cffile
    action = "rename"
    destination = "pathname"
    source = "full pathname"
    attributes = "file attributes list"
    mode = "mode">

**Note:** You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

**See also**
cfdirectory

**History**
See the History section of the main cffile tag page.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td></td>
<td>Type of file manipulation that the tag performs.</td>
</tr>
<tr>
<td>destination</td>
<td>Required</td>
<td></td>
<td>Destination file or directory. If not an absolute path, it is relative to the source directory.</td>
</tr>
</tbody>
</table>
Usage
The `rename` action renames or move a file. The `destination` attribute must be a pathname, not just a new name for the file. If the destination is a directory, the file is moved and not renamed.

Example
Windows example:

```html
<!--- Source Document is read-only but when renamed it becomes normal (not hidden or read-only). --->
<cffile action = "rename" source = "c:\files\memo\readonlymemo.doc"
        destination = "c:\files\memo\normalmemo.doc" attributes="normal">
```

UNIX example:

```
<cffile action = "rename" source = "#myWR#/memo/sample.txt"
        destination = "#myWR#/memo/other_sample.txt" mode="666">
```

cffile action = "upload"

Description
Copies a file to a directory on the server.
Syntax
<pre><code>&lt;cffile
    action = "upload"
    destination = "full pathname"
    fileField = "form field"
    accept = "MIME type|file type"
    attributes = "file attribute or list"
    mode = "permission"
    nameConflict = "behavior"
    result = "result name">
</code>&gt;</pre>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

</tbody>
</table>
ColdFusion Tags

Usage

After a file upload is completed, you can get status information using file upload parameters. To refer to parameters, use either the `cffile` prefix or, if you specified an alternate name in the `result` attribute, the name you specified there. For example, if you did not specify a name in the `result` attribute, access the `fileExisted` parameter as `#cffile.fileExisted#`. If you set the `result` attribute to `myResult`, however, access `fileExisted` as `#myResult.fileExisted#`.

Status parameters can be used anywhere that other ColdFusion parameters can be used.

When you use a `cform` tag or an HTML form tag to submit the form with the file to be uploaded, specify `enctype="multipart/form-data"` in the tag, as shown in the example for this tag. By default, ColdFusion sends the form with the encoding type of application/x-www-form-urlencoded, which causes an error in the `cffile` tag.

The `result` attribute allows functions or CFCs that get called from multiple pages at the same time to avoid overwriting the results of one call with another.

Note: The `file` prefix is deprecated, in favor of the `cffile` prefix. Do not use the `file` prefix in new applications.

If your page is uploading a file that was selected on a form or was otherwise sent to your page via a multipart/form-data HTTP message, you can determine the approximate size of the file by checking the value of the `CGI.content_length` variable. This variable includes the file length plus the length of any other request content.

The following file upload status parameters are available after an upload:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attemptedServerFile</td>
<td>Initial name ColdFusion used when attempting to save a file</td>
</tr>
<tr>
<td>clientDirectory</td>
<td>Directory location of the file uploaded from the client’s system</td>
</tr>
<tr>
<td>clientFile</td>
<td>Name of the file uploaded from the client’s system</td>
</tr>
<tr>
<td>clientFileExt</td>
<td>Extension of the uploaded file on the client system (without a period)</td>
</tr>
<tr>
<td>clientFileName</td>
<td>Name of the uploaded file on the client system (without an extension)</td>
</tr>
<tr>
<td>contentSubType</td>
<td>MIME content subtype of the saved file</td>
</tr>
</tbody>
</table>
Note: File status parameters are read-only. They are set to the results of the most recent cffile operation. If two cffile tags execute, the results of the second overwrite the first, unless you have specified a different result variable in the result attribute.

Example
The following example creates a unique filename, if there is a name conflict when the file is uploaded on Windows:

```html
<cfif isDefined("Form.FileContents")>
<!--- Check to see if the Form variable exists. --->
<!--- If TRUE, upload the file. --->
<cffile action = "upload"
    fileField = "FileContents"
    destination = "c:\files\upload\"
    accept = "text/html"
    nameConflict = "MakeUnique">
</cfif>
<!--- If FALSE, show the Form. --->
<form method="post" action="#cgi.script_name#" enctype="multipart/form-data">
    <input name="FileContents" type="file">
    <br>
    <input name="submit" type="submit" value="Upload File">
</form>
</cfif>
```
**cfile action = "uploadAll"**

**Description**
Copies all files sent to the page in an HTTP request to a directory on the server.

**Syntax**
```
<cfile
    action = "uploadAll"
    destination = "full pathname"
    accept = "list of MIME types"
    attributes = "file attribute or list"
    mode = "permission"
    nameConflict = "behavior"
    result = "result name">
```

**Note:** You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td></td>
<td>Type of file manipulation that the tag performs.</td>
</tr>
<tr>
<td>destination</td>
<td>Required</td>
<td></td>
<td>Pathname of directory in which to upload the file. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the GetTempDirectory function.</td>
</tr>
<tr>
<td>accept</td>
<td>Optional</td>
<td></td>
<td>Limits the MIME types to accept. Comma-delimited list. For example, the following code permits JPEG and Microsoft Word file uploads: accept=&quot;image/jpg, application/msword&quot; The browser uses the file extension to determine file type.</td>
</tr>
<tr>
<td>attributes</td>
<td>Optional</td>
<td></td>
<td>Applies to Windows. A comma-delimited list of attributes to set on the file. If omitted, the file's attributes are maintained. Each value must be specified explicitly. For example, if you specify attributes=&quot;readOnly&quot;, all other attributes are overwritten. * readOnly * hidden * normal (if you use this option with other attributes, it is overridden by them)</td>
</tr>
</tbody>
</table>
Usage

Unlike `cffile action="upload"`, which uploads only one file at a time, `cffile action="uploadall"` uploads multiple files thereby eliminating the need to code multiple `cffile action="upload"` statements.

Use this tag in the page specified by the `action` attribute of a `cffileupload` control. This tag uploads the files that the `cffileupload` control sends when the user clicks the Save File button.

After a file upload is completed, this tag creates an array of structures specified by the result parameter. Each structure in the array contains upload result information for one file. For information on the result structure contents, see `cffile action="upload"`.

**Note:** You can control the maximum file size of the upload by specifying the server Request Throttle Threshold or the Settings page of the Administrator Server Settings section.

Example

The following example copies files uploaded by a `cffileupload` tag to a temp directory.

```cfml
<cfif isdefined("form.submit")>
   <cffile action="uploadall" destination="#expandpath('./upload')#'">
</cfif>
<cfform action="#cgi.script_name#' enctype="multipart/form-data">
   <cfinput type="file" name="attachment1">
   <cfinput type="file" name="attachment2">
   <cfinput type="file" name="attachment3">
   <cfinput type="submit" name="submit" value="submit">
</cfform>
```

cffile action = "write"

Description

Writes a text file on the server, based on dynamic content. You can create static HTML files from the content, or log actions in a text file.
**Syntax**

```
<cffile
    action = "write"
    file = "full pathname"
    output = "content"
    addNewLine = "yes|no"
    attributes = "file attributes list"
    charset = "character set option"
    fixnewline = "yes|no"
    mode = "permission">
```

*Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.*

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <em>hidden</em></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <em>normal</em></td>
</tr>
</tbody>
</table>
Example

This example creates a file with information a user entered in an HTML insert form:

```cftags
<cffile action = "write"
   file = "c:\files\updates\#Form.UpdateTitle#.txt"
   output = "Created By: #Form.FullName#
            Date: #Form.Date#
            #Form.Content#">
```

If the user submitted a form with the following:

- UpdateTitle = "FieldWork"
- FullName = "World B. Frueh"
- Date = "10/30/01"
- Content = "We had a wonderful time in Cambridgeport."

ColdFusion would create a file named FieldWork.txt in the c:\files\updates\ directory and the file would contain the following text:

- Created By: World B. Frueh
- Date: 10/30/01
- We had a wonderful time in Cambridgeport.
This example shows the use of the `mode` attribute for UNIX. It creates the file `/tmp/foo` with permissions `rw-r--r--` (owner = read/write, group = read, other = read):

```cfml
<cffile action = "write"
  file = "/tmp/foo"
  mode = 644>
```

This example appends to the file and sets permissions to read/write (rw) for all:

```cfml
<cffile action = "append"
  destination = "/home/tomj/testing.txt"
  mode = 666
  output = "Is this a test?">
```

This example uploads a file and gives it the permissions owner/group/other = read/write/execute):

```cfml
<cffile action = "upload"
  fileField = "fieldname"
  destination = "/tmp/program.exe"
  mode = 777>
```

This example uses the `fixnewline` attribute to changes embedded line-ending characters in `xmlString`, which is derived from `xmlData`, to operating-system specific line endings.

```cfml
<cfxml variable="xmlData">
  <docroot>
    <payload type="string">This is some plain text</payload>
  </docroot>
</cfxml>
<cfset xmlString = toString(xmlData)>
<cfset key = createUUID()>
<cfset encString=encrypt(xmlString, key)>
<cffile action="write" addnewline="yes"
  file="C:\ColdFusion9\wwwroot\test\store.dat"
  output="#encString#" fixnewline="yes">
<cffile action="read" file="C:\ColdFusion9\wwwroot\test\store.dat"
  variable="retrievedString">
<cfset decString=decrypt(retrievedString, key)>
<cfset newXML = xmlParse(decString)>
```

ColdFusion supports using `cffile` to write an image, for example:

```cfml
<!--- Create a new cfimage. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Draw a square on the image. --->
<cfset ImageDrawRect(myImage,10,10,100,100)>
<!--- Use cffile to write the cfimage to a JPG. --->
<cffile action="write" output="#myImage#" file="C:\cfpix\square.jpg">
```

### cffileupload

**Description**

Displays a dialog for uploading multiple files from the user’s system.
The enhanced dialog includes the following features:

- You can specify the maximum number of files and the maximum file size for the upload.
- A progress bar to visually indicate the overall progress of the file upload task, and another progress bar to indicate the upload progress of each individual file.
- A success or failure message appears for each file upload and the overall upload task.
- At any point during the upload task, you can cancel the upload.

**Category**

File management tags, Forms tags

**Syntax**

```php
<cffileupload>
    addbuttonlabel = "label"
    align = align="center|left|right"
    bgcolor = "color"
    clearbuttonlabel = "label"
    deletebuttonlabel = "label"
    extensionfilter = "none|jpg,jpeg,png"
    height = "number of pixels"
    hideUploadButton = "true|false"
    maxfileselect = "number of files"
    maxuploadsize = "file size in mega bytes"
    name = "File uploader name"
    oncomplete = "JavaScript function name"
    onerror = "JavaScript function name"
    onUploadComplete = "JavaScript function name"
    progressbar = "true|false"
    stoponerror = "true|false"
    style = "style specification"
    title = "Title panel name"
    uploadbuttonlabel = "label"
    url = "URL"
    width = "number of pixels"
    wmode = "window|opaque|transparent"
</cffileupload>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

cffile action = "uploadAll"

**History**

ColdFusion 9: Added this tag.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>JavaScript object.</td>
</tr>
</tbody>
</table>
Usage
Use this tag to create a SWF file-based file upload control that lets a user upload multiple files to a server.

To upload files to the server, define a server-side template. The template that you define reads the upload request and uploads the selected files to the server.

Enhancements made in ColdFusion 9.0.1
In ColdFusion 9.0.1, the fileupload control passes the session information implicitly to the target page if session management is turned on either in Application.cfc or Application.cfm.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onError</td>
<td>Optional</td>
<td></td>
<td>The JavaScript function to run if the uploading of a file fails. The error can be a network error or server-side error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>By default, ColdFusion passes a JavaScript object as a parameter to this function with the following properties:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• STATUS - numeric value that is based on the HTTP status code</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• MESSAGE - Passed or Failed</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• FILENAME - Name of the file selected for upload</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>You can also pass the JavaScript object by creating a struct with parameters &quot;status&quot; and &quot;message&quot; and call serializeJSON() on the JavaScript object.</td>
</tr>
<tr>
<td>onUploadComplete</td>
<td>Optional</td>
<td></td>
<td>The JavaScript function to run after uploading all the files.</td>
</tr>
<tr>
<td>progressBar</td>
<td>Optional</td>
<td>true</td>
<td>Whether to display a progress bar while the files upload:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false</td>
</tr>
<tr>
<td>stopOnError</td>
<td>Optional</td>
<td>true</td>
<td>Specifies whether to ignore the exceptions for this operation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• true - Stops uploading and displays an appropriate error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false - Continues uploading and displays an appropriate error.</td>
</tr>
<tr>
<td>style</td>
<td>Optional</td>
<td></td>
<td>A CSS style specification that defines layout styles.</td>
</tr>
<tr>
<td>title</td>
<td>Optional</td>
<td></td>
<td>Title for the upload dialog.</td>
</tr>
<tr>
<td>uploadbuttonlabel</td>
<td>Optional</td>
<td>Upload</td>
<td>Label of the Upload button.</td>
</tr>
<tr>
<td>url</td>
<td>Optional</td>
<td></td>
<td>The URL to the server where the files are uploaded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The attribute is optional and it defaults to cgi.script_name.</td>
</tr>
<tr>
<td>width</td>
<td>Optional</td>
<td>420</td>
<td>Width of the file upload control, in pixels.</td>
</tr>
<tr>
<td>wmode</td>
<td>Optional</td>
<td>window</td>
<td>Specifies the absolute positioning and layering capabilities in your browser:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• window: Plays the media player in its own rectangular window on a web page</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• opaque: Hides everything behind the media player on the web page</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• transparent: Lets the background of the web page show through the transparent portions of the media player</td>
</tr>
</tbody>
</table>
Assume that fileupload control is defined without a URL attribute. In this case, if the user chooses to upload data using the upload button, the control comes back to the same page. Users can check for `form.fieldnames` to perform the upload as shown in the following example:

Upload.cfm

```cfml
<cfif isdefined("form.FIELDNAMES")>
  <cffile action = "upload" destination = "#ExpandPath('.')#" nameconflict="makeunique">
</cfif>
<cffileupload name="myuploader">

In this case, `url` defaults to CGI.script_name.

To maintain sessions between the fileupload control and the URL, users must turn on session management. You can do this by setting the `this.sessionmanagement=true` in Application.cfc. The setting ensures that CFID and CFtoken are passed as part of the URL if Enable J2EE Session Variables (ColdFusion Administrator > Server Settings > Memory Variables) is not selected. If it is selected, then JsessionID is passed as part of the URL.

**Supported Styles**
The following are the supported styles:

<table>
<thead>
<tr>
<th>Style</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headercolors</td>
<td>Format: color; colors of the band at the top of the DateChooser control. Specify two values, separated by a comma. For a solid band, use the same color for both values. The default value is ##E6EEEE,##FFFFFF.</td>
</tr>
<tr>
<td>textcolor</td>
<td>Color of text. Can be a hexadecimal value or a named color. For a hexadecimal value, use the form &quot;##xxxxxx&quot;, where x = 0-9 or A-F; use two number signs or none.</td>
</tr>
<tr>
<td>titletextalign</td>
<td>Aligns the title text. The recognized values are left, right, and center. The default value is right.</td>
</tr>
<tr>
<td>titletextcolor</td>
<td>Color of the title text.</td>
</tr>
<tr>
<td>bgcolor</td>
<td>The background color for the file upload control. A hexadecimal value without &quot;#&quot; prefixed or a recognized color name, for example red.</td>
</tr>
<tr>
<td>rollovercolor</td>
<td>Displays values on mouse-over.</td>
</tr>
<tr>
<td>selectcolor</td>
<td>Background color for a selected item. Can be a hexadecimal value or a named color. For a hexadecimal value, use the form &quot;##xxxxxx&quot;, where x = 0-9 or A-F; use two number signs or none. For a list of the supported named colors, see <code>cfchart</code>.</td>
</tr>
</tbody>
</table>
Example

<h3>Instructions</h3>
<p>Create a folder Upload in your C: drive</p>
<p>Try uploading files using the file upload component and check if the files have been appropriately saved in the Upload folder.</p>

<script>
var foo = function(result)
{
    alert(ColdFusion.JSON.encode(result));
}
</script>

<cffileupload
    url="uploadFiles.cfm"
    progressbar="true"
    name="myupload"
    addButtonLabel = "Add File"
    clearButtonLabel = "Clear it"
    hideUploadButton = "true"
    width=600
    height=400
    title = "File Upload"
    maxuploadsize="30"
    extensionfilter="*.jpg, *.png, *.flv, *.txt"
    BGCOLOR="#FFFFFF"
    MAXFILESELECT=10
    UPLOADBUTTONLABEL="Upload now"/>

uploadfiles.cfm is given below:

<cffile action="upload" destination="#expandpath('./upload')#" nameconflict="makeunique">
    <cfoutput>#serializeJSON({STATUS=200,MESSAGE='Passed'})#</cfoutput>
</cffile>

This example sends user-specified files to the server-side template - uploadfiles.cfm. The template file that you define can use the "upload" or "uploadall" action defined in the cffile tag.

Note: The filefield attribute of the upload action is optional.

Use the destination attribute in the cffile tag to define the location to save the files. For the uploadfiles.cfm code, see cffile action = "uploadAll".

cffinally

Description
Used inside a cftry tag. Code in the cffinally block is processed after the main cftry code and, if an exception occurs, the cfcatch code. The cffinally block code always executes, whether or not there is an exception.

Category
Exception handling tags
Syntax
<cftry>
  try code<cfcatch>
  catch code<cfcatch>
  ...
  <cffinally>
    final code</cffinally>
</cftry>

See also
cftry, cfcatch, cferror, cfrethrow, cfthrow, onError; Handling Errors in the Developing ColdFusion Applications

History
ColdFusion 9: Added the tag

Usage
The cffinally tag is optional in a cftry block, and the block can have only one cffinally tag. Put the cffinally tag at the end of all cftry block, after any cfcatch blocks. This tag requires an end tag. You can nest cftry/cfcatch/cffinally blocks.

Use the cffinally tag for code that should execute whether or not an exception occurs. For example, use it to free up resources.

Example
<h3>cffinally Example</h3>
<!--- Open a cftry block. --->
<cftry>
  ...  
  <cfcatch type = "Database">
  ...
  </cfcatch>
  <cffinally>
  ...
  </cffinally
</cftry>

cfflush

Description
Flushes currently available data to the client.

Category
Data output tags, Page processing tags

Syntax
<cfflush
  interval = "integer number of bytes">
Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcache, cfheader, cfinclude, cfsetting, cfsilent

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>Optional</td>
<td>Integer</td>
<td>Flushes output each time this number of bytes becomes available. HTML headers, and data that is already available when the tag is executed, are omitted from the count.</td>
</tr>
</tbody>
</table>

Usage

The first occurrence of this tag on a page sends back the HTML headers and any other available HTML. Subsequent cfflush tags on the page send only the output that was generated after the previous flush.

When you flush data, ensure that enough information is available, as some browsers might not respond if you flush only a small amount. Similarly, set the interval attribute for a few hundred bytes or more, but not thousands of bytes.

Use the interval attribute only when a large amount of output is sent to the client, such as in a cfloop or a cfoutput of a large query. Using this form globally (such as in the Application.cfm file) might cause unexpected errors when CFML tags that modify HTML headers are executed.

Because the cfflush tag sends data to the browser when it executes, it has several limitations, including the following:

- Using any of the following tags or functions on a page anywhere after the cfflush tag can cause errors or unexpected results: cfcontent, cfcookie, cfheader, cfform, cfhtmlhead, cflocation, and SetLocale. Similarly, do not use any tags that use AJAX features, including cfdiv, cfform, cfformarea, cfgrid, cfgridheader, cfgridcell, cftooltip, cfwindow, or HTML format cfgrid, cftree, cftextarea, or cfinput (using autosuggest or datefield attributes) tags. All of the preceding tags and functions normally modify the HTML header, but cannot do so after a cfflush tag, because the cfflush sends the header.

- Using the cfset tag to set a cookie anywhere on a page that has a cfflush tag does not set the cookie in the browser.

- Using the cfflush tag in the body of several tags, including cfsavecontent, cfquery, and custom tags, causes errors.

- If you save Client variables as cookies, any client variables that you set after a cfflush tag are not saved in the browser.

**Note:** Normally, the cfflush tag discards the current output buffer and replaces it with the contents of the error page. The cfflush tag discards the current buffer. As a result, the Error. GeneratedContent variable resulting from a cfflush tag after a cfflush contains any contents of the output buffer that has not been flushed. This content is not sent to the client. The content of the error page displays to the client after the bytes that have been sent.

Example

The following example uses cfloop tags and the rand random number generating function to delay data display. It simulates a page that is slow to generate data.
<h1>Your Magic numbers</h1>
<p>It will take us a little while to calculate your ten magic numbers. It takes a lot of work to find numbers that truly fit your personality. So relax for a minute or so while we do the hard work for you.</p>
<h2>We are sure you will agree it was worth the short wait!</h2>
<cfflush>
<cfflush interval=10>
<!--- Delay Loop to make it seem harder. --->
<cfloop index="randomindex" from="1" to="200000" step="1">
   <cfset random=rand()>
</cfloop>
<!--- Now slowly output 10 random numbers. --->
<cfloop index="Myindex" from="1" to="10" step="1">
   <cfloop index="randomindex" from="1" to="100000" step="1">
      <cfset random=rand()>
   </cfloop>
   <cfoutput>
      Magic number #Myindex# is: &nbsp;&nbsp;&#RandRange\(100000, 999999\)\n<br><br>
   </cfoutput>
</cfloop>
</cfflush>

<cfform>

**Description**
Builds a form with CFML custom control tags; these provide more functionality than standard HTML form input elements. You can include the resulting form on the client page as HTML or Adobe Flash content, and generate the form by using XML and XSLT.

**Category**
Forms tags
Syntax
<cfform
    accessible = "yes|no"
    action = "form action"
    archive = "URL"
    codeBase = "URL"
    format = "HTML|Flash|XML"
    height = "pixels|percent"
    id = "HTML id" method = "POST|GET"
    name = "name"
    onError = "JavaScript function name or ActionScript code"
    onLoad = "load event script" onReset = "reset event script" onSubmit = "JavaScript"
    onSuccess = "JavaScript function name"
    preloader = "yes|no"
    preserveData = "yes|no"
    scriptSrc = "path"
    skin = "Flash skin|XSL skin"
    style = "style specification"
    timeout = "seconds"
    width = "pixels|percent"
    wMode = "window|transparent|opaque">
...
</cfform>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

cfajaximport, cfapplet, cfcalendar, cfformgroup, cfformitem, cfgrid, cfinput, cfselect, cfslider, cftextarea, cftree; Requesting and Presenting Information in the Developing ColdFusion Applications

History
ColdFusion 8:
• Added support for adding interactive fields in PDF forms.
• Added the onSuccess attribute and support in AJAX controls for the onError attribute

ColdFusion MX 7:
• Added ability to set the default value of the scriptSrc attribute in the ColdFusion Administrator.
• Deprecated the passthrough attribute. The tag now supports all HTML form tag attributes directly.
• Added the method attribute and support for the GET method.
• Added support for Flash and XML output, including the format, height, width, preloader, timeout, wMode, accessible, and skin attributes.
• Added cfformgroup, cfformitem, and cftextarea child tags.
• Added the onReset attribute.

ColdFusion MX:
• Deprecated the enableCAB attribute. It might not work, and might cause an error, in later releases.
• Changed the name and action attributes to optional.

Last updated 7/9/2012
• Changed integer validation to require an integer value. In previous releases it would convert a floating point value to an integer.

Attributes

The following table lists attributes that ColdFusion uses directly. For HTML format forms, this tag also supports the standard HTML form tag attributes that are not on this list, and passes them directly to the browser. ColdFusion also includes all supported HTML attributes in the XML.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Applies to</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessible</td>
<td>Flash</td>
<td>Opt</td>
<td>no</td>
<td>Specifies whether to include support screen readers in the Flash form. Screen reader support adds approximately 80 KB to the SWF file sent to the client.</td>
</tr>
<tr>
<td>action</td>
<td>Flash, HTML, XML</td>
<td>Opt</td>
<td>See Description</td>
<td>Name of ColdFusion page to execute when the form is submitted for processing. If you omit this attribute and the method is get, the form posts to the page identified by the CGI.SCRIPT_NAME variable (the requested page that resulted in displaying the form). If the method is post, the form posts to the page identified by the CGI.QUERY_STRING variables.</td>
</tr>
<tr>
<td>archive</td>
<td>applets in HTML and XML</td>
<td>Opt</td>
<td>/CFIDE/classes/cfapplets.jar</td>
<td>URL of downloadable Java classes for cfgrid, cfslider, and cftree applet controls.</td>
</tr>
<tr>
<td>codeBase</td>
<td>applets in HTML and XML</td>
<td>Opt</td>
<td>/CFIDE/classes/cf-j2re-win.cab</td>
<td>URL of downloadable JRE plug-in for Internet Explorer; used for cfgrid, cfslider, and cftree Java applet controls.</td>
</tr>
</tbody>
</table>
| format    | Flash, HTML, XML | Opt     | HTML    | • HTML: generates an HTML form and send it to the client. cfgrid and cftree child controls can be in Flash or applet format.  
• Flash: generates a Flash form and send it to the client. All controls are in Flash format.  
• XML: generates XForms-compliant XML and save the results in a variable specified by the name attribute. By default, ColdFusion also applies an XSL skin and displays the result. For more information, see the skin attribute. |
| height    | Flash, XML | Opt     | 100%    | The height of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as "height=60%" to specify a percentage of the available width. The displayed height might be less than the specified size.  
Note: The width and height attributes are required for Flash forms, if they are used inside of a table. |
| id        | name attribute value |          |         | the HTML id of the form. |
| method    | Flash, HTML, XML | Opt     | post    | The method the browser uses to send the form data to the server:  
• post: sends the data using the HTTP post method. This method sends the data in a separate message to the server.  
• get: sends the data using the HTTP get method, which puts the form field contents in the URL query string. |
### ColdFusion Tags

**Name**

A name for the form.

In HTML format, if you omit this attribute and specify an `id` attribute, ColdFusion does not include a name attribute in the HTML sent to the browser; this behavior lets you use the `cfform` tag to create XHTML-compliant forms. If you omit the `name` attribute and the `id` attribute, ColdFusion generates a name of the form `CFForm_n` where `n` is a number that is assigned serially to the forms on a page.

**OnError**

For Flash format forms: Applies only for `onSubmit` or `onBlur` validation; has no effect for `onServer` validation.

An ActionScript expression or expressions to execute if the user submits a form with one or more validation errors.

For HTML format forms: Applies only to forms inside `cfdiv`, `cflayout`, `cfpod`, or `cfwindow` controls. The name of a JavaScript function that runs if an asynchronous form submission fails. For more information, see the Usage section.

**OnLoad**

JavaScript to execute when the form loads.

**OnReset**

JavaScript to execute when the user clicks a reset button.

**OnSubmit**

JavaScript or ActionScript function to execute to preprocess data before form is submitted. If any child tags specify `onSubmit` field validation, ColdFusion does the validation before executing this JavaScript.

**OnSuccess**

Applies only to forms inside `cfdiv`, `cflayout`, `cfpod`, or `cfwindow` controls. The name of a JavaScript function that runs when an asynchronous form submission succeeds. For more information see the Usage section.

**Preloader**

Specifies whether to display a progress bar when loading the Flash form.

**PreserveData**

When the `cformaction` attribute posts back to the page that contains the form, this attribute determines whether to override the control values with the submitted values.

- `no`: uses values specified in the control tag attributes.
- `yes`: uses corresponding submitted values.

Applies to these controls:

- `cfinput`, `cfslider`, `cftextinput`: overrides the `value` attribute value.
- `cfselect` controls that are populated from queries: overrides the `selected` attribute. See `cfselect`.
- `cftree` controls: overrides the `cftreeitemexpand` attribute. If `yes`, expands previously-selected elements. The `cftreecompletePath` attribute must be set to `yes`.
- `cfgrid` controls: has no effect. (This avoids confusion as to whether data has been resubmitted to the database by the control.)

<td>HTML, XML</td>
<td>Opt</td>
<td>no</td>
<td>When the <code>cformaction</code> attribute posts back to the page that contains the form, this attribute determines whether to override the control values with the submitted values.</td>
</tr>
</tbody>
</table>

- `no`: uses values specified in the control tag attributes.
- `yes`: uses corresponding submitted values.

Applies to these controls:

- `cfinput`, `cfslider`, `cftextinput`: overrides the `value` attribute value.
- `cfselect` controls that are populated from queries: overrides the `selected` attribute. See `cfselect`.
- `cftree` controls: overrides the `cftreeitemexpand` attribute. If `yes`, expands previously-selected elements. The `cftreecompletePath` attribute must be set to `yes`.
- `cfgrid` controls: has no effect. (This avoids confusion as to whether data has been resubmitted to the database by the control.)

<tr>
<td>Flash, HTML, XML</td>
<td>Opt</td>
<td>See Description</td>
<td>Specifies the URL, relative to the web root, of the directory that contains ColdFusion JavaScript files, including the cfform.js file with the client-side JavaScript used by this tag and its child tags. For XML format forms, this directory is also the default directory for XSLT skins. When you use this attribute, the specified directory must have the same structure as the /CFIDE/scripts directory. For example, if you specify <code>scriptsrc=&quot;/resources/myScripts&quot;</code>, the JavaScript files used by ColdFusion AJAX features must be in the /resources/myScripts/ajax directory. This attribute is useful if the file is not in the default location. This attribute may be required in some hosting environments and configurations that block access to the /CFIDE directory. The location is set in the ColdFusion Administrator; by default, it is /CFIDE/scripts. <strong>Notes:</strong> If you specify this attribute, copy the CF_RunActiveContent.js file from the CFIDE/scripts directory to the specified directory. You can have only one <code>scriptsrc</code> attribute on a page, including any <code>cfajaximport</code> tag <code>scriptsrc</code> attribute. If you have multiple <code>cfform</code> tags, you can specify the <code>scriptsrc</code> attribute in a <code>cfajaximport</code> tag and it applies to all HTML format forms.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Applies to</td>

<td>---------</td>
</tr>
</tbody>
</table>
| skin      | Flash, XML | Opt     | Flash: haloGreen XML: default.xsl | **Flash:** Use a halo color to stylize the output. The skin determines the color used for highlighted and selected elements.  
  - haloSilver  
  - haloBlue  
  - haloGreen  
  - haloOrange  

**XML:** Specifies whether to apply an XSL skin and display the resulting HTML to the client. Can be any of the following:  
  - ColdFusion skin name: applies the specified skin.  
  - XSL file name: applies the skin located in the specified path.  
  - none: does not apply an XSL skin. Your CFML page must process the XML that ColdFusion saves in the variable specified by the `name` attribute, and display any results.  
  - omitted or default: uses the ColdFusion default skin.  

You can specify the following ColdFusion skins (located in the `cf_webroot\x`  
  - basic  
  - basıccss  
  - beige  
  - blue  
  - lightgray  
  - red  
  - silver  

A filename can be any of the following:  
  - absolute URL  
  - URL relative to the web root  
  - absolute file path  
  - name of a file in the scripts folder or a subdirectory of the `cf_webroot\CFIDE\scripts` directory. In this case, do not specify the `.xsl` suffix.  

| style     | HTML, Flash, XML | Opt     | Styles to apply to the form. In HTML or XML format, ColdFusion passes the style attribute to the browser or XML.  
  In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see Creating Forms in Flash in the Developing ColdFusion Applications. |
### Usage

This tag requires an end tag.

You can use the following ColdFusion form control tags in the `cfform` tag:

- **cfapplet**: Used in HTML and XML format only; embeds a registered Java applet.
- **cfappletgroup**: Used in Flash and XML format only; groups and arranges child controls.
- **cfappletitem**: Used in Flash and XML format only; adds horizontal rules, vertical rules, and text to the form.
- **cfgrid**: Creates a grid control to display tabular data.
- **cfinput**: Creates an input element.
- **cfselect**: Creates a drop-down list box.
- **cfslider**: Used in HTML and XML format only; creates a slider control.
- **cftextarea**: Creates a multiline text input box.
- **cfslider**: Creates a slider.

In HTML format, all tags, and in Flash format the `cfgrid` and `cftree` tags, require JavaScript support on the browser. The `cfapplet` tag and applet format `cfgrid`, `cftree`, and `cfvision` tags require the client to download a Java applet.

If you specify Flash format in the `cfform` tag, ColdFusion ignores any HTML in the form body. Use ColdFusion tags, such as `cfinput`, for all form controls. You can include individual Flash format `cfgrid` and `cftree` controls in an HTML format `cfform` tag.

---

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Applies to</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Flash</td>
<td>Opt</td>
<td>0</td>
<td>Integer number of seconds for which to keep the form data in the Flash cache on the server. A value of 0 prevents the data from being cached. For more information, see Caching data in Flash forms in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>width</td>
<td>Flash</td>
<td>Opt</td>
<td>100%</td>
<td>The width of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as <code>width=60%</code> to specify a percentage of the available width. Note: The <code>width</code> and <code>height</code> attributes are required for Flash forms, if they are used inside of a table.</td>
</tr>
<tr>
<td>wmode</td>
<td>Flash</td>
<td>Opt</td>
<td>window</td>
<td>Specifies how the Flash form appears relative to other displayable content that occupies the same space on an HTML page. • <code>window</code>: the Flash form is the topmost layer on the page and obscures anything that would share the space, such as drop-down dynamic HTML lists. • <code>transparent</code>: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, transparent regions in the form show the content that is below it. • <code>opaque</code>: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, it blocks any content that is below it.</td>
</tr>
</tbody>
</table>

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML as html namespace attributes to the `form` tag.
In Flash format, if your forms do not request sensitive data (such as credit card numbers), consider setting the `timeout` attribute. This can prevent users from getting "The form data has expired. Please reload this page in your browser" errors if they use the browser back button to return to the form. For more information, see Caching data in Flash forms in the Developing ColdFusion Applications.

**Note:** In Flash format, if you do not specify `height` and `width` attributes, Flash reserves browser space equal to the area of the browser window. If any other output follows the form, users must scroll to see it. Therefore, if you follow a Flash form with additional output, specify the `height` and `width` values. The `width` and `height` attributes are required for Flash forms, if they are used inside of a table.

If attribute value text must include quotation marks, escape them by doubling them.

**Using the `onError` attribute in Flash forms**

If you use onSubmit or onBlur validation, the `onError` attribute lets you specify ActionScript code to execute if the user tries to submit a Flash form with validation errors, as follows:

- If you specify one or more valid Flash expressions, Flash executes the expressions.
- If you omit the attribute, Flash displays a dialog box with all applicable error messages.
- If you specify `onError=""` (an empty string) Flash does not display any message, but does not submit the form.

Your ActionScript can use the `errors` variable to determine the fields and errors. The `errors` object has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The <code>name</code> attribute of the control’s CFML tag.</td>
</tr>
<tr>
<td>field</td>
<td>The internal name used by Flash for the field name (for example, <code>_level0.field1</code>).</td>
</tr>
<tr>
<td>value</td>
<td>The value in the field.</td>
</tr>
<tr>
<td>message</td>
<td>The <code>message</code> attribute of the control’s CFML tag.</td>
</tr>
</tbody>
</table>

The following example shows `cfform` tags with an `onError` attribute that selects the tab in an accordion or tab navigator that contains a lastName field with an invalid entry:

```html
<cfform name="form1" format="flash" width="800" height="500"
    onError="if (errors['lastName'] != undefined)
    {tabA.selectedIndex=0; _root.lastName.setFocus();}">
</cfform>
```

**Incorporating HTML form tags and attributes**

In HTML format, the `cfform` tag lets you incorporate the following standard HTML elements. They are not available in Flash format:

- Standard HTML `form` tag attributes and values. The attributes and values are included in the `form` tag that `cfform` outputs in the page. For example, you can use `form` tag attributes like `target` or `onMouseOver` with `cfform`.
- HTML tags that can ordinarily be put within the HTML `form` tag. For example, you can use the HTML `input` tag to create a submit button in a `cfform`, without the other features of `cfinput`:

```html
<cfform>
    <input type = "Submit" value = " update... ">
</cfform>
```
Using forms in cfdiv, cflayout, cffpod, and cfwindow controls
The cfdiv, cflayout, cffpod, and cfwindow tags create AJAX-based controls that can serve as containers for interactive forms. When you use such a structure, you do not want submitting form information to cause a new page to be displayed; instead, you want dynamic code to modify the existing page without causing a complete reload. You can do this by using the onSuccess and onError attributes.

The function specified by the onSuccess attribute gets called if the form data is submitted successfully. This function is responsible for updating the pod, layout, or window to reflect the results of the submission, for example, to display additional data or pop up a confirmation window. This function must not take any arguments.

The function specified by the onError attribute gets called if an error occurs when the form data is submitted. This function is responsible for handling the error, such as displaying an error message. This function must take two arguments: an error number and an error message.

Incorporating interactive fields in PDF forms
ColdFusion lets you use the cfform tag to create PDF forms that contain static and interactive form fields. The cfform tag must exist within a cfdocument tag (where format=pdf). Only one cfform tag can exist within a cfdocument tag.

Completed forms can be posted to the server as an HTTP Post, or the entire PDF can be submitted as binary stream. If the PDF is submitted, you can use the cffile tag to save completed PDF form to a hard drive:

```<cffile action="write" file="c:\savedpdf.pdf" output="#PDF.content#">```

The output can be manipulated and extracted by using the tag.

Only the following cfform attributes are supported in generating PDF forms:

- action
- format
- method
- name
- onSubmit
- skin
- style

To embed an existing PDF form generated by LiveCycle Designer or Acrobat, use the tag.
Example

```cfml
<h3>cfform Example</h3>
<!---- If Form.oncethrough exists, the form has been submitted. --->
<cfif IsDefined("Form.oncethrough")>
  <cfif IsDefined("Form.testVal1")>
    <h3>Results of Radio Button Test</h3>
    <cfif Form.testVal1> Your radio button answer was yes </cfif>
    <cfelse> Your radio button answer was no </cfif>
  </cfif>
  <h3>Results of Checkbox Test</h3>
  <cfif IsDefined("Form.chkTest2")>
    Your checkbox answer was yes
    <cfelse>
      Your checkbox answer was no
    </cfif>
  </cfif>
  <cfif IsDefined("Form.textSample") AND Form.textSample is not ">"
    <h3>Results of Credit Card Input</h3>
    Your credit card number, <cfoutput>#Form.textSample#</cfoutput>,
    was valid under the MOD 10 algorithm.
  </cfif>
  <cfif IsDefined("Form.sampleSlider")>
    <cfoutput>
      <h3>You gave this page a rating of #Form.sampleSlider#</h3>
    </cfoutput>
  </cfif>
  <hr noshade="True">
</cfif>
<!---- Begin by calling the cfform tag. --->
<cfform name="cfformexample">
  <h4>This example displays radio button input type for cfinput.</h4>
  Yes <cfinput type = "Radio" name = "TestVal1" value = "Yes" checked>
  No <cfinput type = "Radio" name = "TestVal1" value = "No">
  <h4>This example displays checkbox input type for cfinput.</h4>
  <cfinput type = "Checkbox" name = "ChkTest2" value = "Yes">
  <h4>This shows client-side validation for cfinput text boxes.</h4>
  (i) This item is optional (i)<br>
  Please enter a credit card number:
  <cfinput type = "Text" name = "TextSample"
    message = "Please enter a Credit Card Number"
    validate = "creditcard" required = "No">
  <h4>This example shows the use of the cfslider tag.</h4>
  Rate your approval of this example from 1 to 10 by sliding control.<br>
  1 <cfslider name = "sampleSlider" width="100"
    label = "Page Value: " range = "1,10"
    message = "Please enter a value from 1 to 10" > 10
  </cfinput> 10
  <p><cfinput type = "submit" name = "submit" value = "show me the result">
  <cfinput type = "hidden" name = "oncethrough" value = "Yes"></p>
</cfform>

A simple XML form

The following example shows a simple XML-format form. It uses the default.xsl transform that is supplied with ColdFusion to generate the HTML output for display:
<cfform name="testXForm" format="XML" skin="basic">
<!---- Use cfformgroup to put the first and last names on a single line. --->
  <cfformgroup type="horizontal">
    <cfinput type="text" name="firstname" label="First Name:" value="Robert">
    <cfinput type="text" name="lastname" label="Last Name:" value="Smith">
  </cfformgroup>
<cfinput type="password" name="password" label="Password:" value="">
<cfinput type="hidden" name="hidden" label="hidden:" value="">
<cfselect name="state" style="width:200" label="State">
  <option>California</option>
  <option selected>Utah</option>
  <option>Iowa</option>
  <option selected>New York</option>
</cfselect>
<cftextarea name="description" label="Description:" rows="5" cols="40">
  this is sample text.</cftextarea>
</cfform>

A simple PDF form
<cfdocument format="pdf">
  <cfdocumentsection ../>
  ...
  ...
  <cfform type="html/xform">
    <cfinput type="textbox" name="employeeName" value="#fullName#" readonly="true">
    <cfinput type="textbox" name="employeeID" value="#id#" readonly>
    <cfselect name="contributionPercentage" options="#optionsStruct#" required="true">
    <cfinput type="submit" name="SubmitAsHTTPPost">
    <cfinput type="submit" name="SubmitAsPDF" submitType="PDF">
  </cfform>
  ...
  ...
  <cfdocumentsection ../>
</cfdocument>

**cfformgroup**

**Description**
Creates a container control for multiple form controls. Used in the **cfform** tag body of Adobe Flash and XML forms. Ignored in HTML forms.

**Category**
Forms tags
Syntax
<cfformgroup
    type = "group type"
    label = "label"
    style = "style specification"
    selectedIndex = "page number">
    width = "pixels"
    height = "pixels"
    enabled = "yes|no"
    visible = "yes|no"
    onChange = "ActionScript expression"
    tooltip = "text"
    id = "unique identifier">
    ...ColdFusion forms controls...
</cfformgroup>

OR

<cfformgroup
    type = "repeater"
    query = "query object"
    maxrows = "integer">
    startrow = "row number"
    ...ColdFusion forms controls
</cfformgroup>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

History
ColdFusion MX 7: Added this tag.

Attributes
The following table lists the attributes and their behavior in Flash forms. For XML, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion.

Note: Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt: formats</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Required; Flash and XML</td>
<td>XML: Can be any XForms group type defined in the XSLT. The XSL skins provided with ColdFusion support the following types:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• horizontal: align child tags horizontally within a form and put this tag's label attribute to the left of the children.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• vertical: align child tags vertically within a form and put this tag's label attribute to the left of the children.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fieldset: corresponds to the HTML fieldset tag, which groups its children, typically by drawing a box around them and replacing part of the top line with legend text. To specify the legend, use the label attribute. To specify the box dimensions, use the style attribute with height and width values. Explicitly use cfformgrouptype=&quot;vertical&quot; inside this formgroup to align its child tags vertically.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Flash: Must be one of the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• repeater: dynamically creates an instance of the cfformgroup's child tag or tags for each row of a query object, without requiring ColdFusion to recompile the Flash SWF file when the number of rows changes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• horizontal: aligns child tags horizontally within a form and put this tag's label attribute to the left of the children. Use this tag to arrange individual controls horizontally.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• vertical: aligns child tags vertically within a form and puts this tag's label attribute to the left of the children. Use this tag to arrange individual controls vertically.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• hbox: aligns children horizontally. Use this type to arrange groups of form controls horizontally. Do not use this attribute to align individual controls horizontally, because the child controls do not align properly; use the horizontal type instead.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• vbox: aligns children vertically. Use this type to arrange groups of controls vertically. Do not use this attribute to align individual controls vertically, because the child controls do not align properly; use the vertical type instead.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• hdividedbox: aligns children horizontally. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use a tag with this attribute to arrange groups of form controls horizontally. You cannot use this attribute to align individual controls horizontally.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• vdividedbox: aligns children vertically. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use this type to group form controls, for example as a unit in an hbox form group. Do not use this attribute to align individual tags vertically.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• panel: a container consisting of a title bar containing the label attribute text, a border, and a content area with vertically arranged children.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tile: places the children in a rectangular grid.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• accordion: places each child in a pleat of an expanding and contracting accordion. Define each pleat using a cfformgroup type=&quot;page&quot; tag.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tabnavigator: places the children in a tabbed dialog box. Define each tab by using a cfformgroup type=&quot;page&quot; tag.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• page: places the children tags, aligned vertically, in a single tab of a parent tabnavigator or pleat of an accordion container.</td>

<td>-----------------------------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>query</td>
<td>Required; for type= repeater, ignored otherwise; Flash</td>
<td></td>
<td>The query to use with the repeater. Flash creates an instance of each of the <code>cfformgroup</code> tag’s child tags for each row in the query. You can use the <code>bind</code> attribute in the child tags to use data from the query row for the instance.</td>
</tr>
<tr>
<td>enabled</td>
<td>Optional; Flash</td>
<td>yes</td>
<td>Boolean value that specifies whether the controls in the form group are enabled. Disabled controls appear in light gray.</td>
</tr>
<tr>
<td>height</td>
<td>Optional; Flash</td>
<td></td>
<td>Height of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container height. Ignored for Flash repeater type.</td>
</tr>
<tr>
<td>id</td>
<td>Optional; Flash</td>
<td></td>
<td>Unique identifier for the form group.</td>
</tr>
<tr>
<td>label</td>
<td>Optional; Flash and XML</td>
<td></td>
<td>Label to apply to the form group.</td>
</tr>
<tr>
<td></td>
<td>In Flash, does the following:</td>
<td></td>
<td>• For a page or panel form group, determines the label to put on the corresponding accordion pleat, the tabnavigator tab, or the panel title bar. For a Flash horizontal or vertical form group, specifies the label to put to the left of the group.</td>
</tr>
<tr>
<td></td>
<td>• Ignored in Flash for repeater, hbox, hdividedbox, vbox, vdividedbox, tile, accordion, and tabnavigator types.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>maxrows</td>
<td>Optional; Flash</td>
<td></td>
<td>Used only for the <code>repeater</code> type; ignored otherwise.</td>
</tr>
<tr>
<td></td>
<td>Specifies the maximum number of query rows to use in the Flash form repeater. If the query has more rows than the sum of the <code>startrow</code> attribute and this value, the repeater does not use the remaining rows.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>onChange</td>
<td>Optional; Flash</td>
<td></td>
<td>Tabnavigator and accordion types only: ActionScript expression or expressions to execute when a new tab or accordion page is selected. <strong>Note:</strong> The <code>onChange</code> event occurs when the form first appears.</td>
</tr>
<tr>
<td>selectedIndex</td>
<td>Optional; Flash only</td>
<td></td>
<td>Used only for accordion and tabnavigator types; ignored otherwise. Specifies the page control to display as open, where 0 (not 1) specifies the first page control defined in the group.</td>
</tr>
<tr>
<td>startrow</td>
<td>Optional; Flash</td>
<td>0</td>
<td>Used only for the <code>repeater</code> type; ignored otherwise.</td>
</tr>
<tr>
<td></td>
<td>Specifies the row number of the first row of the query to use in the Flash form repeater. This attribute is zero-based: the first row is row 0, not row 1 (as in most ColdFusion tags).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>style</td>
<td>Optional; Flash and XML</td>
<td></td>
<td><strong>Flash:</strong> a Flash style specification in CSS format. For detailed information on specifying Flash styles, see Creating Forms in Flash in the Developing ColdFusion Applications. <strong>XML:</strong> an inline CSS style specification.</td>
</tr>
<tr>
<td>tooltip</td>
<td>Optional; Flash</td>
<td></td>
<td>Text to display when the mouse pointer hovers in the form group area. If a control in the form group also specifies a tooltip, Flash displays the control’s tooltip when the mouse pointer hovers over the control.</td>
</tr>
<tr>
<td>visible</td>
<td>Optional; Flash</td>
<td>yes</td>
<td>Boolean value specifying whether the controls in the form group are visible. If the controls are invisible, the space that would be occupied by visible controls is blank.</td>
</tr>
<tr>
<td>width</td>
<td>Optional; Flash and XML</td>
<td></td>
<td>Width of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container width. Ignored for Flash repeater type.</td>
</tr>
</tbody>
</table>
Usage
This tag requires an end tag. This tag is ignored if the cfform type is HTML; any tag body’s contents are interpreted as if the surrounding cfformgroup does not exist.

In Flash format forms, this tag organizes the contents of the form. It groups and arranges child tags. The body of this tag can contain the following tags; all other tags and text are ignored:

- cfformitem
- cfcalendar
- cfgrid
- cfinput
- cfselect
- cftextarea
- cftree

For more information on using this tag in Flash forms, see Creating Forms in Flash in the Developing ColdFusion Applications.

In XML format, ColdFusion passes the tag and its attributes to the XML; it is the responsibility of the skin XSLT to handle the XML. The ColdFusion basic skin supports the horizontal, vertical, and dualselectlist styles only. For more information on using this tag in XML forms, see Creating Forms in Flash in the Developing ColdFusion Applications.

Example
For a simple example of an XML form that uses a single cfformgroup tag, see cfform.

The following example shows how to use the cfformgroup tag to arrange elements on a Flash form. It creates an hdividedbox container that has a vbox container on each side. The left box has heading text and two radio buttons. The right box has heading text and three check boxes.

```xml
<h3>Simple cfformgroup Example</h3>
<cfform name="myform" height="450" width="500" format="Flash">
  <cfformgroup type="hdividedbox">
    <cfformgroup type=" vbox">
      <cfformitem type="text" height="20">
        Pets:
      </cfformitem>
      <cfinput type="Radio" name="pets" label="Dogs" value="Dogs" checked>
      <cfinput type="Radio" name="pets" label="Cats" value="Cats">
    </cfformgroup>
    <cfformgroup type=" vbox">
      <cfformitem type="text" height="20">
        Fruits:
      </cfformitem>
      <cfinput type="Checkbox" name="chk1" label="Apples" value="Apples">
      <cfinput type="Checkbox" name="chk2" label="Bananas" value="Bananas">
      <cfinput type="Checkbox" name="chk3" label="Pears" value="Pears">
    </cfformgroup>
  </cfformgroup>
</cfform>
```
The following more complex example shows more fully how you can use cfformgroup tags to arrange controls in a Flash form. It also shows many of the text formatting features that you can use in a text cfformgroup body. When you submit the form, the page dumps the contents of the Forms scope, to show you the submitted data.

```html
<h2>cfformgroup Example</h2>
<cfif IsDefined("form.onceThrough")>
  <h3>The form submitted the following information to ColdFusion:</h3>
  <cfdump var="#form#"/>
</cfif>

<h3>A Flash form using cfformgroup tags</h3>
<cfform name="myform" height="450" width="500" format="Flash">
  <!--- The following formgroup shows how you can present formatted text. --->
  <cfformitem type="html">
    <b><font color="#FF0000" size="+4" face="serif">
      This form has two tabs, asking for the following:</font></b><br>
    <li>contact information</li>
    <li>preferences</li>
    <b>Try entering information on both tabs</b><br>
    Submit the form and see what ColdFusion gets in the Forms scope.</b><br>
    <a href="http://www..com/" target="_blank">
      This link displays the home page in a new browser window</a><br>
  </cfformitem>
  <!--- Use a tabnavigator with two tabs for user input. --->

cfformitem

Description
Inserts a horizontal line, a vertical line, a spacer, or text in a Flash form. Used in the cfform or cfformgroup tag body for Flash and XML forms. Ignored in HTML forms.

Category
Forms tags
Syntax
<cfformitem
   type = "hrule|vrule|spacer"
   height = "pixels"
   style = "style specification"
   visible = "yes|no"
   width = "pixels"/>

OR

<cfformitem
   type = "html|text|script"
   bind = "bind expression"
   enabled = "yes|no"
   height = "pixels"
   style = "style specification"
   tooltip = "text"
   visible = "yes|no"
   width = "pixels">
   ...text</cfformitem>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

History
ColdFusion MX 7.01: Added the "script" value for type attribute.
ColdFusion MX 7: Added tag

Attributes
The following table lists the attributes and their behavior in Flash forms. For XML format, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion.

Note: Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML in all controls except text and html types.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; formats</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Required; Flash and XML</td>
<td></td>
<td><strong>Flash:</strong></td>
</tr>
</tbody>
</table>
|           |                  |         | - `html`: place the text in the body of this tag on the form. For Flash forms, you can use the following text formatting tags, most of which correspond to HTML tags, in the text: `a`, `b`, `br`, `font`, `i`, `img`, `li`, `p`, `textformat`, and `u`. For details on using these formatting tags, see the Flash documentation. The `style` attribute has no effect on the format of the text in `type`.  
|           |                  |         | - `text`: place the text in the body of this tag on the form verbatim, without interpreting any markup. You can control the overall appearance of the text by using the `style` attribute.  
|           |                  |         | - `spacer`: places an invisible spacer of the specified height and width on the form. Used to place space between form controls. This tag must not have any children.  
|           |                  |         | - `hrule`: places a horizontal rule on the form. This tag must not have any children.  
|           |                  |         | - `vrule`: places a vertical rule on the form. This tag must not have any children.  
|           |                  |         | - `script`: lets you create functions in Flash forms, which reduces the possibility of reaching the 64 KB limit.  
|           |                  |         | **XML:**  |
|           |                  |         | - `html`: puts the CFML tag’s body text in a CDATA section in an XML `xf:output` element.  
|           |                  |         | - `text`: XML-formats (escapes characters such as `<`) the CFML tag’s body text and puts it in a CDATA section in an XML `xf:output` element.  
|           |                  |         | - `hrule`: puts an `hr` tag in the output. Use the `style` attribute to specify all rule characteristics, including height and width. This tag must not have any children.  
|           |                  |         | Any other string: generates an XML `xf:group` element with the type name as the `appearance` attribute. The CFML tag body is put in a CDATA section in a `cf:attribute` name="body" element. The XSL transforms provided with ColdFusion ignore these elements.  
| bind      | Optional; Flash  |         | A Flash bind expression that populates the field with information from other form fields. If you use this attribute, ColdFusion ignores any text that you specify in the body of the `cftextitem` tag. This attribute can be useful if the `cfformitem` tag is in a `cfformgroup` type="repeater" tag.  
|           |                  |         | For more information, see Flash form data binding in the `cfinput` tag description.  
| enabled   | Optional; Flash  | yes     | Boolean value that specifies whether the control is enabled. Disabled text appear in light gray. Has no effect on spacers and rules.  
| height    | Optional; Flash  |         | Height of the item, in pixels. If you omit this attribute, Flash automatically sizes the height. In ColdFusion XSL skins, use the `style` attribute, instead.  
| style     | Optional; Flash and XML |         | **Flash:**  |
|           |                  |         | - Must be a style specification in CSS format.  
|           |                  |         | - Ignored if the `type` attribute is `html`.  
|           |                  |         | For detailed information on specifying Flash styles, see Creating Forms in Flash in the Developing ColdFusion Applications. Not used with the `spacer` type.  
|           |                  |         | **XML:**  |
|           |                  |         | - ColdFusion passes the `style` attribute to the XML. ColdFusion skins include the `style` attribute in the generated HTML.  

Last updated 7/9/2012
ColdFusion Tags

Usage
This tag requires an end tag or a slash before the closing end character of the opening tag, as the following example shows:

```html
<cfformitem type="hrule" />
```

For more information on using this tag in Flash forms, see Creating Forms in Flash in the Developing ColdFusion Applications.

Example
The following example shows a simple Flash form by using horizontal rules and text:

```html
<h3>cfformitem Example</h3>
<cfform name="myform" height="450" width="500" format="Flash">
  <cfformitem type="hrule" />
  <cfformitem type="text">
    This simple form has two hrule cfformitem tags around the cfformitem tag that contains this text.
  </cfformitem>
</cfformitem>
```

For a more complex form, see cfformgroup.

**cfftp**

Description
Lets users implement File Transfer Protocol (FTP) operations.

Category
File management tags, Internet protocol tags

Syntax
The tag syntax depends on the action attribute value. See the following sections:

- cfftp: Opening and closing FTP server connections
- cfftp: Opening and closing secure FTP server connections
- cfftp: Connection: file and directory operations
- cfftp action = "listDir"
See also
cfhttp, cfldap, cfmail, cfpop; Performing file operations with cfftp in Interacting with Remote Servers in the Developing ColdFusion Applications

History
ColdFusion 8: Added the fingerprint, key, paraphrase, and secure attributes to support secure FTP. Added the values ="quote", "site", "allo", and "acct" to the action attribute.

ColdFusion MX 7: Added the result attribute for file and directory operations.

ColdFusion MX: Deprecated the agentname attribute. It might not work, and might cause an error, in later releases.

Usage
Use this tag to move files between a ColdFusion server and an FTP server.

This tag does not move files between a ColdFusion server and a client browser. You do this as follows:

• To transfer files from a client to a ColdFusion server: cffile action = "upload"
• To transfer files from a ColdFusion server to a client: the cfcontent tag

Security settings
ColdFusion security settings can prevent the cfftp tag from executing. If you run ColdFusion applications on a server that is used by multiple customers, consider the security of the files that the customer can move. For more information, see the Administering Security section of Configuring and Administering ColdFusion.

cfftp: Opening and closing FTP server connections

Description
To establish a connection with an FTP server, use the open action with a connection attribute.

Syntax
<cfftp
  action = "open|close|quote|site|allo|acct"
  actionparam = "command or account information"
  buffersize = "number"
  connection = "name"
  passive = "yes|no"
  password = "password"
  port = "port"
  proxyServer = "proxy server"
  retryCount = "number"
  server = "server"
  stopOnError = "yes|no"
  timeout = "time-out in seconds"
  username = "name">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• cfftp.errorText: Message text.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For conditional operations, use cfftp.errorCode. Do not use cfftp.errorText for this purpose.</td>
</tr>
<tr>
<td>timeout</td>
<td>Optional</td>
<td>30</td>
<td>Value in seconds for the time-out of all operations, including individual data request operations.</td>
</tr>
<tr>
<td>username</td>
<td>Required if action = &quot;open&quot;</td>
<td></td>
<td>User name to pass in the FTP operation.</td>
</tr>
</tbody>
</table>
Usage
When you establish a connection with `cfftp action="open"` and specify a name in the `connection` attribute, ColdFusion caches the connection so that you can reuse it to perform additional FTP operations. When you use a cached connection for subsequent FTP operations, you do not have to specify the `username`, `password`, or `server` connection attributes. The FTP operations that use the same `connection` name automatically use the information stored in the cached connection. Using a cached connection helps save connection time and improves file transfer performance.

You do not need to open a connection for single, simple, FTP operations, such as `GetFile` or `PutFile`.

With any action except close, you can set the internal buffer size by specifying `buffersize`. If you specify `quote`, `site`, `allo`, or `acct` as the action and set `secure="yes"` an error is generated. You specify the command to send to the FTP server in the `actionparam` attribute when you specify `site` or `quote` as the action. When `site` is the action, you use the `actionparam` attribute to specify the site-specific information.

To keep a connection open throughout a session or longer, put the connection name in the Session or Application scope; for example, specify `connection="Session.FTPConnection"`. However, if you do this, you must specify the full variable name in all FTP operations, and you must use the `close` action when you are finished. Keeping a connection open prevents others from using the FTP server; so close a connection as soon as possible. If you do not assign the connection name to Session or Application variable, the connection remains open for the current page only, and you do not have to close it manually.

Changes to a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.
Example
<p>cfftp lets users implement File Transfer Protocol operations. By default, cfftp caches an open connection to an FTP server.</p>
<p>cfftp operations are usually of two types:</p>
<ul>
  <li>Establishing a connection</li>
  <li>Performing file and directory operations</li>
</ul>
<p>This example opens and verifies a connection, lists the files in a directory, and closes the connection.</p>
<p>Open a connection</p>
<cfftp action = "open"
  username = "anonymous"
  connection = "My_query"
  password = "youremail@email.com"
  server = "ftp.tucows.com"
  stopOnError = "Yes">
  <p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></p>
</cfftp>
<p>List the files in a directory:</p>
<cfftp action = "LISTDIR"
  stopOnError = "Yes"
  name = "ListFiles"
  directory = "/"
  connection = "my_query">
  <cfoutput query = "ListFiles">
    #name#<br>
  </cfoutput>
</cfftp>
<p>Close the connection:</p>
<cfftp action = "close"
  connection = "My_query"
  stopOnError = "Yes">
  <p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></cfoutput>
</cfftp>

**cfftp: Opening and closing secure FTP server connections**

**Description**
To establish a connection with a secure FTP server, use the open action with a connection attribute, specify that secure = "yes", and specify the key, passphrase, and fingerprint as appropriate.
<cfftp
  action = "open|close"
  connection = "name"
  fingerprint = "ssh-dss.ssh-rsa"
  key = "private key"
  passive = "yes|no"
  passphrase = "passphrase"
  password = "password"
  port = "port"
  proxyServer = "proxy server"
  retryCount = "number"
  secure = "yes|no"
  server = "server"
  stopOnError = "yes|no"
  timeout = "time-out in seconds"
  username = "name">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

</tbody>
</table>
Usage
The `cfftp` tag lets you open a connection to a Secure Shell (SSH) server by using either symmetric or asymmetric encryption. To use symmetric encryption, you specify `secure="yes"`, the user name, password, connection, and fingerprint. To use asymmetric encryption, first generate private-public key pairs for each user authorized to have access to the server. Each authorized user’s public key is stored on the server; each user’s private key is encrypted and stored on that user’s computer. To open a connection to the SSH server, you specify `secure="yes"`, the user name, the password, or the private key and the passphrase that the server uses to decrypt the private key, connection, and fingerprint. After you open the connection to the SSH server, you can use that connection for any action supported by the `cfftp` tag.

To keep a connection open throughout a session or longer, put the connection name in the Session or Application scope; for example, specify `connection="Session.FTPConnection"`. However, if you do this, specify the full variable name in all FTP operations, and use the close action when you are finished. Keeping a connection open prevents others from using the FTP server; so close a connection as soon as possible. If you do not assign the connection name to Session or Application variable, the connection remains open for the current page only, and you do not have to close it manually.

Changes to a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

Example
<!--- This example uses symmetric encryption. --->

<!--- Open the secure connection. --->
<cfftp action = "open"
   username = "myusername"
   connection = "My_query"
   password = "mypassword"
   server = "ftp.tucows.com"
   secure = "yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></p>
<cfoutput>
<cfset absolutePathToLocalFile="C:\one\two\myfile.htm">
<cfif FileExists(absolutePathToLocalFile)>
<cfftp action = "putFile"
   connection="My_query"
   localFile="#variables.absolutePathToLocalFile#"
   remoteFile="/home/myname/sftptest/myfile.htm">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></p>
</cfif>
<cfelse>
<!--- Put error handling code here. --->
</cfelse>
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></p>

<!--- Close the connection. --->
<cfftp action="close" connection="My_query">

Last updated 7/9/2012
Example
<!--- This example uses asymmetric encryption. --->

<!--- Open the secure connection. --->
<cfftp action = "open"

cfftp: Connection: file and directory operations

Description
To perform file and directory operations with cfftp, use this form of the cfftp tag.
Syntax
<cfftp
   action = "action"
   ASCIIExtensionList = "extensions"
   connection = "connection name"
   directory = "directory name"
   existing = "file or directory name"
   failIfExists = "yes|no"
   item = "directory or file"
   localFile = "filename"
   name = "query name"
   new = "file or directory name"
   passive = "yes|no"
   password = "password"
   proxyServer = "proxy server"
   remoteFile = "filename"
   result = "result name"
   server = "server"
   timeout = "time-out in seconds"
   transferMode = "ASCII FTP|Binary FTP|Auto FTP"
   username = "name">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

<td>Required if action = &quot;getFile&quot; or &quot;putFile&quot;</td>
<td>Name of the file on the local file system. For more information, see Usage.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>Required if action = &quot;listDir&quot;</td>
<td>Query name of directory listing.</td>
<td></td>
</tr>
</tbody>
</table>
Usage

If you use connection caching to an active FTP connection, you do not have to respecify the `username`, `password`, or `server` connection attributes.

Changing a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

If `action = "listDir"`, the `attributes` column returns `directory` or `normal`. Other platform-specific values, such as `hidden` and `system`, are no longer supported.

If `action = "listDir"`, a `mode` column is returned. The column contains an octal string representation of UNIX permissions; for example, "777."

The `cfftp.returnValue` variable provides the return value for these actions:

- `getCurrentDir`
- `getCurrentURL`
- `existsDir`

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>

<td></td>
<td></td>
<td>• Auto FTP transfer mode</td>
</tr>
<tr>
<td>username</td>
<td>Required if connection is not cached</td>
<td></td>
<td>User name to pass in the FTP operation.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

- existsFile
- exists

For more information, see the *Developing ColdFusion Applications*.

For more information, see the section *Performing file operations with cfftp* in Developing ColdFusion Applications.

**localFile attribute**

Use the following syntax to specify an in-memory file, which is not written to disk, as the local file. In-memory files speed processing of transient data.

```
ram://filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the Developing ColdFusion Applications.

**Action (cfftp.ReturnValue variable)**

The results of an action determine the value of the `returnValue` variable, as the following table shows:

<table>
<thead>
<tr>
<th>cfftp action</th>
<th>Value of cfftp.returnValue</th>
</tr>
</thead>
<tbody>
<tr>
<td>getCurrentDir</td>
<td>String. Current directory.</td>
</tr>
<tr>
<td>getCurrentURL</td>
<td>String. Current URL.</td>
</tr>
<tr>
<td>existsDir</td>
<td>yes or no.</td>
</tr>
<tr>
<td>existsFile</td>
<td>yes or no.</td>
</tr>
<tr>
<td>exists</td>
<td>yes or no.</td>
</tr>
</tbody>
</table>

To access the `returnValue` variable, you must prefix it with either `cfftp` or the value specified by the `result` attribute, if it is set. The `result` attribute provides a way for `cfftp` calls from multiple pages, possibly at the same time, to avoid overwriting the results of one with another. If you set the `result` attribute to `myResult`, for example, you would access the `returnVariable` variable as `myResult.returnVariable`. Otherwise, you would access it as `cfftp.returnVariable`.

**Example**

The following example opens a connection and gets a file that lists file or directory name, path, URL, length, and modification date:
<p>Open a connection</p>
<cfftp connection = "myConnection"
    username = "myUserName"
    password = "myUserName@allaire.com"
    server = "ftp.allaire.com"
    action = "open"
    stopOnError = "Yes">
    <p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput></cfftp>
    <cfftp connection = "myConnection"
        action = "LISTDIR"
        stopOnError = "Yes"
        name = "ListDirs"
        directory = "/">
        <p>FTP Directory Listing:</p>
        <cftable query = "ListDirs" HTMLTable = "Yes" colHeaders = "Yes">
            <cfcol header = "<b>Name</b>" text = "#name#">
            <cfcol header = "<b>Path</b>" text = "#path#">
            <cfcol header = "<b>URL</b>" text = "#url#">
            <cfcol header = "<b>Length</b>" text = "#length#">
            <cfcol header = "<b>LastModified</b>"
                text = "#DateFormat(lastmodified)#">
            <cfcol header = "<b>IsDirectory</b>" text = "#isdirectory#">
        </cftable>
        <p>Move Image File to Remote Server:<br></p>
        <!--- The image will be put into the root directory of the FTP server unless otherwise noted, i.e., remoteFile = "somewhere_put.jpg" vs remoteFile = "/support/somewhere_put.jpg"
        --->
        <cfftp
            connection = "myConnection"
            action = "putFile"
            name = "uploadFile"
            transferMode = "binary"
            localFile = "C:\files\upload\somewhere.jpg"
            remoteFile = "somewhere_put.jpg"">
        <p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
        <p>Close the connection:</p>
        <cfftp connection = "myConnection"
            action = "close"
            stopOnError = "Yes">
        <p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
</cfftp>

<cfftp action = "listDir"

**Description**
To access the columns in a query object, use this tag with action = "listDir".

Last updated 7/9/2012
Usage
When you use this action, specify a value for the name attribute. This value holds the results of the listDir action in a query object. The query object consists of columns that you can reference, in the form `queryname.columnname[row]`, where `queryname` is the name of the query, specified in the name attribute; and `columnname` is a column returned in the query object. The value `row` is the row number of each file/directory entry returned by the listDir operation. A separate row is created for each entry:

<table>
<thead>
<tr>
<th>cfftp query object column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Filename of the current element.</td>
</tr>
<tr>
<td>Path</td>
<td>File path (without drive designation) of the current element.</td>
</tr>
<tr>
<td>URL</td>
<td>Complete URL for the current element (file or directory).</td>
</tr>
<tr>
<td>Length</td>
<td>File size of the current element.</td>
</tr>
<tr>
<td>LastModified</td>
<td>Unformatted date/time value of the current element.</td>
</tr>
<tr>
<td>Attributes</td>
<td>String. Attributes of the current element: normal or Directory.</td>
</tr>
<tr>
<td>IsDirectory</td>
<td>Boolean. Whether object is a file or directory.</td>
</tr>
<tr>
<td>Mode</td>
<td>Applies only to UNIX and Linux. Permissions. Octal string.</td>
</tr>
</tbody>
</table>

Note: Previously supported query column values that pertain to system-specific information are not supported; for example, hidden and system.

cffunction

Description
Defines a function that you can call in CFML. Required to define ColdFusion component methods.

History
ColdFusion 10: restPath, httpMethod, produces, consumes
ColdFusion 8:
- Added returnformat, secureJSON, and verifyClient attributes
- Added component as a valid value for the ReturnType attribute.

ColdFusion MX 7: Added the description attribute, and added the XML value to the returnType attribute.

ColdFusion MX: Added this tag.

Category
Extensibility tags
Syntax
<cffunction
   name = "method name"
   access = "method access"
   description = "function description"
   displayName = "name"
   hint = "hint text"
   output = "yes|no"
   returnFormat = "not specified|JSON|plain|WDDX"
   returnType = "data type"
   roles = "securityRoles"
   secureJSON = "yes|no"
   verifyClient = "no|yes">

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td>A string; a component method that is used in the <strong>cfcomponent</strong> tag.</td>
<td></td>
</tr>
</tbody>
</table>
| access    | Optional| public  | The client security context from which the method can be invoked. The following values are valid:
  - **private**: available only to the component that declares the method and any components that extend the component in which it is defined.
  - **package**: available only to the component that declares the method, components that extend the component, or any other components in the package. Methods are available to the CFC pages in the same package.
  - **public**: available to a locally executing page or component method.
  - **remote**: available to a locally or remotely executing page or component method, or a remote client through a URL, Flash, or a web service. To publish the function as a web service, this option is required. |
| description | Optional | | Supplies a short text description of the function. |
| displayName | Optional | | Meaningful only for CFC method parameters. A value to be displayed in parentheses following the function name when using introspection to show information about the CFC. |
| hint | Optional | | Meaningful only for CFC method parameters. Text to be displayed when using introspection to show information about the CFC. The **hint** attribute value follows the syntax line in the function description. |
| output | Optional | Function body is processed as standard CFML | Specifies under which conditions the function can generate HTML output. The following values are valid:
  - **yes**: the entire function body is processed as if it were in a **cfoutput** tag. Variables names surrounded by number signs (#) are automatically replaced with their values.
  - **no**: the function is processed as if it were within a **cfsilent** tag. |

If you do not specify this attribute, the function body is processed as standard CFML. Any variables must be in **cfoutput** tags.
### ColdFusion Tags

#### returnformat

**Attribute**
returnformat

**Req/Opt**

**Default**
Return as WDDX or XML; see description.

**Description**
The format in which to return values to a remote caller. This attribute has no effect on values returned to a local caller.

The following values are valid:

- **json**: serialize the return value into JSON format before returning it remotely.
- **wddx**: serialize the return value into WDDX format before returning it remotely.
- **plain**: ensure that the return value is a type that ColdFusion can convert directly to a string, and return the string value without serialization. Valid types include all simple types, such as numbers, and XML objects. If the return value is a complex type, such as an array, or a binary value, ColdFusion generates an error. If you specify a `returntype` attribute, its value must be `any`, `boolean`, `date`, `guid`, `numeric`, `string`, `uuid`, `variablename`, or `XML`; otherwise, ColdFusion generates an error.

By default, ColdFusion serializes all return types (including simple return types), except XML, into WDDX format, and returns XML data as XML text.

You can also use `returnformat` as an HTTP request parameter when calling a remote CFC function. This parameter has the same effect as the `returnformat` attribute and overrides any `returnformat` attribute value specified in the `cffunction` tag.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| returnType  | Required for a web service; Optional, otherwise. | any | String: a type name; data type of the function return value:  
  - any  
  - array  
  - binary  
  - boolean  
  - component: the return value must be a ColdFusion component.  
  - date  
  - guid: the argument must be a UUID or GUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx where each x is a character that represents a hexadecimal number (0-9A-F).  
  - numeric  
  - query  
  - string  
  - struct  
  - uuid: the argument must be a ColdFusion UUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx where each x is a character that represents a hexadecimal number (0-9A-F).  
  - variableName: a string formatted according to ColdFusion variable naming conventions.  
  - void: does not return a value.  
  - xml: allows web service functions to return CFML XML objects and XML strings.  
  - A component name: If the returnType attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the value that is returned is not a CFC with the specified name.  
   **Note:** If a function does not return a value and the returnType value is string, ColdFusion generates an error; ColdFusion does not generate an error for other types. |
| roles       | Optional | "" (empty) | A comma-delimited list of ColdFusion security roles that can invoke the method. Only users who are logged in with the specified roles can execute the function. If this attribute is omitted, all users can invoke the method. |
| secureJSON  | Optional | See Description | A Boolean value that specifies whether to add a security prefix in front of any value that the function returns in JSON-format in response to a remote call.  
  The default value is the value of any This.secureJSON variable in the Application.cfc file or the secureJSON attribute of the cfapplication tag, or if there is no secureJSON application setting, the Prefix Serialized JSON setting in the Administrator Server Settings > Settings page, which defaults to false.  
  For more information see Improving security in the Developing ColdFusion Applications. |
| verifyClient| Optional | no | A Boolean value that specifies whether to require remote function calls to include an encrypted security token. For use with ColdFusion AJAX applications only.  
  For more information see Improving security in the Developing ColdFusion Applications. |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restPath</td>
<td>Optional</td>
<td></td>
<td>Specify to use a sub-resource path for the CFC. The path is case-sensitive. Also, it is preferable to avoid special characters when you specify the path. You can include regular expressions in the path. For details of the expressions that you can specify, see the attribute restPath in cfcomponent.</td>
</tr>
<tr>
<td>httpMethod</td>
<td></td>
<td></td>
<td>The HTTP method to use, must be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• GET: Requests information from the server. Any data that the server requires to identify the requested information must be in the URL or in cfhttp type=“URL” tag.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• POST: Sends information to the server for processing. Requires one or more cfhttpparam tags. Often used for submitting form-like data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• PUT: Requests the server to store the message body at the specified URL. Use this method to send files to the server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• DELETE: Requests the server to delete the specified URL.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• HEAD: Identical to the GET method, but the server does not send a message body in the response. Use this method for testing hypertext links for validity and accessibility, determining the type or modification time of a document, or determining the type of server. If you have not specified HEAD, by default, GET method is called. However, message body is not sent in the response.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• OPTIONS: A request for information about the communication options available for the server or the specified URL. This method enables the ColdFusion application to determine the options and requirements associated with a URL, or the capabilities of a server, without requesting any additional activity by the server. If you have not specified OPTIONS, then ColdFusion sends a response. Overrides the value that you specify at component level.</td>
</tr>
<tr>
<td>produces</td>
<td>Optional</td>
<td>*/ *</td>
<td>Comma-separated list of acceptable MIME types. Used to specify the MIME media type of representation a resource can produce, for example, produces=“text/plain, text/html”. If a resource can produce more than one MIME media type, the function chosen corresponds to the most acceptable media type as declared by the client. If no value is specified, */ * is taken by default, which means, all MIME types are consumed. Overrides the value that you specify at the component level.</td>
</tr>
<tr>
<td>consumes</td>
<td>Optional</td>
<td>*/ *</td>
<td>Comma-separated list of acceptable MIME types, for example consumes=“text/plain, text/html”. Used to specify which MIME media types of representation a resource can accept, or consume, from the client. This attribute overrides the same attribute at the component level. If no value is specified, <em>/ * is taken by default, which means, all MIME types are consumed. Adobe recommends that you avoid conflict scenarios while specifying the attributes produces and consumes. For example, avoid situations such as the following: In function 1, you specify produces as text/xml and consumes as text/</em> and in function 2, produces as text/* and consumes as text/xml. Here, both the functions are valid for the request with accept= text/xml and consumes as text/xml.</td>
</tr>
</tbody>
</table>
Usage
The `cffunction` tag can define a function that you call in the same manner as a ColdFusion built-in function.

To define a ColdFusion component (CFC) method, use a `cffunction` tag.

The following example shows `cffunction` tag attributes for a simple CFC method that returns a ColdFusion Query object.

```coldfusion
<cffunction
    name="getEmployees"
    access="remote"
    returnType="query"
    hint="This query returns all records in the employee database. It can drill-down or narrow the search, based on optional input parameters."
>
For detailed information on using the `cffunction` tag for ColdFusion components, see Building and Using ColdFusion Components in the Developing ColdFusion Applications.

If you specify `returnFormat="json"` and the function returns a query, ColdFusion serializes the query into a JSON Object with two entries, an array of column names, and an array of column data arrays. For more information see `SerializeJSON`.

If you specify a `roles` attribute, the function executes only if a user is logged in and belongs to one of the specified roles.

If you specify `variableName` for the `returnType` attribute, the function must return a string that is in ColdFusion variable name format; that is, the function must return a string that starts with a letter, underscore, or Unicode currency symbol, and consist of letters, numbers, and underscores (_), periods, and Unicode currency symbols, only. ColdFusion does not check whether the value corresponds to an existing ColdFusion variable.

Example
<cfcomponent>
    <cffunction name="getEmp">
        <cfquery
            name="empQuery" datasource="ExampleApps" >
            SELECT FIRSTNAME, LASTNAME, EMAIL
            FROM tblEmployees
        </cfquery>
        <cfreturn empQuery>
    </cffunction>
    <cffunction name="getDept">
        <cfquery name="deptQuery" datasource="ExampleApps" >
            SELECT *
            FROM tblDepartments
        </cfquery>
        <cfreturn deptQuery>
    </cffunction>
</cfcomponent>
```
Tags g-h

cfgraph

Description
This tag is deprecated. Use the cfchart, cfchartdata, and cfchartseries tags instead.
Displays data graphically.

History
ColdFusion MX: Deprecated this tag. It works differently than it did in ColdFusion 5, and it might not work in later releases.
The incompatibilities between the ColdFusion MX implementation and earlier implementations of this tag are as follows:

<table>
<thead>
<tr>
<th>cfgraph tag attribute</th>
<th>ColdFusion MX functionality</th>

| Valuelocation         | Ignored.                    |
| url                   | URL of page to open if any item in the graph is clicked.  
                        | The following variables may be used within the URL; they are substituted with real values before the URL is accessed:  
                        | • "$value$": selected row/column value or an empty string.  
                        | • "$itemlabel$": selected item (column) value or an empty string.  
                        | • "$serieslabel$": selected series (row) value or an empty string.  
                        | • "javascript:...": executes client side scripts.  |
| Urlcolumn             | Ignored.                    |
| Type="HorizontalBar" | The (0,0) coordinate is located at the lower left.  |
| ScaleFrom             | If the smallest value in the data is less than scaleFrom or the largest value in the data is greater than scaleTo, the respective data value is used as the minimum or maximum on the Y scale. Therefore, regardless of the scaleFrom or scaleTo value, all data values display.  |

**cfgriddata**

**Description**
This tag is deprecated. Use the cfchart, cfchartdata, and cfchartseries tags instead.

Displays a data point in a graph. Used within the cfgraph tag.

**History**
ColdFusion MX: Deprecated this tag. It works differently than in ColdFusion 5 and might not work in later releases.

**cfgrid**

**Description**
Used in the cfform tag. Puts a grid control (a table of data) in a ColdFusion form. To specify grid columns and row data, use the cfgridcolumn and cfgridrow tags, or use the query attribute, with or without cfgridcolumn tags.

For CFC methods that returns numeric data with a leading zero, for example, zip code 02674, the zero is interpreted by the bind expression as an octal number and its decimal equivalent (in this case 1468) even if you set returnformat="string". To resolve this issue, for URL binds or binds routed by way of a JavaScript function (for example, using cfajaxproxy), you can set returnformat=plain to retain the numeric value. Also, leading zeros are stripped from the suggestion list for autosuggest controls.

**Category**
Forms tags

cfajaximport, cfapplet, cfcalendar, cfgridcolumn, cfgridrow, cfgridupdate, cfform, cfformgroup, cfformitem, cfinput, cfselect, cfslider, cftextarea, cftree, Using HTML grids in the Developing ColdFusion Applications

History
ColdFusion9.0.1: Added the attribute multirowselect, supported only in HTML grids.

ColdFusion 9:
• Added collapsible, groupfield, onLoad, and title attributes, supported in HTML grids only.
• Added ability to use the insert attribute in HTML grids.

ColdFusion 8: Added support for HTML format grids, including the html value of the format attribute and the following attributes: bind, bindOnLoad, pageSize, preservePageOnSort, stripeRows, stripeRowColor.

ColdFusion MX 7.01: Added support for the onBlur and onFocus events.

ColdFusion MX 7:
• Added the format attribute and support for Flash and XML output.
• Added enabled, onChange, style, tooltip, and visible attributes (Flash format only).

ColdFusion MX: Changed the rowHeaderWidth attribute: ColdFusion does not use the rowHeaderWidth attribute. You can omit it.

Attributes
Note: In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

<td>300 (applet only)</td>
<td>Width of the control. In Flash and applet format, must be a number of pixels. In HTML format, can be in any valid CSS measurement unit, and a numeric-only value specifies pixels. If you omit the attribute in Flash or HTML format; the grid sizes automatically.</td>
</tr>
</tbody>
</table>

**Usage**

Most of the following paragraphs describe grid features that apply to all, or at least two, grid formats. For information that is specific to Flash forms, see Creating Forms in Flash in the Developing ColdFusion Applications. For information that is specific to HTML format grids, see Using HTML grids in the Developing ColdFusion Applications.
This tag must be in a cfform tag block.

An applet format grid requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plug-in installed, the system might also have to download an updated Java plug-in to display an applet format grid. A Flash format grid generates a Flash control, and can be embedded in an HTML format cfform tag. For this tag to work properly in either Flash or applet format, the browser must also be JavaScript-enabled.

**Note:** If you specify Flash format for this tag in an HTML format form, and you do not specify height and width attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the grid, including any form controls, users must scroll to see it. Therefore, if you follow a Flash grid in an HTML form with additional output, specify height and width values.

You can populate a cfgrid with data from a cfquery. If you do not specify any cgridcolumn tags in the cfgrid body, ColdFusion generates a grid with the following:

- A column for each column in the query.
- A default header for each column, created by replacing hyphen or underscore characters in the table column name with spaces. The first character, and any character after a space, are changed to uppercase; all other characters are lowercase.

This tag requires an end tag.

**Note:** Clicking the submit button while editing a grid cell occasionally causes the cell changes to be lost. To ensure that changes are submitted properly, Adobe recommends that after user updates data in a cell, they click another cell before submitting the form.

**Returning cfgrid data to the action page**

The following information applies to all cfgrid formats. Also, HTML format grids can dynamically get data by using a bind expression. For more information, see Using HTML grids in the Developing ColdFusion Applications.

When a user submits a form, the cfgrid tag sends information about user actions by setting form variables in the data submitted to the form's action page. Because the data can vary, depending on the tag's SelectMode attribute value, the form variables that are returned also vary depending on this value.

In general, the data returned falls into one of these categories:

- Simple data, returned from simple select operations
- Complex data, returned from insert, update, and delete operations

**Simple selection data (SelectMode = Single, Column, or Row)**

The data that form variables return to the cfform's action page contains information about which cells the user selected. In general, ColdFusion makes this data available in the action page, as ColdFusion variables in the Form scope, with the naming convention form.#GridName#.Column#.

Each SelectMode returns these form variables:

- **Single**
  
  ```
  SelectMode="single"
  form.#GridName#.ColumnName# = "SelectedCellValue"
  ```

- **Column**
  
  ```
  SelectMode="column"
  form.#GridName#.ColumnName# = "ValueOfCellRow1,
  ValueOfCellRow2, ValueOfCellRowN"
  ```

- **Row**
  
  ```
  SelectMode="row"
  form.#GridName#.ColumnName# = "ValueOfCellInSelectedRow"
  ```

  ```
  form.#GridName#.ColumnName# = "ValueOfCellInSelectedRow"
  ```

  ```
  form.#GridName#.ColumnName# = "ValueOfCellInSelectedRow"
  ```

  ```
  form.#GridName#.ColumnName# = "ValueOfCellInSelectedRow"
  ```
Complex update data (SelectMode = Edit)
The grid returns a large amount of data, to inform the action page of inserts, updates, or deletes that the user made to
the grid. In most cases, you can use the cfgridupdate tag to automatically gather the data from the form variables;
The tag collects data, writes SQL calls, and updates the data source.

If you cannot use cfgridupdate (if, for example, you must distribute the returned data to more than one data source),
write code to read form variables. In this mode, ColdFusion creates the following array variables in the Form scope for
each cfgrid:

```
form.#GridName#. #ColumnName#
form.#GridName#.original. #ColumnName#
form.#GridName#. RowStatus. Action
```

Each table row that contains an update, insert, or deletion has a parallel entry in each of these arrays. To view all the
information for all the changes, you can traverse the arrays, as in this example. To make it work with a cfgrid on a
submitted cfform, set the GridName variable to the name of the grid and the ColNameList to a list of the grid columns.

```xml
<cfloop index="ColName" list="#ColNameList#">
  <cfif IsDefined("form.#GridName#. #ColName#")>
    <cfoutput>
      form.#GridName#. #ColName#:<br>
    </cfoutput>
    <cfset Array_New = form[#GridName#][#ColName#]>
    <cfset Array_Orig = form[#GridName#]["original"][#ColName#]>
    <cfset Array_Action = form[#GridName#]. RowStatus. Action>

    <cfif NOT IsArray(Array_New)>
      <b>The form variable is not an array!</b><br>
    <cfelse>
      <cfset size = ArrayLen(Array_New)>
      <cfoutput>
        Result Array Size is #size#. <br>
        Contents:<br>
      </cfoutput>
      <cfloop index="LoopCount" from="1" to=#size#>

      <cfif size IS 0>
        <b>The array is empty.</b><br>
      <cfelse>
        <table BORDER="yes">
          <tr>
            <th>Loop Index</TH>
            <th>Action</TH>
            <th>Old Value</TH>
            <th>New Value</TH>
          </tr>
          <cfloop index="LoopCount" from="1" to=#size#>
            <tr>
              <td>Loop Index</td>
              <td>Action</td>
              <td>Old Value</td>
              <td>New Value</td>
            </tr>
          </cfloop>
        </table>
      </cfif>
    </cfelse>
  </cfif>
</cfloop>
```

Last updated 7/9/2012

</cfloop>

Using the href attribute
When specifying a URL with grid items using the href attribute, the selectMode attribute value determines whether the appended key value is limited to one grid item or extends to a grid column or row. When a user clicks a linked grid item, a cfgridkey variable is appended to the URL, in this form:

http://myserver.com?cfgridkey=selection

If the appendKey attribute is set to no, no grid values are appended to the URL.

The value of selection is determined by the value of the selectMode and attribute:

- If you specify a hrefKey attribute, selection is the field value of the column specified by the attribute. Otherwise, it is one of the following:
  - If selectMode="Single", selection is the value of the column clicked.
  - If selectMode="Row", selection is a comma-delimited list of column values in the clicked row, beginning with the value of the first cell in the row.
  - If selectMode="Column", selection is a comma-delimited list of row values in the clicked column, beginning with the value of the first cell in the column.

When you use an href attribute, you can also specify a target attribute with any of the standard HTML target specifiers, _blank, _parent, _self, and _top, or with a specific frame name.

Enhancements made in ColdFusion 9.0.1
- In ColdFusion 9, data for the first row is available on form submission in a form with dynamic grid. In ColdFusion 9.0.1, the data is not available.
- If the type is Boolean and selectmode is browse, or select=false, the column is shown as a check box where click does not take effect.

Example
The following example creates a Flash form that displays a set of available courses from the CourseList table in the cfdocexamples database. For more complex examples that use the cfgrid tag, see cfgridcolumn, cfgridrow, and cfgridupdate.
<!--- Query the database to fill up the grid. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Course_ID, Dept_ID, CorNumber,
    CorName, CorLevel
    FROM CourseList
    ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<i>Currently available courses</i>
<!--- cfgrid must be inside a cfform tag. --->
<cfform>
    <cfgrid name = "FirstGrid" format="Flash"
    height="320" width="580"
    font="Tahoma" fontsize="12"
    query = "GetCourses">
    </cfgrid>
</cfform>

**cfgridcolumn**

**Description**
Used with the **cfgrid** tag in a **cfform**. Formats a column and optionally populates the column from a query. The font and alignment attributes used in **cfgridcolumn** override global font or alignment settings defined in **cfgrid**.

**Category**
**Forms tags**
Syntax
<cfgridcolumn
    autoExpand = "yes|no"
    name = "column name"
    bgColor = "web color|expression"

History
ColdFusion 9.0.1: Added the attributes autoExpand and headerMenu supported only in HTML grids.

ColdFusion 9: Added boolean, date, numeric, and string_noCase to the type attribute values supported in HTML grids.

ColdFusion MX 7: Added the mask attribute, and the currency type attribute value.

ColdFusion MX: Changed behavior if select="no": a user cannot select and edit the cell data, regardless of the cfgrid selectmode attribute value. When clicked, the cell border (and, depending on the selectColor value, the cell background) changes color, but the cell data cannot be edited.

Attributes
Note: In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

<td>Puts dollar sign before formatted number. Must be the first character of mask.</td>
</tr>
<tr>
<td>^</td>
<td>(Caret) Separates left from right formatting.</td>
</tr>
</tbody>
</table>

**date/time formats in mask attribute**

By default, Flash displays date/time values in grid columns with a format that shows values such as Oct 29 2004 11:03:21. Use the `mask` attribute to display the date or time in a different format, as described in the following table:
### Pattern letter | Description
---|---
Y | Year. If the number of pattern letters is two, the year is truncated to two digits; otherwise, it appears as four digits. The year can be zero-padded, as the third example shows in the following set of examples:
- Example:
  - YY = 03
  - YYYY = 2003
  - YYYY = 02003

M | Month in year. The format depends on the following criteria:
- If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.
- If the number of pattern letters is two, the format is interpreted as numeric in two digits.
- If the number of pattern letters is three, the format is interpreted as short text.
- If the number of pattern letters is four, the format is interpreted as full text.
- Example:
  - M = 7
  - MM = 07
  - MMM = Jul
  - MMMM = July

D | Day in month.
- Example:
  - D = 4
  - DD = 04
  - DD = 10

E | Day in week. The format depends on the following criteria:
- If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.
- If the number of pattern letters is two, the format is interpreted as numeric in two digits.
- If the number of pattern letters is three, the format is interpreted as short text.
- If the number of pattern letters is four, the format is interpreted as full text.
- Example:
  - E = 1
  - EE = 01
  - EEE = Mon
  - EEEE = Monday

A | AM/PM indicator.

J | Hour in day (0-23).

H | Hour in day (1-24).

K | Hour in am/pm (0-11).

L | Hour in am/pm (1-12).
Example
The following example lets you update certain fields of the CourseList table in the cfdocexamples database. It uses cfgridcolumn tags to structure the table.

```cfml
<cfif IsDefined("form.gridEntered")>
  <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples"
    tableName = "CourseList" keyOnly = "Yes">
  </cfgridupdate>
</cfif>

<cfquery name = "GetCourses" dataSource = "cfdocexamples">
  SELECT Course_ID, Dept_ID, CorNumber, CorName, CorLevel, CorDesc
  FROM CourseList
  ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<html>
<head>
<title>cfgrid Example</title>
</head>
<body>
<h3>cfgrid Example</h3>
<p>You can update the Name, Level, and Description information for courses.</p>
</body>
</html>
```

<table>
<thead>
<tr>
<th>Pattern letter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Minute in hour.</td>
</tr>
<tr>
<td>S</td>
<td>Second in minute.</td>
</tr>
<tr>
<td>Other text</td>
<td>You can add other text into the pattern string to further format the string. You can use punctuation, numbers, and all lowercase letters. Avoid upper case letters because they may be interpreted as pattern letters.</td>
</tr>
</tbody>
</table>

Example:
EEEE, MMMM. D, YYYY at H:NN A = Tuesday, Sept. 8, 2003 at 1:26 PM
<cfgrid name = "FirstGrid" width = "500"
    query = "GetCourses" colheaderbold="Yes"
    font = "Tahoma" rowHeaders = "No"
    selectColor = "Red" selectMode = "Edit">
<!--- cfgridcolumn tags arrange the table and control the display. --->
<!--- Hide the primary key, required for update --->
<cfgridcolumn name = "Course_ID" display = "No">
<!--- select="No" does not seem to have any effect!!! --->
<cfgridcolumn name = "Dept_ID" header = "Department" Select="No" width="75" textcolor="blue" bold="Yes">
<cfgridcolumn name = "CorNumber" header = "Course ##" Select="No" width="65">
<cfgridcolumn name = "CorName" header = "Name" width="125">
<cfgridcolumn name = "CorLevel" header = "Level" width="85">
<cfgridcolumn name = "CorDesc" header = "Description" width="125">
</cfgrid>
<br>
<cfinput type="submit" name="gridEntered">
</cfform>
</body>
</html>

**cfgridrow**

**Description**

Lets you define a `cfgrid` control that does not use a query as source for row data. If a query attribute is specified in the `cfgrid` tag, the `cfgridrow` tags are ignored.

**Category**

Forms tags

**Syntax**

```cfgridrow
<cfgridrow
    data = "col1, col2, ..."
    delimiter = "delimiter character">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

cfgrid, cfgridcolumn, cfgridupdate, cfform, cfinput, cfselect, cfslider, cftextarea, cftree

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Required</td>
<td></td>
<td>Delimited list of column values. If a value contains a delimiter character, it must be escaped with another delimiter character.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Optional</td>
<td>,(comma)</td>
<td>Separator between column values.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how you use the `cfgridrow` tag to populate a `cfgrid` tag from list data:

Last updated 7/9/2012
<!--- Set two lists, each with the data for a grid column. --->
<cfset cities = "Rome,Athens,Canberra,Brasilia,Paris">
<cfset countries = "Italy,Greece,Australia,Brazil,France">

<cfform name = "cities">
  <cfgrid name="GeoGrid" autowidth = "yes" vspace = "4" height = "120"
        font="tahoma" rowheaders="no">
    <cfgridcolumn name="City" header="City">
    <cfgridcolumn name="Country" header="Country">
      <!--- Loop through the lists using cfgridrow to populate the grid. --->
      <cfloop index="i" from="1" to="#ListLen(cities)#">
        <cfgridrow data="#ListGetAt(cities, i)#,#ListGetAt(countries, i)#">
      </cfloop>
  </cfgrid>
</cfform>
</cfgridupdate>

**cfgridupdate**

**Description**

Used with a cfgrid tag. Updates data sources directly from edited grid data. This tag provides a direct interface with your data source.

This tag applies delete row actions first, then insert row actions, then update row actions. If it encounters an error, it stops processing rows.

**Category**

Forms tags

**Syntax**

```
<cfgridupdate
  grid = "grid name"
  dataSource = "data source name"
  tableName = "table name"
  keyOnly = "yes|no"
  password = "data source password"
  tableOwner = "table owner"
  tableQualifier = "qualifier"
  username = "data source user name">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

cfgrid, cfgridcolumn, cfgridrow, cfform, cfapplet, cfinput, cfselect, cfslider, cftextinput, cftree

**History**

ColdFusion 10: Added the clientInfo attribute.

ColdFusion MX: Deprecated the connectString, dbName, dbServer, dbtype, provider, and providerDSN attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.
### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientInfo</td>
<td>Optional</td>
<td></td>
<td>Structure containing properties of the client to be set on the database connection.</td>
</tr>
<tr>
<td>grid</td>
<td>Required</td>
<td></td>
<td>Name of the cfgrid form element that is the source for the update action.</td>
</tr>
<tr>
<td>dataSource</td>
<td>Required</td>
<td></td>
<td>Name of the data source for the update action.</td>
</tr>
<tr>
<td>tableName</td>
<td>Required</td>
<td></td>
<td>Name of the table to update.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For ORACLE drivers, entry must be upper-case.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For Sybase driver, entry is case sensitive; must be same case as used when table was created.</td>
</tr>
<tr>
<td>keyOnly</td>
<td>no</td>
<td></td>
<td>Applies to the update action:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: the WHERE criteria are limited to the key values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: the WHERE criteria include key values and the original values of changed fields.</td>
</tr>
<tr>
<td>password</td>
<td>Optional</td>
<td></td>
<td>Overrides password value specified in ODBC setup.</td>
</tr>
<tr>
<td>tableOwner</td>
<td>Optional</td>
<td></td>
<td>Table owner, if supported.</td>
</tr>
<tr>
<td>tableQualifier</td>
<td>Optional</td>
<td></td>
<td>Table qualifier, if supported. Purpose:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• SQL Server and Oracle driver: name of database that contains the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Intersolv dBASE driver: directory of DBF files.</td>
</tr>
<tr>
<td>username</td>
<td>Optional</td>
<td></td>
<td>Overrides username value specified in ODBC setup.</td>
</tr>
</tbody>
</table>

### Example

The following example lets you update a database by using a cfgrid tag to add and delete entire records or to update the data in individual cells. The cfgridupdate tag processes the data from the submitted form and updates the database.
<!--- If the gridEntered form field exists, the form was submitted. Perform gridupdate. --->
<cfif IsDefined("form.gridEntered") is True>
  <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples" Keyonly="true"
    tableName = "CourseList">
    </cfif>

<!--- Query the database to fill up the grid. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
  SELECT Course_ID, Dept_ID, CorNumber, CorName, CorLevel, CorDesc
  FROM CourseList
  ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<i>Try adding a course to the database, and then deleting it.</i>

<cfform>
  <cfgrid name = "FirstGrid" width = "450"
    query = "GetCourses" insert = "Yes" delete = "Yes"
    font = "Tahoma" rowHeaders = "No"
    colHeaderBold = "Yes"
    selectMode = "EDIT"
    insertButton = "Insert a Row" deleteButton = "Delete selected row" >
</cfgrid>
<br>
  <cfinput type="submit" name="gridEntered">
</cfform>...

**cfheader**

**Description**
Generates custom HTTP response headers to return to the client.

**Category**
Data output tags, Page processing tags

**Syntax**
<cfheader
  charset="character set"
  name = "header name"
  value = "header value">

OR

<cfheader
  statusCode = "status code"
  statusText = "status text">

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfcache, cfflush, cfhtmlhead, cfinclude, cfsetting, cfssilent, cfcontent
**History**

ColdFusion MX 6.1: Changed behavior for the `name` attribute: `cfheader name="Content-Disposition"` uses the default file character encoding to encode this header’s value, so the name of a file can include characters in the character encoding used in the file.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Optional</td>
<td>UTF-8</td>
<td>The character encoding in which to encode the header value. The following list includes commonly used values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• utf-8</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• iso-8859-1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• windows-1252</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• us-ascii</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• shift_jis</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• iso-2022-jp</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• euc-jp</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• euc-kr</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• big5</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• euc-cn</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• utf-16</td>
</tr>
</tbody>
</table>

For more information about character encodings, see [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html).

<table>
<thead>
<tr>
<th>name</th>
<th>Required if <code>statusCode</code> not specified</th>
<th></th>
<th>Header name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>statusCode</td>
<td>Required if <code>name</code> not specified</td>
<td></td>
<td>Number. HTTP status code.</td>
</tr>
<tr>
<td>statusText</td>
<td>Optional</td>
<td></td>
<td>Explains the status code.</td>
</tr>
<tr>
<td>value</td>
<td>Optional</td>
<td></td>
<td>HTTP header value.</td>
</tr>
</tbody>
</table>

**Usage**

If you use this tag after the `cfflush` tag on a page, an error is thrown.

**Example**

```html
<h3>cfheader Example</h3>
<p>cfheader generates custom HTTP response headers to return to the client.
This example forces browser client to purge its cache of requested file.
<cfheader name="Expires" value="#GetHttpTimeString(Now())#"></p>

**cfhtmlhead**

**Description**

Writes text to the head section of a generated HTML page.
Category
Page processing tags

Syntax
<cfhtmlhead
text = "text">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcache, cfflush, cfheader, cfinclude, cfsetting, cfsilent

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Required</td>
<td></td>
<td>Text to add to the &lt;head&gt; area of an HTML page.</td>
</tr>
</tbody>
</table>

Usage
Use this tag for embedding JavaScript code, or putting other HTML tags, such as meta, link, title, or base in an HTML page header.

If you use this tag after the cfflush tag on a page, an error is thrown.

Example
<!--- This example adds a favicon to the HTML Head of every page view. The extra CRLF at the end cleans up view source. Note the embedded tag uses double quotes and the cfhtmlhead text attribute uses single quotes, but it could be the other way around too. --->

<cfhtmlhead
text='<link href="/blog/custom/img/favicon.ico" rel="shortcut icon" type="image/x-icon">#chr(13)#chr(10)#'>

<cfhttp>

Description
Generates an HTTP request and handles the response from the server.

Category
Internet protocol tags
Syntax
<cfhttp
    url = "server URL"
    charset = "character encoding"
    clientCert = "filename"
    clientCertPassword = "password"
    columns = "query columns"
    delimiter = "character"
    file = "filename"
    firstrowasheaders = "yes|no"
    getAsBinary = "auto|yes|no|never"
    method = "method name"
    multipart = "yes|no"
    name = "query name"
    password = "password"
    path = "path"
    port = "port number"
    proxyServer = "host name"
    proxyPort = "port number"
    proxyUser = "username"
    proxyPassword = "password"
    redirect = "yes|no"
    resolveURL = "yes|no"
    result = "result name"
    textQualifier = "character"
    throwOnError = "yes|no"
    timeout = "timeout period in seconds"
    username = "username"
    userAgent = "user agent"/>

<cfhttpparam tags [optional for some methods]>
</cfhttp>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfhttpparam, GetHttpRequestData, cfftp, cfldap, cfmail, cfpop

History
ColdFusion 8: Added the clientCert and clientCertPassword attributes.
ColdFusion MX 7.01: Added the “never” value of the getAsBinary attribute.
ColdFusion MX 7: Added the result attribute.
ColdFusion MX 6.1:
- Added support for the following methods: HEAD, PUT, DELETE, OPTIONS, TRACE.
- Added multipart, getAsBinary, proxyUser, and proxyPassword attributes.
- Changed httpparam behavior: all operations can have httpparam tags.
- Added the cfhttp.errorDetail return variable.
- Modified response body content types considered to be text.
• Changed behavior for multiple headers: multiple headers of the same type are returned in an array.
• Added support for HTTPS proxy tunneling.
• Fixed bugs in code and documentation.

ColdFusion MX:
• Added the charset and firstrowsheaders attributes.
• Changed Secure Sockets Layer (SSL) support: ColdFusion uses the Sun JSSE library, which supports 128-bit encryption, to support SSL.

Attributes
The following attributes control the HTTP transaction and can be used for all HTTP methods:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Required</td>
<td>Uses the http protocol</td>
<td>Address of the resource on the server that handles the request. The URL must include the hostname or IP address. If you do not specify the transaction protocol (http:// or https://), ColdFusion uses the default protocol, http. If you specify a port number in this attribute, it overrides any port attribute value. The cfhttpparam tag URL attribute appends query string attribute-value pairs to the URL.</td>
</tr>
<tr>
<td>charset</td>
<td>Optional</td>
<td>For request: UTF-8</td>
<td>The character encoding of the request, including the URL query string and form or file data, and the response. The following list includes commonly used values: utf-8, iso-8859-1, windows-1252, us-ascii, shift_jis, iso-2022-jp, euc-jp, euc-kr, big5, euc-cn, utf-16. For more information character encodings, see <a href="http://www.w3.org/International/Ordinarytext.html">www.w3.org/International/Ordinarytext.html</a>.</td>
</tr>
<tr>
<td>clientCert</td>
<td>Optional</td>
<td>The full path to a PKCS12 format file that contains the client certificate for the request.</td>
<td></td>
</tr>
<tr>
<td>clientCertPassword</td>
<td>Optional</td>
<td>Password used to decrypt the client certificate.</td>
<td></td>
</tr>
<tr>
<td>compression</td>
<td>Optional</td>
<td>The target webserver’s compression status. The only supported value is none. If the target website runs on IIS with HTTP compression enabled, use this attribute to avoid a connection failure while performing GET or POST operations.</td>
<td></td>
</tr>
</tbody>
</table>
getAsBinary

- **Optional**
- **no**: If ColdFusion does not recognize the response body type as text, converts it to a ColdFusion object.
- **auto**: If ColdFusion does not recognize the response body type as text, converts it to ColdFusion Binary type data.
- **yes**: Always converts the response body content into ColdFusion Binary type data, even if ColdFusion recognizes the response body type as text.
- **never**: Prevents the automatic conversion of certain MIME types to the ColdFusion Binary type data; treats the returned content as text.

ColdFusion recognizes the response body as text if:
- the header does not specify a content type.
- the content type starts with "text".
- the content type starts with "message".
- the content type is "application/octet-stream".

If ColdFusion does not recognize the body as text and converts it to an object, but the body consists of text, the `cfoutput` tag can display it. The `cfoutput` tag cannot display Binary type data. (To convert binary data to text, use the `ToString` function.)

**Method**

- **Optional**
- **GET**: Requests information from the server. Any data that the server requires to identify the requested information must be in the URL or in `cfhttptag` tags.
- **POST**: Sends information to the server for processing. Requires one or more `cfhttpparam` tags. Often used for submitting form-like data.
- **PUT**: Requests the server to store the message body at the specified URL. Use this method to send files to the server.
- **DELETE**: Requests the server to delete the specified URL.
- **HEAD**: Identical to the GET method, but the server does not send a message body in the response. Use this method for testing hypertext links for validity and accessibility, determining the type or modification time of a document, or determining the type of server.
- **TRACE**: Requests that the server echo the received HTTP headers back to the sender in the response body. Trace requests cannot have bodies. This method enables the ColdFusion application to see what is being received at the server, and use that data for testing or diagnostic information.
- **OPTIONS**: A request for information about the communication options available for the server or the specified URL. This method enables the ColdFusion application to determine the options and requirements associated with a URL or the capabilities of a server, without requesting any additional activity by the server.

**Password**

Optional

Use to pass a password to the target URL for Basic Authentication. Combined with `username` to form a base64 encoded string that is passed in the `Authenticate` header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.

**Port**

Optional

- 80 for http
- 443 for https

Port number on the server to which to send the request. A port value in the `url` attribute overrides this value.

**Proxy Server**

Optional

Host name or IP address of a proxy server to which to send the request.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxyPort</td>
<td>Optional</td>
<td>80</td>
<td>Port number to use on the proxy server.</td>
</tr>
<tr>
<td>proxyUser</td>
<td>Optional</td>
<td></td>
<td>User name to provide to the proxy server.</td>
</tr>
<tr>
<td>proxyPassword</td>
<td>Optional</td>
<td></td>
<td>Password to provide to the proxy server.</td>
</tr>
<tr>
<td>redirect</td>
<td>Optional</td>
<td>yes</td>
<td>If the response header includes a Location field AND ColdFusion receives a 300-series (redirection) status code, specifies whether to redirect execution to the URL specified in the field:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: redirects execution to the specified page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: stops execution and returns the response information in the cfhttp variable, or throws an error if the throwOnError attribute is True.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The cfhttp.responseHeader.Location variable contains the redirection path. ColdFusion follows a maximum of four redirects on a request. If there are more, ColdFusion functions as if redirect = &quot;no&quot;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> The cflocation tag generates an HTTP 302 response with the url attribute as the Location header value.</td>
</tr>
<tr>
<td>resolveURL</td>
<td>Optional</td>
<td>no</td>
<td>• no: does not resolve URLs in the response body. As a result, any relative URL links in the response body do not work.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: resolves URLs in the response body to absolute URLs, including the port number, so that links in a retrieved page remain functional. Applies to these HTML tags:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• img</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• src</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• a href</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• form action</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• applet code</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>

<tr>
<td></td>
<td></td>
<td></td>
<td>• embed pluginspace</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• body background</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• frame src</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• bgsound src</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• object data</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• object classid</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• object codebase</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• object usemap</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Does not resolve URLs if the file and path attributes are used.</td>
</tr>
<tr>
<td>result</td>
<td>Optional</td>
<td></td>
<td>Lets you specify an alternate variable in which to receive a result.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
The following attribute is used with the PUT method to determine how to send data specified with `httpparam type="formField"`:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multipart</td>
<td>Optional</td>
<td>no</td>
<td>Tells ColdFusion to send all data specified by <code>httpparam type=&quot;formField&quot;</code> tags as multipart form data, with a Content-Type of multipart/form-data. By default, ColdFusion sends <code>cfhttp</code> requests that contain only formField data with a Content Type of application/x-www-form-urlencoded. (If the request also includes File type data, ColdFusion uses the multipart/form-data content type for all parts.) If yes, ColdFusion also sends the request's charset in each Content-Type description. All form field data must be encoded in this character encoding, and ColdFusion does not URLEncode the data. (The field name must be in ISO-8859-1 or ASCII.) Some http parsers, including the one used by previous versions of ColdFusion, ignore the multipart form field character encoding description.</td>
</tr>
</tbody>
</table>

The following attribute sets a multipart header field and is used, for example, for uploading videos on YouTube:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multipartType</td>
<td>Optional</td>
<td>form-data</td>
<td>Allows you to set the multipart header field to related or form-data. By default, the value is form-data.</td>
</tr>
</tbody>
</table>

Example:
<!--- Get Video --->
<cfset videoName = "<video path>\hello.wmv">
<cfset videoFileName = "hello.wmv">
<cfoutput>

<!--- Set User Account Data --->
<cfset clientKey = "client key from google"/>
<cfset devKey = "<dev key from google>"/>
<cfset youTubeUploadURL = "http://uploads.gdata.youtube.com/feeds/api/users/default/uploads"/>

<!--- Authenticate with Google / YouTube --->
<cfhttp url="https://www.google.com/accounts/ClientLogin" method="post" result="result" charset="utf-8">
<cfhttpparam type="formfield" name="accountType" value="HOSTED_OR_GOOGLE">
<cfhttpparam type="formfield" name="Email" value="<gmail id>">
<cfhttpparam type="formfield" name="Passwd" value="<password>">
<cfhttpparam type="formfield" name="service" value="youtube">
<cfhttpparam type="formfield" name="source" value="youtubecode">
</cfhttp>

<!--- Create Auth Token --->
<cfset content = result.filecontent>
<cfset authdata = structNew()>
<cfloop index="line" list="#content#" delimiters="#chr(10)#">
<cfset dtype = listFirst(line, ">")>
<cfset value = listRest(line, ">")>
<cfset authdata[dtype] = value></cfloop>

<!--- Create ATOM XML and save to a file to be sent with video --->
<cfsavecontent variable="meta"><cfoutput>
<entry xmlns="http://www.w3.org/2005/Atom"
xmlns:media="http://search.yahoo.com/mrss/"
xmlns:yt="http://gdata.youtube.com/schemas/2007">
<media:group>
<media:title type="plain">WithOutQuotes</media:title>
<media:description type="plain">Test Description</media:description>
<media:category
<media:keywords>yourvideo</media:keywords>
</media:group>
</entry>
</cfoutput></cfsavecontent>
ColdFusion Tags

The following attribute allows you to specify the name of the variable in which you would like the results of the operation returned. The name you specify replaces `cfhttp` as the prefix by which you access the returned variables. For example, if you set the `result` attribute to `myResult`, you would access `FileContent` as `#myResult.FileContent#`.

The `result` attribute allows functions or CFCs that are called from multiple pages at the same time to avoid overwriting the results of one call with another. For information about the variables returned by a `cfhttp` `get` operation, see the section Variables returned by a `cfhttp` `get` operation in the Usage section.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>result</code></td>
<td>Optional</td>
<td></td>
<td>Specifies the name of the variable in which you want the result returned.</td>
</tr>
</tbody>
</table>

The following attributes tell ColdFusion to put the HTTP response body in a file. You can put the response body in a file for GET, POST, PUT, DELETE, OPTIONS, and TRACE methods, but it is generally not useful with the DELETE or OPTIONS method.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>file</code></td>
<td>Required if <code>path</code> is specified and not a GET method</td>
<td>See Description</td>
<td>Name of the file in which to store the response body. For a GET operation, the default is the file requested in the URL, if there is one. For example, if the URL in a GET method is <code>http://www.myco.com/test.htm</code>, the default file is <code>test.htm</code>. Do not specify the path to the directory in this attribute; use the <code>path</code> attribute.</td>
</tr>
<tr>
<td><code>path</code></td>
<td>Required if <code>file</code> is specified.</td>
<td>Tells ColdFusion to save the HTTP response body in a file. Contains the absolute path to the directory in which to store the file.</td>
<td></td>
</tr>
</tbody>
</table>

Use the following syntax in the `path` attribute to specify an in-memory directory for your files. In-memory files speed processing of transient data.

`ram:///filepath`
The filepath can include multiple directories, for example ram:///petStore/images. Create the directories in the path before you can use them. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The following attributes tell ColdFusion to convert the HTTP response body into a ColdFusion query object. They can be used with the GET and POST methods only.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td>Optional</td>
<td>First row of response contains column names.</td>
<td>The column names for the query, separated by commas, with no spaces. Column names must start with a letter. The remaining characters can be letters, numbers, or underscore characters (_). If there are no column name headers in the response, specify this attribute to identify the column names. If you specify this attribute, and the firstrowasHeader attribute is True (the default), the column names specified by this attribute replace the first line of the response. You can use this behavior to replace the column names retrieved by the request with your own names. If a duplicate column heading is encountered in either this attribute or in the column names from the response, ColdFusion appends an underscore to the name to make it unique. If the number of columns specified by this attribute does not equal the number of columns in the HTTP response body, ColdFusion generates an error.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Optional</td>
<td>, (comma)</td>
<td>A character that separates query columns. The response body must use this character to separate the query columns.</td>
</tr>
</tbody>
</table>
| firstrowasheaders | Optional| yes     | Determines how ColdFusion processes the first row of the query record set:  
  * yes: processes the first row as column heads. If you specify a columns attribute, ColdFusion ignores the first row of the file.  
  * no: processes the first row as data. If you do not specify a columns attribute, ColdFusion generates column names by appending numbers to the word "column"; for example, "column_1". |
| name           | Optional|                                              | Tells ColdFusion to create a query object with the given name from the returned HTTP response body.                                                                                                           |
| textQualifier  | Optional| "[double-quotimation mark]"                   | A character that, optionally, specifies the start and end of a text column. This character must surround any text fields in the response body that contain the delimiter character as part of the field value. To include this character in column text, escape it by using two characters in place of one. For example, if the qualifier is a double-quotimation mark, escape it as ".". |

Usage
The cfhttp tag is a general-purpose tool for creating HTTP requests and handling the returned results. It enables you to generate most standard HTTP request types. You use embedded cfhttpparam tags to specify request headers and body content.

When ColdFusion receives a response to a cfhttp request, it can put the response body (if any) in a file or the cfhttp.FileContent string variable. If the body text is structured as a result set, ColdFusion can put the body text in query object. You can also access the values of all returned headers and specify how to handle error status and redirections, and specify a time-out to prevent requests from hanging.
The HTTP protocol is the backbone of the World Wide Web and is used for every web transaction. Because the `cfhttp` tag can generate most types of requests, it provides significant flexibility. Possible uses include:

- Interacting with dynamic web sites and services that are not available as web services. (Use the `cfinvoke` tag to access SOAP web services.)
- Getting the contents of an HTML page or other file such as an image on a web server for use in your CFML page or storage in a file.
- Sending a secure request to a server by specifying the https protocol in the `url` attribute.
- Using the POST method to send a multipart/form-data style post to any URL that can handle such data and return results, including CGI executables or even other ColdFusion pages.
- Using the PUT method to upload files to a server that does not accept FTP requests.

This tag can, and for PUT and POST requests must, have a body that contains `cfhttpparam` tags. If this tag has `cfhttpparam` tags, it must have a `<cfhttp>` end tag.

To use HTTPS with the `cfhttp` tag, you might need to manually import the certificate for each web server into the keystore for the JRE that ColdFusion uses. This procedure should not be necessary if the certificate is signed (issued) by an authority that the JSSE (Java Secure Sockets Extension) recognizes (for example, Verisign); that is, if the signing authority is in the cacerts already. However, you might need to use the procedure if you are issuing SSL (secure sockets layer) certificates yourself.

**Manually import a certificate**

1. Go to a page on the SSL server in question.
2. Double-click the lock icon.
3. Click the Details tab.
4. Click Copy To File.
5. Select the base64 option and save the file.
6. Copy the CER file into `C:\ColdFusion9\runtime\jre\lib\security` (or whichever JRE ColdFusion is using).
7. Run the following command in the same directory (keytool.exe is located in `C:\ColdFusion9\runtime\jre\bin`):
   ```
   keytool -import -keystore cacerts -alias giveUniqueName -file filename.cer
   ```

**Variables returned by a cfhttp get operation**

The `cfhttp` tag returns the following variables. If you set the `result` attribute, the name you assign replaces `cfhttp` as the prefix. For additional information, see the `result` attribute.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cfhttp.charSet</code></td>
<td>Response character character set (character encoding) specified by the response Content-Type header.</td>
</tr>
<tr>
<td><code>cfhttp.errorDetail</code></td>
<td>If the connection to the HTTP server fails, contains details about the failure. For instance: &quot;Unknown host: my.co.com&quot;; otherwise, the empty string. recommends that you check this variable for an error condition before checking other variables.</td>
</tr>
<tr>
<td><code>cfhttp.fileContent</code></td>
<td>Response body; for example, the contents of an html page retrieved by a GET operation. Empty if you save the response in a file.</td>
</tr>
<tr>
<td><code>cfhttp.header</code></td>
<td>Raw response header containing all header information in a single string. Contains the same information as the <code>cfhttp.responseHeader</code> variable.</td>
</tr>
<tr>
<td><code>cfhttp.mimeType</code></td>
<td>MIME type specified by the response Content-Type header; for example, text/html.</td>
</tr>
</tbody>
</table>
Building a query from a delimited text file

The `cfhttp` tag can create a ColdFusion query object from the response body. To do so, the response body must consist of lines of text, with each line having fields that are delimited by a character that identifies the column breaks. The default delimiter is a comma (,). The response data can also use a text qualifier; the default is a double-quotation mark ("). If you surround a string field in the text qualifier, the field can contain the delimiter character. To include the text qualifier in field text, escape it by using a double character. The following line shows a two-line request body that is converted into a query. It has three comma-delimited fields:

Field1,Field2,Field3
"A comma, in text","A quote: "Oh My!"",Plain text

Run the following code to show how ColdFusion treats this data:

```cfml
<cfhttp method="Get"
   url="127.0.0.1:8500/tests/escapetest.txt"
   name="onerow">
<cfdump var="#onerow#"><br>
```

Column names can be specified in three ways:

- By default, ColdFusion uses the first row of the response as the column names.
- If you specify a comma-delimited `columns` attribute, ColdFusion uses the names specified in the attribute as the column names. Set `firstRowAsHeaders="no"` if the first row of the response contains data. Otherwise, ColdFusion ignores the first row.
- If you do not specify a `columns` attribute and set `firstRowAsHeaders="no"`, ColdFusion generates column names of the form Column_1, Column2, etc.

The `cfhttp` tag checks to ensure that column names in the data returned by the tag start with a letter and contain only letters, numbers, and underscore characters (_).

ColdFusion checks for invalid column names. Column names must start with a letter. The remaining characters can be letters, numbers, or underscores (_). If a column name is not valid, ColdFusion generates an error.

**Notes**

- For the ColdFusion Administrator time-out and the URL time-out to take effect, enable the time-out in the ColdFusion Administrator, Server Settings page. For more information, see Configuring and Administering ColdFusion.
The `cfhttp` tag supports Basic Authentication for all operations.

The `cfhttp` tag uses SSL to negotiate secure transactions.

If you put the HTTP response body in a file, ColdFusion does not put it in the CFHTTP.FileContent variable or generate a query object. If you do not put the response body in a file, ColdFusion puts it in the CFHTTP.FileContent variable; if you specify a name attribute ColdFusion generates a query object.

The `cfhttp` tag does not support NTLM or Digest Authentication.

If you are using Microsoft IIS, there is no HTTP header size limit. To specify an HTTP header size limit, set it in IIS.

**Example**

```cfml
<!--- This example displays the information provided by
     the Designer & Developer Center XML feed,
     http://www.adobe.com/devnet/resources/_resources.xml
     See http://www.adobe.com/devnet/articles/xml_resource_feed.html
     for more information on this feed. --->

<!--- Set the URL address. --->
<cfset urlAddress = "http://www.adobe.com/devnet/resources/_resources.xml">

<!--- Use the CFHTTP tag to get the file content represented by urladdress.
     Note that />, not an end tag, terminates this tag. --->
<cfhttp url="#urlAddress#" method="GET" resolveurl="Yes" throwOnError="Yes"/>

<!--- Parse the XML and output a list of resources. --->
<cfset xmlDoc = XmlParse(CFHTTP.FileContent)>
<cfset resources = xmlDoc.xmlroot.xmlChildren>
<cfset numresources = ArrayLen(resources)>
<cfloop index="i" from="1" to="#numresources#">
    <cfset item = resources[i]>
    <cfoutput>
        <strong><a href="#item.url.xmltext#">#item.title.xmltext#</a></strong><br>
        <strong>Author</strong>&nbsp;&nbsp;#item.author.xmltext#<br>
        <strong>Applies to these products</strong><br>
        <cfloop index="i" from="4" to="#arraylen(item.xmlChildren)#">
            #item.xmlChildren[i].xmlAttributes.Name#<br>
        </cfloop>
        <br>
    </cfoutput>
</cfloop>
```

**cfhttpparam**

**Description**

Allowed inside `cfhttp` tag bodies only. Required for `cfhttp` POST operations. Optional for all others. Specifies parameters to build an HTTP request.

**Category**

Internet protocol tags
Syntax
<cfhttpparam
    type = "transaction type"
    encoded = "yes|no"
    file = "filename"
    mimeType = "MIME type designator"
    name = "data name"
    value = "data value">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfhttp, GetHttpRequestData, cfftp, cfldap, cfmail, cfmailparam, cfpop

History
ColdFusion MX 6.1:
- Added the header and body types.
- Added the encoded and mimeType attributes.
- Changed HTTP method behavior: all HTTP methods can have httpparam tags.
- Changed the name attribute requirements: it is not required for all types.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| type      | Required|         | Information type:  
  - header: specifies an HTTP header. ColdFusion does not URL encode the header.  
  - CGI: specifies an HTTP header. ColdFusion URL encodes the header by default.  
  - body: specifies the body of the HTTP request. ColdFusion does not automatically set a content-type header or URL encode the body contents. To specify the content-type, use a separate cfhttpparam tag with type-header.  
  - XML: identifies the request as having a content-type of text/xml. Specifies that the value attribute contains the body of the HTTP request. Used to send XML to the destination URL. ColdFusion does not URL encode the XML data.  
  - file: tells ColdFusion to send the contents of the specified file. ColdFusion does not URL encode the file contents.  
  - URL: specifies a URL query string name-value pair to append to the cfhttpurl attribute. ColdFusion URL encodes the query string.  
  - formField: specifies a form field to send. ColdFusion URL encodes the Form field by default.  
  - cookie: specifies a cookie to send as an HTTP header. ColdFusion URL encodes the cookie. |
| encoded   | Optional| yes     | Applies to FormField and CGI types; ignored for all other types. Specifies whether to URL encode the form field or header. |
| file      | Required only if type="File" |         | Applies to File type; ignored for all other types. The absolute path to the file that is sent in the request body. |
Usage
Specifies header or body data to send in the HTTP request. The type attribute identifies the information that the parameter specifies. A cfhttp tag can have multiple cfhttpparam tags, subject to the following limitations:

- An XMLtype attribute cannot be used with additional XMLtype attributes, or with body, file, or formFieldtype attributes.
- A bodytype attribute cannot be used with additional bodytype attributes, or with XML, file, or formFieldtype attributes.
- The XML and bodytype attributes cannot be used with the cfhttp tag TRACE method.
- The filetype attribute is only meaningful with the cfhttp tag POST and PUT methods.
- The formField type attribute is only meaningful with the cfhttp tag POST and GET methods.

If you send an HTTP request to a ColdFusion page, all HTTP headers, not just those sent using the CGI type, are available as CGI scope variables. However, any custom variables (such as "myVar") do not appear in a dump of the CGI scope.

When you send a file using the type="file" attribute, the file content is sent in the body of a multipart/form-data request. If you send the file to a ColdFusion page, the Form scope of the receiving page contains an entry with the name you specified in the cfhttpparam tag name attribute as the key. The value of this variable is the path to a temporary file containing the file that you sent. If you also send Form field data, the location of the filename in the form.fieldnames key list depends on the position of the cfhttpparam tag with the file relative to the cfhttp tags with the form data.

URL-encoding preserves special characters (such as the ampersand) when they are passed to the server. For more information, see the function "URLEncodedFormat" on page 1373.

To send arbitrary data in a "raw" HTTP message, use a cfhttpparam tag with a type="body" attribute to specify the body content and use cfhttpparam tags with a type="header" attributes to specify the headers.
Example

<!--- This example consists of two CFML pages. The first page posts to the second. --->

<!--- The first, posting page. This page posts variables to another page and displays the body of the response from the second page. Change the URL and port as necessary for your environment. --->

<cfhttp
method="post"
url="http://127.0.0.1/tests/http/cfhttpparamexample.cfm"
port="8500"
throwonerror="Yes">
<cfhttpparam name="form_test" type="FormField" value="This is a form variable">
<cfhttpparam name="url_test" type="URL" value="This is a URL variable">
<cfhttpparam name="cgi_test" type="CGI" value="This is a CGI variable">
<cfhttpparam name="cookie_test" type="Cookie" value="This is a cookie">
</cfhttp>

<!--- Output the results returned by the posted-to page. --->
<cfoutput>
#cfhttp.fileContent#
</cfoutput>

<!--- This is the cfhttpparamexample.cfm page that receives and processes the Post request. Its response body is the generated HTML output. --->

<h3>Output the passed variables</h3>
<cfoutput>
Form variable: #form.form_test#
<br>URL variable: #URL.url_test#
<br>Cookie variable: #Cookie.cookie_test#
<br>CGI variable: #CGI.cgi_test#
<br>Note that the CGI variable is URL encoded.
</cfoutput>

Tags

cif

Description

Creates simple and compound conditional statements in CFML. Tests an expression, variable, function return value, or string. Used, optionally, with the cfelse and cfelseif tags.

Category

Flow-control tags

Last updated 7/9/2012
Syntax
<cfif expression>
  HTML and CFML tags
  <cfelseif expression>
  HTML and CFML tags
  <cfelse>
  HTML and CFML tags
</cfif>

See also
cfelse, cfelseif, cfabort, cfbreak, cfexecute, cfexit, cflocation, cfloop, cfswitch, cfthrow, cftry

Usage
If the value of the expression in the cfif tag is true, ColdFusion processes all the code that follows, up to any cfelseif or cfelse tag, and then skips to the cfif end tag. Otherwise, ColdFusion does not process the code that immediately follows the cfif tag, and continues processing at any cfelseif or cfelse tag, or with the code that follows the cfif end tag.

When testing the return value of a function that returns a Boolean, you do not have to define the True condition explicitly. This example uses the IsArray function:
<cfif IsArray(myarray)>

If successful, IsArray evaluates to yes, the string equivalent of the Boolean True. This is preferred over explicitly defining the True condition this way:
<cfif IsArray(myarray) IS True>

This tag requires an end tag.

Example
In this example, variables are shown within number signs. This is not required.

<!--- This example shows the interaction of cfif, cfelse, and cfelseif. --->
<!----- First, perform a query to get some data. ------>
<cfquery name="getCenters" datasource="cfdocexamples">
  SELECT Center_ID, Name, Address1, Address2, City, State, Country, PostalCode,
  Phone, Contact
  FROM Centers
  ORDER by City, State, Name
</cfquery>
<p>CFIF gives us the ability to perform conditional logic based on a condition or set of conditions.</p>
<p>For example, we can output the list of Centers from the snippets datasource by group and only display them <b>IF</b> City = San Diego.</p>
<hr>

<!---- Use CFIF to test a condition when outputting a query. ------>
<p>The following centers are in San Diego:</p>
<cfoutput query="getCenters">
  <cfif Trim(City) is "San Diego">
    <br><b>Name/Address:</b> #Name#, #Address1#, #City#, #State#<br>
    <br>
  </cfif>
</cfoutput>
<hr>
<p>If we would like more than one condition to be the case, we can ask for a list of the
centers in San Diego <b>OR</b> Santa Ana. If the center does not follow this condition, we can use CFELSE to show only the names and cities of the other centers.

Notice how a nested CFIF is used to specify the location of the featured site (Santa Ana or San Diego).

<!----- Use CFIF to specify a conditional choice for multiple options; also note the nested CFIF. --->

Complete information is shown for centers in San Diego or Santa Ana. All other centers are listed in italic:

```
<cfoutput query="getCenters">
  <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
    <h4>Featured Center in</h4>
    <cfif Trim(City) is "San Diego">
      San Diego
    <cfelse>
      Santa Ana
    </cfif>
    <h4>Name/Address:</h4>
    #Name#, #Address1#, #City#, #State#<br>
    <h4>Contact:</h4>
    #Contact#<br>
  </cfif>
  <cfelse>
    <i>#Name#, #City#</i><br>
  </cfif>
</cfoutput>
```

Finally, we can use CFELSEIF to cycle through a number of conditions and produce varying output. Note that you can use CFCASE and CF_SWITCH for a more elegant representation of this behavior.

<!--- Use CFIF in conjunction with CFELSEIF to specify more than one branch in a conditional situation. --->

```
<cfoutput query="getCenters">
  <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
    <i>#Name#, #City#</i> (this one is in <cfif Trim(City) is "San Diego">San Diego
  <cfelse>Santa Ana
  </cfif>)
  <cfelseif Trim(City) is "San Francisco">
    <i>#Name#, #City#</i> (this one is in San Francisco)
  <cfelseif Trim(City) is "Suisun">
    <i>#Name#, #City#</i> (this one is in Suisun)
  <cfelse>
    <i>#Name#</i><br>
    <b>Not in a city we track</b>
  </cfif>
</cfoutput>
```

### cfimage

**Description**

Creates a ColdFusion image. You can use the `cfimage` tag to perform common image manipulation operations as a shortcut to `Image` functions. You can use the `cfimage` tag independently or in conjunction with `Image` functions.

**History**

ColdFusion 10: Added the attribute `interpolation` to `cfimage action = "resize"

ColdFusion 8: Added this tag.
Category
Other tag

Syntax
Add a border to an image
<cfimage
  required
    action = "border"
    source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
  optional
    color = "hexadecimal value|web color"

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action    | N/A    | Optional| read    | Action to take. Must be one of the following:  
• border  
• captcha  
• convert  
• info  
• read  
• resize  
• rotate  
• write  
• writeToBrowser  
The default action is `read`, which you do not need to specify explicitly. |
| angle     | rotate | Required |         | Angle in degrees to rotate the image.  
Specify an integer for the value. |
| color     | border | Optional | black  | Border color.  
Hexadecimal value or supported named color; see the name list in Valid HTML named colors section. For a hexadecimal value, use the form `"##xxxxxx"` or `"xxxxxx"`, where x = 0-9 or A-F; use two number signs or none. |
| destination | border | Optional (see Description) |         | Absolute or relative pathname where the image output is written.  
The image format is determined by the file extension.  
The `convert` and `write` actions require a destination attribute.  
The `border`, `captcha`, `resize`, and `rotate` actions require a `name` attribute or a destination attribute. You can specify both.  
ColdFusion supports only CAPTCHA images in PNG format.  
Where the CAPTCHA image is placed depends on the following:  
• If `destination` is specified, image is written to the file (based on the absolute or relative pathname you specify).  
• If `name` is specified, image is written to the image variable.  
• If neither `destination` nor `name` is specified, image is written to the browser. |

| name        | border   | Optional | name       | Name of the ColdFusion image variable to create.  
  The read action requires a name attribute.  
  The border, resize, and rotate actions require a name attribute or a destination attribute. You can specify both. |
|            | convert  | (see Description) |             |                                                                             |
|            | read     |         |            |                                                                             |
|            | resize   |         |            |                                                                             |
|            | rotate   |         |            |                                                                             |
ColdFusion provides the `cfimage` tag and the ColdFusion image, a construct native to ColdFusion that contains image data. You can manipulate ColdFusion images in memory and write them to a file, a database, or directly to a browser. You use the `cfimage` tag to create ColdFusion images from existing image files and perform simple image actions, such as rotating or resizing. Alternatively, you can use the `ImageNew` function to create a ColdFusion image from the beginning or from an existing image. You can use the `Image` functions to perform complex image manipulation operations on ColdFusion images that you create with the `cfimage` tag or with the `ImageNew` function.

## Attribute Action | Req/Opt | Default | Description
--- | --- | --- | ---
overwrite | border | Optional | no | Valid only if the `destination` attribute is specified. The overwrite values are:
- yes: overwrites the destination file.
- no: does not overwrite the destination file.
If the destination file exists, ColdFusion generates an error if the overwrite action is not set to yes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| quality | write | Optional | 0.75 | Quality of the JPEG destination file. Applies only to files with an extension of JPG or JPEG. Valid values are fractions that range from 0 through 1 (the lower the number, the lower the quality).

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| source | border | Required | | URL of the source image; for example, "http://www.google.com/images/logo.gif"
- Absolute pathname or a pathname relative to the web root; for example: "c:\images\logo.jpg"
- ColdFusion image variable containing another image, BLOB, or byte array; for example, "#myImage#"
- Base64 string; for example, "data:image/jpg;base64,/9j/4AAQSkZJRgABA……..."

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| structName | info | Required | | Name of the ColdFusion structure to be created.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| text | captcha | Required | | Text string displayed in the CAPTCHA image. Use capital letters for better readability. Do not include spaces because users cannot detect them in the resulting CAPTCHA image.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| thickness | border | Optional | 1 | Border thickness in pixels. The border is added to the outside edge of the source image, increasing the image area accordingly. The value must be an integer.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| width | captcha | Required | | Width in pixels of the image.
For `resize`, you also can specify the width as a percentage (an integer followed by the % symbol).
When you resize an image, if you specify a value for the height, you can let ColdFusion calculate the aspect ratio by specifying "" as the width.
If specified, the value must be an integer.

Usage
ColdFusion provides the `cfimage` tag and the ColdFusion image, a construct native to ColdFusion that contains image data. You can manipulate ColdFusion images in memory and write them to a file, a database, or directly to a browser. You use the `cfimage` tag to create ColdFusion images from existing image files and perform simple image actions, such as rotating or resizing. Alternatively, you can use the `ImageNew` function to create a ColdFusion image from the beginning or from an existing image. You can use the `Image` functions to perform complex image manipulation operations on ColdFusion images that you create with the `cfimage` tag or with the `ImageNew` function.
You can perform the following tasks with ColdFusion images:

- Convert an image from one file format to another. For example, you can convert a BMP file to a JPEG file or a Base64 string to a GIF.
- Enforce consistent sizes on files uploaded to the server.
- Enforce size limits on JPEG images (by changing the quality of the image).
- Save a ColdFusion image to a file or write the image directly to a browser.
- Use the `ImageGetBlob` function within the `cfquery` tag to insert a ColdFusion image as a Binary Large Object Bitmap (BLOB) in a database. Also, you can extract a BLOB from a database and generate a ColdFusion image from it.
- Create watermark images.
- Create thumbnail images.
- Create a Completely Automated Public Turing test to tell Computers and Humans Apart (CAPTCHA) image, a distorted text image that is human-readable, but not machine-readable, used in a challenge-response test for preventing spam.

For more detailed examples, see Creating and Manipulating ColdFusion Images in the Developing ColdFusion Applications.

**File attributes**

Use the following syntax to specify an in-memory file, which is not written to disk in the `destination` and `source` attributes. In-memory files speed processing of transient data.

```
ram:///filepath
```

The `filepath` can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

**Supported image file formats**

The `cfimage` tag operates on a number of different file formats. To list the formats that are supported on the server where the ColdFusion application is deployed, use the `GetReadableImageFormats` function and the `GetWriteableImageFormats` function.

ColdFusion supports the following default image formats on Macintosh, Windows, and Unix operating systems:

- JPEG
- GIF
- TIFF
- PNG
- BMP

ColdFusion does not support the following image formats:

- Animated GIF
- Multipage TIFF
- PSD
- AI
CMYK support
The cfimage tag supports reading and writing CMYK images, but does not support actions that require converting the images. For example, you can use CMYK images with the read, write, writeToBrowser, resize, rotate, and info actions. You cannot use CMYK images with the convert, captcha, and border actions. The same rule applies to image functions. For example, the ImageNew, ImageRead, and ImageWrite functions support CMYK images, but the ImageAddBorder function does not.

Valid HTML named colors
The following table lists the W3C HTML 4 named color value or hexadecimal values that the color attribute accepts:

<table>
<thead>
<tr>
<th>Color name</th>
<th>RGB value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black</td>
<td>#000000</td>
</tr>
<tr>
<td>Blue</td>
<td>#0000FF</td>
</tr>
<tr>
<td>Red</td>
<td>#FF0000</td>
</tr>
<tr>
<td>Gray</td>
<td>#808080</td>
</tr>
<tr>
<td>LightGray</td>
<td>#D3D3D3</td>
</tr>
<tr>
<td>DarkGray</td>
<td>#A9A9A9</td>
</tr>
<tr>
<td>Green</td>
<td>#008000</td>
</tr>
<tr>
<td>Pink</td>
<td>#FFC0CB</td>
</tr>
<tr>
<td>Cyan</td>
<td>#00FFFF</td>
</tr>
<tr>
<td>Magenta</td>
<td>#FF00FF</td>
</tr>
<tr>
<td>Orange</td>
<td>#FFA500</td>
</tr>
<tr>
<td>White</td>
<td>#FFFFFF</td>
</tr>
<tr>
<td>Yellow</td>
<td>#FFFF00</td>
</tr>
</tbody>
</table>

For all other color values, enter the hexadecimal value. Enter a six-digit value, which specifies the RGB value. Values between 00 and FF are allowed.

Image quality
By default, the cfimage tag generates images with antialiasing turned on (to remove the appearance of jagged edges). The interpolation method is set to highestQuality: this produces a high-quality image, but decreases processing speed. To turn off antialiasing, use the ImageSetAntialiasing function. To change the interpolation method or for more control over image attributes, use the following functions:

- ImageResize
- ImageRotate
- ImageScaleToFit
- ImageShear
- ImageTranslate

**border action** Use the border action to create a rectangular border around the outer edge of an image. You can control the thickness of the border and its color. For more control, use the ImageAddBorder function. The following example shows how to set the thickness and color of a border:
<!--- This example shows how to create a ColdFusion image from an existing JPEG file, add a five-pixel-wide red border to the image, and save it to a new JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" action="border" thickness="5"
    destination="jeff05.jpg" color="red" overwrite="yes">

captcha action Use the captcha action to create a distorted text image that is human-readable but not machine-readable. When you create a CAPTCHA image, you specify the text that is displayed in the CAPTCHA image; ColdFusion randomly distorts the text. You can specify the height and width of the text area, which affects the spacing between letters, the font size, the fonts used for the CAPTCHA text, and the level of difficulty, which affects readability. The following example shows how to write a CAPTCHA image directly to the browser:

    <cfimage action="captcha" fontSize="25" width="400" height="150" text="rEadMe"
        fonts="Arial,Verdana,Courier New">

**Note:** For the CAPTCHA image to display, the width value must be greater than: fontSize times the number of characters specified in text times 1.08. In this example, the minimum width is 162.

ColdFusion supports CAPTCHA images in PNG format only.

**Note:** Use unique names for the CAPTCHA image files so that when multiple users access the CAPTCHA images, the files are not overwritten.

The following example shows how to create CAPTCHA images with a medium level of difficulty that are written to files:

    <!--- Use the GetTickCount function to generate unique names for the CAPTCHA files. --->
    <cfset tc = GetTickCount()>
    <cfimage action="captcha" fontSize="15" width="180" height="50" text="rEadMe"
        destination="images/rEadMe#tc#.png" difficulty="medium">

For a detailed example, see the Creating and Manipulating ColdFusion Images in the Developing ColdFusion Applications.

convert action Use the convert action to convert an image from one file format to another. For more information on file formats, see the section Supported image file formats. The following example shows how to convert a JPEG file to a PNG file:

    <!--- This example shows how to convert a JPEG image to a PNG image. --->
    <cfimage source="../cfdocs/images/artgallery/aiden02.jpg" action="convert"
        destination="aiden02.png">

**Note:** Converting images between one file format to another is time-consuming. Also, image quality can degrade; for example, PNG images support 24-bit color, but GIF images support only 256 colors. Converting transparent images (images with alpha) can degrade image quality.

info action Use the info action to create a ColdFusion structure that contains information about the image, including the color model, height, width, and source of the image. The structure is the same as returned by the ImageInfo function. The following example shows how to retrieve all of the information about an image:
<!--- This example shows how to retrieve and display image information. --->
<cfimage source="../cfdocs/images/artgallery/viato03.jpg" action="info"
structName="viatoInfo">
<cfdump var="#viatoInfo#"/>

<!--- Alternatively, you can use the cfoutput tag to display specific image information, as shown in the following example. --->
<cfoutput>
  <p>height: #viatoInfo.height# pixels</p>
  <p>width: #viatoInfo.width# pixels</p>
  <p>source: #viatoInfo.source#</p>
  <p>transparency: #viatoInfo.colormodel.transparency#</p>
  <p>pixel size: #viatoInfo.colormodel.pixel_size#</p>
  <p>color model: #viatoInfo.colormodel.colormodel_type#</p>
  <p>alpha channel support: #viatoInfo.colormodel.alpha_channel_support#</p>
  <p>color space: #viatoInfo.colormodel.colorspace#</p>
</cfoutput>

**read action** Use the `read` action to read an image from the specified local file pathname or URL, and create a ColdFusion image in memory. You can use the ColdFusion image variable as the source for another `cfimage` tag or for `Image` functions. The read action performs the same operation as the `ImageRead` function. The following example shows how to create a ColdFusion image from a JPEG file and manipulate it using the `ImageGrayscale` function:

<!--- This code shows how to create a ColdFusion image from a JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff01.jpg" name="myImage">

<!--- This code shows how to convert the image to grayscale. --->
<cfset ImageGrayscale(myImage)>

<!--- This code shows how to write the grayscale image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="myGrayscaleImage.jpg" overwrite="yes">

**resize action** Use the `resize` action to resize an image to the specified height and width. You can specify the height and width in pixels or as a percentage:

<!--- This example shows how to specify the height and width of an image in pixels. --->
<cfimage source="../cfdocs/images/artgallery/jeff01.jpg" action="resize" width="100" height="100" destination="jeff01_thumbnail.jpg" overwrite="yes"/>

<!--- This example shows how to specify the height and width of an image as percentages. --->
<cfimage source="../cfdocs/images/artgallery/jeff02.jpg" action="resize"
width="50%" height="50%" destination="jeff02_thumbnail.jpg" overwrite="yes"/>

<!--- This example shows how to specify the height of an image in pixels and its width as a percentage. --->
<cfimage source="../cfdocs/images/artgallery/jeff03.jpg" action="resize"
width="50%" height="100" destination="jeff03_thumbnail.jpg" overwrite="yes"/>

For more control of resize attributes, use the `ImageResize` function.

**rotate action** Use the `rotate` action to rotate an image by degrees:

<!--- This example shows how to rotate an image by 30 degrees. --->
<cfimage source="../cfdocs/images/artgallery/maxwell01.jpg" action="rotate" angle="30"
name="maxwellAngle"/>

<!--- Display the rotated image in a browser. --->
<cfimage source="#maxwellAngle#" action="writeToBrowser"/>

For more control of the rotate attributes, use the `ImageRotate` function.
**write action**  Use the `write` action to write an image to the specified path. The new image is converted to the file type specified in the destination attribute. The `write` action performs the same operation as the `ImageWrite` function. When you write an image to a JPEG file, the image quality is set to 75% of the original image by default. To control the image size, use the `quality` attribute of the `write` action.

You can use the `write` action to change the quality of a JPEG image to reduce file size. The following example shows how to change image quality to .5:

```coldfusion
<!--- This example shows how to create a PNG file from a JPEG file by using the write action. --->
<cfimage source="../cfdocs/images/artgallery/aiden01.jpg" action="write"
        destination="aiden01.png">
<!--- This example shows how to create a low-quality JPEG image. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" action="write"
        destination="jeff05_lq.jpg" quality=".5">
<!--- This example shows how to write a JPEG file to a new location. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" action="write"
        destination="jeff05.jpg">
```

**writeToBrowser action**  Use the `writeToBrowser` action to display one or more ColdFusion images directly to the browser without writing them to files. Images are displayed in PNG format. The following example shows how to reduce the size of an image and display it in the browser:

```coldfusion
<!--- This example shows how to create a ColdFusion image from a JPEG file, resize it, and then display it in the browser as a PNG image. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" action="resize"
        width="50%" height="50%" name="smLogo">
<cfimage source="#smLogo#" action="writeToBrowser">
```

**Example**

This example shows how to create a ColdFusion image and manipulate it by using `Image` functions:

```coldfusion
<!--- Create the ColdFusion image variable "myImage" from a JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Pass the ColdFusion image to the Image functions to blur the image by a radius of 5, flip the image 90 degrees, and convert the image to grayscale. --->
<cfset ImageBlur(myImage,5)>
<cfset ImageFlip(myImage,"90")>
<cfset ImageGrayscale(myImage)>
<!--- Write the transformed image to a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

**cfimap**

**Description**

Queries an IMAP server to retrieve and manage mails within multiple folders.

**Category**

Communications tags, Internet protocol tags
Syntax
<cfimap
    action = "DELETE|DELETEFOLDER|CREATEFOLDER|OPEN|CLOSE|RENAMEFOLDER|LISTALLFOLDERS|
    MARKREAD|MOVEMAIL|GETALL|GETHEADERONLY"
    attachmentpath = "string"
    connection = "string"
    folder = "string"
    generateuniquefilenames = "yes|no"
    maxrows = "integer"

History
New tag introduced in ColdFusion 9.
## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action    | Optional| GetHeaderOnly | Returns the message header information for all retrieved mail. Other values for this attribute are:  
  - **GetAll**: Returns mail. The information includes the message header information, message text, and any attachments. Set the AttachmentPath attribute to retrieve attachments.  
  - **Delete**: Deletes messages from a folder.  
  - **Open**: Initiates an open session or connection with the IMAP server.  
  - **Close**: Terminates the open session or connection with the IMAP server.  
  - **MarkRead**: Marks all messages read from a folder.  
  - **CreateFolder**: Creates a folder in the Mailbox.  
  - **DeleteFolder**: Deletes a folder in the Mailbox.  
  - **RenameFolder**: Renames an existing user-defined folder.  
  - **ListAllFolders**: Displays a list of all existing folders in the mailbox or under the folder name defined by the Folder attribute.  
  - **MoveMail**: Moves mail from one folder to another. |
| attachment path | Optional for GetAll action | Specifies the name of the folder where ColdFusion retrieves attachments. If this folder does not exist, ColdFusion creates. If you do not specify the folder, then the attachment is not saved.  
  Note: If you specify a relative path, then attachments are saved in a temporary folder. This folder is same as one returned by the GetTempDirectory function. |
| Connection | Required for the following actions: Open and Close | Specifies the variable name for the connection/session. If the server attribute has an invalid IP address or invalid domain name, then the connection fails and ColdFusion returns an error message. |
| Folder | Required for the following actions:  
  - DeleteFolder,  
  - CreateFolder,  
  - RenameFolder,  
  - Optional for ListAllFolders, Movemail, Markread, Getall, GetheaderOnly, delete. | INBOX  
  (For ListAllFolders action, the default folder is mailbox)  
  For mail actions: Specifies the folder name where messages are retrieved, moved, or deleted. If folder name is invalid, ColdFusion defaults to INBOX.  
  For folder actions: Specifies the folder name that is deleted (DeleteFolder) or created (CreateFolder) or renamed (RenameFolder).  
  When selecting a subfolder, use the period (.) character as appropriate. For example, when deleting mail in folder ‘Module’ in folder ‘Product.Version.Module’, define the Folder attribute as ‘Product.Version.Module’. |
<p>| GenerateUniqueFileNames | Optional | Ensures that unique file names are generated for each attachment file. The goal is to avoid name conflicts for attachments that have the same filename. |
| MaxRows | Optional | Specifies the number of rows to be marked as read, deleted, or moved across folders. When the value is 1, it signals the row determined by StartRow. Any incremental value marks rows starting from the StartRow. If you have specified the UID or MessageNumber attribute, then MaxRows is ignored. |</p>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MessageNumber</td>
<td>Optional</td>
<td></td>
<td>Specifies the message number or a comma delimited list of message numbers for retrieval, deletion, marking mail as read, or moving mails. If you set an invalid message number, then the IMAP operation is ignored. For example, if you specify that cfimap deletes a specified message number, and if that message number does not exist, then the operation is ignored. If you have specified the UID attribute, then MessageNumber attribute is ignored.</td>
</tr>
<tr>
<td>Name</td>
<td>Optional</td>
<td></td>
<td>Specifies the name for the query object that contains the retrieved message information.</td>
</tr>
<tr>
<td>NewFolder</td>
<td>Optional</td>
<td></td>
<td>Specifies the name of the new folder when you rename a folder or the name of the destination folder where all mails move.</td>
</tr>
<tr>
<td>Password</td>
<td>Optional</td>
<td></td>
<td>Specifies the password for assessing the users' e-mail account.</td>
</tr>
<tr>
<td>Port</td>
<td>Optional</td>
<td>143 or 993</td>
<td>Specifies the IMAP port number. Use 143 for non-secure connections and 993 for secured connections.</td>
</tr>
<tr>
<td>Recurse</td>
<td>Optional</td>
<td>False</td>
<td>Specifies whether ColdFusion runs the CFIMAP command in subfolders. Recurse works for action=’ListAllFolders’. When recurse is set to ‘true’, ColdFusion parses through all folders and subfolders and returns folder/subfolder names and mail information.</td>
</tr>
<tr>
<td>Secure</td>
<td>Optional</td>
<td>False</td>
<td>Specifies whether the IMAP server uses a Secure Sockets Layer.</td>
</tr>
<tr>
<td>Server</td>
<td>Optional</td>
<td></td>
<td>Specifies the IMAP server identifier. You can assign a host name or an IP address as the IMAP server identifier.</td>
</tr>
<tr>
<td>StartRow</td>
<td>Optional</td>
<td></td>
<td>Defines the first row number for reading or deleting. If you have specified the UID or MessageNumber attribute, then StartRow is ignored. You can also specify StartRow for moving mails.</td>
</tr>
<tr>
<td>StopOnError</td>
<td>Optional</td>
<td>True</td>
<td>Specifies whether to ignore the exceptions for this operation. When the value is true, it stops processing, displays an appropriate error.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Optional</td>
<td>60</td>
<td>Specifies the number of seconds to wait before timing out connection to IMAP server. An error message is displayed when timeout occurs.</td>
</tr>
<tr>
<td>Uid</td>
<td>Optional</td>
<td></td>
<td>Specifies the unique ID or a comma-delimited list of Uids to retrieve, delete, and move mails. If you set invalid Uids, then they are ignored.</td>
</tr>
<tr>
<td>Username</td>
<td>Optional</td>
<td></td>
<td>Specifies the user name. Typically, the user name is same the e-mail login.</td>
</tr>
</tbody>
</table>
Usage
Open a session or connection with an IMAP server. To open a session, define the server, user name, and password attributes. You can open a connection with an IMAP server by specifying values for the server, user name, password, and connection attributes. For a secure connection, specify secure="true". You can reuse the connection attribute in subsequent CFIMAP tags, without having to specify the server, user name, or password attributes. Once you have established a connection, you can perform the following actions:

- Retrieve mail: Retrieve mail using the GetHeaderOnly or GetAll attributes and store the information in a query object. Use the cfdump command to display the content of the query object. You can also download attachments in temporary ColdFusion folder or a new folder as defined by the AttachmentPath attribute.
- Delete any unnecessary mail or delete folders. You can delete any user-created folders. Standard folders, such as INBOX, OUTBOX, SEND, cannot be deleted.
- Mark multiple mail as read.
- Manage mail folders by creating folders, renaming them or moving mail across folders. If you are using sub folders, then use periods (.) to specify the exact path.

Once you have performed all actions, close the session or connection with the IMAP server. For example, mail from your e-mail account in Gmail can be retrieved by setting a connection to the Gmail IMAP server. You can define the login (user name) and set a secure connection. Next, you can quickly retrieve a top-level snapshot of e-mails using the GetHeaderOnly attribute or access full information about e-mails using the GetAll attribute.

Note: Gmail is not a complete IMAP implementation so some of the features of a regular IMAP server may not work with Gmail.

The following table lists the query information (column names) returned by various cfimap attributes.

<table>
<thead>
<tr>
<th>Values for &quot;action&quot; attribute</th>
<th>Columns</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetHeaderOnly</td>
<td>ANSWERED, CC, DELETED, DRAFT, FLAGGED, FROM, HEADER, LINES, MESSAGEID,</td>
</tr>
<tr>
<td></td>
<td>MESSAGENUMBER, RECENT, REPLYTO, RXDDATE, SEEN, SENTDATE, SIZE, SUBJECT,</td>
</tr>
<tr>
<td></td>
<td>TO, UID</td>
</tr>
<tr>
<td>GetAll</td>
<td>ANSWERED, ATTACHMENTFILES, ATTACHMENTS, BODY, CC, CIDS, DELETED, DRAFT,</td>
</tr>
<tr>
<td></td>
<td>FLAGGED, FROM, HEADER, HTMLBODY, LINES, MESSAGEID, MESSAGENUMBER, RECENT,</td>
</tr>
<tr>
<td></td>
<td>REPLYTO, RXDDATE, SEEN, SENTDATE, SIZE, SUBJECT, TEXTBODY, TO, UID.</td>
</tr>
<tr>
<td></td>
<td>CID is used to find the correct place of an image in an HTML e-mail message that the CFIMAP tag retrieves. If the e-mail message contains more than one embedded image, only the last embedded image is available.</td>
</tr>
<tr>
<td>ListAllFolders</td>
<td>FULLNAME (specifies the entire directory structure), NAME, NEW, TOTALMESSAGES, and UNREAD</td>
</tr>
</tbody>
</table>

Note: The cfimap command works best on IMAP4 revision1. IMAP4 revision1 is backwards compatible with IMAP2 and IMAP2bis versions. Any previous versions are no more actively used.

You can get errors in following scenarios:

- Accessing an invalid server connection is established. Check the network conditions and whether you are using appropriate server IP address and domain names. Use valid e-mail user names and passwords.
- Accessing non-existent folders: Check whether the folder you are accessing exists. Create or rename folders with valid names. You cannot rename core folders. Move mail within existing folders.
- Slow network: Verify if the timeout attribute needs a higher value. Actions such as CreateFolder may need longer time to execute. In such cases, adjust the value of the timeout attribute.
• Incorrect usage of cfimap attributes: Check if you are using the correct attribute. For example, if you have 15 e-mails in a folder and if the startrow or maxrow attribute has value of 18 then ColdFusion returns an error.

• The e-mail client does not recognize IMAP access. Verify whether your e-mail is set up to allow IMAP access. Complete the necessary IMAP access in connection settings section of your e-mail client.

• Using incorrect syntax for attributes: Verify that all attributes are defined per syntax.

Example: 1

<!---- Retrieving e-mails from a folder --->
<html >
<head>
<title>IMAP Mail Client</title>
</head>
<body>
<!--- Replace your username and password with valid IMAP email account name and password. Replace "server address" with your IMAP server address --->
<cfimap
    server = "server address" <!---->
    username = "yourname"

</html>
**cfimpersonate**

**Description**
This tag is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications.

**History**
ColdFusion MX: This tag is obsolete. It does not work in ColdFusion MX and later releases.

**cfimport**

**Description**
You can use the cfimport tag to import either of the following:

- All ColdFusion pages in a directory, as a tag custom tag library.
- A Java Server Page (JSP) tag library. A JSP tag library is a packaged set of tag handlers that conform to the JSP 1.1 tag extension API.

**Category**
Application framework tags

**Syntax**
```
<cfimport
    prefix = "custom"
    taglib = "tag library location">
```

**See also**
cfapplication

**History**
ColdFusion MX: Added this tag.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taglib</td>
<td>Required</td>
<td>Tag library URI. The path must be relative to the web root (and start with /), the current page location, or a directory specified in the Administrator ColdFusion mappings page.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A directory in which custom ColdFusion tags are stored. In this case, all the cfm pages in this directory are treated as custom tags in a tag library.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A path to a JAR in a web-application, for example, &quot;WEB-INF/lib/sometags.jar&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- A path to a tag library descriptor, for example, &quot;sometags.tld&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> You must put JSP custom tag libraries in the /WEB-INF/lib directory. This limitation does not apply to ColdFusion pages.</td>
</tr>
<tr>
<td>prefix</td>
<td>Required</td>
<td>Prefix by which to access the imported custom CFML tags JSP tags.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If you import a CFML custom tag directory and specify an empty value, &quot; &quot;, for this attribute, you can call the custom tags without using a prefix. Specify and use a prefix for a JSP tag library.</td>
</tr>
</tbody>
</table>
Usage
The following example imports the tags from the directory myCustomTags:

```cfml
<cfimport
   prefix="mytags"
   taglib="myCustomTags">
```

You can import multiple tag libraries using one prefix. If there are duplicate tags in a library, the first one takes precedence.

JSP tags have fixed attributes; however, if the tag supports runtime attribute expressions, most tag libraries support the use of the syntax `#expressions#`.

To reference a JSP tag in a CFML page, use the syntax `<prefix:tagname>`. Set the prefix value in the `prefix` attribute.

Use JSP custom tags in a ColdFusion page
1 Put a JSP tag library JAR file (for example, myjsptags.jar) into the ColdFusion server directory wwwroot/WEB-INF/lib. If the tag library has a separate TLD file, put it in the same directory as the JAR file.

2 At the top of a CFML page, insert code such as the following:

```cfml
<cfimport
   prefix="mytags"
   taglib="/WEB-INF/lib/myjsptags.jar">
```

To reference a JSP tag from a JAR file, use the following syntax:

```cfml
<cfoutput>
   <mytags:helloTag message="#mymessage#" />
<cfoutput>
```

The `cfimport` tag must be on the page that uses the imported tags. For example, if you use a `cfimport` tag on a page that you include with the `cfinclude` call, you cannot use the imported tags on the page that has the `cfinclude` tag. Similarly, if you have a `cfimport` tag on your Application.cfm page, the imported tags are available on the Application.cfm page only, not on the other pages in the application. ColdFusion does not throw an error in these situations, but the imported tags do not run.

You cannot use the `cfimport` tag to suppress output from a tag library.

For more information, see the Java Server Page 1.1 specification.

Example
<h3>cfimport example</h3>
<p>This example uses the random JSP tag library that is available from the Jakarta Taglibs project, at http://jakarta.apache.org/taglibs/</p>

```cfml
<cfimport taglib="/WEB-INF/lib/taglibs-random.jar" prefix="randomnum">
<randomnum:number id="randPass" range="000000-999999" algorithm="SHA1PRNG" provider="SUN"/>
<cfset myPassword = randPass.random>
<cfoutput>
   Your password is #myPassword#<br>
</cfoutput>
```
cfinclude

Description
Embeds references to ColdFusion pages in CFML. You can embed cfinclude tags recursively. For another way to encapsulate CFML, see “cfmessagebox” on page 459. (A ColdFusion page was formerly sometimes called a ColdFusion template or a template.)

Category
Flow-control tags, Page processing tags

Syntax
```cfinclude
<cfinclude
    template = "template name"
    runOnce = "true|false">
```

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcache, cfflush, cfheader, cfhtmlhead, cfsetting, cfsilent

History
ColdFusion 10: Added the attribute runOnce

ColdFusion MX: Changed error behavior: if you use this tag to include a CFML page whose length is zero bytes, you do not get an error.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Required</td>
<td></td>
<td>A logical path to a ColdFusion page.</td>
</tr>
<tr>
<td>runOnce</td>
<td>Optional</td>
<td>false</td>
<td>If set to true, the given template (if already processed) is not processed again for a given request.</td>
</tr>
</tbody>
</table>

Usage
ColdFusion searches for included files in the following locations:

1. In the directory of the current page or a directory relative to the current page
2. In directories mapped in the ColdFusion Administrator

You cannot specify an absolute URL or file system path for the file to include. You can only use paths relative to the directory of the including page or a directory that is registered in the ColdFusion Administrator Mappings. The following cfinclude statements work, assuming that the myinclude.cfm file exists in the specified directory:

```cfinclude
<cfinclude template="myinclude.cfm">
<cfinclude template="../myinclude.cfm">
<cfinclude template="/CFIDE/debug/myinclude.cfm">
```

But the following do not work:

```cfinclude
<cfinclude template="C:\ColdFusion\wwwroot\doccomments\myinclude.cfm">
<cfinclude template="http://localhost:8500/doccomments/myinclude.cfm">
```
The included file must be a syntactically correct and complete CFML page. For example, to output data from within the included page, you must have a `cfoutput` tag, including the end tag, on the included page, not the referring page. Similarly, you cannot span a `cfif` tag across the referring page and the included page; it must be complete within the included page.

You can specify a variable for the `template` attribute, as the following example shows:

```
<cfset templatetouse="../header/header.cfm">
<cfinclude template="#templatetouse#">
```

Example

```
<!--- This example shows the use of cfinclude to paste CFML or HTML code into another page dynamically. --->

<h4>This example includes the dochome.htm page from the CFDOCS directory. The images do not display, because they are located in a separate directory. However, the page appears fully rendered within the contents of this page.</h4>
<cfinclude template = "../cfdocs/dochome.htm">
```

cfindex

Description

Populates a search engine collection with metadata and creates indexes for searching it. The engine (Solr) can search physical files of various types or a database query. Indexing database columns that result from a query lets users search the query data much faster than they could if you used multiple SQL queries to return the same data.

You must define a collection using the ColdFusion Administrator or the `cfcollection` tag before creating indexes for the collection.

You also can index a collection using the ColdFusion Administrator.

For more information on creating, indexing, and searching a collection, see Building a Search Interface in the Developing ColdFusion Applications.

Category

Extensibility tags
Syntax

cfindex supports script style syntax:

new index(collection="<collection_name>");

cfindex
    action = "update|delete|purge|refresh|fullimport|deltaimport|status|abort"
    autoCommit = "yes|no"
    collection = "collection name"
    body = "body"
    category = "category name"
    categoryTree = "category tree"
    custom1 = "custom value"
    custom2 = "custom value"
    custom3 = "custom value"
    custom4 = "custom value"
    extensions = "file extensions"
    key = "ID"
    language = "language"
    prefix = "location of documents"
    query = "query name"
    recurse = "yes|no"
    status = "status"
    title = "title"
    type = "type"
    URLpath = "URL">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

See also
cfcollection, cfexecute, cfobject, cfreport, cfssearch, cfwddx

History

ColdFusion 10:
- Added new actions fullimport, deltaimport, status, abort
- Added the attribute autoCommit, fieldBoost, docBoost

ColdFusion 9: Added Solr search engine support.

ColdFusion MX 7.0.1: Added the prefix attribute.

ColdFusion MX 7:
- Added the category, categoryTree, custom3, and custom4 attributes for the update and refresh actions.
- Added the status attribute for the update, refresh, delete, and purge actions.
- Removed reference to external collections.
- Removed suggested cflock usage.

ColdFusion MX:
- The action attribute value optimize is obsolete. It does not work, and might cause an error, in ColdFusion MX.
- Changed the external attribute behavior: it is not necessary to specify the external attribute. (ColdFusion automatically detects whether a collection is internal or external.)
• Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
• Changed thrown exceptions: this tag can throw the SEARCHENGINE exception.
• Changed acceptable collection naming: this tag accepts collection names that include spaces.
• Changed query result behavior: the cfindex tag can index the query results from a cfsearch tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td></td>
<td>• update: updates a collection and adds key to the index.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• delete: removes collection documents as specified by the key attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• purge: deletes all of the documents in a collection. Causes the collection to be taken offline, preventing searches.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• refresh: deletes all of the documents in a collection, and then performs an update.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• fullimport: To index full database. For instance, when you index the database for the first time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• deltaimport: For partial indexing. For instance, for any updates in the database, instead of a full import, you can perform delta import to update your collection.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• status: Provides the status of indexing, such as the total number of documents processed and status such as idle or running.</td>
</tr>
<tr>
<td></td>

<td></td>
<td>• abort: Aborts an ongoing indexing task.</td>
</tr>
<tr>
<td>autoCommit</td>
<td>Optional</td>
<td></td>
<td>If yes, automatically commit the changes to the search server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If no, indexed documents are not committed unless you specifically commit using cfindex action=&quot;commit&quot;. By default, the value is set to true.</td>
</tr>
<tr>
<td>collection</td>
<td>Required</td>
<td></td>
<td>Name of a collection that is registered by ColdFusion; for example, &quot;personnel&quot;.</td>
</tr>
<tr>
<td>body</td>
<td>Required if type=custom</td>
<td></td>
<td>• ASCII text to index.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Query column names, if name is specified in query.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>You can specify columns in a delimited list, for example: &quot;emp_name, dept_name, location&quot;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>This attribute is ignored if type is file or path, and is invalid if action is delete.</td>
</tr>
<tr>
<td>category</td>
<td>Optional</td>
<td></td>
<td>A string value that specifies one or more search categories for which to index the data. You can define multiple categories, separated by commas, for a single index.</td>
</tr>
<tr>
<td>categoryTree</td>
<td>Optional</td>
<td></td>
<td>A string value that specifies a hierarchical category or category tree for searching. It is a series of categories separated by forward slashes (/). You can specify only one category tree.</td>
</tr>
<tr>
<td>custom1</td>
<td>Optional</td>
<td></td>
<td>Use to index discrete values in collection records, which lets you search for specific records. By contrast, values specified in the body attribute are concatenated and searched as a body of text using the specified criteria.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If type = custom, a query column name. If type is file or path, a string.</td>
</tr>
<tr>
<td>custom2</td>
<td>Optional</td>
<td></td>
<td>Usage is the same as for custom1.</td>
</tr>
<tr>
<td>custom3</td>
<td>Optional</td>
<td></td>
<td>Usage is the same as for custom1.</td>
</tr>
<tr>
<td>custom4</td>
<td>Optional</td>
<td></td>
<td>Usage is the same as for custom1.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Req/Opt</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>docBoost</td>
<td>Optional</td>
<td></td>
<td>Boost entire document while indexing. <code>docBoost</code> enhances the score of the documents and thereby the ranking in the search results.</td>
</tr>
</tbody>
</table>
| extensions | Optional| htm, html, cfm, cfml, dbm, dbml | Delimited list of file extensions that ColdFusion uses to index files, if `type`="Path". `'.'`, `'*'` returns files with no extension. `'*'` returns all files. For example, the following code returns files with a listed extension or no extension:  
```
extensions = ".htm, .html, .cfm, .cfml, '*. '
```
| fieldBoost | Optional| htm, html, cfm, cfml, dbm, dbml | Boost specific fields while indexing. `fieldBoost` enhances the score of the fields and thereby the ranking in the search results. Multiple fields can be boosted by specifying the values as a comma-separated list. |
| key        | Required| (empty string) | The value specified for `key` depends on the `type` attribute:  
- If `type`="file", the directory path and filename for the file,  
- If `type`="path", the directory path for the location of the files.  
- If `type`="custom", a unique identifier that specifies the location of the data. For a query, the name of the column that holds the primary key, for example. If not a query, an identifier such as the URL for a web page, for example. |
| language   | Optional| English | For options, see `cfcollection`. |
| prefix     | Optional|         | Specifies the location of files to index when the computer that contains the K2 Search Service is not the computer on which you installed ColdFusion, and when you index files with the `type` attribute set to `path`. |
| query      | Optional.|         | The name of the query against which the collection is generated. |
| recurse    | Optional| no      | • `yes`: if `type`="path", indexes qualified files in directories below the path specified in the `key` attribute.  
• `no` |
| status     | Optional|         | The name of the structure into which ColdFusion returns status information. |
| title      | Optional|         | Provides a title for the document if one cannot be extracted from the document. |
| type       | Optional| custom, if `query` attribute is specified. Otherwise, `file`. | • `file`: applies `action` value to filename, including path. Expects a filename in the `key` attribute.  
• `path`: applies `action` to files in a directory path that pass the `extensions` filter. Expects a directory name in the `key` attribute.  
• `dih`: used for Data Import Handler.  
• `custom`: applies `action` to custom data; for example, to data from a query. |
| URLpath    | Optional|         | If `type` is `file` or `path`, specifies the URL path. During indexing, this pathname is prefixed to filenames and returned from a search as the `url`. |
Usage
The attributes settings that the cfindex tag requires depend on whether you set the query attribute. If you set the query attribute to a valid query name, it specifies that cfindex is to index the data in the query rather than indexing documents on a disk. If you do not set the query attribute, cfindex assumes that it is indexing a file (type = file), a set of files in a directory path (type = path), or text that you provide in the body attribute (type = custom).

If you set the query attribute to a valid query name, the cfindex tag creates indexes as specified by the following attributes and their values:

<table>
<thead>
<tr>
<th>Type</th>
<th>Attribute values</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>The key attribute is the name of a column in the query that contains a full filename (including path).</td>
</tr>
<tr>
<td>Path</td>
<td>The key attribute is the name of a column in the query that contains a directory pathname.</td>
</tr>
<tr>
<td></td>
<td>The extensions and recurse attributes, if specified, elaborate on which files are included. If the action is delete, cfindex deletes keys for the collection.</td>
</tr>
<tr>
<td>Custom</td>
<td>The key attribute specifies a column name that contains anything you want; for example, the primary key value in the database. It must be unique because this is the primary key in the collection. If the action is delete, the key attribute is the name of a column in the query that contains the keys to delete.</td>
</tr>
<tr>
<td></td>
<td>The body attribute is required and is a comma-delimited list of the names of the columns that contain the text data to be indexed.</td>
</tr>
</tbody>
</table>

If you do not set the query attribute, the cfindex tag creates indexes as specified by the following attributes and their values:

<table>
<thead>
<tr>
<th>Type</th>
<th>Attribute values</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>The key attribute is required and is a full pathname to a file.</td>
</tr>
<tr>
<td>Path</td>
<td>The key attribute is required and it is a directory pathname.</td>
</tr>
<tr>
<td></td>
<td>The extensions and recurse attributes, if specified, designate which types of files are included. If the action is delete, both the keys and the document files are deleted.</td>
</tr>
<tr>
<td>Custom</td>
<td>The key attribute is an identifier that specifies the key. If the action is delete, the key attribute is the document key to delete.</td>
</tr>
<tr>
<td></td>
<td>The body attribute is required and is the text to be indexed.</td>
</tr>
</tbody>
</table>

If type is not specified but query is set, ColdFusion sets the type to the default value of custom.

If neither type nor query is set, ColdFusion sets type to the default value of file.

If type equals custom, all attributes except for key and body can specify a literal value, not only a column name. This allows you to change a field to empty in the collection.

Status attribute
The status attribute provides the following information and diagnostics about the result of a cfindex operation:

<table>
<thead>
<tr>
<th>Key</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BADKEYS</td>
<td>Struct</td>
<td>A structure of keys with diagnostic messages about the indexing of these keys. If there are no bad keys, this key does not exist.</td>
</tr>
<tr>
<td>DELETED</td>
<td>Number</td>
<td>The number of keys deleted.</td>
</tr>
</tbody>
</table>
Example

<!--- EXAMPLE #1 Index a file, type = "file". ---------------------------->
<!--- Example dumps content of status variable (info). ------------------->
<cfindex collection="CodeColl"
   action="refresh"
   type="file"
   key="C:\ColdFusion\wwwroot\vw_files\cfindex.htm"
   urlpath="http://localhost:8500/vw_files/"
   language="English"
   title="Cfindex Reference page"
   status="info">

<!--- Search for Attributes. --->
<cfsearch
   name = "mySearch"
   collection = "CodeColl"

   type="path"
   key="C:\inetpub\wwwroot\vw_files\newspaper\sports"
   urlpath="http://localhost/vw_files/newspaper/sports"
   extensions = ".htm, .html"
   recurse="no"
   language="English"
   categoryTree="vw_files/newspaper/sports"
   category="Giants">

<!--- Search for any references to criteria. --->
<cfsearch
   name = "mySearch"
   collection = "CodeColl"
   categoryTree="vw_files/newspaper/sports"
   category="Giants"
   criteria = "Williams"
   contextpassages = "1"
   maxrows = "100">

MESSAGES Array An array of diagnostic messages, including nonfatal errors and warnings. If there are no messages, this key does not exist.

INSERTED Number The number of keys inserted into the collection.

UPDATED Number The number of keys updated in the collection.
maxrows = "100">
<cfoutput>
  key=#mySearch.key#<br />
  title=#mySearch.title#<br />
  context=#mySearch.context#<br />
  url=#mySearch.url#<br />
</cfoutput></cfoutput>

<!---EXAMPLE #3: Index a QUERY (type = "custom") using custom1.------------>
<!--- Retrieve data from the table. --->
<cfquery name="getCourses" datasource="cfdocexamples">
  SELECT * FROM COURSES
</cfquery>

<!--- Update the collection with the above query results. --->
<!--- key is Course_ID in the Courses table. ---->
<!--- body specifies the columns to be indexed for searching. ---->
<!--- custom1 specifies the value of the Course_Number column. ---->
<cfindex
  query="getCourses"
  collection="CodeColl"
  action="Update"
  type="Custom"
  key="Course_ID"
  title="Courses"
  body="Course_ID,Descript"
  custom1="Course_Number"
>

<h2>Indexing Complete</h2>
<!--- cno supplies value for searching custom1; could be form input instead. --->
<cfset cno = "540">
<cfsearch
  name = "mySearch"
  collection = "CodeColl"
  criteria = "CF_CUSTOM1 <MATCHES> #cno#"
  contextpassages = "1"
  maxrows = "100">
<!--- Returns indexed values (Course_ID and Descript) for Course_Number 540. ---->
<cfoutput>
  key=#mySearch.key#<br />
  title=#mySearch.title#<br />
  context=#mySearch.context#<br />
  url=#mySearch.url#<br />
</cfoutput></cfoutput>

<!--- EXAMPLE #4 Index a FILE within a QUERY (type= "file").------------>
<!--- Retrieve row with a column that contains a filename (Contract_File). --->
<cfquery name="getEmps" datasource="cfdocexamples">
  SELECT * FROM EMPLOYEE WHERE EMP_ID = 1
</cfquery>

<!--- Update the collection with the above query results. --->
<!--- key specifies the column that contains a complete filename. ---->
<!--- file is indexed in same way as if no query involved. ---->
<cfindex
query="getEmps"
collection="CodeColl"
action="Update"
type="file"
key="Contract_File"
title="Contract_File"
body="Emp_ID,FirstName,LastName,Contract_File">

<h2>Indexing Complete</h2>
<cfsearch
    name = "mySearch"
collection = "CodeColl"
criteria = "vacation"

width = "integer number of pixels">

Some attributes apply to only specific display formats. For details, see the Attributes table.

In HTML format forms, standard HTML input control attributes not listed above are passed to the HTML and have their normal effect.

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

History

ColdFusion 8

- Added autosuggest, autosuggestBindDelay, autosuggestMinLength, delimiter, maxResultsDisplayed, showAutosuggestLoadingIcon, and typeahead attributes.
- Added support for the bind attribute in HTML forms and the bindAttribute and bindOnload, and onBindError attributes.
- Added the sourceForTooltip attribute
- Added support for datefield value of the type attribute in HTML forms.

ColdFusion MX 7:

- Added support for button, file, hidden, image, reset, and submit controls.
- Added support for generating Flash and XML controls (specified in the cfform tag).
- Added datefield type (Flash forms only) and the supporting dayNames and monthNames attributes.

Last updated 7/9/2012
- Added `bind`, `enabled`, `height`, `label`, `tooltip`, `visible`, and `width` attributes for use in Flash forms.
- Added support for `onBlur` and `onServer` validation, including the `validateAt` attribute.
- Added `USdate`, `range`, `boolean`, `email`, `URL`, `uuid`, `guid`, `maxlength`, `noblanks`, and `submitOnce validate` attribute values.
- Added support for preventing multiple submissions.
- Added the `mask` attribute.
- Deprecated the `passthrough` attribute. The tag now supports all HTML `input` tag attributes directly.

**ColdFusion MX:** Changed the `cfinput` tag `preserveData` attribute behavior: if it is set to True, ColdFusion checks radio and check box values only if their value matches the posted value for the control. (In earlier releases, if the posted value did not match any of the `cfinput` check boxes or radio buttons for the control, the checked attribute was used.

### Attributes

The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML `form` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are not marked as supported in All or XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; formats</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required; all</td>
<td></td>
<td>Name for form input element.</td>
</tr>
</tbody>
</table>
| autosuggest     | Optional, HTML   |         | Specifies entry completion suggestions to display as the user types into a text input. The user can select a suggestion to complete the text entry. The valid value can be either of the following:  
  - A string that consists of the suggestion values separated by the delimiter specified by the `delimiter` attribute.  
  - A bind expression that gets the suggestion values based on the current input text. The bind expression must pass a `cfautosuggestvalue` bind parameter to represent the user input.  
  Valid only for `cfinput type="text"`.  
  For more information, see Using autosuggest text input fields in the Developing ColdFusion Applications.
| autosuggestBindDelay | Optional, HTML    | 0.5 seconds | A nonzero integer that specifies the minimum time between autosuggest bind expression invocations, in seconds. This value also specifies the delay from when the user first enters a minimum-length entry in the field until the suggestion box appears. Use this attribute to limit the number of requests that are sent to the server when a user types.  
  Valid only for `cfinput type="text"`.  
  **Note:** The only way to get the default behavior is to omit the attribute. Otherwise, the delay must be a nonzero integer value. |
| autosuggestMinLength | Optional, HTML | 1 | The minimum number of characters required in the text box before invoking a bind expression to return items for suggestion.  
  Valid only for `cfinput type="text"`. |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; formats</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind</td>
<td>Optional; HTML, Flash</td>
<td></td>
<td>A bind expression that dynamically sets an attribute of the control. For details, see Usage.</td>
</tr>
<tr>
<td>bindAttribute</td>
<td>Optional; HTML</td>
<td>value</td>
<td>Specifies the HTML tag attribute whose value is set by the bind attribute. You can only specify attributes in the browser’s HTML DOM tree, not ColdFusion-specific attributes. Ignored if there is no bind attribute. Valid only for cfinput type=&quot;text&quot;.</td>
</tr>
<tr>
<td>bindOnLoad</td>
<td>Optional; HTML</td>
<td>no</td>
<td>A Boolean value that specifies whether to execute the bind attribute expression when first loading the form. Ignored if there is no bind attribute. Valid only for cfinput type=&quot;text&quot;.</td>
</tr>
</tbody>
</table>
| checked            | Optional; all     | no        | Selects a radio button or check box control:  
  - yes  
  - no  
  For HTML format, you can indicate that the item is selected by specifying the value as checked or specifying the attribute with no value. |
| dayNames           | Optional; all     | S, M, T, W, T, F, S | Applies to datefield type only. A comma-delimited list that sets the names of the weekdays displayed in the calendar. Sunday is the first day; the rest of the weekday names follow in the normal order. |
| delimiter          | Optional, HTML    | comma (,) | The delimiter to use to separate entries in a static auto-suggest list. This attribute is meaningful only if the autosuggest attribute is a string of delimited values. |
| disabled           | Optional; all     | not disabled | Enables user input, making the control read-only. The attribute behavior depends on the format of the form as follows:  
  - HTML format forms: ColdFusion passes this attribute directly to the HTML. To disable input, specify disabled without a value (HTML format) or with the value disabled (XHTML compliant). To enable input, omit this attribute.  
  - Flash format forms: To disable input, specify disabled without an attribute, or disabled="yes" (or any ColdFusion positive Boolean value, such as true). To enable input, omit the attribute or specify disabled="no" (or any ColdFusion negative Boolean value, such as false). |
<p>| enabled            | Optional; Flash   | yes       | Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. The inverse of the disabled attribute. |
| firstDayOfWeek     | Optional; all     | 0         | Applies to datefield type only. Integer in the range 0-6 that specifies the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday. |
| height             | Optional; see Description |           | Applies to most Flash types, HTML image type on some browsers. The height of the control, in pixels. The displayed height might be less than the specified size. |
| id                 | Optional; HTML    | name attribute value | The HTML ID of the form. |</p>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; formats</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Optional; Flash, XML</td>
<td></td>
<td>Label to put next to the control on a Flash form. Not used for button, hidden, image, reset, or submit types.</td>
</tr>
</tbody>
</table>
| mask              | Optional; Flash, HTML |         | For tags with type="text". A mask pattern that controls the character pattern that users can enter, or that the form sends to ColdFusion. Mask characters and the corresponding valid input characters are:  
  - A = [A-Za-z]  
  - X = [A-Za-z0-9]  
  - 9 = [0-9]  
  - ? = Any character  
  - All other characters = insert the literal character  
  For tags with type="datefield", a pattern that controls the format of dates that the user selects in the calendar. Mask characters are:  
  - D = day; can use 0-2 mask characters.  
  - M = month; can use 0-4 mask characters.  
  - Y = year; can use 0, 2, or 4 characters.  
  - E = day in week; can use 0-4 characters.  
  For more information, see the Usage section. |
| matchContains     | Optional         | false   | If true, the match returned contains the query string. By default, the results that start with the query string are returned. |
| maxLength         | Optional; all    |         | Maximum length of text entered, if type="Text" or "password". For complete length validation, specify maxLength validation in a validate attribute; otherwise, this attribute prevents users from typing beyond the specified length, but does not prevent them from pasting in a longer value. |
| maxResultsDisplayed | Optional; HTML | 10      | The maximum number suggestions to display in the auto-suggest list. Valid only for cfinput type="text". |
| message           | Optional; all    |         | Message text to display if validation fails. |
| monthNames        | Optional; all    |         | Applies to datefield type only. A comma-delimited list of the month names that display at the top of the calendar. |
| onBindError       | Optional; HTML   | See Description | The name of a JavaScript function to execute if evaluating a bind expression, including an auto-suggest bind expression, results in an error. The function must take two attributes: an HTTP status code and a message.  
  If you omit this attribute, and have specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), it displays the error message; otherwise a default error pop-up displays. |
### Attribute |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>onChange</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action. In Flash, applies to datefield, password, and text types only.</td>
<td></td>
</tr>
<tr>
<td><strong>onClick</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user clicks the control. In Flash, applies to button, checkbox, image, radio, reset, and submit types only.</td>
<td></td>
</tr>
<tr>
<td><strong>.onError</strong></td>
<td>Optional; HTML, XML</td>
<td>Name of a custom JavaScript function to execute if validation fails.</td>
<td></td>
</tr>
<tr>
<td><strong>onKeyDown</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.</td>
<td></td>
</tr>
<tr>
<td><strong>onKeyUp</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.</td>
<td></td>
</tr>
<tr>
<td><strong>onMouseDown</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.</td>
<td></td>
</tr>
<tr>
<td><strong>onMouseUp</strong></td>
<td>Optional; all</td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.</td>
<td></td>
</tr>
<tr>
<td><strong>onValidate</strong></td>
<td>Optional; HTML, XML</td>
<td>Name of a custom JavaScript function to validate user input. The form object, input object, and input object values are passed to the routine, which should return <code>true</code> if validation succeeds, and <code>false</code> otherwise. If used, the <code>validate</code> attribute is ignored.</td>
<td></td>
</tr>
<tr>
<td><strong>pattern</strong></td>
<td>Required if validate= &quot;regex&quot;; HTML, XML</td>
<td>JavaScript regular expression pattern to validate input. ColdFusion uses this attribute only if you specify <code>regex</code> in the <code>validate</code> attribute. Omit leading and trailing slashes. For examples and syntax, see Building Dynamic Forms with <code>cfform</code> Tags in the Developing ColdFusion Applications.</td>
<td></td>
</tr>
<tr>
<td><strong>range</strong></td>
<td>Optional; all</td>
<td>Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify <code>range</code> in the <code>validate</code> attribute. If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.</td>
<td></td>
</tr>
<tr>
<td><strong>readOnly</strong></td>
<td>Optional; Flash, HTML</td>
<td>Applies to HTML and Flash forms. Valid only for <code>cfinput</code> type= &quot;text&quot;. ColdFusion ignores this attribute for all other input types.</td>
<td></td>
</tr>
<tr>
<td><strong>required</strong></td>
<td>Optional; all</td>
<td><strong>no</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>yes</code>: the field must contain data.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>no</code>: allows an empty field.</td>
<td></td>
</tr>
<tr>
<td><strong>showAutosuggestLoadingIcon</strong></td>
<td>Optional; HTML</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td><strong>size</strong></td>
<td>Optional; all</td>
<td>Size of input control. Ignored, if <code>type= &quot;radio&quot;</code> or <code>checkbox</code>. If specified in a Flash form, ColdFusion sets the control width pixel value to 10 times the specified size and ignores the <code>width</code> attribute.</td>
<td></td>
</tr>
<tr>
<td>Attribute</td>
<td>Req/Opt; formats</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>sourceForTooltip</td>
<td>Optional; HTML</td>
<td></td>
<td>The URL of a page to display as a tool tip. The page can include HTML markup to control the format, and the tip can include images. If you specify this attribute, an animated icon appears with the text “Loading...” while the tip is being loaded.</td>
</tr>
<tr>
<td>src</td>
<td>Optional; Flash, HTML</td>
<td></td>
<td>Applies to Flash button, reset, submit, and image types, and the HTML image type. URL of an image to use on the button.</td>
</tr>
<tr>
<td>style</td>
<td>Optional; all</td>
<td></td>
<td>In HTML or XML format, ColdFusion passes the style attribute to the browser or XML. In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see Creating Forms in Flash in the Developing ColdFusion Applications. In XML format, ColdFusion passes the style attribute to the XML.</td>
</tr>
<tr>
<td>tooltip</td>
<td>Optional; Flash, HTML</td>
<td></td>
<td>Text to display when the mouse pointer hovers over the control. Ignored if you specify a sourceForTooltip attribute.</td>
</tr>
<tr>
<td>type</td>
<td>Optional; all</td>
<td>text</td>
<td>The input control type to create:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• button: push button.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• checkbox: check box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• datefield: HTML and Flash only; date entry field with an expanding calendar from which users select the date or dates. In HTML format only, users can also enter the date by typing in the field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• file: file selector; not supported in Flash. Not supported when you use Ajax form submission to submit the form asynchronously from the page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• hidden: invisible control.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• image: clickable button with an image.</td>

<td></td>
<td></td>
<td>• text: text entry box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The attribute supports all HTML 5 input types, for example, email, range, or date.</td>
</tr>
<tr>
<td>typeahead</td>
<td>Optional; HTML</td>
<td>no</td>
<td>A Boolean value that specifies whether the auto-suggest feature should automatically complete a user’s entry with the first result in the suggestion list. Valid only for cfinput type=&quot;text&quot;.</td>
</tr>
<tr>
<td>validate</td>
<td>Optional; all</td>
<td></td>
<td>The type or types of validation to do. Available validation types and algorithms depend on the format. For details, see Usage.</td>
</tr>
</tbody>
</table>
Attributes that are marked as not supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

Usage
For this tag to work properly, the browser must be JavaScript-enabled.

If the cfformpreserveData attribute is true and the form posts back to the same page, the posted value of the cfinput control is used, instead of its Value or Checked attribute.

You can use the keyboard to access and select dates from a datefield Flash input: press Tab to go to the field and press the Spacebar to open the menu. Use the Up, Down, Left, and Right Arrow keys to change the selected date. Use the Home and End keys to reach the first and last enabled date in a month, respectively. Use the Page Up and Page Down keys to reach the previous and next month, respectively.

Note: To clear a datefield entry in Flash format forms, select the field to open the menu, and click the selected date.

For more information, see Cfform. For information on using JavaScript regular expressions with this tag, see Building Dynamic Forms with Cfform Tags in the Developing ColdFusion Applications.

Validation
The following sections describe how to do validation in cfinput tags.

Validation methods ColdFusion provides four methods of validation of cfinputtext and password fields.

You can specify one or a combination of the following in the validateAt attribute:

- onSubmit The form page on the browser includes JavaScript functions that perform validation before the form is submitted to the server. In Flash format forms, this option is identical to onBlur.
- onBlur In HTML format the form page on the browser includes JavaScript functions that perform validation when the field loses the focus. In Flash format, the attribute is equivalent to onSubmit. OnBlur validation uses the same algorithms as onSubmit validation. OnBlur validation was added in ColdFusion MX 7.
onServer  ColdFusion performs the validation on the server. Some onServer algorithms vary from the onSubmit algorithms. OnServer Date and Time validation allow more patterns than onSubmit validation. OnServer validation was added in ColdFusion MX 7, and automatically generates hidden fields to support the validation.

You can also omit a validate attribute and specify the type of validation for the field in a separate hidden form field. This form of validation is equivalent to onServer validation, but it lets you specify separate messages for each validation that you do on the field. It is backward compatible with previous ColdFusion releases. For more information on hidden form field validation, see cfform and Validating form data using hidden fields in Validating form data using hidden fields in the Developing ColdFusion Applications.

Validation types  Use the following values in the validate attribute to specify input validation for all validation methods. Most attributes apply only to password or text fields. You can specify multiple validation types in a comma-delimited list, but only some combinations are meaningful.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>If validateAt=“onServer”, allows any date format that returns true in the IsDate function; otherwise, same as USdate.</td>
</tr>
<tr>
<td>USdate</td>
<td>A US date of the format mm/dd/yy mm-dd-yy or mm.dd.yy, with 1-2 digit days and months, 1-4 digit years.</td>
</tr>
<tr>
<td>eurodate</td>
<td>A date of the format dd/mm/yy, with 1-2 digit days and months, 1-4 digit years. The format can use /,-, or . characters as delimiters.</td>
</tr>
<tr>
<td>time</td>
<td>Time format hh:mm:ss</td>
</tr>
<tr>
<td>float</td>
<td>numeric</td>
</tr>
<tr>
<td>integer</td>
<td>An integer.</td>
</tr>
<tr>
<td>range</td>
<td>A numeric range.</td>
</tr>
<tr>
<td>boolean</td>
<td>A value that can be converted to a Boolean value: Yes, No, True, False, or a number.</td>
</tr>
<tr>
<td>telephone</td>
<td>Standard U.S. telephone formats. Allows an initial 1 long-distance designator and up to 5-digit extensions, optionally starting with x.</td>
</tr>
<tr>
<td>zipcode</td>
<td>U.S. 5- or 9-digit ZIP code format #####-####. The separator can be a hyphen (-) or a space.</td>
</tr>
<tr>
<td>creditcard</td>
<td>Strips blanks and dashes; verifies number using mod10 algorithm. Number must have 13-16 digits.</td>
</tr>
<tr>
<td>ssn</td>
<td>social_security_number</td>
</tr>
<tr>
<td>email</td>
<td>A valid e-mail address of the form <a href="mailto:name@server.domain">name@server.domain</a>. ColdFusion validates the format only; it does not check that entry is a valid active e-mail address.</td>
</tr>
<tr>
<td>URL</td>
<td>A valid URL pattern; supports http, https, ftp file, mailto, and news URLs.</td>
</tr>
<tr>
<td>guid</td>
<td>A unique identifier that follows the Microsoft/DCE format, xxxxxxx-xxxx-xxxx-xxxx-xxxx-xxxx-xxxx-xxxx-xxxx-xxxx, where x is a hexadecimal number.</td>
</tr>
<tr>
<td>uuid</td>
<td>A universally unique identifier (UUID) that follows the ColdFusion format, xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx, where x is a hexadecimal number.</td>
</tr>
<tr>
<td>maxlength</td>
<td>Limits the input to a maximum number of characters.</td>
</tr>
<tr>
<td>noblanks</td>
<td>Does not allow fields that consist only of blanks.</td>
</tr>
<tr>
<td>regex</td>
<td>regular_expression</td>
</tr>
<tr>
<td>SubmitOnce</td>
<td>Used only with submit and image types; prevents the user from submitting the same form multiple times before until the next page loads (for example, submitting an order a second time before getting the first order confirmation). Valid in HTML and XML format only; ignored in Flash format.</td>
</tr>
</tbody>
</table>
Validation differences  The preceding table describes the general validation behavior. The underlying validation code must differ depending on the validation method and the form type. As a result, the algorithms used vary in some instances, including the following:

- The validation algorithms used for date/time values varies between onSubmit/OnBlur and OnServer.
- The algorithms used for onSubmit/OnBlur validation in Flash vary from those used for HTML/XML format, and generally follow simpler rules.

The table describes the onSubmit/OnBlur behavior in HTML format. For detailed information on the OnServer validation algorithms, see Data validation types in Data validation types in the Developing ColdFusion Applications.

For more information on validation, including discussions of the advantages and disadvantages of different validation types, see Validating Data in the Developing ColdFusion Applications.

Masking input data
In HTML and Flash forms, the mask attribute controls the format of data that can be entered into a text field or that is selected in a datefield input control calendar. In HTML format, it does not prevent users from typing a date that does not follow the mask into a datefield input control. You can combine masking and validation on a field.

In text fields, ColdFusion automatically inserts any literal mask characters, such as hyphen (-) characters in telephone numbers. Users type only the variable part of the field.

The following pattern enforces entry of a part number of the format EB-1234-c1-098765, where the user starts the entry by typing the first numeric character, such as 3. ColdFusion fills in the preceding EB prefix and all - characters. The user must enter four numbers, followed by two alphanumeric characters, followed by six numbers.

```xml
<cfinput type="text" name="newPart" mask="EB-9999-XX-999999"/>
```

Note: To force a pattern to be all-uppercase or all-lowercase, use the ColdFusion UCase or LCase functions in the action page.

For tags with type=type= "datefield" (and cfcalendar tags), the number of pattern characters determines the format of the output when the user selects a date in the calendar, as follows:

<table>
<thead>
<tr>
<th>Mask</th>
<th>Pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>Single- or double-digit day of month, such as 1 or 28</td>
</tr>
<tr>
<td>DD</td>
<td>Double-digit day of month, such as 01 or 28</td>
</tr>
<tr>
<td>M</td>
<td>Single- or double-digit month, such as 1 or 12</td>
</tr>
<tr>
<td>MM</td>
<td>Double-digit month, such as 01 or 12</td>
</tr>
<tr>
<td>MMM</td>
<td>Abbreviated month name, such as Jan or Dec</td>
</tr>
<tr>
<td>MMMM</td>
<td>Full month name, such as January or December</td>
</tr>
<tr>
<td>YY</td>
<td>Two-character year, such as 05</td>
</tr>
<tr>
<td>YYYY</td>
<td>Four-character year, such as 2005</td>
</tr>
<tr>
<td>E</td>
<td>Single-digit day of week, such as 1 or 7</td>
</tr>
<tr>
<td>EEE</td>
<td>Abbreviated day of week name, such as Mon or Sun</td>
</tr>
<tr>
<td>EEEE</td>
<td>Full month day of week name, such as Monday or Sunday</td>
</tr>
</tbody>
</table>

The following pattern specifies that the Flash forms sends the date selected by using a datefield input control to ColdFusion as text in the format 04/29/2004:

```xml
<cfinput name="stDate" type="datefield" label="date:" mask="mm/dd/yyyy"/>
```
Flash form data binding
The bind attribute lets you populate form fields by using the contents of other form fields. To specify text from another field in a Flash format cfinput tag bind attribute, use the following format:

\{sourceTagName.text\}

For example, the following line uses the values from the firstName and lastName fields to construct an e-mail address. (The user can change or replace this value with a typed entry.)

\<cfinput type="text" name="email" label="email"
  bind="\{firstName.text\}.\{lastName.text\}@mm.com\>"

HTML form data binding
The bind attribute lets you set cfinput attributes dynamically. For example, you can automatically fill an email field text-input value based on name and domain field values.

In HTML format, the bind attribute specifies a bind expression, which can have any for the following forms:

- A Bind parameter or string that contains one or more bind parameters. A bind parameter specifies a form control value or other attribute and, optionally, an event. In its most basic form, a bind parameter consists of the name or id attribute of the control to which you are binding in braces ({}). The value of the control attributes specified in the bind parameters determine the value of the cfinput control attribute.

- A CFC or JavaScript function, or URL, typically using one or more bind parameters as function parameters. The data returned by the function or URL sets the cfinput attribute value.

For details of using HTML form data binding, see Binding data to form fields in the Developing ColdFusion Applications.

Note: To bind to a cfinput control with type attribute of button, specify a bind event setting such as click in the bind expression of the control that binds to the button. The default event, onChange, has no effect.
Example: without binding

<!--- This example shows the use of cfinput within a cfform to ensure simple validation of text items. --->
<cfform action = "cfinput.cfm">
<!--- Phone number validation. --->
Phone Number Validation (enter a properly formatted phone number): <br>
<cfinput type = "Text" name = "MyPhone" message = "Enter telephone number, formatted xxx-xxx-xxxx (e.g. 617-761-2000)"
validate = "telephone" required = "yes">  
<font size = -1 color = red>Required</font>
<!--- Zip code validation. --->
<p>Zip Code Validation (enter a properly formatted zip code):<br>
<cfinput type = "Text" name = "MyZip" message = "Enter zip code, formatted xxxxx or xxxxx-xxxx"
validate = "zipcode" required = "yes">  
<font size = -1 color = red>Required</font>
<!--- Range validation. --->
<p>Range Validation (enter an integer from 1 to 5): <br>
<cfinput type = "Text" name = "MyRange" range = "1,5"
message = "You must enter an integer from 1 to 5"
validate = "integer" required = "no">  
<!--- Date validation. --->
<p>Date Validation (enter a properly formatted date):<br>
<cfinput type = "Text" name = "MyDate"
message = "Enter a correctly formatted date (dd/mm/yy)"
validate = "date" required = "no">  
<input type = "Submit" name = 
value = "send my information">  
</cfform>

Example: with binding

The following example uses binding to generate a default e-mail address based on input controls with a first, last and domain names, and fills in the e-mail text-input field with the result.

The CFML page contains the following code:
<h3>CFC bind using onkeyup() event</h3>

<ul>
  <li>When you type in the First Name field, the first initial appears in the Email control.</li>
  <li>Each key you enter in the Last Name and Domain fields appears in the Email control.</li>
</ul>

```coldfusion
<cfform name="mycfform">
  First Name<font color="#FF0000">*</font>:&nbsp;&nbsp;&nbsp;
  <cfinput type="text" name="firstname" required="yes"><br>
  Last Name<font color="#FF0000">*</font>:&nbsp;&nbsp;&nbsp;
  <cfinput type="text" name="lastname" required="yes"><br>
  Domain<font color="#FF0000">*</font>:&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;
  <cfinput type="text" name="domain" required="yes"><br>
  <br>
  <cfinput type="text" name="email1" bind="cfc:bindFcns.getEmailId({firstname@keyup},{lastname@keyup},{domain@keyup})">

  <br><br>
</cfform>
```

<font color="#FF0000">*</font> indicates the field is required.

The bindFcns CFC contains the following code:

```coldfusion
<cfcomponent>
  <cffunction name="getEmailId" access="remote">
    <cfargument name="firstname">
    <cfargument name="lastname">
    <cfargument name="domain">
    <cfreturn "#left(firstname,1)#.#lcase(arguments.lastname)#@#lcase(domain)#"/>
  </cffunction>
</cfcomponent>
```

**cfinser**

**Description**
Inserts records in data sources from data in a ColdFusion form or form Scope.

**Category**
Database manipulation tags

**Syntax**
<cfinsert
dataSource = "data source name"
tableName = "table name"
fetchClientInfo = "true|false"
formFields = "formfield1, formfield2, ..."
password = "password"
tableOwner = "owner"
tableQualifier = "table qualifier"
username = "user name"
**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

See also

cfprocparam, cfpresresult, cfquery, cfqueryparam, cfstoredproc, cftesnaction, cfupdate

**History**

ColdFusion 10: Added the attribute `fetchClientInfo` and `clientInfo`.

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSource</td>
<td>Required</td>
<td></td>
<td>Data source; contains table.</td>

</tbody>
</table>
Example

<!--- This example shows how to use cfinsert instead of cfquery to put data in a datasource. --->
<cfif IsDefined("form.posted")>
    <cfinsert dataSource = "cfdocexamples"
        tableName = "COMMENTS"
        formFields = "Email,FromUser,Subject,MessText,Posted">
        <h3><I>Your record was added to the database.</i></h3>
    </cfif>
<cfif IsDefined("form.posted")>
    <cfif Server.OS.Name IS "Windows NT">
        <cfinsert datasource="cfdocexamples" tablename="COMMENTS"
            formfields="EMail,FromUser,Subject,MessText,Posted">
    </cfif>
    <cfelse>
        <cfinsert datasource="cfdocexamples" tablename="COMMENTS"
            formfields="CommentID,EMail,FromUser,Subject,MessText,Posted">
    </cfif>
    <h3><i>Your record was added to the database.</i></h3>
</cfif>

<!--- Use a query to show the existing state of the database. --->
<cfquery name = "GetComments" dataSource = "cfdocexamples">
    SELECT
        CommentID, EMail, FromUser, Subject, CommtType, MessText, Posted, Processed
    FROM
        COMMENTS
</cfquery>

<html>
<head></head>
<h3>cfinsert Example</h3>
<p>First, show a list of the comments in the cfdocexamples datasource. </p>
<cfoutput query = "GetComments">
    <table>
        <tr>
            <td>From User</td><td>Subject</td><td>Comment Type</td>
            <td>Message</td><td>Date Posted</td>
        </tr>
        <cfoutput query = "GetComments">
            <tr>
                <td valign = "top"><a href = "mailto:#Email#">#FromUser#</a></td>
                <td valign = "top">#Subject#</td>
                <td valign = "top">#CommtType#</td>
                <td valign = "top"><font size = "+2">#Left(MessText, 125)#</font></td>
                <td valign = "top">#AddedDate#</td>
            </tr>
        </cfoutput>
    </table>
</cfoutput>
</html>
<td valign = top>#Posted#</td>
</tr>
</cfoutput>
</table>
<p>Next, we'll offer the opportunity to enter a comment:
<!--- Make a form for input. --->
<form action = "cfinsert.cfm" method = "post">
<pre>
Email:   <input type = "Text" name = "email">
From:    <input type = "Text" name = "fromUser">
Subject: <input type = "Text" name = "subject">
Message: <textarea name = "MessText" COLS = "40" ROWS = "6"></textarea>
Date Posted:  <cfoutput>#DateFormat(Now())#</cfoutput>
<!--- Dynamically determine today's date. --->
<input type = "hidden"
    name = "posted" value = "<cfoutput>#Now()#</cfoutput>">
</pre>
<input type = "Submit" name = "" value = "insert my comment">
</form>

>Note: The cfinsert tag internally uses parameterized queries.

### cfinterface

**Description**
Defines an interface that consists of a set of signatures for functions. The interface does not include the full function definitions; instead, you implement the functions in a ColdFusion component (CFC). The interfaces that you define by using this tag can make up the structure of a reusable application framework.

**History**
ColdFusion 8: Added this tag.

**Category**
Application framework tags, Extensibility tags

**Syntax**
<cfinterface
    displayName = "descriptive name"
    extends = "interfaceName1[,interfaceName2]..."
    Hint = "hint text">
    <cffunction ...>
        <cfargument ... >
        <cfargument ... >
    ... 
    </cffunction>
    <cffunction ...>
    ... 
</cfinterface>
See also
cfargument, cfcomponent, cffunction, GetComponentMetaData, IsInstanceOf

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>displayName</td>
<td>Optional</td>
<td></td>
<td>A value to be displayed when using introspection to show a descriptive name for the interface.</td>
</tr>
<tr>
<td>extends</td>
<td>Optional</td>
<td></td>
<td>A comma-delimited list of one or more interfaces that this interface extends. Any CFC that implements an interface must also implement all the functions in the interfaces specified by this property. If an interface extends another interface, and the child interface specifies a function with the same name as one in the parent interface, both functions must have the same attributes; otherwise ColdFusion generates an error.</td>
</tr>
<tr>
<td>hint</td>
<td>Optional</td>
<td></td>
<td>Text to be displayed when using introspection to show information about the interface. The hint attribute value follows the syntax line in the function description.</td>
</tr>
</tbody>
</table>

Usage

The cfinterface tag declares a set of related functions that any ColdFusion component (CFC) that implements the interface must define. The interface specifies function signatures, but does not implement the functions; instead, the CFC that implements the interface must contain the full function definitions.

For example, you could create a create, read, update, and delete (CRUD) interface that defines the basic signatures of the four operations. All components that implement the interface must then conform to the interface signatures. You can then implement the interface in different components to manage different types of data sources. Because all the components implement the same interface, you can ensure that you can easily replace one component with another, depending on the specific data source that an individual application requires.

You define an interface by creating a ColdFusion file with a .cfc extension and specifying the cfinterface tag as the first and only top-level tag in the file. The filename determines the interface name, so myInterface.cfc defines the myInterface interface. You can specify any attributes in the cfinterface tag; however, only the names listed in the Attributes table are meaningful to ColdFusion. The filename must not contain commas, or any periods except for the separator before the .cfc extension.

Inside the cfinterface tag body, you specify the interface by declaring the functions of the interface. The interface definition must follow these basic rules:

- The cfinterface tag body can contain only cffunction tags and comments.
- The cffunction tag bodies can contain only cfargument tags, which declare the function arguments, and comments.
- The cffunction tag body is optional.

The following example shows the general format of an interface definition:
<cfinterface extends="IBasicInterface">
  <cffunction name="hello" description="Should print a greeting containing the input
argument or 'world'.">
    <cfargument name="whom" type="string" default="world">
  </cffunction>
  <cffunction name="calculateTwo" returnType="numeric" output="no"
    description="calculates a result using two numbers and returns the result">
    <cfargument name="first" type="numeric" required="yes"/>
    <cfargument name="second" type="numeric" required="no" default="0"/>
  </cffunction>
  <cffunction name="disclaimer"/>
</cfinterface>

This interface extends the IBasicInterface interface, so any component that implements this interface must also implement the methods of the IBasicInterface interface. This interface requires the component to implement the following three functions:

- A hello function that can optionally take a single string argument, which has a default value of "world".
- A calculateTwo function that takes one required numeric argument, has an optional numeric argument with a default value of 0, and must return a number.
- A disclaimer function that takes no arguments and returns any type.

The CFC that implements an interface specifies the interface name in the cfcomponent tag’s implements attribute. It must implement all of the interface’s methods as specified in the interface cffunction tags. The order of function arguments in the interface definition and the component definition must be identical.

The following table lists the attributes that you can use in the cffunction and cfargument tags, and describes the requirements and limitations on how you can use them in the interface definition and the component implementation:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Interface requirements</th>
<th>Implementation requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>cffunction</td>
<td>access Optional; only public is allowed</td>
<td>Optional; can be public or remote.</td>
</tr>
<tr>
<td></td>
<td>description Optional</td>
<td>Can differ from value in interface.</td>
</tr>
<tr>
<td></td>
<td>displayName Optional</td>
<td>Can differ from value in interface.</td>
</tr>
<tr>
<td></td>
<td>hint Optional</td>
<td>Can differ from value in interface.</td>
</tr>
<tr>
<td></td>
<td>name Required</td>
<td>Must be identical to value in interface.</td>
</tr>
<tr>
<td></td>
<td>output Optional</td>
<td>Need not be identical to the value in the interface. Even if you omit the attribute in the interface, you can use it in the implementation. Similarly, you can use the attribute in the interface and omit it in the implementation.</td>
</tr>
<tr>
<td></td>
<td>returnType Optional</td>
<td>Must be identical to value in interface; however, an omitted type option and an option value of any are equivalent and ColdFusion treats them as a match.</td>
</tr>
<tr>
<td></td>
<td>roles Not allowed</td>
<td>Can be any valid value.</td>
</tr>
<tr>
<td>cfargument</td>
<td>default Optional</td>
<td>Must be identical to value in interface. If you omit this attribute in the interface, you can specify any value in the implementation.</td>
</tr>
<tr>
<td></td>
<td>displayName Optional</td>
<td>Can differ from value in interface.</td>
</tr>
</tbody>
</table>
A CFC can implement multiple interfaces.

**Note:** If a CFC implements multiple interfaces and two or more of the interfaces define functions with identical names, the signatures of these functions must be the same in all the interfaces; ColdFusion does not support function overloading.

ColdFusion uses the same rules to locate interfaces as it does to locate components. You can use the `GetComponentMetaData` function to get information about an interface.

Adobe recommends that you use a consistent technique for identifying interface names, for example, by always starting the file (and therefore interface) name with a capital I. Any component that implements only that single interface could have a similar name, for example the same root prefixed by a capital C. You could have an `IresourceInfo.cfc` interface file and a corresponding `CresourceInfo.cfc` component file, for example.

**Example**

The following example defines an `IBasicMath` interface with `add`, `subtract`, `multiply`, and `divide` operations. The `integerMath` CFC implements this interface by defining integer arithmetic versions of the operations. The `testMath.cfm` application uses the `integerMath` functions to do arithmetic calculations on two decimal numbers (using the values of pi and e).

As an exercise, consider modifying the interface definition to take and return values of any type, and then implement a second CFC that uses the `PrecisionEvaluate` function to calculate arbitrary precision arithmetic and return the results. (These versions are omitted for brevity.)

The `IBasicMath.cfc` file defines the interface as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Interface requirements</th>
<th>Implementation requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>hint</td>
<td>Optional</td>
<td>Can differ from value in interface</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td>Must be identical to value in interface.</td>
</tr>
<tr>
<td>required</td>
<td>Optional</td>
<td>If the interface specifies <em>yes</em>, this attribute must also specify <em>yes</em>. If the interface specifies <em>no</em> or omits this attribute, you can specify <em>no</em> or omit the attribute.</td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>Must be identical to value in interface; however, an omitted <code>type</code> option and an option value of <code>any</code> are equivalent and ColdFusion treats them as a match.</td>
</tr>
</tbody>
</table>
<cfinterface>
  <cffunction name = add returntype = "numeric" output = "no"
    description = "Add two values">
    <cfargument name = "first" type="numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
  </cffunction>

  <cffunction name = subtract returntype = "numeric" output = "no"
    description = "Subtract two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
  </cffunction>

  <cffunction name = multiply returntype = "numeric" output = "no"
    description = "Multiply two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
  </cffunction>

  <cffunction name = divide returntype = "numeric" output = "no"
    description = "Divide two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "1"/>
  </cffunction>
</cfinterface>

The integerMath.cfc file defines the integerMath component, which implements the IBasicMath interface, as follows:

<cfcomponent implements = "IBasicMath">
  <cffunction name = add returntype = "numeric" output = "no"
    description = "Add two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
    <cfreturn Round(first + second)>
  </cffunction>

  <cffunction name = subtract returntype = "numeric" output = "no"
    description = "Subtract two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
    <cfreturn Round(first - second)>
  </cffunction>

  <cffunction name = multiply returntype = "numeric" output = "no"
    description = "Multiply two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "0"/>
    <cfreturn Round(first * second)>
  </cffunction>

  <cffunction name = divide returntype = "numeric" output = "no"
    description = "Divide two values">
    <cfargument name = "first" type = "numeric" required = "no" default = "0"/>
    <cfargument name = "second" type = "numeric" required = "no" default = "1"/>
    <cfreturn Round(first / second)>
  </cffunction>
</cfcomponent>

The testMath.cfm file uses the integerMath component methods to calculate integer values, as follows:
<cfscript>
    arguments = StructNew();
    arguments.first = pi();
    arguments.second = "2.718281828459045235360287471352";
</cfscript>

<cfobject name = "iMathObj" component = "integerMath">
<coutput>
<h3>Function Arguments</h3>
    argument 1: #arguments.first#<br>
    argument 2: #arguments.second#<br>
    
    <h3>Addition</h3>
    #iMathObj.add(argumentCollection = arguments)#
    
    <h3>Subtraction</h3>
    #iMathObj.subtract(argumentCollection = arguments)#
    
    <h3>Multiplication</h3>
    #iMathObj.multiply(argumentCollection = arguments)#
    
    <h3>Division</h3>
    #iMathObj.divide(argumentCollection = arguments)#
</coutput>

**cfinvoke**

**Description**

Does either of the following:

- Invokes a component method from within a ColdFusion page or component.
- Invokes a web service.

This tag works as follows:

- Transiently instantiates a component or web service and invokes a method on it.
- Invokes a method on an instantiated component or web service.

This tag can pass parameters to a method in the following ways:

- With the `cfinvokeargument` tag
- As named attribute-value pairs, one attribute per parameter
- As a structure, in the `argumentCollection` attribute

**Category**

<td>See Usage</td>
<td></td>
<td>A string that contains a space-delimited list of arguments to pass to the WSDL2Java tool that generates Java stubs for the web services. Useful arguments include the following:&lt;br&gt;• -W or --noWrapped: Turns off the special treatment of wrapped document/literal style operations.&lt;br&gt;• -a or --all: Generates code for all elements in the WSDL, even unreferenced ones.&lt;br&gt;• -w or --wrapArrays: Preferences building beans to straight arrays for wrapped XML array types. This switch is not included in the Axis documentation. For detailed information on valid arguments, see the Apache Axis WSDL2Java Reference.</td>
</tr>
<tr>
<td>wsVersion</td>
<td>Optional</td>
<td></td>
<td>Specifies version of the axis to be used. If the wsversion is specified as &quot;1&quot; then axis 1 will be used for Consuming. If it is &quot;2&quot; then axis 2 will be used.</td>
</tr>
</tbody>
</table>

**Note:** If you do not specify any attributes of the proxy server, and a corresponding system property is set (typically in the JVM startup arguments) ColdFusion uses the system property value.
## Usage

The following table shows when you can use each attribute:

<table>
<thead>
<tr>
<th>This attribute is required, optional, ignored, or invalid:</th>
<th>For this cfinvoke tag syntax:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Syntax 1</td>
</tr>
<tr>
<td>argumentCollection</td>
<td>Optional</td>
</tr>
<tr>
<td>component</td>
<td>Required</td>
</tr>
<tr>
<td><strong>input_params ...</strong></td>
<td>Optional</td>
</tr>
<tr>
<td>method</td>
<td>Required</td>
</tr>
<tr>
<td>password</td>
<td>Ignored</td>
</tr>
<tr>
<td>proxyPassword</td>
<td>Invalid</td>
</tr>
<tr>
<td>proxyPort</td>
<td>Invalid</td>
</tr>
<tr>
<td>proxyServer</td>
<td>Invalid</td>
</tr>
<tr>
<td>proxyUser</td>
<td>Invalid</td>
</tr>
<tr>
<td>returnVariable</td>
<td>Optional</td>
</tr>
<tr>
<td>servicePort</td>
<td>Invalid</td>
</tr>
<tr>
<td>timeout</td>
<td>Invalid</td>
</tr>
<tr>
<td>username</td>
<td>Ignored</td>
</tr>
<tr>
<td>webservice</td>
<td>Invalid</td>
</tr>
<tr>
<td>wsdl2javaArgs</td>
<td>Invalid</td>
</tr>
</tbody>
</table>

If the `component` attribute specifies a component name, the component with the corresponding name is instantiated, the requested method is invoked, and then the component instance is immediately destroyed. If the attribute contains a reference to an instantiated component object, no instantiation or destruction of the component occurs.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lower case. If it does not find the file, it looks for a file name that matches the component name exactly, with the identical character casing.

Method arguments can be passed in any of the following ways. If an argument is passed in more than one way with the same name, this order of precedence applies:

1. **Using the cfinvokeargument tag**
2. Passing directly as attributes of the `cfinvoke` tag (they cannot have the same name as a registered `cfinvoke` attribute: `method`, `component`, `webservice`, `returnVariable`)
3. Passing as struct keys, using the `argumentCollection` attribute

For example, the `params` struct contains three keys: `a=1, b=1, c=1`. The following call is evaluated as if the arguments were passed to the method in the order `a=3, b=2, c=1`:

```xml
<cfinvoke ...
  a=2 b=2 argumentCollection=params>
  <cfinvokeargument name="a" value="3"/>
</cfinvoke>
```

### Note:
The following `cfinvoke` tag attribute names are reserved; they cannot be used for argument names: `component`, `method`, `argumentCollection`, and `result`.

Last updated 7/9/2012
Example 1
This example uses Syntax 1.

```cfm
<!--- Immediate instantiation and destruction. --->
<cfinvoke
    component="nasdaq.quote"
    method="getLastTradePrice"
    returnVariable="res">
    <cfinvokeargument
        name="symbol"
        value="macr">
</cfinvoke>
<cfoutput>#res#</cfoutput>
```

Example 2
This example uses Syntax 1.

```cfm
<!--- Passing the arguments using argumentCollection. --->
<cfset args = StructNew()>
<cfset args.symbol = "macr">
<cfinvoke
    component="nasdaq.quote"
    method="getLastTradePrice"
    argumentCollection="#args#"
    returnVariable="res">
<cfoutput>#res#</cfoutput>
```

Example 3
This example uses Syntax 2.

```cfm
<!--- Called only from within a component, MyComponent. --->
<cfinvoke
    method = "a method name of MyComponent"
    returnVariable = "variable name">
```

Example 4
This example uses Syntax 3.

```cfm
<!--- Using cfinvoke to consume a web service using a ColdFusion component. --->
<cfinvoke
    webservice="http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
    method="getTemp"
    returnVariable="aTemp">
    <cfinvokeargument
        name="zipcode" value="55987"/>
</cfinvoke>
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

For more information on web services, see Using Web Services in the Developing ColdFusion Applications.

Example 5
This example uses Syntax 4A.
<!--- Separate instantiation and method invocation; useful for multiple invocations using different methods or values. --->
<cfobject
   name="quoteService"
   component="nasdaq.quote">
<cfinvoke
   component="#quoteService#"
   method="getLastTradePrice"
   symbol="macr"
   returnVariable="res_macr">
<cfoutput>#res#</cfoutput>
</cfinvoke>
<cfoutput>#res#</cfoutput>
<cfinvoke
   component="#quoteService#"
   method="getLastTradePrice"
   symbol="mot"
   returnVariable="res_mot">
<cfoutput>#res#</cfoutput>
</cfinvoke>

**cfinvokeargument**

**Description**
Passes the name and value of a parameter to a component method or a web service. This tag is used in the cfinvoke tag.

**Category**
Extensibility tags

**Syntax**

```html
<cfinvokeargument
   name="argument name"
   value="argument value"
   omit = "yes|no">
```

**Note:** You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

**See also**
cfargument, cfcomponent, cffunction, cfinvoke, cfobject, cfproperty, cfreturn

**History**
ColdFusion MX 7: Added the omit attribute.
ColdFusion MX: Added this tag.
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Argument name.</td>
</tr>
<tr>
<td>value</td>
<td>Required</td>
<td></td>
<td>Argument value.</td>
</tr>
<tr>
<td>omit</td>
<td>Optional</td>
<td>no</td>
<td>Enables you to omit a parameter when invoking a web service. It is an error to specify omit=&quot;yes&quot; if the cfinvokewebservice attribute is not specified. yes: omit this parameter when invoking a web service. no: do not omit this parameter when invoking a web service.</td>
</tr>
</tbody>
</table>

Usage

You can have multiple cfinvokeargument tags in a cfinvoke tag body.

You can use cfinvokeargument tag to dynamically determine the arguments to be passed. For example, you can use conditional processing to determine the argument name, or you can use a cfif tag to determine whether to execute the cfinvokeargument tag.

If you are invoking a web service, you can omit a parameter by setting the omit attribute to "yes". If the WSDL specifies that the argument is nillable, ColdFusion MX sets the associated argument to null. If the WSDL specifies minoccurs=0, ColdFusion omits the argument from the WSDL.

Example1

```xml
<cfinvoke
    component="nasdaq.quote"
    method="getLastTradePrice"
    returnVariable="res">
    <cfinvokeargument name="symbol" value="mot"/>
    <cfinvokeargument name="symbol" value="macr"/>
</cfinvoke>

<cfoutput>#res#</cfoutput>
```

Example2

```xml
<!-- Using cfinvoke to consume a web service using a ColdFusion component. -->
<cfinvoke
    webservice="http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
    method="getTemp"
    returnvariable="aTemp">
    <cfinvokeargument name="zipcode" value="55987"/>
</cfinvoke>

<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```
Tags j-l

cflayout

Description
Creates a region of its container (such as the browser window or a cflayoutarea tag) with a specific layout behavior: a bordered area, a horizontal or vertically arranged box, or a tabbed navigator.

Category
Display management tags

Syntax

```cflayout
  type="accordion|border|hbox|tab|vbox"
  activeOnTop="false|true"
  align="center|justify|left|right"
  fillHeight="true|false"
  fitToWindow="true|false"
  height="integer"
  name="string"
  padding="integer"
  style="CSS style specification"
  tabHeight="measurement"
  tabPosition="top|bottom"
  tabStrip="true|false"
  titleCollapse="true|false"
  width="integer">
  cflayoutarea tags
</cflayout>
```

Note: You can specify this tag’s attribute in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute name as structure key.

</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Required</td>
<td>all</td>
<td>all</td>
<td>The type of layout. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• accordion: a container with multiple layout areas that display no more than one area at a time. Each layout area has a title bar that is always displayed. The user can expand or collapse each layout area by clicking + or - button on the layout area title bar.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• border: a box with a border and up to five layout areas, each with a border. For more information, see Usage.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• hbox: a horizontal box where all immediate child <code>cflayoutarea</code> controls are arranged horizontally.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• tab: a tabbed display where the current child <code>cflayoutarea</code> tag occupies the display area of the layout, and each layout area has a tab that the user can select to display its contents.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• vbox: a vertical box where all immediate child <code>cflayoutarea</code> controls are arranged vertically.</td>
</tr>
<tr>
<td><strong>activeOnTop</strong></td>
<td>Optional</td>
<td>false</td>
<td>accordion</td>
<td>Specifies whether the active panel moves to the top of the layout, becoming the first panel.</td>
</tr>
<tr>
<td><strong>align</strong></td>
<td>Optional</td>
<td>Determined by browser layout direction</td>
<td>all</td>
<td>Specifies the default alignment of the content of child layout areas. Each <code>cflayoutarea</code> tag can specify an <code>alignment</code> attribute to override this value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• center</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• justify</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• left</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• right</td>
</tr>
<tr>
<td><strong>fillHeight</strong></td>
<td>Optional</td>
<td>true</td>
<td>accordion</td>
<td>A Boolean value that specifies whether to adjust the active layout area’s height to fill the available space in the layout control container:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If you specify <code>fillHeight</code> as <code>false</code>, then ColdFusion sets <code>overflow</code> to <code>hidden</code>.</td>
</tr>
<tr>
<td><strong>fitToWindow</strong></td>
<td>Optional</td>
<td>false</td>
<td>border</td>
<td>A Boolean value that specifies whether the border layout must occupy 100% of the width and height of the window:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• true</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>The underlying implementation uses a viewport, hence, any content outside the layout is not accommodated in the layout.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>When using nested border layouts, if you specify <code>fitToWindow</code> as <code>true</code>, the layouts nested within the border layout may not automatically fit into the available space. Hence, for nested layouts, it is recommended to use <code>width</code> or <code>size</code> instead of <code>fitToWindow</code>.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Usage

The immediate children of a cflayout tag must be cflayoutarea tags or nondisplay tags whose bodies contain one or more cflayoutarea tags at the top level. For example, a cflayout tag could have a tag such as cfloop or cfquery as a child, and these tags would have cflayoutarea tags in their bodies.

The border type layout has the following characteristics:

- The layout control and each of its immediate layout area children is surrounded by a border.
- The control can have up to five children positioned at the left, right, center, top, and bottom of the layout.
- You can configure the child layout areas, except for the center area, to have splitters so that users can expand and collapse them or close them completely.
- The center child layout area occupies all available space in the layout that is not used by any of the other layout areas.
- To specify layout height, use the height setting of the style attribute.

Note: If you specify a border layout on a page that has a DOCTYPE declaration, the layout cannot properly determine its height and you must specify the height in a cflayout tag style attribute.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Applies to</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>Optional</td>
<td>600 for border layout; autoheight for others</td>
<td>all</td>
<td>Height of the layout in pixels. For the tab layout, the height attribute has the same functionality as the tabheight attribute. If you specify both height and tabheight attributes, height takes priority over tabheight. The height value specified here takes priority over the height value specified using the style attribute.</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td></td>
<td>all</td>
<td>The name of the layout region. Should be unique on a page.</td>
</tr>
</tbody>
</table>
| padding       | Optional| 0                  | hbox, vbox | • For hbox layouts, specifies the padding on the right side of each child layout area.
• For vbox layouts, specifies the padding at the bottom of each child layout area.
You can use any valid CSS length or percent format, such as 10, 10% 10px, or 10em, for this attribute.
The padding is included in the child layout area and takes the style of the layout area. |
| style         | Optional|                    | all        | A CSS style specification that defines layout styles.                      |
| tabHeight     | Optional|                    | tab        | Specifies the height of the content area of all child layout areas. You can override this setting by specifying a height setting in an individual cflayoutarea tag style attributes. |
| tabPosition   | Optional| top                | tab        | Specifies the location of the tabs relative to the tab region contents.     |
• bottom: the tabs appear at the bottom of the layout.
• top: the tabs appear at the top of the layout. |
| tabStrip      | Optional| true               | tab        | If true, a background tab strip is displayed.                              |
| titleCollapse | Optional| true               | accordion  | Specifies whether clicking anywhere on each layout area’s title bar expands and collapses the layout area. If false, the user must click the title bar +/- button to expand or collapse a layout area. |
| width         | Optional|                    | all        | Width of the layout in pixels. This value takes priority over the width defined using the style attribute. If no value is specified, autoWidth is applied and therefore, content fills the entire screen. |
You can use the following JavaScript functions to access the underlying Ext JS - JavaScript Library objects for border and tab type `cflayout` controls.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ColdFusion.Layout.getBorderLayout</code></td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified border type <code>cflayout</code> control.</td>
</tr>
<tr>
<td><code>ColdFusion.Layout.getTabLayout</code></td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified tab type <code>cflayout</code> control.</td>
</tr>
<tr>
<td><code>ColdFusion.Layout.getAccordionLayout</code></td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified accordion type <code>cflayout</code> control.</td>
</tr>
</tbody>
</table>

For more information on configuring layout areas, see `cflayoutarea`.

**Example**

The following example shows a set of nested layouts. The outer layout is a vbox, with two layout areas. The top layout area has a border layout, the bottom layout area contains a form with buttons to control the display of the border layout areas.

```
<html>
<head>
</head>
<body>
<cflayout name="outerlayout" type="vbox">
  <cflayoutarea style="height:400;">  
    <cflayout name="thelayout" type="border">  
      <!- The 100% height style ensures that the background color fills the area. -->
      <cflayoutarea position="top" size="100" splitter="true" style="background-color:##00FFFF; height:100%">  
        This is text in layout area 1: top
      </cflayoutarea>
      <cflayoutarea title="Left layout area" position="left" closables="true" collapsible="true" name="left" splitter="true" style="background-color:##FF00FF; height:100%">  
        This is text in layout area 2: left<br />
        You can close and collapse this area.
      </cflayoutarea>
      <cflayoutarea title="Center layout area" position="center" style="background-color:##FFFF00; height:100%">  
        This is text in layout area 3: center<br />
      </cflayoutarea>
      <cflayoutarea title="Right Layout Area" initcollapsed="true" style="background-color:##FF00FF; height:100%">  
        This is text in layout area 4: right<br />
        You can collapse this, but not close it.<br />
        It is initially collapsed.
      </cflayoutarea>
      <cflayoutarea position="bottom" size="100" splitter="true" style="background-color:##00FFFF; height:100%">  
        This is text in layout area 5: bottom
      </cflayoutarea>
    </cflayout>
  </cflayoutarea>
</cflayout>
</body>
```
cflayoutarea

Description
Defines a region within a cflayout tag body, such as an individual tab of a tabbed layout.

Category
Display management tags

Syntax
In a border layout
<cflayoutarea
required
  position="bottom|center|left|right|top"
optional
  align="left|center|justify|right"
  collapsible="false|true"
  initcollapsed="false|true"
  inithide="false|true"
  maxSize="number of pixels"
  minSize="number of pixels"
  name="string"
  onBindError = "JavaScript function name"
  overflow = "auto|hidden"
  size="number of pixels"
  source="URL"
  splitter="false|true"
  style="CSS style specification"
  title="string">
  area elements
</cflayoutarea>
In a hbox or vbox layout
<cflayoutarea
  optional
  name="string"
  onBindError = "JavaScript function name"
  overflow = "auto|hidden|scroll|visible"
  size="number of pixels"
  source="URL"
  style="CSS style specification">
  area elements
</cflayoutarea>

In a tab layout
<cflayoutarea
  optional
  bindonload="false|true"
  closable="false|true"
  disabled="false|true"
  inithide="false|true"
  name="string"
  onBindError = "JavaScript function name"
  overflow = "auto|hidden|scroll|visible"
  refreshOnActivate = "false|true"
  selected="false|true"
  source="URL"
  style="CSS style specification"
  tabTip="text"
  title="string">
  area elements
</cflayoutarea>

In an accordion layout
<cflayoutarea
  optional
  bindonload="false|true"
  closable="false|true"
  name="string"
  onBindError = "JavaScript function name"
  overflow = "auto|hidden|scroll|visible"
  refreshOnActivate = "false|true"
  selected="false|true"
  source="URL"
  style="CSS style specification"
  title="string"
  titleicon="icon location">
  area elements
</cflayoutarea>

If you specify a source attribute, all child tags are ignored. If you do not have child tags, close the tag with />.

Note: You can specify this tag’s attribute in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute name as structure key.

</table>
| overflow     | Optional | auto         | all        | Specifies how to display child content whose size would cause the control to overflow the window boundaries. The following values are valid:  
• auto: show scroll bars when necessary.  
• hidden: do not allow access to overflowing content.  
• scroll: always show horizontal and vertical scroll bars, even if they are not needed.  
• visible: content can display outside the bounds of the layout area.  
**Notes:**  
• You cannot use visible or scroll for layout areas in border layouts.  
• In Internet Explorer, layout areas with the visible setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area. |
| position     | Required if the `cflayout` type is border | border     | border     | The position of the area in the layout. Must be one of the following values:  
  • top: Position the area across the top of the full layout.  
  • bottom: Position the area across the bottom of the full layout.  
  • left: Position the area on the left side of the layout, between any visible top and bottom areas.  
  • right: Position the area on the right side of the layout, between any visible top and bottom areas.  
  • center: Position the area in the space not taken by the top, bottom, left, and right areas.  
Border style layouts can have at most one layout area of each type. |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Applies to</th>
<th>Description</th>
</tr>
</thead>
</table>
| refreshOnActivate | Optional| false   | tab, accordion | • true: Refresh the contents of the tab/accordion panel by running the `source` bind expression whenever the tab/panel display region shows (for example, when the user selects the tab), in addition to when bind events occur.  
• false: Refresh the tab/accordion panel display region only when the bind expression is triggered by its bind event.  
To use this attribute, also specify a `source` attribute. |
| selected          | Optional| first tab is selected | tab, accordion | A Boolean value that specifies whether this tab is initially selected so that its contents appears in the layout. |
| size              | Optional| -1      | border, hbox, vbox | For hbox layouts and border layouts with `position` attribute values of `top` or `bottom`, the initial height of the area.  
For vbox layouts and border layouts with `position` attribute values of `left` or `right`, the initial width of the area.  
For hbox and vbox layouts, you can use any valid CSS length or percent format (such as 10, 10%, 10px, or 10em) for this attribute.  
For border layouts, this attribute value must be an integer number of pixels.  
You cannot use this attribute for border layout areas with a `position` attribute value of `center`. ColdFusion automatically determines the center size based on the size of all other layout areas.  
**Note:** If a layout area in a border layout contains only AJAX controls such as HTML format `cftree` tags, specify a `size` attribute. Otherwise, the AJAX components may not be visible until the layout area is resized. |
| source            | Optional| all     | all         | A URL that returns the layout area contents. ColdFusion uses standard page path resolution rules. You can use a bind expression with dependencies in this attribute.  
If a file specified in this attribute includes tags that use AJAX features, such as `cfform`, `cfgrid`, and `cfpod`, use the `cfajaximport` tag on the page that includes the `cflayoutarea` tag. For more information, see `cfajaximport`.  
For more information on the `source` attribute, see Usage. |
| splitter          | Optional| false   | border      | A Boolean value that specifies whether the layout area has a divider between it and the adjacent `layoutarea` control. Users can drag the splitter to change the relative sizes of the areas.  
If this attribute is set to `true` on a `left` or `right` position layout area, the splitter resizes the area and its adjacent area horizontally. If this attribute is set to `true` on a `top` or `bottom` position layout area, the splitter resizes the layout vertically.  
You cannot use this attribute for border layout areas with a `position` attribute value of `center`. |
| style             | Optional| all     | all         | A CSS style specification that controls the appearance of the area. |
Usage

All `cflayoutarea` tags must be children of `cflayout` tags and cannot have `cflayoutarea` tags as immediate children, but they can contain `cflayout` tags. However, the `cflayoutarea` tags do not have to be direct children of the `cflayout` tag; instead, the `cflayout` tag could have a tag such as `cfloop` or `cfquery` as a child, and the `cflayoutarea` tags could be in the body of the `cfloop` or `cfquery` tag. These rules let you create arbitrarily complex combinations of different layouts.

**Note:** You cannot put a layout of type `border` inside a layout of type `tab`.

If you do not specify a `size` attribute value, ColdFusion attempts to determine the required size for the layout area contents. However, in some cases, such as when the layout area contains AJAX controls, ColdFusion might not be able to determine the required size, and you must specify the `size` attribute to make the AJAX control appear. In these cases, a scroll bar appears for the layout area.

You can use a `source` attribute or a tag body to specify the layout area contents; if you specify both, ColdFusion uses the contents specified by the `source` attribute and ignores the tag body. If you use a `source` attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.

If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```javascript
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```javascript
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application's main page, and not write them inline in code that you get using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a `bind expression` to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only. For detailed information on using bind expressions see Using Ajax Data and Development Features in the Developing ColdFusion Applications.

In `border` type layouts, a center layout area always takes up any space that is not used by the other areas, even if you do not specify a `cflayoutarea` tag with a `centerposition` attribute. Therefore, if you want only two layout areas in either direction, one of the two must be the center area, or you must explicitly size the two areas to take up the full layout area.

When you nest layouts, set the inner layout area initial sizes appropriately to ensure that they appear.

Use the following JavaScript functions to enable, disable, show, hide, expand, collapse, and select layout areas:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Applies to</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tabTip</td>
<td>Optional</td>
<td></td>
<td>tab</td>
<td>If defined, a tab tip is displayed.</td>
</tr>
<tr>
<td>title</td>
<td>Optional; required for tab layouts</td>
<td>border, tab, accordion</td>
<td>For tab layouts, the text to display on the tab. For border layouts, if you specify this attribute, ColdFusion creates a title bar for the layout area with the specified text as the title. By default, border layouts that are not closable or collapsible do not have a title bar. You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code>.</td>
<td></td>
</tr>
<tr>
<td>titleIcon</td>
<td>Optional</td>
<td>accordion</td>
<td>Specifies the location of the icon to display with the title.</td>
<td></td>
</tr>
</tbody>
</table>
Note: When you use the style attribute to specify the background color of a border layout area, specify a height style of 100% to make the background color cover the entire layout area. This is because the style specification applies to an inner content area of the layout area, not the layout area itself, and the 100% specification ensures that the content area takes up all available space in the layout area.

Example
The following example creates a three-tabbed layout and lets you use buttons to dynamically control the second tab.
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
</head>
<body>
<h3>Atab</h3>
<cflayout type="tab" name="thelayout" tabheight="175" style="background-color:##CCffFF; color:red; height:200">
  <cflayoutarea title="Tab 1" style="background-color:##FFAAFF;" closable="true">
    This is text in layout area 1
  </cflayoutarea>
  <cflayoutarea name="area2" title="Tab 2" inithide="true" style="background-color:##FFCCFF">
    This is text in layout area 2
  </cflayoutarea>
  <cflayoutarea title="Tab 3" style="background-color:##FF99FF;">
    This is text in layout area 3
  </cflayoutarea>
</cflayout>
<br />
<cfform>
  <cfinput name="show" width="40" value="show tab" type="button" onClick="ColdFusion.Layout.showTab('thelayout', 'area2');">
  <cfinput name="hide" width="40" value="hide tab" type="button" onClick="ColdFusion.Layout.hideTab('thelayout', 'area2');">
  <cfinput name="enable" width="40" value="enable tab" type="button" onClick="ColdFusion.Layout.enableTab('thelayout', 'area2');">
  <cfinput name="disable" width="40" value="disable tab" type="button" onClick="ColdFusion.Layout.disableTab('thelayout', 'area2');">
  <cfinput name="select" width="40" value="select tab" type="button" onClick="ColdFusion.Layout.selectTab('thelayout', 'area2');">
</cfform>
</body>
</html>

cfldap

Description
Provides an interface to a Lightweight Directory Access Protocol (LDAP) directory server, such as the Netscape Directory Server.

Category
Internet protocol tags
Syntax
<cfldap
  action = "action"
  server = "server name"
  attributes = "attribute, attribute"
  delimiter = "delimiter character"
  dn = "distinguished name"
  filter = "filter"
  maxRows = "number"
  modifyType = "replace|add|delete"
  name = "name"
  password = "password"
  port = "port number"
  rebind = "yes|no"
  referral = "number of allowed hops"
  returnAsBinary = "column name, column name"
  scope = "scope"
  secure = "multifield security string"
  separator = "separator character"
  sort = "attribute[, attribute]..."
  sortControl = "nocase|desc|asc"
  start = "distinguished name"
  startRow = "row number"
  timeout = "milliseconds"
  username = "user name">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfftp, cfhttp, cfmail, cfmajaxparam, cfpop, Managing LDAP Directories in the Developing ColdFusion Applications

History
ColdFusion 8: Added the ability to use a comma as a delimiter when specifying a list of variables in the returnAsBinary attribute, for example, returnAsBinary="objectGUID,objectSID". Previously, the allowed delimiter was a space.

ColdFusion MX 7: Added the returnAsBinary attribute. Added SSL V2 client based authentication; this means that ColdFusion supports the CFSSL_CLIENT_AUTH option. If CFSSL_CLIENT_AUTH is selected, ColdFusion assumes that the first certificate in the cacerts (or the certificate database) contains the Client Certificate.

ColdFusion MX:
- Changed the name attribute behavior: this tag validates the query name in the name attribute.
- Changed sorting behavior: this tag does not support client-side sorting of query results. (It supports server-side sorting; use the sort and sortcontrol attributes.)
- Changed how results are sorted: server-side sorting results might be sorted slightly differently than in ColdFusion 5. If you attempt a sort against a server that does not support it, ColdFusion MX throws an error.
- Deprecated the filterConfig and filterFile attributes. They might not work, and might cause an error, in later releases.
## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action      | Required| query   | • query: returns LDAP entry information only. Requires name, start, and attributes attributes.  
• add: adds LDAP entries to LDAP server. Requires attributes attribute.  
• modify: modifies LDAP entries, except distinguished name dn attribute, on LDAP server. Requires dn. See modifyType attribute.  
• modifyDN: modifies distinguished name attribute for LDAP entries on LDAP server. Requires dn.  
• delete: deletes LDAP entries on an LDAP server. Requires dn. |
| server      | Required| Host name or IP address of LDAP server. |
| attributes  | Required if action="Query", "Add", "ModifyDN", or "Modify" | For queries: comma-delimited list of attributes to return. For queries, to get all attributes, specify "*".  
If action="add" or "modify", you can specify a list of update columns. Separate attributes with a semicolon.  
If action="ModifyDN", ColdFusion passes attributes to the LDAP server without syntax checking. |
| delimiter   | Optional| ; (semicolon) | Separator between attribute name-value pairs. Use this attribute if either of these situations exist:  
• The attributes attribute specifies more than one item.  
• An attribute contains the default delimiter (semicolon), for example: mgrpmsgrejecttext;lang-en  
Used by query, add, and modify actions, and by cfldap to output multi-value attributes.  
For example, if $ (dollar sign), you could specify "cn=DoubleTreeInn$street=1111Elm;Suite100, where the semicolon is part of the street value. |
| dn          | Required if action="Add", "Modify", "ModifyDN", or "delete" | Distinguished name, for update action, for example, "cn=BobJensen, o=AceIndustry, c=US" |
| filter      | Optional| "objectclass = " | Search criteria for action="query".  
List attributes in the form: * (attributeoperatorvalue) * For example: * (sn=Smith) * |
| maxRows     | Optional| | Maximum number of entries for LDAP queries. |
| modifyType  | Optional| replace | How to process an attribute in a multi-value list:  
• add: appends it to any attributes.  
• delete: deletes it from the set of attributes.  
• replace: replaces it with specified attributes.  
You cannot add an attribute that is already present or that is empty. |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required if action=&quot;Query&quot;</td>
<td></td>
<td>Name of LDAP query. The tag validates the value.</td>
</tr>
<tr>
<td>password</td>
<td>Required if secure=&quot;CFSSL_BASIC&quot;</td>
<td></td>
<td>Password that corresponds to user name. If secure = &quot;CFSSL_BASIC&quot;, V2 encrypts the password before transmission.</td>
</tr>
<tr>
<td>port</td>
<td>Optional</td>
<td>389</td>
<td>Port.</td>
</tr>
</tbody>
</table>
| rebind             | Optional      | no      | • yes: attempts to rebind referral callback and reissue query by referred address using original credentials.  
  • no: referred connections are anonymous. |
| referral           | Optional      |         | Integer. Number of hops allowed in a referral. A value of 0 disables referred addresses for LDAP; no data is returned. |
| returnAsBinary     | Optional      |         | A space-delimited list of columns that are to be returned as binary values. |
| scope              | Optional      | oneLevel | Scope of search, from entry specified in start attribute for action="Query".  
  • oneLevel: entries one level below entry.  
  • base: only the entry.  
  • subtree: entry and all levels below it. |
| secure             | Optional      |         | Security to employ, and required information. If you specify this attribute, its value must be CFSSL_BASIC, which provides V2 SSL encryption and server authentication. |
| separator          | Optional      | , (comma) | Delimiter to separate attribute values of multi-value attributes. Used by query, add, and modify actions, and by cfldap to output multi-value attributes.  
  For example, if $ (dollar sign), the attributes attribute could be "objectclass=top$person", where the first value of objectclass is top, and the second value is person. This avoids confusion if values include commas. |
| sort               | Optional      |         | Attributes by which to sort query results. Use a comma delimiter.           |
| sortControl        | Optional      | asc     | • nocase: case-insensitive sort.  
  • asc: ascending (a to z) case-sensitive sort.  
  • desc: descending (z to a) case-sensitive sort.  
  You can enter a combination of sort types; for example, sortControl= "nocase,asc". |
| start              | Required if action="Query" |         | Distinguished name of entry to be used to start a search.                  |
| startRow           | Optional      | 1       | Used with action="query". First row of LDAP query to insert into a ColdFusion query. |
| timeout            | Optional      | 60000   | Maximum length of time, in milliseconds, to wait for LDAP processing.      |
| username           | Required if secure="CFSSL_BASIC" | (anonymous) | User ID.                                                                     |
Usage
If you use the query action, cfldap creates a query object, allowing access to information in the query variables, as follows:

```
<table>
<thead>
<tr>
<th>Variable name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryname.recordCount</td>
<td>Number of records returned by query</td>
</tr>
<tr>
<td>queryname.currentRow</td>
<td>Current row of query that cfoutput is processing</td>
</tr>
<tr>
<td>queryname.columnList</td>
<td>Column names in query</td>
</tr>
</tbody>
</table>
```

If you use the `security="CFSSL_BASIC"` option, ColdFusion determines whether to trust the server by comparing the server’s certificate with the information in the jre/lib/security/cacerts keystore of the JRE used by ColdFusion. The ColdFusion default cacerts file contains information about many certificate granting authorities. If you must update the file with additional information, you can use the keytool utility in the ColdFusion jre/bin directory to import certificates that are in X.509 format. For example, enter the following:

```
keytool -import -keystore cacerts -alias ldap -file ldap.crt -keypass bl19mq
```

Then restart ColdFusion. The keytool utility initial `keypass` password is “change it”. For more information on using the keytool utility, see the Sun JDK documentation.

Characters that are illegal in ColdFusion can be used in LDAP attribute names. As a result, the cfldap tag could create columns in the query result set whose names contain illegal characters and are, therefore, inaccessible in CFML. In ColdFusion, illegal characters are automatically mapped to the underscore character; therefore, column names in the query result set might not exactly match the names of the LDAP attributes.

For usage examples, see the Developing ColdFusion Applications.

Example
<h3>cfldap Example</h3>
<p>Provides an interface to LDAP directory servers. The example uses the University of Connecticut public LDAP server. For more public LDAP servers, see <a href="http://www.emailman.com">http://www.emailman.com</a>.</p>
<p>Enter a name and search the public LDAP resource. An asterisk before or after the name acts as a wildcard.</p>
<p> <!--- If form.name exists, the form was submitted; run the query. --->
<cfif IsDefined("form.name")>>
  <!--- Check to see that there is a name listed. --->
  <cfif form.name is not ">
  <!--- Make the LDAP query. --->
  <cfldap
      server = "ldap.uconn.edu"
      action = "query"
      name = "results"
      start = "dc=uconn,dc=edu"
      filter = "cn=#name#"
      attributes = "cn,o,title,mail,telephonenumber"
      sort = "cn ASC">
  <!--- Display results. --->
  <center>
  <table border = 0 cellspacing = 2 cellpadding = 2>
  <tr>
    <th colspan = 5>
      <cfoutput>#results.recordCount# matches found</cfoutput>
    </th>
  </tr>
  </table>
  </center>
</cfif>
```
ColdFusion Tags

<cfoutput query = "results">
<tr>
<td><font size="-2">Name</font></td>
<td><font size="-2">Organization</font></td>
<td><font size="-2">Title</font></td>
<td><font size="-2">E-Mail</font></td>
<td><font size="-2">Phone</font></td>
</tr>
<tr>
<td><font size="-2">#cn#</font></td>

<A href = "mailto:#mail#">#mail#</A></font></td>
<td><font size="-2">#telephoneNumber#</font></td>
</tr>
</cfoutput>
</table>
</center>
</cfif>
</cfif>
<form action="#cgi.script_name#" method="POST">
<p>Enter a name to search in the database.</p>
<input type="Text" name="name">
<input type="Submit" value="Search" name="">
</form>

**cflocation**

**Description**

Stops execution of the current page and opens a ColdFusion page or HTML file.

**Category**

Flow-control tags, Page processing tags

**Syntax**

```html
<cflocation
    url = "URL"
    addToken = "yes|no"
    statusCode = "300|301|302|303|304|305|307">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

cfabort, cfbreak, cfexecute, cfexit, cfif, cfloop, cfswitch, cfthrow, cftry

**History**

ColdFusion 8: Added the statusCode attribute.

<td>• 307 HTTP_TEMPORARY_REDIRECT: The requested data temporarily resides at a new location.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The status codes from 304 to 307 do not redirect you to the page specified in a URL, unless you also follow the guidelines specified in the most recent HTTP RFC.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

You might write a standard message or response in a file, and call it from several applications. Use this tag to redirect the user’s browser to the standard file.

This tag has no effect if you use it after the cfflush tag on a page.

Note: When using cfabort, cflocation, or cfcontent tags, the OnAbort method is invoked instead on OnRequestEnd.

Example

```
<h3>cflocation Example</h3>
<p>This tag redirects the browser to a web resource; normally, you would use this tag to go to a CF page or an HTML file on the same server. The addToken attribute lets you send client information to the target page.</p>
<p>If you remove the comments, this code redirects you to CFDOCS home page:</p>

<!--- <cflocation url = "http://localhost:8500/cfdocs/dochome.htm" addToken = "no" --->
```
**cflock**

**Description**
Ensures the integrity of shared data. Instantiates the following kinds of locks:

- **Exclusive** - Allows single-thread access to the CFML constructs in its body. The tag body can be executed by one request at a time. No other requests can start executing code within the tag while a request has an exclusive lock. ColdFusion issues exclusive locks on a first-come, first-served basis.

- **Read-only** - Allows multiple requests to access CFML constructs within the tag body concurrently. Use a read-only lock only when shared data is read and not modified. If another request has an exclusive lock on shared data, the new request waits for the exclusive lock to be released.

**Category**
Application framework tags

**Syntax**
```
<cflock
timeout = "time-out in seconds"
name = "lock name"
scope = "Application|Server|Session|Request"
throwOnTimeout = "yes|no"
type = "readOnly|exclusive">
<!--- CFML to be synchronized. --->
</cflock>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfapplication, cfassociate, cfmessagebox, Using Persistent Data and Locking in the Developing ColdFusion Applications

**History**
ColdFusion 8: Added Request Value to scope attribute.
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Required</td>
<td></td>
<td>Maximum length of time, in seconds, to wait to obtain a lock. If lock is obtained, tag execution continues. Otherwise, behavior depends on throwOnTimeout attribute value. If you set timeout=&quot;0&quot;, the timeout is determined by the &quot;Timeout Requests after x&quot; setting in the ColdFusion Administrator Settings page, if that setting is enabled. However, if the setting is not enabled, and you set timeout=&quot;0&quot;, ColdFusion can wait indefinitely to obtain the lock.</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td></td>
<td>Locks name. Mutually exclusive with the scope attribute. Only one request can execute the code within a cflock tag with a given name at a time. Cannot be an empty string. Permits synchronizing access to resources from different parts of an application. Lock names are global to a ColdFusion server. They are shared among applications and user sessions, but not clustered servers.</td>
</tr>
<tr>
<td>scope</td>
<td>Optional</td>
<td></td>
<td>Locks scope. Mutually exclusive with the name attribute. Only one request in the specified scope can execute the code within this tag (or within any other cflock tag with the same lock scope) at a time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Application</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Request</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Server</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Session</td>
</tr>
<tr>
<td>throwOnTimeout</td>
<td>Optional</td>
<td>yes</td>
<td>How time-out conditions are handled:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: exception is generated for the time-out.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: execution continues past this tag.</td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>exclusive</td>
<td>• readOnly: lets more than one request read shared data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• exclusive: lets one request read or write shared data.</td>
</tr>
</tbody>
</table>

**Note:** Limit the scope of code that updates shared data structures, files, and CFXs. Exclusive locks are required to ensure the integrity of updates, but read-only locks are faster. In a performance-sensitive application, substitute read-only locks for exclusive locks where possible, for example, when reading shared data.

**Usage**

ColdFusion is a multi-threaded server; it can process multiple page requests at a time. Use the cflock tag for these purposes:

- To ensure that modifications to shared data and objects made in concurrently executing requests occur sequentially.
- Around file manipulation constructs, to ensure that file updates do not fail because files are open for writing by other applications or tags.
- Around CFX invocations, to ensure that ColdFusion can safely invoke CFXs that are not implemented in a thread-safe manner. (This applies only to CFXs developed in C++.)

To work safely with ColdFusion, a C++ CFX that maintains and manipulates shared (global) data structures must be made thread-safe; however, this requires advanced knowledge. You can use a CFML custom tag wrapper around a CFX to make its invocation thread-safe.
When you display, set, or update variables in a shared scope, use the `scope` attribute to identify the scope as Server, Application or Session.

**Deadlocks**

A **deadlock** is a state in which no request can execute the locked section of a page. After a deadlock occurs, neither user can break it, because all requests to the protected section of the page are blocked until the deadlock can be resolved by a lock time-out.

The `cflock` tag uses kernel level synchronization objects that are released automatically upon time out and/or the abnormal termination of the thread that owns them. Therefore, while processing a `cflock` tag, ColdFusion never deadlocks for an infinite period. However, large time-outs can block request threads for long periods, and radically decrease throughput. To prevent this, always use the minimum time-out value.

Another cause of blocked request threads is inconsistent nesting of `cflock` tags and inconsistent naming of locks. If you nest locks, everyone accessing the locked variables must consistently nest `cflock` tags in the same order. Otherwise, a deadlock can occur.

These examples show situations that cause deadlocks:

<table>
<thead>
<tr>
<th>Example deadlock with two users</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User 1</strong></td>
<td><strong>User 2</strong></td>
</tr>
<tr>
<td>Locks the session scope.</td>
<td>Locks the Application scope.</td>
</tr>
<tr>
<td>Deadlock: Tries to lock the Application scope, but it is already locked by User 2.</td>
<td>Deadlock: Tries to lock the Session scope, but it is already locked by User 1.</td>
</tr>
</tbody>
</table>

The following deadlock could occur if you tried to nest an exclusive lock inside a read lock:

<table>
<thead>
<tr>
<th>Example deadlock with one user</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User 1</strong></td>
<td></td>
</tr>
<tr>
<td>Locks the Session scope with a read lock.</td>
<td></td>
</tr>
<tr>
<td>Attempts to lock the Session scope with an exclusive lock.</td>
<td></td>
</tr>
<tr>
<td>Deadlock: Cannot lock the Session scope with an exclusive lock because the scope is already locked for reading.</td>
<td></td>
</tr>
</tbody>
</table>

The following code shows this scenario:

```cfc
cflock timeout = "60" scope = "SESSION" type = "readOnly">
..............
<cflock timeout = "60" scope = "SESSION" type = "Exclusive">
..............
</cflock>
</cflock>
```

To avoid a deadlock, everyone who nests locks must do so in a well-specified order and name the locks consistently. If you must lock access to the Server, Application, and Session scopes, do so in this order:

1. Lock the Session scope. In the `cflock` tag, specify `scope = "session"`.
2. Lock the Application scope. In the `cflock` tag, specify `scope = "Application"`.
3. Lock the Server scope. In the `cflock` tag, specify `scope = "server"`.
4. Unlock the Server scope.
5. Unlock the Application scope.
Unlock the Session scope.

Note: If you do not have to lock a scope, you can skip any pair of these lock/unlock steps. For example, if you do not have to lock the Server scope, you can skip Steps 3 and 4. Similar rules apply for named locks.

For more information, see the following:

- Using Persistent Data and Locking in the Developing ColdFusion Applications.
- Locking thread data and resource access in the Developing ColdFusion Applications (for information on locking the Request scope when you use the cfthread tag to create multithreaded ColdFusion applications).
- ColdFusion Locking Best Practices, on the Adobe website.

Example

<!--- This example shows how cflock can guarantee consistency of data updates to variables in the Application, Server, and Session scopes. --->

<!--- Copy the following code into an Application.cfm file in the application root directory. --->
<!----------------- Beginning of Application.cfm code ----------------->
<!--- cfapplication defines scoping for a ColdFusion application and enables or disables storing of application and session variables. Put this tag in a special file called Application.cfm. It is run before any other ColdFusion page in its directory. --->
<!---- Enable session management for this application. --->
<cfapplication name = "ETurtle" sessionTimeout = #CreateTimeSpan(0,0,0,60)# sessionManagement = "yes">

<!--- Initialize session and application variables used by E-Turtleneck. Use session scope for the session variables. --->
<cflock scope = "Session" timeout = "30" type = "Exclusive">
  <cfif NOT IsDefined("session.size")>
    <cfset session.size = ">
  </cfif>
  <cfif NOT IsDefined("session.color")>
    <cfset session.color = ">
  </cfif>
</cflock>

<!--- Use an application lock for the application-wide variable that keeps track of the number of turtlenecks sold. For a more efficient, but more complex, way of handling Application scope locking, see the "Developing ColdFusion Applications"--->
<cflock scope = "Application" timeout = "30" type = "Exclusive">
  <cfif NOT IsDefined("application.number")>
    <cfset application.number = 0>
  </cfif>
</cflock>

<!---------------------- End of Application.cfm ---------------------->

<h3>cflock Example</h3>

<cfif IsDefined("form.submit")>
  <!--- The form has been submitted; process the request. --->
</cfif>
<cfoutput>
    Thanks for shopping E-Turtleneck. You chose size <b>#form.size#</b>, color <b>#form.color#</b>.
</cfoutput>

<!--- Lock the code that assigns values to session variables. ---->
<cflock scope = "Session" timeout = "30" type = "Exclusive">
    <cfparam name = session.size Default = #form.size#>
    <cfparam name = session.color Default = #form.color#>
</cflock>

<!--- Lock the code that updates the Application scope number of turtlenecks sold. --->
<cflock scope = "Application" timeout = "30" type = "Exclusive">
    <cfset application.number = application.number + 1>
    <cfoutput>
        E-Turtleneck has now sold #application.number# turtlenecks!
    </cfoutput>
</cflock>

<cfelse>
    <!--- Show the form only if it has not been submitted. --->
    <cflock scope = "Application" timeout = "30" type = "Readonly">
        <cfoutput>
            E-Turtleneck has sold #application.number# turtlenecks to date.
        </cfoutput>
    </cflock>
</cfelse>

<form method="post" action="cflocktest.cfm">
    <p>Congratulations! You selected the most comfortable turtleneck in the world. Please select color and size.</p>
    <table cellspacing = "2" cellpadding = "2" border = "0">
        <tr>
            <td>Select a color.</td>
            <td><select type = "Text" name = "color">
                <option>red
                <option>white
                <option>blue
                <option>turquoise
                <option>black
                <option>forest green
            </select>
        </tr>
    </table>
</form>
Select a size.</select></td>
</tr>
<tr><td>Press Submit when you are finished making your selection.</td><td><input type = "Submit" name = "submit" value = "Submit"></td></tr>
</table>
</form>
</cfif>

### cflog

**Description**

Writes a message to a log file.

**Category**

Data output tags

**Syntax**

```xml
<cflog
text = "text"
type = "information|warning|error|fatal"
application = "yes|no"
file = "filename"
log = "log type">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

`cfcol`, `cfcontent`, `cfoutput`, `cftable`

**History**

ColdFusion MX: Deprecated the `thread`, `date`, and `time` attributes. They might not work, and might cause an error, in later releases. (In earlier releases, these attributes determined whether the respective data items were output to the log. In ColdFusion MX, this data is always output.)
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Required</td>
<td></td>
<td>Message text to log.</td>
</tr>
</tbody>
</table>
| application | Optional | yes    | • yes: logs the application name, if it is specified in a cfapplication tag or Application.cfc file.  
|            |         |         | • no            |
| file      | Optional |         | Message file. Specify only the main part of the filename. For example, to log to the Testing.log file, specify "Testing". The file must be located in the default log directory. You cannot specify a directory path. If the file does not exist, it is created automatically, with the extension .log. |
| log       | Optional |         | If you omit the file attribute, writes messages to standard log file. Ignored, if you specify file attribute.  
|           |         |         | • Application: writes to Application.log, normally used for application-specific messages.  
|           |         |         | • Scheduler: writes to Scheduler.log, normally used to log the execution of scheduled tasks. |
| type      | Optional | Information | Type (severity) of the message:  
|           |         |         | • Information  
|           |         |         | • Warning  
|           |         |         | • Error  
|           |         |         | • Fatal |

Usage

This tag logs custom messages to standard or custom log files. You can specify a file for the log message or send messages to the default application or scheduler log. The log message can include ColdFusion expressions. Log files must have the extension .log and must be located in the ColdFusion log directory.

Log entries are written as comma-delimited lists with these fields:

- type
- thread
- date
- time
- application
- text

Values are enclosed in double quotation marks. If you specify no for the application attribute, the corresponding entry in the list is empty.

You can disable cflog tag execution. For more information, see the ColdFusion Administrator Basic Security page.

The following example logs the name of a user that logs on an application. The message is logged to the file myAppLog.log in the ColdFusion log directory. It includes the date, time, and thread ID, but not the application name.
<cflog file="myAppLog" application="no"
   text="User #Form.username# logged on.">

For example, if a user enters "Sang Thornfield" in a form’s username field, this entry is added to the myApplog.log file entry:

"Information","153","02/28/01","14:53:40","User Sang Thornfield logged on."

cflogin

Description
A container for user login and authentication code. ColdFusion runs the code in this tag if a user is not already logged in. You put code in the tag that authenticates the user and identifies the user with a set of roles. Used with cfloginuser tag.

Category
Security tags

Syntax
<cflogin
   applicationToken = "token"
   cookieDomain = "domain"
   idletimeout = "value">
   ...
<cfloginuser
   name = "name"
   password = "password"
   roles = "roles">
</cflogin>

See also
cfloginuser, cflogout, GetAuthUser, GetUserRoles, IsUserInAnyRole, IsUserInRole, IsUserLoggedIn,
Securing Applications in the Developing ColdFusion Applications

History
ColdFusion 8: The applicationToken attribute lets you specify a unique application identifier for each application, or the same value for multiple applications.

ColdFusion MX 6.1: Changed behavior: the cflogin variable exists when ColdFusion receives a request with NTLM or Digest (HTTP Negotiated header) authentication information.

ColdFusion MX: Added this tag.
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>applicationtoken</td>
<td>Optional</td>
<td>The current application name</td>
<td>The login that applies to the application. To let users log in to only one application, specify a unique value for that application. To let users log in to multiple applications, specify the same value for those applications. If you do not set a value for the applicationtoken attribute, the default value is $CFAUTHORIZATION_{applicationname}$.</td>
</tr>
<tr>
<td>cookiedomain</td>
<td>Optional</td>
<td>Domain of the cookie that is used to mark a user as logged in. Use this attribute to enable a user login cookie to work with multiple clustered servers in the same domain.</td>
<td></td>
</tr>
<tr>
<td>idletimeout</td>
<td>Optional</td>
<td>1800</td>
<td>Time interval, in seconds, after which ColdFusion logs off the user.</td>
</tr>
</tbody>
</table>

Usage

The body of this tag executes only if there is no logged-in user. When using application-based security, you put code in the body of the cflogin tag to check the user-provided ID and password against a data source, LDAP directory, or other repository of login identification. The body must include a cfloginuser tag to establish the authenticated user's identity in ColdFusion.

You control the data source and are responsible for coding the SQL within the cflogin tag; make sure that the associated database has user, password, and role information.

The cflogin tag has a built-in cflogin structure that contains two variables, cflogin.name and cflogin.password, if the page is executing in response to any of the following:

- Submission of a form that contains input fields with the names j_username and j_password.
- A request that uses HTTP Basic authentication and, therefore, includes an Authorization header with the user name and password.
- A request that uses NTLM or Digest authentication. In this case, the username and password are hashed using a one-way algorithm in the Authorization header; ColdFusion gets the username from the web server and sets the cflogin.password value to the empty string.

You can use these values in the cflogin tag body to authenticate the user, and, in the cfloginuser tag, to log the user in. The structure is only available in the cflogin tag body.

Example

The following example shows a simple authentication. This code is typically in the Application.cfc onRequestStart method or in the application.cfm page.

```cfml
<cflogin>
  <cfif NOT IsDefined("cflogin")>
    <cfinclude template="loginform.cfm" />
    <cfabort />
  <cfelse>
    <cfif cflogin.name eq "admin">
      <cfset roles = "user,admin" />
    <cfelse>
      <cfset roles = "user" />
    </cfif>
    <cfloginuser name="#cflogin.name#" password="#cflogin.password#" roles="#roles#" />
  </cfif>
</cflogin>
```
The following view-only example checks the user ID and password against a data source:

```cfml
<cfquery name="qSecurity" datasource="UserRolesDb">
  SELECT Roles FROM SecurityRoles
  WHERE username=#cflogin.name# CFSQLTYPE="CF_SQL_VARCHAR"
  AND password=#cflogin.password# CFSQLTYPE='CF_SQL_VARCHAR'
</cfquery>

<cfif qSecurity.recordcount gt 0>
  <cfloginuser name = "#cflogin.name#"
               password = "#cflogin.password#"
               roles = "#trim(qSecurity.Roles)#" >
</cfif>
```

**cfloginuser**

**Description**
Identifies an authenticated user to ColdFusion. Specifies the user ID and roles. Used within a `cflogin` tag.

**Category**
Security tags

**Syntax**
```
<cfloginuser
    name = "name"
    password = "password"
    roles = "roles">
```

**See also**
`cflogin, cflogout, GetAuthUser, GetUserRoles, IsUserInAnyRole, IsUserInRole, IsUserLoggedIn, Securing Applications in the Developing ColdFusion Applications`

**History**
ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, and the `cfapplication` tag `loginStorage` attribute is set to Session, the login remains in effect until the session expires or the user is logged out by the `cflogout` tag.

ColdFusion MX: Added this tag.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>A user name.</td>
</tr>
<tr>
<td>password</td>
<td>Required</td>
<td></td>
<td>A user password.</td>
</tr>
<tr>
<td>roles</td>
<td>Required</td>
<td></td>
<td>A comma-delimited list of role identifiers. ColdFusion processes spaces in a list element as part of the element.</td>
</tr>
</tbody>
</table>

**Usage**
Used inside the `cflogin` tag to identify the authenticated user to ColdFusion. After you call this function, the `GetAuthUser` and `IsUserInRole` return the user name and role information.
Note: By default, the user information is stored as memory-only cookies. The cfapplication tag or the Application.cfc This.loginStorage variable can specify that login information is stored in the Session scope.

Example
See cflogin.

cflogout

Description
Logs the current user out. Removes knowledge of the user ID, password, and roles from the server. If you do not use this tag, the user is automatically logged out when the session ends.

Category
Security tags

Syntax
<cflogout>

See also
cflogin, cfloginuser, GetAuthUser, GetUserRoles, IsUserInAnyRole, IsUserInRole, IsUserLoggedIn, Securing Applications in Developing ColdFusion Applications

History
ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, a login remains in effect until the session expires or the user is logged out by the cflogout tag.

ColdFusion MX: Added this tag.

Example
<cflogin>
  <cfloginuser
    name = "foo"
    password = "bar"
    roles = "admin">
</cflogin>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>
<cflogout>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>

cfloop

Description
Looping is a programming technique that repeats a set of instructions or displays output repeatedly until one or more conditions are met. This tag supports the following types of loops:

- cfloop: index loop
- cfloop: conditional loop
- cfloop: looping over a date or time range
ColdFusion Tags

- **cfloop**: looping over a query
- **cfloop**: looping over a list, a file, or an array
- **cfloop**: looping over a COM collection or structure

For more information, see cfloop and cfbreak and Populating arrays with data in the *Developing ColdFusion Applications*.

**Category**
Flow-control tags

### cfloop: index loop

**Description**
An index loop repeats for a number of times that is determined by a numeric value. An index loop is also known as a FOR loop.

**Syntax**
```coldfusion
<cfloop
    index = "parameter name"
    from = "beginning value"
    to = "ending value"
    step = "increment"
    charset="charset to read in a file">
    HTML or CFML code ...
</cfloop>
```

**See also**
`cfabort, cfbreak, cfcontinue, cfdirectory, cfexecute, cfexit, cfif, cflocation, cfsid, cfswitch, cfthrow, cftry`, cfloop and cfbreak in the *Developing ColdFusion Applications*

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Required</td>
<td></td>
<td>Index value. ColdFusion sets it to the from value and increments or decrements by step value, until it equals the to value.</td>
</tr>
<tr>
<td>from</td>
<td>Required</td>
<td></td>
<td>Beginning value of index.</td>
</tr>
<tr>
<td>to</td>
<td>Required</td>
<td></td>
<td>Ending value of index.</td>
</tr>
<tr>
<td>step</td>
<td>Optional</td>
<td>1</td>
<td>Step by which to increment or decrement the index value.</td>
</tr>
<tr>
<td>charset</td>
<td>optional</td>
<td></td>
<td>Charset to use when reading in a file line-by-line.</td>
</tr>
</tbody>
</table>

**Usage**
Using anything other than integer values in the from and to attributes of an index loop can produce unexpected results. For example, if you increment through an index loop from 1 to 2, with a step of 0.1, ColdFusion outputs "1,1.1,1.2,...,1.9", but not "2". This is a programming language problem regarding the internal representation of floating point numbers.

**Note:** The to value is evaluated once, when the cfloop tag is encountered. Any change to this value within the loop block, or within the expression that evaluates to this value, does not affect the number of times the loop is executed.
Example
In this example, the code loops five times, displaying the index value each time:

```cfml
<cfloop index = "LoopCount" from = "1" to = "5">
    The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
The loop index is 5.

In this example, the code loops four times, displaying the index value each time. The value of j is decreased by one for each iteration. This does not affect the value of to, because it is a copy of j that is made before entering the loop.

```cfml
<cfset j = 4>
<cfloop index = "LoopCount" from = "1" to = #j#>
    <cfoutput>The loop index is #LoopCount#</cfoutput>.<br>
    <cfset j = j - 1>
</cfloop>
```

The output of this loop is as follows:
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.

As before, the value of j is decremented by one for each iteration, but this does not affect the value of to, because its value is a copy of j that is made before the loop is entered.

In this example, step has the default value, 1. The code decrements the index:

```cfml
<cfloop index = "LoopCount" 
    from = "5" 
    to = "1" 
    step = "-1">
    The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:
The loop index is 5.
The loop index is 4.
The loop index is 3.
The loop index is 2.
The loop index is 1.

cfloop: conditional loop

Description
A conditional loop iterates over a set of instructions as long as a condition is True. To use this type of loop correctly, the instructions must change the condition every time the loop iterates, until the condition is False. Conditional loops are known as WHILE loops, as in, "loop WHILE this condition is true."
**Syntax**

```cfmllang
<cfloop
   condition = "expression">
   ...
</cfloop>
```

**See also**

cfabsort, cfbreak, cfcontinue, cfexecute, cfexit, cfif, cflocation, cfswitch, cfthrow, cftry; cfloop and cfbreak in the Developing ColdFusion Applications

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td>Required</td>
<td></td>
<td>Condition that controls the loop.</td>
</tr>
</tbody>
</table>

**Example**

The following example increments CountVar from 1 to 5.

```cfmllang
<!--- Set the variable CountVar to 0. --->
<cfset CountVar = 0>
<!--- Loop until CountVar = 5. --->
<cfloop condition = "CountVar LESS THAN 5">
   <cfset CountVar = CountVar + 1>
   The loop index is #CountVar#
</cfloop>
```

The output of this loop is as follows:

The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
The loop index is 5.

**cfloop: looping over a date or time range**

**Description**

Loops over the date or time range specified by the from and to attributes. By default, the step is 1 day, but you can change the step by creating a timespan. The cfloop tag loops over tags that cannot be used within a cfoutput tag.

**Syntax**

```cfmllang
<cfloop
   from = "start time"
   to = "end time"
   index = "current value"
   step = "increment">
</cfloop>
```

**See also**
cfabsort, cfbreak, cfcontinue, cfdirectory, cfexecute, cfexit, cfif, cflocation, cfthrow, cfswitch, cfthrow, cftry; cfloop and cfbreak in the Developing ColdFusion Applications
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>Required</td>
<td></td>
<td>The beginning of the date or time range.</td>
</tr>
<tr>
<td>to</td>
<td>Required</td>
<td></td>
<td>The end of the date or time range.</td>
</tr>
<tr>
<td>index</td>
<td>Required</td>
<td>1 day</td>
<td>Index value. ColdFusion sets it to the from value and increments by the step value, until it equals the to value.</td>
</tr>
<tr>
<td>step</td>
<td>Optional</td>
<td></td>
<td>Step, expressed as a timespan, by which the index increments.</td>
</tr>
</tbody>
</table>

Example

The following example loops from today’s date to today’s date plus 30 days, stepping by 7 days at a time and displaying the date:

```coldfusion
<cfset startDate = Now()>
<cfset endDate = Now() + 30>
<cfloop from="#startDate#" to="#endDate#" index="i" step="#CreateTimeSpan(7,0,0,0)#">
  <cfoutput>#dateformat(i, "mm/dd/yyyy")#<br /></cfoutput>
</cfloop>
```

The following example displays the time in 30-minute increments, starting from midnight and ending 23 hours, 59 minutes, and 59 seconds later:

```coldfusion
<cfset startTime = CreateTime(0,0,0)>
<cfset endTime = CreateTime(23,59,59)>
<cfloop from="#startTime#" to="#endTime#" index="i" step="#CreateTimeSpan(0,0,30,0)#">
  <cfoutput>#TimeFormat(i, "hh:mm tt")#<br /></cfoutput>
</cfloop>
```

cfloop: looping over a query

Description

A loop over a query executes for each record in a query record set. The results are similar to those of the cfoutput tag. During each iteration, the columns of the current row are available for output. The cfloop tag loops over tags that cannot be used within a cfoutput tag.

Syntax

```coldfusion
<cfloop
    query = "query name"
    startRow = "row number"
    endRow = "row number"
    group = "Query column"
</cfloop>
```

</tr>
<tr>
<td>startRow</td>
<td>Optional</td>
<td></td>
<td>First row of query that is included in the loop.</td>
</tr>
<tr>
<td>endRow</td>
<td>Optional</td>
<td></td>
<td>Last row of query that is included in the loop.</td>
</tr>
<tr>
<td>group</td>
<td>Optional</td>
<td></td>
<td>Query column to use to group sets of records. Eliminates adjacent duplicate rows when data is sorted. Use if you retrieved a recordset ordered on one or more query columns. For example, if a recordset is ordered on &quot;Customer_ID&quot;, you can group the output on &quot;Customer_ID&quot;.</td>
</tr>
</tbody>
</table>

Example

```cfquery name = "MessageRecords" dataSource = "cfdocexamples">
    SELECT * FROM Messages
</cfquery>
<cfloop query = "MessageRecords">
    <cfoutput>#Message_ID#</cfoutput><br>
</cfloop>
```

The `cfloop` tag also iterates over a record set with dynamic start and stop points. This gets the next \( n \) sets of records from a query. This example loops from the fifth through the tenth record returned by the `MessageRecords` query:

```cfset Start = 5
<cfset End = 10>
<cfloop query = "MessageRecords" startRow = "#Start#" endRow = "#End#">
    <cfoutput>#MessageRecords.Message_ID#</cfoutput><br>
</cfloop>
```

The loop stops when there are no more records, or when the current record index is greater than the value of the `endRow` attribute. The following example combines the pages that are returned by a query of a list of page names into one document, using the `cfinclude` tag:

```cfquery name = "GetTemplate" dataSource = "Library" maxRows = "5">
    SELECT TemplateName
    FROM Templates
</cfquery>
<cfloop query = "GetTemplate">
    <cfinclude template = "#TemplateName#">
</cfloop>
```

cfloop: looping over a list, a file, or an array

Description

Looping over a list steps through elements contained in any of these entities:

- A variable
- A value that is returned from an expression
• An array
• A file

Looping over a file does not open the entire file in memory.

Syntax
<cfloop
    index = "index name"
    array = "array"
    characters = "number of characters"
    delimiters = "item delimiter"
    file = "absolute path and filename">
    list = "list items"
    ...
</cfloop>

See also
cfabort, cfbreak, cfflush, cfexecute, cfexit, cfif, cflocation, cfswitch, cfwrite, cfrtry; cfloop and
 cfbreak in the Developing ColdFusion Applications

History
ColdFusion 8: Added the characters, file, and array attributes.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Required</td>
<td></td>
<td>In a list, file, or array loop, the variable to receive the next element.</td>
</tr>
<tr>
<td>list</td>
<td>Required unless you specify a filename in the file attribute</td>
<td></td>
<td>A list, variable, or filename; contains a list.</td>
</tr>
<tr>
<td>array</td>
<td>Optional</td>
<td>An array.</td>
<td></td>
</tr>
<tr>
<td>characters</td>
<td>Optional</td>
<td>The number of characters to read during each iteration of the loop from the file specified in the file attribute. If the value of the characters attribute is more than the number of characters in the file, ColdFusion uses the number of characters in the file.</td>
<td></td>
</tr>
<tr>
<td>delimiters</td>
<td>Optional</td>
<td>Characters that separate items in list.</td>
<td></td>
</tr>
<tr>
<td>file</td>
<td>Optional</td>
<td>The absolute pathname of the on-disk or in-memory text file to read, one line at a time. This is helpful when reading large text files, because you can reuse the value of the index variable, which contains the current line of the file. When the loop completes, ColdFusion closes the file.</td>
<td></td>
</tr>
</tbody>
</table>

Example
This loop displays four names:

<cfloop index = "ListElement" list = "John,Paul,George,Ringo">
    <cfoutput>#ListElement#</cfoutput><br>
</cfloop>

You can put more than one character in the delimiters attribute, in any order. For example, this loop processes commas, colons, and slashes as list delimiters:
<cfloop index = "ListElement" list = "John/Paul, George::Ringo" delimiters = ",,:/">
  <cfoutput>#ListElement#</cfoutput><br>
</cfloop>

ColdFusion skips the second and subsequent consecutive delimiters between list elements. Thus, in the example, the two colons between "George" and 'Ringo' are processed as one delimiter.

To loop over each line of a file, use the tag as follows:

<cfloop file="c:\temp\simplefile.txt" index="line">
  <cfoutput>#line#</cfoutput><br>
</cfloop>

To read a specified number of characters from a text file during each iteration of the loop, use the tag as follows:

<cfloop file="c:\temp\simplefile.txt" index="chars" characters="12">
  <cfoutput>#chars#</cfoutput><br>
</cfloop>

When you read the following text file, ColdFusion reads 12 characters during each iteration of the loop; the result appears as follows:

<table>
<thead>
<tr>
<th>Text file</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>This is line 1.</td>
<td>This is line</td>
</tr>
<tr>
<td>This is line 2.</td>
<td>1. This is line 2.</td>
</tr>
<tr>
<td>This is line 3.</td>
<td>line 2. Th</td>
</tr>
<tr>
<td>This is line 4.</td>
<td>is is line 3</td>
</tr>
<tr>
<td>This is line 5.</td>
<td>. This is l</td>
</tr>
<tr>
<td>This is line 6.</td>
<td>ine 4. This</td>
</tr>
<tr>
<td>This is line 7.</td>
<td>is line 5.</td>
</tr>
<tr>
<td>This is line 8.</td>
<td>is lin</td>
</tr>
<tr>
<td>This is line 9.</td>
<td>e 6. This i</td>
</tr>
<tr>
<td>This is line 10.</td>
<td>s line 7. T</td>
</tr>
<tr>
<td>This is line 11.</td>
<td>his is line</td>
</tr>
<tr>
<td></td>
<td>8. This is line 9. Th</td>
</tr>
<tr>
<td></td>
<td>is line 10</td>
</tr>
<tr>
<td></td>
<td>. This is l</td>
</tr>
<tr>
<td></td>
<td>ine 11.</td>
</tr>
</tbody>
</table>

To loop over an array, you can do the following:

<cfset x = ["mars", "earth", "venus", "jupiter"]>
<cfloop array="#x#" index="name">
  <cfoutput>#name#</cfoutput><br>
</cfloop>
cfloop: looping over a COM collection or structure

Description
The cfloopcollection attribute loops over every object within a COM/DCOM collection object, or every element in a structure:

- A COM/DCOM collection object is a set of similar items referenced as a group. For example, the group of open documents in an application is a collection.
- A structure contains a related set of items, or it can be used as an associative array. Looping is particularly useful when using a structure as an associative array.

In the loop, each item is referenced by the variable name in the item attribute. The loop executes until all items have been accessed.

The collection attribute is used with the item attribute. In the example that follows, item is assigned a variable called file2, so that with each cycle in the cfloop, each item in the collection is referenced. In the cfoutput section, the name property of the file2 item is referenced for display.

For more information, see Integrating COM and CORBA Objects in CFML Applications in the Developing ColdFusion Applications.

Example
This example uses a COM object to output a list of files. In this example, FFunc is a collection of file2 objects.
<cfobject>
   class = FileFunctions.files
   name = FFunc
   action = Create>
<cfset FFunc.Path = "c:\">
<cfset FFunc.Mask = "*.*" >
<cfset FFunc.attributes = 16 >
<cfset x = FFunc.GetFilesList()>
<cfloop collection = #FFUNC# item = "file2">
   <cfoutput> #file2.name# <br> </cfoutput>
</cfloop>
<!---Loop through a structure that is used as an associative array: --->
<cfset Departments = StructNew()>
<cfset val = StructInsert(Departments, "John ", "Sales ")>
<cfset val = StructInsert(Departments, "Tom ", "Finance ")>
<cfset val = StructInsert(Departments, "Mike ", "Education ")>
<!--- Build a table to display the contents --->
<cfoutput>
<table cellpadding = "2 " cellspacing = "2 ">
   <tr>
      <td><b>Employee</b></td>
      <td><b>Dept.</b></td> 
   </tr>
   <cfloop collection = #Departments# item = "person ">
      <tr>
         <td>#person#</td>
         <td>#StructFind(Departments, person)#</td>
      </tr>
   </cfloop>
</table>
</cfoutput>
 <table cellpadding = "2 " cellspacing = "2 ">
   <tr>
      <td>Employee</b></td>
      <td>Dept.</td> 
   </tr>
</table>
</cfoutput>
</cfloop>
</table>
</cfobject>

cfmail

Description
Sends an e-mail message that optionally contains query output, using an SMTP server.

Category
Communications tags, Internet protocol tags
Syntax
<cfmail
    from = "e-mail address"
    to = "comma-delimited list"
    bcc = "comma-delimited list"
    cc = "comma-delimited list"
    charset = "character encoding"
    debug = "yes|no"
    failto = "e-mail address"
    group = "query column"
    groupcasesensitive = "yes|no"
    mailerid = "header id"
    maxrows = "integer"
    mimeattach = "path"
    password = "string"
    port = "integer"
    priority = "integer or string priority level"
    query = "query name"
    remove = "yes|no"
    replyto = "e-mail address"
    server = "SMTP server address"
    spoolenable = "yes|no"
    startrow = "query row number"
    subject = "string"
    timeout = "number of seconds"
    type = "mime type"
    username = "SMTP user ID"
    useSSL = "yes|no"
    useTLS = "yes|no"
    wraptext = "column number"
    sign = "true|false"
    keystore = "location of keystore"
    keystorepassword = "password of keystore"
    keyalias = "alias of key"
    keypassword = "password for private key">
    (Optional) Mail message body and/or cfmailparam tags
</cfmail>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfmailparam, cfmailpart, cfpop, cfftp, cfhttp, cfldap, Wrap; Using ColdFusion with mail servers in Sending and Receiving E-Mail in the Developing ColdFusion Applications

History
ColdFusion 8.0.1: Added the attribute Remove.

ColdFusion 8: Added priority, useSSL, and useTLS attributes.

ColdFusion MX 7:
- The cfmail tag no longer lets you send multipart mail by embedding the entire MIME-encoded message in the tag body. Use the cfmailpart tag, instead.
The `cfmail` tag renders non-proportional fonts proportionately. This is a behavior change from ColdFusion 5. ColdFusion MX 7 uses UTF-8 and sends this in the mail header (Content-Type: text/plain; charset=UTF-8). ColdFusion 5 uses ISO-8859-1 (Latin 1). To avoid this behavior, add the `charset="ISO-8859-1"` attribute to restore the default ColdFusion 5 encoding. Alternatively, you can change the encoding on the Mail page in the ColdFusion Administrator.

ColdFusion MX 6.1:
- Added the following attributes: `charset`, `failto`, `replyto`, `username`, `password` and `wraptext`.
- Added support for multiple mail servers in the `server` attribute.
- Added several configuration options to the ColdFusion Administrator Mail Settings page.

ColdFusion MX: Added the `SpoolEnable` attribute.

ColdFusion 9: Added support for digitally signing the mail. The following are the relevant attributes that are newly added: `sign`, `keystore`, `keystorepassword`, `keyalias`, `keypassword` and `remove`.

<td>Optional</td>
<td>Do not wrap text</td>
<td>The maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, preceding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72.</td>
</tr>
</tbody>
</table>
Usage
Sends a mail message to the specified address. Mail messages can include attachments. The tag body can include CFML code to generate mail output. The cfmailparam and cfmailpart tags can only be used in the cfmail tag body.

Mail messages can be single or multipart. If you send a multi-part mail message, all message content must be in cfmailpart tags; ColdFusion ignores multipart message text that is not in cfmailpart tags.

Note: The cfmail tag does not make copies of attachments when spooling mail to disk. If you use the cfmail tag to send a message with an attachment with spooling enabled and you use the cffile tag to delete the attachment file, ColdFusion might not send the mail because the mailing process might execute after the file was deleted. (When this happens, the mail log includes a FileNotFound exception and the e-mail is not sent.) You can prevent this problem by setting SpoolEnable="No" in the attribute or disabling spooling in the ColdFusion Administrator. Disabling spooling causes the e-mail to be delivered immediately.

If you set type="text", sometimes whitespace might be compressed in the messages that you send. To resolve this, in the ColdFusion Administrator, go to Server Settings > Settings and then deselect the option Enable Whitespace Management.

Mail addressing
Mail addresses can have any of the following forms:

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>user@server</td>
<td><a href="mailto:rsmith@company.com">rsmith@company.com</a></td>
</tr>
<tr>
<td><a href="mailto:user@server">user@server</a></td>
<td><a href="mailto:rsmith@company.com">rsmith@company.com</a></td>
</tr>
<tr>
<td>DisplayName <a href="mailto:user@server">user@server</a></td>
<td>Rob Smith <a href="mailto:rsmith@company.com">rsmith@company.com</a></td>
</tr>
<tr>
<td>&quot;DisplayName&quot; <a href="mailto:user@server">user@server</a></td>
<td>&quot;Rob Smith&quot; <a href="mailto:rsmith@company.com">rsmith@company.com</a></td>
</tr>
<tr>
<td>user@server (DisplayName)</td>
<td><a href="mailto:rsmith@company.com">rsmith@company.com</a> (Rob Smith)</td>
</tr>
</tbody>
</table>

Specifying mail servers
The server attribute can specify one or more mail servers.

Note: If you specify multiple mail servers in ColdFusion Standard, the cfmail tag uses only the first server in the specification. ColdFusion logs a warning message to the mail log file and ignores the additional servers.

For each server, you can optionally specify a user name, password, and port. These values override the corresponding attributes, if any. The server attribute has the following format:

[user:password@]server[:port], [user:password@]server[:port], ...

For example, the following line specifies one server, mail.myco.com that uses the default port and no user or password, and a second server with a user, password, and specific port:

server=mail.myco.com,mail_admin:adm2qzf@mail2.myco.com:24

When you specify multiple mail servers in ColdFusion Enterprise, ColdFusion tries the available servers in the order they are listed until it connects to a server. ColdFusion does not try to connect to a server that was unavailable in the last 60 seconds.

Digital Signature
To add digital signature to your mail, specify the attributes sign, keystore, keystorepassword, keyalias, and keypassword as provided in the following example:
ColdFusion Tags

<cfmail from="Sender@Company.com" server="sendmail.myCo.com" sign="true"
        keystore="C:\OpenSSL\bin\hello.jks" keystorepassword="digital"
        to="Recipient@Company.com"
        keyalias="crypto" keypassword="signature" subject="Mail with Digital Signature">

To add digital signature to all the mails you send, instead of adding the attributes to the tag, specify the settings in the
Server Settings > Settings page of the ColdFusion Administrator.

If you do not specify the attributes in the tag, the Administrator settings are applied. Also, in the tag, if you set sign =
"true" and do not specify the attributes keystore, keystorepassword, keyalias, and keypassword, then
the values for these attributes specified using ColdFusion Administrator are applied.

<cfmailparam

Description
Attaches a file or adds a header to an e-mail message.

Category
Communications tags, Internet protocol tags
Syntax
<cfmail>
   to = "recipient"
   subject = "message subject"
   from = "sender"
   more attributes... >
<cfmailparam
   contentID = "content ID"
   disposition = "disposition type">
   file = "filename"
   type = "media type"
</cfmailparam>
OR
<cfmailparam
   name = "header name"
   value = "header value">
...
</cfmail>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

History
ColdFusion 8.0.1: Added the attributes Content and Remove.
ColdFusion MX 6.x: Added the Disposition and ContentID attributes.
ColdFusion MX 6.1: Added the type attribute.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| content   |         |         | Lets you send the contents of a ColdFusion variable as an attachment. To do so, specify the variable in # signs as the content attribute value, as in the following example:
<cfmailparam file="anyname"
content="#variablename#" |
| contentID | Optional|         | The Identifier for the attached file. This ID must be globally unique and is used to identify the file in an IMG or other tag in the mail body that references the file content. |
| disposition| Optional| attachment | How the attached file is to be handled. Can be one of the following:
• attachment: presents the file as an attachment.
• inline: displays the file contents in the message. |
| file      | Required if you do not specify name attribute |         | Attaches a file in a message. Mutually exclusive with name attribute. The file is MIME encoded before sending. |
| name      | Required if you do not specify file attribute |         | Name of header. Case-insensitive. Mutually exclusive with file attribute. |
Usage
This tag attaches a file or adds a header to an e-mail message. It can only be used in the \texttt{cfmail} tag. You can use multiple \texttt{cfmailparam} tags within a \texttt{cfmail} tag.

You can use this tag to include a file, such as an image, in an HTML mail message. The file can be displayed inline in an HTML message, or as an attachment, as Example 2 shows. To include multiple files, use multiple \texttt{cfmailparam} tags.

Display a file inline in a mail message
1. Specify \texttt{type=“html”} in the \texttt{cfmail} tag.
2. Specify \texttt{disposition=“inline”} and a \texttt{ContentID} attribute in the \texttt{cfmailparam} tag.
3. Use a \texttt{src=“cid:ContentIDValue”} attribute to identify the content to include in the HTML tag such as the \texttt{img} tag.

Example
Example 1: This view-only example uses the \texttt{cfmailparam} tag to add a header to a message, attach files, and to return a receipt to the sender.

\[<cfmail from = “peter@domain.com” To = “paul@domain.com” Subject = “See Important Attachments and Reply”>
  <cfmailparam name = “Importance” value = “High”>
  Please review the new logo. Tell us what you think.
  <cfmailparam file = “c:\work\readme.txt” type=“text/plain”>
  <cfmailparam file = “c:\work\logo.gif” type=“image/gif”>
  <cfmailparam name=“Disposition-Notification-To” value=“peter@domain.com”>
</cfmail>\]

Example 2: This view-only example displays an image in the body of an HTML message.
<cfmail type="HTML">
  to = "#form.mailto#"
  from = "#form.mailFrom#"
  subject = "Sample inline image">
  <cfmailparam file="C:\Inetpub\wwwroot\web.gif"
    disposition="inline"
    contentID="image1">
    <p>There should be an image here</p>
    <p>After the picture</p>
  </cfmailparam>
</cfmail>

**cfmailpart**

**Description**
Specifies one part of a multipart e-mail message. Can only be used in the `cfmail` tag. You can use more than one `cfmailpart` tag within a `cfmail` tag.

**Category**
Communications tags, Internet protocol tags

**Syntax**
```
<cfmail
  ...
  (Optional cfmailparam entries)
  <cfmailpart
    charset="character encoding"
    type="mime type"
    wraptext="number"
  >
    Mail part contents
  </cfmailpart>
  ...
</cfmail>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

</tr>
<tr>
<td>wraptext</td>
<td>Optional</td>
<td>Do not wrap text</td>
<td>Specifies the maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, precede</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>ding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72.</td>
</tr>
</tbody>
</table>

Usage

Use this tag to create mail messages with alternative versions of the message that duplicate the content in multiple formats. The most common use is to send a plain text version of the message that can be read by all mail readers followed by a version formatted in HTML for display by HTML-compatible mail readers. Specify the simplest version first, with more complex versions afterwards. For more information, see [www.ietf.org/rfc/rfc2046.txt](http://www.ietf.org/rfc/rfc2046.txt).
Example

```cfmailpart Example</h3>
<cfmail from = "peter@domain.com" To = "paul@domain.com"
   Subject = "Which version do you see?">
   <cfmailpart type="text" wraptext="74">
       You are reading this message as plain text, because your mail reader does not handle
       HTML text.
   </cfmailpart>
   <cfmailpart type="html">
       <h3>HTML Mail Message</h3>
       <p>You are reading this message as <strong>HTML</strong>.</p>
       <p>Your mail reader handles HTML text.</p>
   </cfmailpart>
</cfmail>
```

cfmap

**Description**

Embeds a geographical map within a ColdFusion web page.

Currently, ColdFusion supports only embedding of Google map. To generate a map, provide a valid Google map API key, and specify the latitude and longitude of the location, or the address of the location.

The Google map API key can be specified in the following ways:

1. Using the `cfajaximport` tag. You specify the map API key in the `params` attribute as follows:
   ```
   <cfajaximport params="#{googlemapkey='Map API Key'}#">
   ```

2. Using `Application.cfc` as follows:
   ```
   <cfset this.googlemapkey="Map API Key">
   ```

3. Using the Settings page in the ColdFusion Administrator. Specify the map API key in the Google Map Key field. You can also specify the map API key in `runtime.cfc`
Syntax
<cfmap
centeraddress="address"
centerlatitude="latitude in degrees"
centerlongitude="longitude in degrees"

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false</td>
</tr>
<tr>
<td>tip</td>
<td>Optional</td>
<td></td>
<td>A short description of the center location that appears as a tool tip.</td>
</tr>
<tr>
<td>title</td>
<td>Optional</td>
<td></td>
<td>Title of the panel. You cannot define a title, if you set hideborder to true.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Usage
This tag can be used to create a map within an HTML page, a div tag, or in a new window. If you use this tag in a new window, you must use the cfmap tag within the cfwindow tag.

The zoomcontrol attribute lets you change the size of the embedded map. You can increase the zoom value to get a close-up view of the map. Or, decrease the zoom value to view a larger area of the map at a reduced size. Each time you change the zoom value, the entire map does not refresh, but only those portions of the map that change, making the display of data fast.

The cfmap tag supports the map display in five formats - map, satellite, terrain, earth, and hybrid. The map format displays a standard road map image. The satellite format displays a satellite image of the map. The hybrid format displays a combination of the roadmap and the satellite image of the map, with important street names and places marked on the satellite image.

The following attributes do not work if type="earth": Zoomlevel, showScale, overview, tip, zoomControl, showCenterMarker, and showAllMarkers.

For cfmap tag to work on Safari 3.x and Google Chrome, specify the HTML head tag (<head></head>).

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>

<td>3</td>
<td>Specifies the starting zoom value.</td>
</tr>
</tbody>
</table>
Examples
<h3>cfmap Example using latitude and longitude attributes</h3>
<cfmap name="gmap01"
   centerlatitude="71.094224"
   centerlongitude="42.339641"
   doubleclickzoom="true"
   overview="true"
   scrollwheelzoom="true"
   showscale="true"
   tip="My Map"
   zoomlevel="4"/>

<h3>cfmap Example using center address</h3>
<cfmap name="gmap02"
   centeraddress="345 Park Avenue, san jose, CA 95110-2704, USA"
   doubleclickzoom="true"
   scrollwheelzoom="true"
   showscale="false"
   tip="My Map"/>

cfmapitem

Description
The cfmapitem tag is a child tag of the cfmap tag. This tag creates markers on the map. You can specify the marker in a map using either the cfmapitem tag or using the ColdFusion.Map.AddMapMarker JavaScript API. See “ColdFusion.Map.addMarker” on page 1457 for details.

Category
Display management tags

Syntax
<cfmapitem
    address="address"
    latitude="latitude in degrees"
    longitude="longitude in degrees"
    markerColor="marker color"
    markerIcon="icon path"
    markerWindowContent="content"
    name="name of the map"
    showMarkerWindow="true|false"
    showUser="true|false"
    tip="marker tip" />

<td>Optional</td>
<td>Static content displayed in the marker window. This attribute ignores the markerbind attribute defined in the tag cmap.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td>The name of the map.</td>
<td></td>
</tr>
<tr>
<td>showmarkerwindow</td>
<td>Optional</td>
<td>Inherits parent cmap setting</td>
<td>If set to true, displays the marker window. If the attribute markerbind is used, unless you set this attribute to true, the marker window is not displayed.</td>
</tr>
<tr>
<td>showUser</td>
<td>Optional</td>
<td>false</td>
<td>If set to true, on HTML-compliant browsers, user location is shown on the map.</td>
</tr>
<tr>
<td>tip</td>
<td>Optional</td>
<td>A short description of the marker location that appears as a tool tip.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

This tag must be used within the cmap tag.

The following inheritance rules apply:

- The value specified for the attribute showmarkerwindow in the cmap tag is inherited by all cmapitem tags.
- A child cmapitem tag can override the attribute showmarkerwindow in the cmap tag by changing the value.
- Any bind expression defined using the markerbind is ignored if the cmapitem tag defines the attribute markerwindowcontent.
Examples

<h3>cfmapitem example using latitude and longitude attributes</h3>
<cfmap name="gmap01"
   centerlatitude="71.094224"
   centerlongitude="42.339641"
   doubleclickzoom="true"
   overview="true"
   scrollwheelzoom="true"
   showscale="true"
   tip="My Map"
   zoomlevel="4">
<cfmapitem name="marker01"
   latitude="70.50"
   longitude="42.50"
   tip="New marker"/>
</cfmap>

<h3>cfmap Example using address address</h3>
<cfmap name="gmap02"
   centerlatitude="71.094224"
   centerlongitude="42.339641"
   doubleclickzoom="true"
   overview="true"
   scrollwheelzoom="true"
   showscale="true"
   tip="My Map"
   zoomlevel="4">
<cfmapitem name="marker02"
   address="345 Park Avenue, san jose, CA 95110-2704, USA"
   tip="New marker"/>
</cfmap>

cfmediaplayer

Description
Creates an in-built media player that lets you play videos in any format supported by HTML 5 compliant browsers in addition to FLV, MPEG-3, and MPEG-4 files.

FLV files can be played from any web server. You can play MPEG-3/MPEG-4 only from Flash Media Server using RTMP. You can also play audio files of MP3 format.

<td>The URL to the FLV file. This can be a URL relative to the current page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>You can store the FLV file on the ColdFusion server or any other streaming server.</td>
</tr>
</tbody>
</table>
Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. You need to store an FLV file - `mediafile.flv` in the location `web_root\xyz\`. You can now create the media player with the following content:
<h3>cfmediaplayer Example</h3>
<cfmediaplayer
    name="Myvideo"
    source="/xyz/mediafile.flv"
    width=500
    height=400
    align="center"
    quality="high"
    fullscreencontrol="true"/>

The following code illustrates styling of the media player:
<cfset bgColorTheme = "EDC393">
<cfset titleColorTheme = "800517">
<cfset controlsColorTheme = titleColorTheme>
<cfset progressColorTheme = "E67451">
<cfset progressBgColorTheme = "FFF8C6">
<cfmediaplayer name="player2" style="bgcolor:#bgColorTheme#;
titletextcolor:#titleColorTheme#;titlebgcolor:#bgColorTheme#
controlbarbgcolor:#bgColorTheme#
frontbgcolor:#bgColorTheme#
progressbgcolor:#progressColorTheme#
progresscolor:#progressColorTheme#
borderleft:20;borderright:20;bordertop:10;borderbottom:13"
hideborder="false" hideTitle=false controlbar="true" source="#defaultFlvfile#">

<cfmenu>

Description
Creates a horizontal or vertical menu. Any menu item can be the top level of a submenu.

Category
Display management tags

Syntax
<cfmenu>
    bgcolor="HTML color value"
    childStyle="CSS style specification"
    font="HTML font family"
    fontColor="HTML color value"
    fontSize="Number of pixels"
    menuStyle="CSS style specification"
    name="string"
    selectedFontColor="HTML color value"
    selectedItemColor="HTML color value"
    type="horizontal|vertical"
    width="Number of pixels">
    cfmenuitem tags

</cfmenu>

The cfmenu tag must have a body that contains at least one cfmenuitem tag to define the menu items and an end cfmenu tag.

Note: You can specify this tag’s attribute in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute name as structure key.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| bgColor           | Optional| Background color style of the menu | The color of the menu background. You can use any valid HTML color specification.  
This specification has the following behaviors:  
• You can override it locally by specifying the menuStyle attribute of this tag and any cfmenuitem tag.  
• It controls the background of color surrounding a submenu whose background is specified by a childStyle attribute. |
| childStyle        | Optional| A CSS style specification that applies to the following menu items:  
• The items of the top-level menu  
• All child menu items, including the children of submenus  
This attribute lets you use a single style specification for all menu items. |
| font              | Optional| Browser default font | The font to use for all child menu items. Use any valid HTML font-family style attribute. Some common values are serif, sans-serif, Times, Courier, and Arial. |
| fontColor         | Optional| black | The color of the menu text. Use any valid HTML color specification. |
| fontSize          | Optional| Font size of the menu item | The size of the font. Use a numeric value, such as 8, to specify a pixel character size. Use a percentage value, such as 80%, to specify a size relative to the default font size.  
Font sizes larger than 20 pixels can result in submenu text exceeding the menu boundary. |
| menuStyle         | Optional| A CSS style specification that applies to the menu, including any parts of the menu that do not have items.  
If you do not specify style information in the cfmenuitem tags, this attribute controls the style of the top-level items. |
| name              | Optional| | The name of the menu. |
| selectedFontColor | Optional| black | The color of the text for the menu item that has the focus. Use any valid HTML color specification. |
ColdFusion Tags

Usage
The `cfmenu` tag defines a horizontal or vertical ColdFusion menu. You use a single `cfmenu` tag to define the general menu characteristics, and you use `cfmenuitem` child tags to define the individual menu entries and any submenus. You create submenus by putting `cfmenuitem` tags in the body of a `cfmenuitem` tag.

You cannot nest a `cfmenu` tag inside a form or inside a `cfmenu` tag or `cfmenuitem` tag.

Example
The following example creates a simple menu bar. When you click an entry in the bar, the browser displays the Adobe website page for the selected product. You can expand the ColdFusion item by clicking the icon, and then select an item to display a specific ColdFusion web page.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>
<cfmenu name="menu" type="horizontal" fontsize="14" bgcolor="#CCFFFF">
  <cfmenuitem name="acrobat" href="http://www.adobe.com/acrobat" display="Acrobat"/>
  <cfmenuitem name="aftereffects" href="http://www.adobe.com/aftereffects" display="After Effects"/>
  <!--- The ColdFusion menu item has a pop-up menu. --->
  <cfmenuitem name="coldfusion" href="http://www.adobe.com/products/coldfusion" display="ColdFusion">
    <cfmenuitem name="buy" href="http://www.adobe.com/products/coldfusion/buy/" display="Buy"/>
    <cfmenuitem name="devcenter" href="http://www.adobe.com/devnet/coldfusion/" display="Developer Center"/>
    <cfmenuitem name="documentation" href="http://www.adobe.com/support/documentation/en/coldfusion/" display="Documentation"/>
    <cfmenuitem name="support" href="http://www.adobe.com/support/coldfusion/" display="Support"/>
  </cfmenuitem>
  <cfmenuitem name="flex" href="http://www.adobe.com/flex" display="Flex"/>
</cfmenu>
</body>
</html>
```
**cfmenuitem**

**Description**
Defines an entry in a menu, including an item that is the head of a submenu.

**Category**
Display management tags

**Syntax**

```xml
<cfmenuitem
display="string"
childStyle="CSS style specification"
href="URL or JavaScript function"
image="path"
menuStyle="CSS style specification"
name="string"
style="CSS style specification"
target="location identifier">
  Optional child menuitem tags
</cfmenuitem>
```

OR

```xml
<cfmenuitem
divider[="true"]/>
```

If the `cfmenuitem` tag does not have a body with an end `</cfmenuitem>` tag, close the tag with a forward slash character before the closing greater than character (`/`), for example, `<cfmenuitem divider="true"/>`.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>display</td>
<td>Required if divider attribute is not specified</td>
<td></td>
<td>The text to show as the menu item label.</td>
</tr>
<tr>
<td>childStyle</td>
<td>Optional</td>
<td>Style determined by parent</td>
<td>A CSS style specification that applies to all child menu items, including the children of submenus.</td>
</tr>
<tr>
<td>divider</td>
<td>Optional</td>
<td></td>
<td>This attribute specifies that the item is a divider. If you specify this attribute, you cannot specify any other attributes. You can use this attribute without a value, as in the following example: <code>&lt;cfmenuitem divider /&gt;</code>. You cannot use this attribute in a top-level horizontal menu.</td>
</tr>
<tr>
<td>href</td>
<td>Optional</td>
<td></td>
<td>A URL link to activate or JavaScript function to call when the user clicks the menu item.</td>
</tr>
<tr>
<td>image</td>
<td>Optional</td>
<td></td>
<td>URL of an image to display at the left side of the menu item. The file type can be any format that the browser can display. For most displays, you must use 15x15 pixel images, because larger images conflict with the menu item text.</td>
</tr>
<tr>
<td>menuStyle</td>
<td>Optional</td>
<td>Style determined by parent</td>
<td>A CSS style specification that controls the overall style of any submenu of this menu item. This attribute controls the submenu of the current menu item, but not any child submenus of the submenu.</td>
</tr>
<tr>
<td>style</td>
<td>Optional</td>
<td>Style determined by parent</td>
<td>A CSS style specification that applies to the current menu item only. It is not overridden by the childStyle attribute.</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td></td>
<td>The name of the menu item.</td>
</tr>
<tr>
<td>target</td>
<td>Optional</td>
<td>The current window and frame (if any)</td>
<td>The target in which to display the contents returned by the href attribute. The attribute can be a browser window or frame name, or an HTML target value, such as <code>_self</code>.</td>
</tr>
</tbody>
</table>

### Usage

Every `cfmenuitem` tag must be a child of a `cfmenu` tag or a `cfmenuitem` tag. To create a submenu, put the `cfmenuitem` tags for submenu items in the body of the `cfmenuitem` tag for the submenu root in the parent menu. For an example of a simple submenu, see `cfmenu`.

### Example

The following menu shows the effects of the various style attributes on the menu and menu item appearance.
cfdmessagebox

Description
Defines a control for displaying pop-up messages. The control has more features than the standard alert box, including
the ability to include a prompt and entry field in the box.

Category
Display management tags

tSynopsis
<cfmessagebox
    bodyStyle = "CSS style specification"
    buttonType = "yesno|yesnocancel"
    callbackHandler = "function name"
    icon = "error|info|question|warning"
    labelCancel = "Cancel button label text"
    labelNo = "No button label text"
    labelOk = "OK button label text"
    labelYes= "Yes button label text"
    message = "message text"
    modal = "yes|no"
    multiline = "false|true"
    name = "control name"
    title = "title"
    type = "alert|confirm|prompt"
    width = "number of pixels"
    x = "numeric pixel coordinate"
    y = "numeric pixel coordinate"/>

<td>Optional</td>
<td>false</td>
<td>Valid only for prompt type message boxes. A boolean value specifying whether the prompt input text box has a single or multiple lines for text input.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>The control name. Used to refer to the control in JavaScript.</td>
</tr>
<tr>
<td>title</td>
<td>Optional</td>
<td></td>
<td>The title for the message box. If you do not specify a title, ColdFusion assigns the control type value as the default title.</td>
</tr>
<tr>
<td>type</td>
<td>Required</td>
<td></td>
<td>The control type. Must be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• alert - A message with a single OK button.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• confirm - A message box with two buttons YES and NO or three buttons YES, NO, and CANCEL.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• prompt - A message box with a single-line or multiline text input area and OK and CANCEL buttons.</td>
</tr>
<tr>
<td>width</td>
<td>Optional</td>
<td></td>
<td>Width of the message box in pixels.</td>
</tr>
<tr>
<td>x</td>
<td>Optional</td>
<td></td>
<td>The X (horizontal) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the y attribute.</td>
</tr>
<tr>
<td>y</td>
<td>Optional</td>
<td></td>
<td>The Y (vertical) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the x attribute.</td>
</tr>
</tbody>
</table>
Usage
The cfmessagebox creates a message box, but does not show it. You show a message box, say named mymessagebox, in JavaScript code as follows:

ColdFusion.MessageBox.show("mymessagebox");

If you specify a callbackhandler, clicking a button in the message box invokes the callbackhandler by passing the button label as a parameter. For prompt boxes, an additional parameter containing the prompt text is also passed.

For alert and confirm boxes:

var function_name = function(button);

For prompt boxes:

var function_name = function(button, promptmessage);

The EventObject parameter is the JavaScript ID (not the name) of the button that was pressed.

The textmessage parameter is a string with the contents of the prompt text box.

Example
The following example has three buttons, one to display each type of message box. The message box labels are customized, and the messagebox callback function displays the type of the clicked button.

```html
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
<title>Untitled Document</title>
<script type="text/javascript">
//Function to to show result of a message box.
var showResult1 = function(btn,message){
    alert("You entered: "+message);
}
//Function to show results of other message boxes.
var showResult2 = function(btn){
    alert("You clicked button: "+btn);
}

//The button onClick handler displays the message boxes.
function showMB(mbox) {
    ColdFusion.MessageBox.show(mbox);
}
</script>
</head>

<body>
<p>Click a button display the corresponding message box.</p>
<cfform>
  <cfinput name="Prompt" type="button" value="Prompt"
              onclick="showMB('mymessagebox01')"/>
  <cfinput name="Prompt" type="button" value="Prompt"
              onclick="showMB('mymessagebox02')"/>
  <cfinput name="Prompt" type="button" value="Prompt"
              onclick="showMB('mymessagebox03')"/>
</cfform>
</body>
</html>
```
onclick="showMB('mymessagebox03')"></cfform>
</html>

**cfmodule**

**Description**
Invokes a custom tag for use in ColdFusion application pages. This tag processes custom tag name conflicts.

**Category**
Application framework tags

**Syntax**
<cfmodule
    attributeCollection = "collection structure"
    attribute_name1 = "valuea"
    attribute_name2 = "valueb"
    name = "tag name"
    template = "path"
    ...
>

**See also**
cfapplication, cfassociate, cflock; Creating and Using Custom CFML Tags in the Developing ColdFusion Applications

**History**
ColdFusion MX: Changed behavior when using this tag within a custom tag: if the attribute_name parameter is the same as a key element within the attributeCollection parameter, ColdFusion now uses the name value that is within the attributeCollection parameter. (Earlier releases did not process this consistently.)

Last updated 7/9/2012
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| attributeCollection | Optional | Structure | A collection of key-value pairs that represent attribute names and values. You can specify multiple key-value pairs. You can specify this attribute only once.  
**Note:** This attribute functions differently from the `attributeCollection` attribute that is supported by most other tags. You must specify the `name` and `template` attributes as direct `cfmodule` tag attributes, not in the `attributeCollection` structure. |
| attribute_name     | Optional | Attribute for a custom tag. You can include multiple instances of this attribute to specify the parameters of a custom tag.                  |
| name               | Required unless `template` attribute is used | Mutually exclusive with the `template` attribute. A custom tag name, in the form "Name.Name.Name..." Identifies subdirectory, under the ColdFusion tag root directory, that contains custom tag page, for example (Windows format):  
`<cfmodule name = ".Forums40. GetUserOptions">`  
This identifies the page `GetUserOptions.cfm` in the directory `CustomTags\Forums40` under the ColdFusion root directory. |
| template           | Required unless `name` attribute is used | Mutually exclusive with the `name` attribute. A path to the page that implements the tag.  
• Relative path: expanded from the current page.  
• Absolute path: expanded by using ColdFusion mapping.  
A physical path is not valid. |

Usage
To name a ColdFusion page that contains the custom tag definition, including its path, use the `template` attribute. To refer to the custom tag in the ColdFusion installation directory, using dot notation to indicate its location, use the `name` attribute.

On UNIX systems, ColdFusion searches first for a file with a name that matches the `name` attribute, but is all lower case. If it does not find the file, it looks for a file name that matches the attribute with identical character casing.

You can use the `attributeCollection` attribute and explicit custom tag attributes in the same call.

Within the custom tag code, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

Similarly, if the custom tag uses a `cfassociate` tag to save its attributes, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

If you specify an end tag to `cfmodule`, ColdFusion calls your custom tag as if it had both a start and an end tag. For more information, see Handling end tags in the Developing ColdFusion Applications.
Example

<h3>cfmodule Example</h3>

This view-only example shows use of cfmodule to call a custom tag inline.

This example uses a sample custom tag that is saved in myTag.cfm in the snippets directory. You can also save ColdFusion custom tags in the CFusionMX7\CustomTags directory.

```cfc
<cfset attrCollection1 = StructNew()>

  <cfparam name="attrCollection1.value1" default="22">
  <cfparam name="attrCollection1.value2" default="45">
  <cfparam name="attrCollection1.value3" default="88">

  <!--- Call the tag with CFMODULE with Name--->
  <cfmodule
      Template="myTag.cfm"
      X="3"
      attributeCollection=#attrCollection1#
      Y="4">

  <!--- Show the code. --->
  <HR size="2" color="#0000A0">
  <P>Here is one way in which to invoke the custom tag, using the TEMPLATE attribute.</P>
  <cfoutput>"<CFMODULE
      Template="myTag.cfm"
      X=3
      attributeCollection=#attrCollection1#
      Y=4">"
  </cfoutput>
  <p>The result: <cfoutput>#result#</cfoutput></p>

cfNTauthenticate

**Description**

Authenticates a user name and password against the Windows NT domain on which the ColdFusion server is running, and optionally retrieves the user’s groups.

**Category**

Security tags

**Syntax**

```cfm
<cfNTauthenticate
domain="NT domain"
password="password"
username="user name"
listGroups = "yes|no"
result="result variable"
throwOnError = "yes|no">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

cflogin, cfloginuser, IsUserInAnyRole, GetAuthUser

**History**

ColdFusion MX 7: Added this tag.

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>the user’s groups in the result structure.</td>
</tr>
<tr>
<td>result</td>
<td>Optional</td>
<td>cfntauthenticate</td>
<td>Name of the variable in which to return the results.</td>
</tr>
<tr>
<td>throwOnError</td>
<td>Optional</td>
<td>no</td>
<td>Boolean value that specifies whether to throw an exception if the validation</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>fails. If this attribute is yes, ColdFusion throws an error if the</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>username or password is invalid; the application must handle such errors</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>in a try/catch block or ColdFusion error handler page.</td>
</tr>
</tbody>
</table>

Usage

Use this function to authenticate a user against a Windows NT domain and optionally get the user’s groups. This function does not work with the Microsoft Active Directory directory service, and does nothing on UNIX and Linux systems. You typically use this tag inside a cflogin tag to authenticate the user for a cfloginuser tag, as the example shows.

**Note:** ColdFusion must run as a user that has the privilege to authenticate other users in the specified domain.

The structure specified in the result attribute contains the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth</td>
<td>Whether the user is authenticated:</td>
</tr>
<tr>
<td></td>
<td>• yes</td>
</tr>
<tr>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>groups</td>
<td>A comma-delimited list of the user’s groups in the specified domain.</td>
</tr>
<tr>
<td></td>
<td>The structure includes this field only if the listGroups attribute is</td>
</tr>
<tr>
<td></td>
<td>yes</td>
</tr>
<tr>
<td>name</td>
<td>The user name; equals the tag’s username attribute.</td>
</tr>
<tr>
<td>status</td>
<td>The authentication status. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• success</td>
</tr>
<tr>
<td></td>
<td>• UserNotInDirFailure: the user is not listed in the directory.</td>
</tr>
<tr>
<td></td>
<td>• AuthenticationFailure: the user is in the directory, but the password</td>
</tr>
<tr>
<td></td>
<td>is not valid.</td>
</tr>
</tbody>
</table>

This tag provides two models for handling authentication: status checking and exception handling. If the throwOnError attribute is no, use the result variable’s auth and status fields to determine whether the user was authenticated and, if not, the reason for the failure. If the throwOnError attribute is yes, ColdFusion throws an exception error if the user is not valid. In this case, use try/catch error handling. The catch block must handle any authentication failure.
Example

The following example uses the auth and status fields to determine whether the user is authenticated and the failure cause. It consists of three files that you put in the same directory:

- A main cfntauthexample.cfm page that displays the name if the user is authenticated and contains a logout link.
- A login form page that is displayed if the user is not logged in.
- The Application.cfm page, which contains all the login, authentication, and logout processing code.

For a full description of login processing, see the Developing ColdFusion Applications. For information on how this example works, see the comments in the code.

Save the following page as cfntauthenticateexample.cfm. To run the example, request this page in your browser or IDE.

```cfml
<!--- The Application.cfm page, which is processed each time a user requests this page, ensures that you log in first. --->
<cfoutput>
<h3>Welcome #GetAuthUser()#</h3>
<!--- A link to log out the user. --->
<a href="#CGI.script_name#?logout=Yes">Log Out</a>
</cfoutput>

Save the following page as loginform.cfm:

<!--- A simple login form that posts back to the page whose request initiated the login. --->
<h2>Please Log In</h2>
<cfform action="#CGI.script_name#">
<!--- j_username and j_password are special names that populate cflogin tag variables. --->
User Name: <cfinput type="text" name="j_username" value="cfqa_user1" required="Yes"><br>
Password: <cfinput type="password" name="j_password" value="cfqa_user1" required="Yes"><br>
Domain: <cfinput type="text" name="domain" value="rnd" required="Yes"><br>
<br>
<input type="submit" value="Log In">
</cfform>

Save the following page as Application.cfm:

<!--- If this page is executing in response to the user clicking a logout link, log out the user. The cflogin tag code will then run. --->
<cfif IsDefined("URL.logout") AND URL.logout>
<cflogout>
</cfif>
<!--- The cflogin body code runs only if a user is not logged in. --->
<cflogin>
<!--- cflogin variable exists only if login credentials are available. --->
<cfif NOT IsDefined("cflogin")>
<!--- Show a login form that posts back to the page whose request initiated the login, and do not process the rest of this page. --->
<cfinclude template="loginform.cfm">
<cfabort>
<cfelse>
<!--- Trim any leading or trailing spaces from the username and password submitted by the form. --->
<cfset theusername=trim(form.j_username)>
<cfset thepassword=trim(form.j_password)>
<cfset thedomain=trim(form.domain)>
<cfauthenticate username="#theusername#" password="#thepassword#"
domain="#thedomain#" result="#authresult" listgroups="yes">
</cfif>
<!--- authresult.auth is True if the user is authenticated. --->
<cfif authresult.auth>
<!--- Log user in to ColdFusion and set roles to the user's Groups. --->
<cfloginuser name="#theusername#" password="#thepassword#"
roles="#authresult.groups#">
<cfelse>
<!--- The user was not authenticated. 
Display an error message and the login form. --->
<cfoutput>
<!--- The user is valid, but not the password. --->
<cfif authresult.status IS "AuthenticationFailure">
<h2>The password for #theusername# is not correct<br>Please Try again</h2>
</cfif>
<!--- There is one other status value, invalid user name. --->
</cfoutput>
</cfif>
</cfoutput>
<cfinclude template="loginform.cfm">
<cfabort>
</cfif>
</cflogin>

**cfobject**

**Description**

Creates a ColdFusion object of a specified type.

*Note: You can enable and disable this tag in the ColdFusion Administrator page, under ColdFusion Security > Sandbox Security.*

**Category**

Extensibility tags

**Syntax**

The tag syntax depends on the object type. Some types use the `type` attribute; others do not. See the following sections:

- "cfobject: .NET object" on page 469
- "cfobject: COM object" on page 472
- "cfobject: component object" on page 474
- "cfobject: CORBA object" on page 475
- "cfobject: Java or EJB object" on page 477
- "cfobject: web service object" on page 478

*Note: On UNIX, this tag does not support COM objects.*
See also

cfargument, cfcomponent,cffunction, cfinvoke, cfinvokeargument, cfproperty, cfreturn; Using Java objects in the Developing ColdFusion Applications

History

ColdFusion 8:

- Added password, proxyPassword, proxyPort, proxyServer, proxyUser, refreshWSDL, userName, wsdl2JavaArgs, and wsportname attributes to for use with web service objects.
- Added .NET/dotnet type and the associated assembly, port, protocol, and secure attributes.

ColdFusion MX:

- Changed instantiation behavior: this tag, and the CreateObject function, can now instantiate ColdFusion components (CFCs); you can use them within the cfscript tag.
- For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if "context=NameService", for a class, use either of the following formats for the class parameter:
  - "/Eng/CF"
  - ".current/Eng.current/CF"
  (In earlier releases, the format was ".Eng.CF").
- For CORBA object: changed the locale attribute; it specifies the Java configuration that contains the properties file.

\textbf{cfobject: .NET object}

Description

Creates a .NET object, that is, a ColdFusion proxy for accessing a class in a local or remote .NET assembly.

Syntax

\begin{verbatim}
<cfobject
  class="class name"
  name="instance name"
  type=".NET|dotnet"
  action="create"
  assembly="absolute path"
  port="6086"
  protocol="tcp|http"
  secure="no|yes"
  server = "localhost">
\end{verbatim}

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

</tr>
<tr>
<td>action</td>
<td>Optional</td>
<td>create</td>
<td>Action to take. Must be create.</td>
</tr>
</tbody>
</table>
| assembly  | Optional. | mscorlib.dll which contains the .NET core classes. | For local .NET assemblies, the absolute path or paths to the assembly or assemblies (EXE or DLL files) from which to access the .NET class and its supporting classes. If a class in an assembly requires supporting classes that are in other assemblies, you must also specify those assemblies. You can, however, omit the supporting assemblies for the following types of supporting classes:  
  • .NET core classes (classes in mscorlib.dll)  
  • Classes in assemblies that are in the global assembly cache (GAC)  
To specify multiple assemblies, use a comma-delimited list. For remote .NET assemblies, you must specify the absolute path or paths of the local proxy JAR file or files that represent the assemblies. If you omit this attribute, and there is no local .NET installation, the tag fails without generating an error. If you omit this attribute, there is a local .NET installation, and the specified class is not in the .NET core classes, ColdFusion generates an error. |
| port      | Optional| 6086    | Port number at which the .NET-side agent is listening. |
| protocol  | Optional| tcp     | Protocol to use for communication between ColdFusion and .NET. Must be one of the following values:  
  • http: Use HTTP/SOAP communication protocol. This option is slower than tcp, but might be required for access through a firewall.  
  • tcp: Use binary TCP/IP protocol. This method is more efficient than HTTP. |
| secure    | Optional| false   | Whether to secure communications with the .NET-side agent. If true, ColdFusion uses SSL to communicate with .NET. |
| server    | Optional| localhost | Host name or IP address of the server where the .NET-side agent is running. Can be in any of these forms:  
  • server name (for example, myserver)  
  • IP address (for example, 127.0.0.1)  
You must specify this attribute to access .NET components on a remote server. |

Usage

The `cfobject` tag with a .NET or dotnet value for the type attribute creates a reference to a .NET object of a given class. Using the reference, you can access the .NET object’s fields and methods. The .NET classes do not have to be local, and you can use the `cfobject` tag on a system that does not have .NET installed, including UNIX-based or OS-X systems.

To access .NET assemblies, do the following:

- Install the ColdFusion .NET Extension and run the .NET extension service on the system on which the assemblies are installed. You do not have to install the extension or run the extension service on a ColdFusion system that accesses only remote assemblies. For installation instructions, see *Installing and Using ColdFusion*. 

Last updated 7/9/2012
If the assemblies are located on a remote system, create Java proxies for the .NET classes that you use, copy the proxies to the ColdFusion system, and configure the remote system for access by the proxies. For information on these steps, see Using Microsoft .NET Assemblies in the Developing ColdFusion Applications. If the .NET assemblies are on your ColdFusion system, you do not have to perform these steps.

Accessing methods and fields
You call .NET methods as you use any other ColdFusion object methods. In the simplest case, your application code uses the following format to call a .NET class method:

```coldfusion
<cfobject type=".NET" name="mathInstance" class="mathClass">
    assembly="C:/Net/Assemblies/math.dll">
    <cfset myVar=mathInstance.multiply(1,2)>
```

If a .NET class has multiple constructors, and you do not want ColdFusion to use the default constructor to create the object, invoke a specific constructor by calling the special `init` method of the ColdFusion object with the constructor’s arguments. For example, you can use the following tags to instantiate `com.foo.MyClass(int, int)`:

```coldfusion
<cfobject type=".NET" class="com.foo.MyClass">
    assembly="c:\temp\myLib.dll" name="myObj" >
    <cfset myObj.init(10, 5)>
```

You access and change .NET class public fields by calling the following methods:

- `Get_fieldName()`
- `Set_fieldName()`

For example, if the .NET class has a public field named `account`, you can access and modify its value by using `Get_account()` and `Set_account()` methods, respectively.

You can access, but not modify final fields, so you can only call `Get_fieldName()` for these fields.

Example
The following example uses the GetProcess method of the .NET System.Diagnostics.Process class to get and display information about the processes running on the local system. Because it uses a core .NET class, for which ColdFusion automatically generates proxies, you do not have to specify an assembly name in the `cfobject` tag.

For more complex examples, including examples that use custom .NET classes, see Using Microsoft .NET Assemblies in the Developing ColdFusion Applications.
<cfobject type=".NET" name="proc" class="System.Diagnostics.Process">
<cfset processes = proc.GetProcesses()>
<cfset arrLen = arrayLen(processes)>
<table border=0 cellspacing="3" cellpadding="3">
<tr bgcolor="#33CCCC">
<td style="font-size:12px; font-weight:bold" nowrap>Process ID</td>
<td style="font-size:12px; font-weight:bold" nowrap>Name</td>
<td style="font-size:12px; font-weight:bold" nowrap>Memory (KB)</td>
<td style="font-size:12px; font-weight:bold" nowrap>Peak Memory (KB)</td>
<td style="font-size:12px; font-weight:bold" nowrap>Virtual Memory Size (KB)</td>
<td style="font-size:12px; font-weight:bold" nowrap>Start Time</td>
<td style="font-size:12px; font-weight:bold" nowrap>Total Processor Time</td>
</tr>
<cfloop from = 1 to="#arrLen#" index=i>
<cfset process = processes[i]>

<td align="right">#process.Get_VirtualMemorySize()/1000#</td>
<td>#process.Get_StartTime()#</td>
<td>#process.Get_TotalProcessorTime()#</td>
</tr>
</cfoutput>
</cfif>
</cfloop>
</cfoutput>
</cfif>
</table>

**cfobject: COM object**

**Description**
Creates and manipulates a Component Object Model (COM) object. Invokes a registered automation server object type.

For information on OLEView, and about COM and DCOM, see the Microsoft OLE Development website: [www.microsoft.com](http://www.microsoft.com).

To use this tag, provide the object’s program ID or filename, the methods and properties available through the IDispatch interface, and the arguments and return types of the object’s methods. For most COM objects, you can get this information with the OLEView utility.

*Note: On UNIX, the cfobject tag does not support COM objects.*
Syntax

```cfobject
class = "program ID"
name = "instance name"
action = "create|connect"
context = "inproc|local|remote"
server = "server name">
type = "com"
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

  item = file2>
<cfoutput>Last name: #file2.lastname# <br></cfoutput>
</cfloop>

cfobject: component object

Description

Creates an instance of a ColdFusion component (CFC) object.

Syntax

<cfobject
  component = "component name"
  name = "instance name"
  type = "component">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.
See also

cfcollection, cfcomponent, cfexecute, cfindex, IsInstanceOf, cfreport, cfsearch, cfwddx; Using ColdFusion components in the Developing ColdFusion Applications

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>Required</td>
<td></td>
<td>Name of component to instantiate.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>String; name for the instantiated component. The name must not have a period as the first or last character.</td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>component</td>
<td>The object type. You can omit this attribute or specify component. ColdFusion automatically sets the type to component.</td>
</tr>
</tbody>
</table>

Usage

When the cfoject tag creates an instance of the CFC, ColdFusion executes any constructor code in the CFC; that is, it runs code that is not in the method definitions.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a filename that matches the component name exactly, with the identical character casing.

Example

<!--- Separate instantiation and method invocation; --->
<!--- permits multiple invocations. --->
<cfobject
  name="quoteService"
  component="nasdaq.quote">
<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="macr"
  returnVariable="res">
<cfoutput>#res#</cfoutput><br>
<cfinvoke
  component="#quoteService#"
  method="getLastTradePrice"
  symbol="mot"
  returnVariable="res">
<cfoutput>#res#</cfoutput>
</cfobject>

**cfoject: CORBA object**

**Description**

Calls methods on a registered CORBA object.
Syntax

```html
<cfobject
    class = "filepath or naming service"
    context = "ior|nameservice"
    name = "instance name"
    type = "corba"
    locale = "type-value arguments">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
collection, cfexecute, cfindex, cfreport, cfsearch, cfwddx; CORBA in the Developing ColdFusion Applications

**History**
See the History section of the main cfobject tag page.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| class     | Required|         | • If context=“ior”, absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it must be local to ColdFusion server or accessible on network.  
  • If context=“nameservice”, forward slash-delimited naming context for naming service, for example: Allaire//Doc/empobject. |
| context   | Required|         | • ior: ColdFusion uses Interoperable Object Reference (IOR) to access CORBA server.  
  • nameservice: ColdFusion uses naming service to access server. This option is valid only with the InitialContext of a VisiBroker Orb. |
| locale    | Optional|         | Sets arguments for a call to init_orb. Use this attribute only for VisiBroker ORBs. It is available on C++, Version 3.2. The value must be in the form:  
  locale = "-ORBagentAddr 199.99.129.33 -ORBagentPort 19000"
  Each type-value pair must start with a hyphen. |
| name      | Required|         | String; name for the instantiated component. An application uses it to reference the CORBA object’s methods and attributes. |
| type      | Required for CORBA|         | Object type. Must be corba for CORBA objects. |

**Usage**
ColdFusion Enterprise version 4.0 and later supports CORBA through the Dynamic Invocation Interface (DII). To use cfobject with CORBA objects, provide the name of the file that contains a string-formatted version of the IOR, or the object’s naming context in the naming service; and the object’s attributes, method names, and method signatures. User-defined types (for example, structures) are not supported.
Example
<cfobject type = "corba"
    context = "ior"
    class = "c:\myobject.ior"
    name = "GetName">

cfobject: Java or EJB object

Description
Creates and manipulates a Java and Enterprise Java Bean (EJB) object.

Syntax
<cfobject
class = "Java class"
type = "Java"
name = "instance name"
action = "create">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcollection, cfexecute, cfindex, IsInstanceOf, cfreport, cfsearch, cfwddx; Using Java objects in the Developing ColdFusion Applications

<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>String: name for the instantiated component.</td>
</tr>
<tr>
<td>type</td>
<td>Required for Java</td>
<td></td>
<td>Object type. Must be java for Java and EJB objects.</td>
</tr>
</tbody>
</table>

Usage
To call Java CFXs or Java objects, ColdFusion uses a Java Virtual Machine (JVM) that is embedded in the process. You can configure JVM loading, location, and settings in the ColdFusion Administrator.

Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion, by using the cfobject tag.

Access Java methods and fields
1 Call the cfobject tag, to load the class. See the example code.
2 Use the init method with appropriate arguments, to call a constructor. For example:
   `<cfset ret = myObj.init(arg1, arg2)>`

Calling a public method on the object without first calling the init method results in an implicit call to the default constructor. Arguments and return values can be any Java type (simple, array, object). ColdFusion makes the conversions if strings are passed as arguments, but not if they are received as return values.
Overloaded methods are supported if the number of arguments is different.

**Calling EJBs**

To create and call EJB objects, use the `cfobject` tag. In the second example in the following section, the WebLogic JNDI is used to register and find EJBHome instances.

**Example**

<!-- Example of a Java Object, this cfobject call loads the class MyClass but does not create an instance object. Static methods and fields are accessible after a call to cfobject. -->

```cfobject
action = "create"
type = "java"
class = "myclass"
name = "myobj"
```

<!-- Example of an EJB - The cfobject tag creates the Weblogic Environment object, which is used to get InitialContext. The context object is used to look up the EJBHome interface. The call to Create() results in getting an instance of stateless session EJB. -->

```cfobject
action = "create"
type = "java"
class = "weblogic/jndi/Environment"
name = "wLEnv"
```

```cfset ctx = wLEnv.getInitialContext()>
<cfset ejbHome = ctx.lookup("StatelessSession.TraderHome")>
<cfset trader = ejbHome.Create()>
<cfset value = trader.shareValue(20, 55.45)>
<cfoutput>
  Share value = #value#
</cfoutput>
<cfset value = trader.remove()>
```

**cfobject: web service object**

**Description**

Creates a web service proxy object.
Syntax
<cfobject>
    name = "local name">
    webservice = "service identifier"
    password = "string"
    proxyPassword = "string"
    proxyPort = "port number"
    proxyServer = "URL or IP address"
    proxyUser = "string"
    refreshWSDL = "no|yes"
    type = "webservice"
    username = "string"
    wsdl2javaArgs = "argument string"
    wsportname = "port name">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

</tbody>
</table>
ColdFusion Tags

Usage
Instantiates a proxy object for a web service. You can enter the absolute URL in this tag, or refer to a web service that is entered in the ColdFusion Administrator. To minimize potential code maintenance, enter the web service in the Administrator, and then refer to that name in this tag.

**cfobjectcache**

Description
Flushes the query cache.

Category
Database manipulation tags

Syntax
```cFoxml
<cfobjectcache
    action = "clear">
</cfobjectcache>
```

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Optional</td>
<td></td>
<td>The object type. You can omit this attribute or specify webservice.</td>
</tr>
<tr>
<td>username</td>
<td>Optional</td>
<td>User name set in the Administrator, if any</td>
<td>The user name to use to access the web service. If the webservice attribute specifies a web service configured name in the ColdFusion Administrator, overrides any user name specified in the Administrator entry.</td>
</tr>
</tbody>
</table>
| wsdl2javaArgs | Optional|                  | A string that contains a space-delimited list of arguments to pass to the WSDL2Java tool that generates Java stubs for the web services. Useful arguments include the following:  
• `-W` or `--noWrapped`: turns off the special treatment of wrapped document/literal style operations.  
• `-a` or `--all`: generates code for all elements in the WSDL, even unreferenced ones.  
• `-w` or `--wrapArrays`: prefers building beans to straight arrays for wrapped XML array types. This switch is not in included in the Axis documentation.  
For detailed information on valid arguments, see the Apache Axis WSDL2Java Reference. |
| wsportname    | Optional| First port in the WSDL | The port name for the web service. This value is case sensitive and corresponds to the port element’s name attribute under the service element. Specify this parameter if the web service contains multiple ports. |
Attributes

<table>
<thead>
<tr>
<th>Attribute</th>

<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td>clear</td>
<td>clears queries from the cache in the Application scope.</td>
</tr>
<tr>
<td>group</td>
<td>Optional</td>
<td></td>
<td>Query column to use to group sets of records. Eliminates adjacent duplicate rows when data is sorted. Use if you retrieved a record set ordered on one or more a query columns. For example, if a record set is ordered on &quot;Customer_ID&quot; in the cfquery tag, you can group the output on &quot;Customer_ID.&quot;</td>
</tr>
<tr>
<td>groupCaseSensitive</td>
<td>Optional</td>
<td>yes</td>
<td>Boolean. Whether to consider the case in grouping rows.</td>
</tr>
<tr>
<td>maxRows</td>
<td>Optional</td>
<td>Displays all rows</td>
<td>Maximum number of rows to display.</td>
</tr>
<tr>
<td>query</td>
<td>Optional</td>
<td></td>
<td>Name of cfquery from which to draw data for output section.</td>
</tr>
<tr>
<td>startRow</td>
<td>Optional</td>
<td>1</td>
<td>Row from which to start output.</td>
</tr>
</tbody>
</table>

Usage

In the cfoutput tag body, ColdFusion treats text that is surrounded by number signs (#) as a ColdFusion variable or function call. For example, the following code displays the text "Hello World":

```html
<cfoutput>
    #Hello World#!
</cfoutput>
```
<cfset myVar="Hello World!">
<cfoutput>#myVar#</cfoutput>

When you specify a `query` attribute, this tag loops over the query rows and produces output for each row within the range specified by the `startRow` and `maxRows` values, and groups or eliminates duplicate entries as specified by the grouping attribute values, if any. It also sets the `query.currentRow` variable to the current row being processed.

If you nest `cfoutput` blocks that process a query, you specify the `query` and `group` attributes at the top-most level; you can specify a `group` attribute for each inner block except the innermost `cfoutput` block.

This tag requires an end tag.

**Example**

```cfml
<!--- EXAMPLE: This example shows how cfoutput operates. --->
<!--- Run a sample query. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Dept_ID, CorName, CorLevel
    FROM courseList
    ORDER by Dept_ID, CorLevel, CorName
</cfquery>
<h3>cfoutput Example</h3>
<p>cfoutput tells ColdFusion Server to begin processing, and then to hand back control of page rendering to the web server.</p>
<p>For example, to show today's date, you could write #DateFormat("#Now()#"). If you enclosed that expression in cfoutput, the result would be<cfoutput>#DateFormat(Now())#</cfoutput>.</p>
<p>In addition, cfoutput may be used to show the results of a query operation, or only a partial result, as shown:</p>
<p>There are #getCourses.recordCount# total records in our query. Using the maxRows parameter, we are limiting our display to 4 rows.</p>
<p>#Dept_ID# #CorName# #CorLevel#<br>
<cfoutput query = "GetCourses" maxRows = 4>

```
SELECT Emp_ID, firstname, lastname, e.dept_id, salary, d.dept_name 
FROM employee e, departmt d 
WHERE e.dept_id = d.dept_id 
ORDER BY d.dept_name
</cfquery>

<!--- Outer cfoutput. --->
<cfoutput query="empSalary" group="dept_id">
  <h2>#dept_name#</h2>
  <table width="95%" border="2" cellspacing="2" cellpadding="2">
    <tr>
      <th>Employee</th>
      <th>Salary</th>
    </tr>
    <cfset deptTotal = 0 >
    <!--- Inner cfoutput. --->
    <cfoutput>
      <tr>
        <td>#empSalary.lastname#, #empSalary.firstname#</td>
        <td align="right">#DollarFormat(empSalary.salary)#</td>
      </tr>
      <cfset deptTotal = deptTotal + empSalary.salary>
    </cfoutput>
    <tr>
      <td align="right">Total</td>
      <td align="right">#DollarFormat(deptTotal)#</td>
    </tr>
    <cfset deptTotal = 0>
  </table>
</cfoutput>

Tags p-q

cfparam

Description
Tests for the existence of a parameter (that is, a variable), validates its data, and, if a default value is not assigned, optionally provides one.

History
ColdFusion 10: Added the attribute maxLength

ColdFusion MX 7:
- Added min, max, and pattern attributes.
- Added creditcard, email, eurodate, float, integer, range, regex, regular_expression, ssn, social_security_number, time, URL, USdate, XML, and zipcode values of the type attribute.

Category
Variable manipulation tags
### Syntax

```html
cfparam
ame = "parameter name"
default = "value"
max = "value"
maxLength = "number"
min = "value"
pattern = "regular expression"
type = "data_type">
```

<td></td>
<td></td>
<td></td>
<td>- <code>variableName</code>: a string formatted according to ColdFusion variable naming conventions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- xml: XML objects and XML strings.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- zipcode: U.S., 5- or 9-digit format ZIP codes.</td>
</tr>
</tbody>
</table>
Usage

You can use this tag to make the following tests:

- To test whether a required variable exists, use this tag with only the `name` attribute. If it does not exist, ColdFusion stops processing the page and returns an error.

- To test whether a required variable exists, and that it is of the specified type, use this tag with the `name` and `type` attributes. If the variable does not exist or its value is not of the specified type, ColdFusion returns an error.

- To set a default value for the variable, use this tag with the `name` and `default` attributes. If the variable does not exist, it is created and set to the `default` attribute value. If the variable exists, processing continues; the value is not changed.

If you specify `variableName` for the `type` attribute, the parameter’s value must be a string that is in ColdFusion variable name format; that is, starts with a letter, underscore (_), or Unicode currency symbol, and contains letters, numbers, underscores, periods, and Unicode currency symbols, only. ColdFusion does not check whether the parameter value corresponds to an existing ColdFusion variable.

To improve performance, avoid using the `cfparam` tag in ColdFusion functions, including in CFC methods. Instead, place the `cfparam` tags in the body of the CFML pages.

Example

```coldfusion
<!--- This example shows how to use CFPARAM to define default values for page variables. --->
<cfparam name = "storeTempVar" default = "my default value">
<cfparam name = "tempVar" default = "my default value">

<!--- Check if form.tempVar was passed. --->
<cfif IsDefined("form.tempVar") is "True">
  <!--- Check if form.tempVar is not blank. --->
  <cfif form.tempVar is not "">
    <!--- If not, set tempVar to value of form.tempVar --->
    <cfset tempVar = form.tempVar>
  </cfif>
</cfif>

<!--- Check if tempVar is still the same as StoreTempVar and that tempVar is not blank. --->
<cfif tempVar is not #StoreTempVar# and tempVar is not "">
  <h3>The value of tempVar has changed: the new value is <cfoutput>#tempVar#</cfoutput></h3>
</cfif>

<p>The default value of our tempVar is "<cfoutput>#StoreTempVar#</cfoutput>"</p>

<p>Type in a new value for tempVar, and hit submit:<br>
  <input type = "Text" name = "tempVar">
  <input type = "Submit" name = "" value = "submit">
</p>
</body>
</h3>
</cfparam Example</h3>

<p>cfparam is used to set default values so that a developer does not have to check for the existence of a variable using a function like IsDefined.</p>

<p>The value of tempVar has changed: the new value is <cfoutput>#tempVar#</cfoutput></p>
</cfif>
</cfparam>
</p>
</form>

Last updated 7/9/2012
**cfpdf**

**Description**
Manipulates existing PDF documents. The following list describes some of the tasks you can perform with the cfpdf tag:

- Merge several PDF documents into one PDF document.
- Delete pages from a PDF document.
- Merge pages from one or more PDF documents and generate a new PDF document.
- Linearize PDF documents for faster web display.
- Remove interactivity from forms created in Acrobat® to generate flat PDF documents.
- Encrypt and add password protection to PDF documents.
- Generate thumbnail images from PDF documents or pages.
- Add or remove watermarks from PDF documents or pages.
- Retrieve information associated with a PDF document, such as the software used to generate the file or the author, and set information for a PDF document, such as the title, author and keywords.
- Create PDF portfolios
- Add and remove header/footer from PDF documents
- Optimize PDF documents

**History**
ColdFusion 8: Added this tag.

ColdFusion 9: Added new attributes: jpgdpi, maxBreadth, noAttachments, leftMargin, algo, noMetadata, noBookMarks, noJavaScripts, useStructure, noFonts, text, noComments, encodeAll, numberFormat, compressTIFFs, addQuads, rightMargin, topMargin, bottomMargin, noThumbnails, align, noLinks, maxLength, hires, hScale, overridepage, honourspaces, maxScale, package, vScale

**Category**
Data output tags
Syntax

Add a watermark to a PDF document
<cfpdf
  required
  action = "addwatermark"
  source = "absolute or relative pathname to a PDF file|PDF document variable|
           cfdocument variable"
  one of the following:

<td>addWatermark</td>
<td>Required</td>
<td></td>
<td>Pathname of the modified PDF document. If the destination file exists, set the overwrite attribute to yes. If the destination file does not exist, ColdFusion creates the file, if the parent directory exists. You can specify the destination attribute or the name attribute, but not both. For the thumbnail action, the destination is the directory path where the images are written. If you specify a relative path name to the destination directory, the destination directory is relative to the template directory. If you do not specify a destination directory, ColdFusion creates a directory called thumbnails in the directory in the template directory. For the optimize action, destination is the path where the PDF document which needs to be optimized is located. For extracttext and extractimage, destination is the path of the PDF document from which the text or image needs to be extracted. For addheader, addfooter, removeheaderfooter, destination is the path of the PDF document where you need to add a header or footer, or remove the header and footer. For transform, destination specifies the directory path of the PDF document where you need to perform page level transformations.</td>

</table>

Last updated 7/9/2012
Note: To modify the PDF source document, specify the same file pathname for the source and destination attributes, and set the overwrite attribute to yes.

Usage
You use the cfpdf tag to manipulate and assemble existing PDF documents. Although the cfpdf tag provides much of the functionality available in Acrobat, you cannot use this tag to generate a PDF document from another file format. To create PDF output from HTML and CFML content, use the cfdocument tag.

You cannot embed a cfpdf tag within a cfdocument tag or embed a cfdocument tag within a cfpdf tag; however, you can write the output of a cfdocument tag to a variable and pass the variable to the cfpdf tag. The following example shows how to use the cfdocument tag to create a cover page and add it to a merged PDF document:
<!--- Use the cfdocument tag to create a cover page and write the output to a variable called cfdoc. --->
<cfdocument format="PDF" name="cfdoc">
<html>
<body>
<h1>Here is a cover page</h1>
</body>
</html>
</cfdocument>

<!--- Use the cfpdf tag and cfpdfparam tags to merge individual PDF documents into a new PDF document called new.pdf. Notice that the cfdoc variable created by using the cfdocument tag is the source value of the first cfpdfparam tag. --->
<cfpdf action="merge" destination="/samtemp/pdfs/new.pdf" overwrite="yes">
  <cfpdfparam source="cfdoc">
  <cfpdfparam source="/samtemp/pdfs/pdf2.pdf">
  <cfpdfparam source="/samtemp/pdfs/pdf1.pdf">
</cfpdf>

You can use the cfpdf tag to assemble interactive PDF form files into a single PDF document and flatten forms created in Acrobat (by using the flatten attribute with the write action); however, to process PDF form data, use the cfpdfform and related tags. You cannot use the cfpdf tag to flatten forms created in Adobe LiveCycle Designer ES.

Reading and writing PDF files
The cfpdf tag provides several options for reading and writing PDF files. You can specify a PDF variable or a PDF file as the source, and you can write the output to a variable or to a file (but not both). The following table explains the read and write operations:

<table>
<thead>
<tr>
<th>Task</th>
<th>Attributes</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overwrite a source PDF file</td>
<td>Specify the PDF file pathname as the source and do not specify a destination.</td>
<td>&lt;cfpdf action=&quot;addWatermark&quot; source=&quot;myPDF.pdf&quot; image=&quot;myImage.jpg&quot;&gt;</td>
</tr>
<tr>
<td>Write a PDF document in memory to a file</td>
<td>Specify the PDF variable as the source and a PDF file pathname for the destination.</td>
<td>&lt;cfpdf action=&quot;addWatermark&quot; source=&quot;myPDF&quot; image=&quot;myImage.jpg&quot; destination=&quot;outputFile.pdf&quot;&gt;</td>
</tr>
<tr>
<td>Write a PDF document to a new file</td>
<td>Specify a PDF file pathname as the source and a different PDF file pathname as the destination.</td>
<td>&lt;cfpdf action=&quot;addWatermark&quot; source=&quot;sourceFile.pdf&quot; image=&quot;myImage.jpg&quot; destination=&quot;outputFile.pdf&quot;&gt;</td>
</tr>
<tr>
<td>Write a PDF file to a PDF variable</td>
<td>Specify the PDF file pathname as the source and a PDF variable name.</td>
<td>&lt;cfpdf action=&quot;addWatermark&quot; source=&quot;sourceFile.pdf&quot; image=&quot;myImage.jpg&quot; name=&quot;myPDF&quot;&gt;</td>
</tr>
<tr>
<td>Overwrite a PDF document in memory</td>
<td>Specify the PDF variable name as the source and do not specify a destination.</td>
<td>&lt;cfpdf action=&quot;addWatermark&quot; source=&quot;myPDF&quot; image=&quot;myImage.jpg&quot;&gt;</td>
</tr>
</tbody>
</table>

Working with PDF files in memory
ColdFusion gives you the option to write a PDF file to a variable by using the name attribute, which is useful if you want to perform multiple operations on a document before writing it to a file. However, this is practical for small files only because of memory requirements. If you are working with large PDF documents, write the PDF documents to files.

ColdFusion recommends that you do not specify the name attribute when you specify a variable as the source because it creates a copy, which increases processing. In most cases, this is unnecessary because you can reuse variables even after you write them to files.
Note: When you use PDF variables within a try/catch block and ColdFusion generates an error, the variables are unusable after the error is generated.

Printing PDF documents
Use the cfprint tag to print PDF documents. Markups, such as sticky notes, comments, and editorial revisions, are not printed with the document.

addWatermark action Use the addwatermark action to add a watermark to specified pages in a PDF document. You can add a watermark in one of the following ways:

• Use the first page of another PDF document as a watermark. ColdFusion overlays the copyfrom page on the source document, without enlarging the image.
• Specify an image file to use as a watermark.
• Specify an image in memory by using an image variable.

The following code shows how to use the first page of a PDF document as a watermark:

```<cfpdf action="addWatermark" source="c:\myBook.pdf" copyFrom="e:\yourBook.pdf" destination="ourBook.pdf" overwrite="yes">```

By default, ColdFusion applies the watermark to all of the pages in the output file, with the watermark image centered on the page. The following code applies a JPEG image as a watermark to the first page of the output file:

```<cfpdf action="addWatermark" source="Book.pdf" image="../cfdocs/images/artgallery/paul01.jpg" destination="newBook.pdf" pages="1" overwrite="yes">```

To specify a ColdFusion image as a watermark, use the cfimage tag or Image functions. The addwatermark action also supports RGB and ARGB images, especially the images added using the cfimage tag and related functions. The following example converts an image to grayscale and applies it as a watermark to a PDF file:

```<!--- Use the ImageNew function to create a ColdFusion image from a JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff05.jpg")>

<!--- Use the ImageGrayscale function to convert the image to grayscale in memory. --->
<cfset ImageGrayscale(myImage)>

<!--- Specify the image variable to apply the grayscale image as a watermark in the Book.pdf file. Because the source and destination are the same and the overwrite attribute is set to yes, ColdFusion overwrites the source file. --->
<cfpdf action="addWatermark" source="Book.pdf" destination="Book.pdf" overwrite="yes" image="#myImage#">

For more information on ColdFusion images, see Creating and Manipulating ColdFusion Images in the Developing ColdFusion Applications.

addfooter Use this action to add a footer in a PDF document. Specify the source where the PDF document is located and the destination where the new PDF document with the footer is saved, as shown in the following code snippet:

```<cfpdf action = "addfooter"
 source = ".\myBook.pdf"
 destination = ".\myBookwithfooter.pdf"
 image = "adobelogo.JPG" // Use this attribute to add an image in the footer
 align = "right"> // By default, the alignment is center```

You can also specify an image or text that you have to insert in the footer along with various other attributes such as align, bottommargin, leftmargin, numberformat, and opacity.

Last updated 7/9/2012
addheader  Use this action to add header in a PDF document. Specify the source and destination for the PDF document and specify the text or image that you want to insert in the header, as shown in the following code:

```cfpdf action = "addheader"
    source = ".\myBook.pdf"
    destination = ".\myBookwithheader.pdf"
    text = "Adobe"
    align = "left">
```

deletePages action  Use the deletePages action to remove pages from a specified PDF document. You can specify a single page, a page range, or a comma-separated list of pages, as the following code shows:

```cfpdf action="deletePages" source=c:\myBook.pdf" pages="1,16-32,89,100-147"
    destination="myLittleBook.pdf">
```

ejecttext  Use the ejecttext action to extract all words from the specified page numbers in the PDF document, as shown in the following code snippet:

```cfpdf action = "extracttext" source = ../myBook.pdf" pages = "5-20, 29, 80" destination = ".\adobe/textdoc.txt"
```

ejectimage  Use the ejectimage action to extract all images from the specified page number in a PDF document, as shown in the following code snippet:

```cfpdf action = "extractimage" source = ../myBook.pdf" pages = "1-200" destination = ".\mybookimages" imageprefix = "mybook">
```

The images are extracted and saved in the directory that you specify in the destination attribute. You can specify a prefix for the images (imageprefix) being extracted, otherwise the system prefixes the image name similar to “cf+page number”. To save the images in a specific format, use the format attribute.

getInfo action  Use the ejectInfo action to extract information associated with the PDF document, such as the author, title, and creation date. You specify the name of the structure variable that contains the relevant data associated with the file, as the following code shows:

```cfpdf action="getInfo" source="myBook.pdf" name="#mybook#">
```

For a complete list of information elements, use the cfdump tag, as the following code shows:

```cfdump var="#mybook#">
```

Note: To view the permissions for a PDF document that is password-protected, specify the user password, not the owner password. If you specify the owner password, all permissions are set to Allowed.

Reducing quality of PDF document

The optimize action is used to downsample images and discard unused objects in a PDF document.

optimize  To downsample images in a PDF document, the algo attribute is used with values bilinear, bicubic, and nearest_neighbour. The following code snippet generates a PDF after image downsampling:

```cfpdf action = "optimize" algo = "bicubic" source ".\\myBook.pdf" name = #mybook#>
```

You can also discard unused objects such as comments, JavaScripts, attachments, bookmarks, and metadata from your PDF document using the following attributes with optimize action:
Transforming pages in a PDF document
You can scale a page, specify the position, and rotation values for pages in a PDF document.

**transform** The `transform` action has four attributes that define the size (hscale, vscale), position(position), and rotation(rotation) of a page. The following code snippet shows the usage:

```coldfusion
<cfpdf action = "transform"
   required
   source = "..\myBook.pdf"
   optional
   destination = "..\new\myBook.pdf">
   hscale = ".5"
   vscale = ".15"
   position = "8, 10"
   rotation = "180">
```

The value for rotation must be in steps (0, 90, 180, 270). If you specify any other value, the system generates an error.

**PDF file information elements**
The following table describes the information elements you can retrieve with the `getinfo` action:
<table>
<thead>
<tr>
<th><strong>Element</strong></th>
<th><strong>Example</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Acrobat PDFMaker 7.0.7 for Word</td>
<td>Application used to create the PDF document. This value is read-only.</td>
</tr>
<tr>
<td>Author</td>
<td>Harper Lee</td>
<td>Author of the PDF document. You can specify a text string with the <code>setInfo</code> action.</td>
</tr>
<tr>
<td>CenterWindowOnScreen</td>
<td>[empty string]</td>
<td>Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.</td>
</tr>
<tr>
<td>ChangingDocument</td>
<td>Not Allowed</td>
<td>Permissions assigned for editing the PDF content. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>Commenting</td>
<td>Allowed</td>
<td>Permissions assigned for adding comments to the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>Content Extraction</td>
<td>Allowed</td>
<td>Permissions assigned for extracting content from the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>CopyContent</td>
<td>Allowed</td>
<td>Permissions assigned for copying content from the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>Created</td>
<td>D:20061121155226-05'00'</td>
<td>System-generated creation date of the PDF document. You can specify a text string with the <code>setInfo</code> action.</td>
</tr>
<tr>
<td>DocumentAssembly</td>
<td>Not Allowed</td>
<td>Permissions assigned for merging the PDF document with other PDF documents. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>Encryption</td>
<td>Password Security</td>
<td>Specifies whether the PDF file is password-protected. To change the encryption algorithm, or add a password, use the <code>protect</code> action.</td>
</tr>
<tr>
<td>FilePath</td>
<td>C:\ColdFusion\wwwroot\lion\myDoc.pdf</td>
<td>Absolute pathname for the PDF file. This value is read-only.</td>
</tr>
<tr>
<td>FillingForm</td>
<td>Allowed</td>
<td>Permissions assigned for entering data in form fields. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.</td>
</tr>
<tr>
<td>FitToWindow</td>
<td>[empty string]</td>
<td>Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.</td>
</tr>
<tr>
<td>HideMenubar</td>
<td>[empty string]</td>
<td>Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.</td>
</tr>
<tr>
<td>HideToolbar</td>
<td>[empty string]</td>
<td>Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.</td>
</tr>
<tr>
<td>HideWindowUI</td>
<td>[empty string]</td>
<td>Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.</td>
</tr>
<tr>
<td>Keywords</td>
<td>marketing, sales, production</td>
<td>Keywords specified for searches in the PDF document. You can specify a comma-separated list of keywords with the <code>setInfo</code> action.</td>
</tr>
<tr>
<td>Language</td>
<td>EN-US</td>
<td>Language version used to create the source file for the PDF document. This value is read-only.</td>
</tr>
</tbody>
</table>
merge action  Use the merge action to assemble PDF documents or pages from PDF source files into one output file. The following code shows how to merge all the PDF files in a directory:

```cfcdf<cfpdf action="merge" directory="c:\myPDFfiles" destination="oneBigFile.pdf" overwrite="yes">
```

By default, ColdFusion adds the files in descending order by timestamp. The following code merges the source files in ascending order by filename:

```cfcdf<cfpdf action="merge" directory="c:\book" order="name" ascending="yes" destination="c:\book\output1.pdf" overwrite="yes">
```

This is useful if the source files have logical names, such as Chap0.pdf, Chap1.pdf, Chap2.pdf, and so on.

Last updated 7/9/2012
By default, ColdFusion continues the merge process even if it encounters a file in the specified directory that is not a valid PDF document. To stop the merge process if the directory contains files other than valid PDF documents, set the stopOnError attribute to yes:

```cfpdf action="merge" directory="c:\bookfiles" destination="book.pdf" overwrite="yes" order="name" ascending="yes" keepBookmark="yes" stopOnError="yes">
```

To create a PDF file from specific pages in a document, use the source attribute with the pages attribute. The following code creates a file from pages 1–5 of the source document:

```cfpdf action="merge" source="myBigBook.pdf" pages="1-5" destination="myShortBook.pdf" overwrite="yes">
```

To merge several files into one document, specify the absolute pathnames of the files in a comma-separated list, as the following code shows:

```cfpdf action="merge" source="c:\PDFdocs\myBook\Chap1.pdf, c:\PDFdocs\myBook\Chap2.pdf, c:\PDFdocs\myBook\Chap3.pdf" destination="myBook.pdf" package = "true" overwrite="yes">
```

You can now create PDF packages using the package = "true" attribute with the merge action.

For more control over the order of files, to assemble files in different locations, and to extract pages from multiple PDF files, use the `cfpdfparam` tag with the merge action. For more information on merging PDF files, see Assembling PDF Documents in the Developing ColdFusion Applications.

If `cfpdf action="merge"` and `package="yes"`, all file formats can be used as source. The following sample code has ZIP and JPEG file formats as source:

```cfpdf action="merge" package="yes" destination="./myBook/adobetest.pdf" overwrite="yes">
    <cfpdfparam source="/inputFiles/c.zip" />
    <cfpdfparam source="/inputFiles/d.jpg" />
</cfpdf>
```

**proccessddx action** Use the `proccessddx action` to assemble PDF files by processing Document Description XML (DDX) instructions. DDX is a declarative markup language used by Adobe® LiveCycle® Assembler. You can use DDX instructions to perform advanced tasks, such as adding table of contents pages, headers and footers, automatic page numbers, and text-string watermarks to PDF documents.

ColdFusion provides a subset of LiveCycle Assembler functionality. To determine whether you can perform your tasks in ColdFusion or whether you have to purchase LiveCycle Assembler, see the tables in the following sections.

For complete DDX syntax, see the Adobe LiveCycle Assembler Document Description XML Reference.

**Supported DDX elements**
The following table lists the DDX elements that ColdFusion supports:

<table>
<thead>
<tr>
<th>About</th>
<th>Author</th>
<th>Background</th>
</tr>
</thead>
<tbody>
<tr>
<td>Center</td>
<td>DatePattern</td>
<td>DDX</td>
</tr>
<tr>
<td>DocumentInformation</td>
<td>DocumentText</td>
<td>Footer</td>
</tr>
<tr>
<td>Header</td>
<td>InitialViewProfile</td>
<td>Keyword</td>
</tr>
<tr>
<td>Keywords</td>
<td>Left</td>
<td>MasterPassword</td>
</tr>
<tr>
<td>Metadata</td>
<td>NoBookmarks</td>
<td>OpenPassword</td>
</tr>
<tr>
<td>PageLabel</td>
<td>Password</td>
<td>PasswordAccessProfile</td>
</tr>
</tbody>
</table>
Note: ColdFusion does not support the certification and mergeLayers attributes of the PDF element.

Restricted DDX elements
The following table lists the DDX elements that ColdFusion excludes:

<table>
<thead>
<tr>
<th>ArtBox</th>
<th>AttachmentAppearance</th>
<th>Bookmarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>BlankPage</td>
<td>BleedBox</td>
<td>Comments</td>
</tr>
<tr>
<td>Description</td>
<td>FileAttachments</td>
<td>FilenameEncoding</td>
</tr>
<tr>
<td>LinkAlias</td>
<td>Links</td>
<td>NoBackgrounds</td>
</tr>
<tr>
<td>NoComments</td>
<td>NoFileAttachments</td>
<td>NoFooters</td>
</tr>
<tr>
<td>NoForms</td>
<td>NoHeaders</td>
<td>NoLinks</td>
</tr>
<tr>
<td>NoPageLabels</td>
<td>NoThumbnails</td>
<td>NoWatermarks</td>
</tr>
<tr>
<td>NoXFA</td>
<td>PageMargins</td>
<td>PageSize</td>
</tr>
<tr>
<td>PageRotation</td>
<td>PageOverlay</td>
<td>PageUnderlay</td>
</tr>
<tr>
<td>PDFsFromBookmarks</td>
<td>Transform</td>
<td>TrimBox</td>
</tr>
</tbody>
</table>

Simple DDX instructions
You can create DDX instructions in any text editor and save the file with a DDX extension. The following example shows the DDX instructions for merging several documents and generating a table of contents with bookmarks from the source PDF documents:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<DDX xmlns="http://ns.adobe.com/DDX/1.0/
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="http://ns.adobe.com/DDX/1.0/ coldfusion_ddx.xsd">
    <PDF result="Out1">
        <PDF source="Title"/>
        <PDF source="Doc1"/>
        <PDF source="Doc2"/>
        <PDF source="Doc3"/>
    </PDF>
</DDX>
```

Processing DDX instructions in ColdFusion
The following code processes the DDX instructions in ColdFusion:
<!--- The following code verifies that the DDX file exists and the DDX instructions are valid. --->
<cfif IsDDX("Book.ddx")>

<!--- The following code maps the PDF source files to the PDF source variables in the DDX file. --->
<cfset inputStruct=StructNew()>
<cfset inputStruct.Title="Title.pdf">
<cfset inputStruct.Doc1="Chap1.pdf">
<cfset inputStruct.Doc2="Chap2.pdf">
<cfset inputStruct.Doc3="Chap3.pdf">

<!--- The following code maps the PDF output file to the PDF result variable in the DDX file. --->
<cfset outputStruct=StructNew()>
<cfset outputStruct.Out1="output.pdf">

<!--- The following code process the DDX instructions in the Book.ddx file to generate a merged document. --->
<cfpdf action="processddx" ddxfile="Book.ddx" inputfiles="#inputStruct#" outputfiles="#outputStruct#" name="ddxVar">

<cfelse>
   <p>The DDX instructions are not valid.</p>
</cfif>

<!--- The following code displays a success or failure message. --->
<cfoutput>#ddxVar.Out1#</cfoutput>

The name attribute defines a variable that you use to determine the success or failure of the process. Use the cfoutput tag to display the success or failure message, as the previous example shows, or use the cfdump tag to display a structure:
<cfoutput>#{ddxVar}#</cfoutput>

This code returns the following information for each output file in the structure:

- “Successful”, if the file is assembled successfully.
- “Reason for failure”, if the file is not assembled successfully and the reason for failure is known.
- “Failure”, if the file is not assembled successfully and the reason for failure is not known.

Use the IsDDX function to determine whether a DDX file or set of instructions is valid.

For detailed examples, see Assembling PDF Documents in the Developing ColdFusion Applications.

**protect action**  Use the protect action to password-protect PDF output files, set permissions, and encrypt PDF output files.

When you use the protect action, set a newUserPassword or a newOwnerPassword. (You can set both, as long as the passwords differ.) When you assign a user password to a document, all users must use this password to open the PDF document. The following code adds a user password to a PDF document:
<cfpdf action="protect" source="Finances.pdf" destination="myFinances.pdf" newUserPassword="keepOut">

To set the permissions on the output file, set the newOwnerPassword. A user who enters the owner password when accessing the PDF file is considered the owner of file. The following example shows how to set a new owner password:
<cfpdf action="protect" encrypt="AES_128"source="Book.pdf" destination="MysteryBook.pdf" overwrite="yes" newOwnerPassword="pssst" permissions="AllowDegradedPrinting">

Last updated 7/9/2012
Because the permissions are set to AllowDegradedPrinting in this example, ColdFusion lets users print the document at 150 DPI, but prohibits all other actions. If a user tries to delete the file, for example, ColdFusion generates an error message indicates that the password was entered incorrectly or the permissions do not allow the action to be performed.

ColdFusion does not retain permissions: if you add a newUserPassword attribute, you also must set the permission explicitly.

To work with myVar, you specify newUserPassword as the password.

**PDF document passwords**

A PDF document can have two kinds of passwords: a user password and an owner password. The following table describes the two types of ColdFusion passwords and their equivalents in Acrobat:

<table>
<thead>
<tr>
<th>ColdFusion password</th>
<th>Acrobat equivalent</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User password</td>
<td>Document Open password, user password</td>
<td>Anyone who tries to open the PDF document must enter the password that you specify. A user password does not allow a user to change restricted features in the PDF document.</td>
</tr>
<tr>
<td>Owner password</td>
<td>Permissions password, master password</td>
<td>Lets the person who enters the password restrict access to features in a PDF document.</td>
</tr>
</tbody>
</table>

When you protect a PDF, your password changes to the one you provide. ColdFusion updates the variable’s saved password to the one you provide. However, if you provide both passwords, ColdFusion uses the owner password.

The following protects a PDF:

```coldfusion
<cfpdf action="protect" source="myVar" password="oldpassword"
permissions="none" newUserpassword="newuserpw"
newownerpassword="newownerpw">
```

To get all the properties of the PDF, you do the following:

```coldfusion
<cfpdf action="info" source="myVar" name="info">
```

To get only the properties allowed for the user, you do the following:

```coldfusion
<cfpdf action="info" source="myVar" password="newuserpw" name="info">
```

**Permissions for PDF documents**

The following table lists the permissions an owner can set for PDF documents:

<table>
<thead>
<tr>
<th>Permissions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>There are no restrictions on the PDF document.</td>
</tr>
<tr>
<td>AllowAssembly</td>
<td>Users can add the PDF document to a merged document.</td>
</tr>
<tr>
<td>AllowCopy</td>
<td>Users can copy text, images, and other file content. This setting is required to generate thumbnail images with the thumbnail action.</td>
</tr>
<tr>
<td>AllowDegradedPrinting</td>
<td>Users can print the document at low-resolution (150 DPI).</td>
</tr>
<tr>
<td>AllowFillIn</td>
<td>Users can enter data into PDF form fields. Users can sign PDF forms electronically.</td>
</tr>
<tr>
<td>AllowModifyAnnotations</td>
<td>Users can add or change comments in the PDF document.</td>
</tr>
<tr>
<td>AllowModifyContents</td>
<td>Users can change the file content. Users can add the PDF document to a merged document.</td>
</tr>
</tbody>
</table>
Encryption for PDF documents

The encrypt attribute sets the type of encryption used for opening a password-protected document. By default, ColdFusion uses the RC4 128-bit encryption algorithm to encrypt PDF files. To change the encryption algorithm, use the encrypt attribute with the protect action. The following code encrypts the PDF output file with the AES algorithm:

```xml
<cfpdf action="protect" encrypt="AES_128" source="Book.pdf" destination="MysteryBook.pdf" overwrite="yes" newOwnerPassword="pssst" permissions="AllowDegradedPrinting">
```

ColdFusion supports the following encryption algorithms:

<table>
<thead>
<tr>
<th>Encryption algorithm</th>
<th>Compatibility</th>
<th>Description</th>
</tr>
</thead>
</table>
| AES_128              | Adobe Acrobat 7.0 and later | Advanced Encryption Standard (AES) specifies the Rijndael algorithm, a symmetric block cipher that can process data blocks of 128 bits. This is the highest encryption level. This encryption algorithm lets users do the following:
  • Encrypt all document contents.
  • Encrypt all document contents except for the metadata.
  • Encrypt only the file attachments. |
| RC4_128M             | Adobe Acrobat 6.0 and later | RC4 specifies the RSA Security software stream cipher for algorithms such as Secure Sockets Layer (SSL), to protect Internet traffic, and WEP, to secure wireless networks. This encryption algorithm lets users do the following:
  • Encrypt all document contents.
  • Encrypt all document contents except for the metadata. |
| RC4_128              | Adobe Acrobat 5.0 and later | RC4 128-bit encryption. This encryption algorithm lets users encrypt the document contents, but not the document metadata. |
| RC4_40               | Adobe Acrobat 3.0 and later | RC4 40-bit encryption. This is the lowest encryption level. |
| None                 |                      | The document is not encrypted.                                                                                                               |

Note: Document metadata is used in Internet searches. If the metadata is encrypted, search engines cannot search the PDF document. Users running an earlier version of Acrobat cannot open a PDF document with a higher encryption setting. For example, if you specify AES 128 encryption, a user cannot open the document in Acrobat 6.0 or earlier.

**read action** Use the read action to read the source PDF document into the `name` variable, as the following code shows:

```xml
<cfif IsPDFFile("Book.pdf")>
  <cfpdf action="read" source="Book.pdf" name="myBook">
  ...
</cfif>
```
**removeWatermark action** Use the `removewatermark` action to remove a watermark from a PDF document or specified pages in a document. The following example removes a watermark from the first page of a PDF document and writes the output to a new file:

```cfpdf action="removeWatermark" source="Book.pdf" pages="1" destination="newBook.pdf" overwrite="yes"```

**removeheaderfooter action** Use this action to remove the header and footer from a PDF document or from specified pages in a document. The following example removes the header and footer from the entire document:

```cfpdf action = "removeheaderfooter" source="/\mybook.pdf" destination = "new.pdf"```

**setInfo action** Use the `setinfo` action to specify information associated with a PDF document to be saved with it. Create a structure that contains the relevant information. Use the `info` attribute of the `cfpdf` tag to refer to the structure. The following code shows the elements that you can modify by using the `setInfo` action:

```cfset PDFinfo=StructNew()
cfset PDFinfo.Title="Make Way for Ducklings">
cfset PDFinfo.Author="Donald Duck">
cfset PDFinfo.Keywords="Huey,Dewy,Louie">
cfset PDFinfo.Subject="Ducks">
```  

```cfpdf action="setInfo" source="chap1.pdf" info="#PDFinfo#" destination="meta1.pdf" overwrite="yes"```

**thumbnail action** Use the `thumbnail` action to generate thumbnail images from the source PDF document.

If you do not specify a destination directory for the thumbnail files, ColdFusion creates a directory for the thumbnails in the directory where the CFM page is located. If you specify a filename as the source, the thumbnail directory name is a concatenation of the name of the source file and _thumbnails. For example, the following code generates a thumbnail image for each page in myBook.pdf and stores them in a directory called myBook_thumbnails:

```cfpdf action="thumbnail" source="myBook.pdf"```

If the CFM page is located in the directory `c:\myProject\genThumbnails.cfm`, the pathname for the thumbnails directory is `c:\myProject\myBook_thumbnails`.

By default, ColdFusion generates thumbnail files in JPEG format and the images are scaled to 25% of the original. You can specify individual pages within the source document to generate thumbnails. Also, you can change the size of the thumbnail; the resolution, the output format (JPEG, PNG, or TIFF); and the prefix used for the thumbnail filenames. The following code generates a low-resolution thumbnail from the first page of the source document that is scaled at 50% of the original size:

```cfpdf action="thumbnail" source="myBook.pdf" pages="1" destination="c:\myBook\images" imagePrefix="Cover" format="png" scale="50" resolution="low"```

The full output file pathname is as follows:

`c:\myBook\images\Cover_page_1.png`

**Note:** To generate thumbnail images, the permissions of the source document must include AllowCopy. For more information, see Permissions for PDF documents in `cfpdf`.

With ColdFusion 9, the following new attributes were introduced for the thumbnail action:

- **hires:** You can set this attribute to `true` to extract high-resolution images from the page. If a document contains high-resolution images and you want to retain the resolution of the images, then this attribute is useful.

  For example:
Override page: If you set this attribute to true, the thumbnail generated does not adhere to the PDF page size, but to the image size that is present in that page. If the image is not present, the size is set to the maximum size of the page.

Compress stiffs: Use this attribute to compress the size of the thumbnail images. As the name of the attribute suggests, it is only valid for the TIFF format. Following is an example:

```cfpdf action="thumbnail" source="C:\WORK\myBook.pdf" destination="C:\WORK\Testing_CFPDF" overwrite="true" hires="yes" compressstiffs="yes">
```

Maxscale: Use this attribute to specify an integer value for the maximum scale of the thumbnail images.

Maxlength: Use this attribute to specify an integer value of the maximum length of the thumbnail images.

Maxbreadth: Use this attribute to specify an integer value of the maximum width of the thumbnail.

The following example illustrates the use of maxscale, maxlength, and maxbreadth:

```cfpdf action="thumbnail" source="./WORK/myBook.pdf" destination="./WORK/Testing_CFPDF" overwrite="true" format="jpg" maxscale="3" maxlength="300" maxbreadth="200" hires="yes" scale="100">
```

Note: Typically, the value of the scale attribute is set to ‘100’ when using the maxscale attribute.

**write action** Use the write action to write the source PDF document, or the PDF document stored in memory as a variable, to a file. The following code converts a PDF file stored in memory to a different PDF version and writes the output to a new file:

```cfpdf action="read" source="Book.pdf" name="myBook">
<cfpdf action="write" source="myBook" destination="myBook1.pdf" version="1.4">
```

You can now use either name or destination attributes with the write action. The name attribute takes the value as the PDF document variable. For example, you can write the preceding code snippet as:

```cfpdf action="read" source="Book.pdf" name="myBook">
<cfpdf action="write" source="myBook" name=#myBook# version="1.4">
```

The new `encodeall` attribute encodes all the unencoded streams in the source. However, it does not discriminate between dumb encodings like `LZW` and encodings like `flate`, so only unencoded streams get `flate` encoded.

Note: You can now register thumbnail fonts using the font management screen.

**PDF versions**

Change the PDF version so that users running an older version of Acrobat or Adobe Reader can open the file. The following table shows the compatibility between the PDF version and the corresponding Acrobat and Adobe Reader versions:

<table>
<thead>
<tr>
<th>PDF version</th>
<th>Compatibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.1</td>
<td>Acrobat and Adobe Reader 2</td>
</tr>
<tr>
<td>1.2</td>
<td>Acrobat and Adobe Reader 3</td>
</tr>
<tr>
<td>1.3</td>
<td>Acrobat and Adobe Reader 4</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
To linearize PDF documents for faster web display, set the `saveOption` attribute to `linear`, as the following code shows:

```cfpdf
<cfpdf action="write" source="myBook" destination="myBook1.pdf" saveOption="linear"
         overwrite="yes">
</cfpdf>
```

Do not use the linear save option if you have to maintain interactivity in PDF forms or if the PDF document is enabled for electronic signatures. To allow for electronic signatures, set the `saveOption` attribute to `incremental`, as the following code shows:

```cfpdf
<cfpdf action="write" source="myDraft" destination="mySignedDoc.pdf"
         saveOption="incremental" overwrite="yes">
</cfpdf>
```

Use the `flatten` attribute to flatten forms created in Acrobat:

```cfpdf
<cfpdf action="write" source="myAcrobatForm.pdf"
         destination="myFlatForm.pdf" flatten="yes" overwrite="yes">
</cfpdf>
```

**Note:** ColdFusion does not support flattening forms created in Adobe® LiveCycle®. For more information about forms created in LiveCycle and Acrobat, see Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications.

**Example**

The following example generates thumbnail images from pages in a PDF document and links the thumbnail images to the pages in the PDF document:
PDF Thumbnail Demo

<!--- Create a variable for the name of the PDF document. --->
<cfset mypdf="myBook">
<cfset thisPath=ExpandPath(".")>
<!--- Use the getInfo action to retrieve the total page count for the PDF document. --->
<cfpdf action="getInfo" source="#mypdf#.pdf" name="PDFInfo">
<cfset pageCount="#PDFInfo.TotalPages#">

<!--- Generate a thumbnail image for each page in the PDF source document, create a directory (if it doesn't already exist) in the web root that is a concatenation of the PDF source name and the word "thumbnails", and save the thumbnail images in that directory. --->
<cfpdf action="thumbnail" source="#mypdf#.pdf" overwrite="yes" destination="#mypdf#_thumbnails" scale=60>

<!--- Loop through the images in the thumbnail directory and generate a link from each image to the corresponding page in the PDF document. --->
<cfloop index="LoopCount" from="1" to="#pageCount#" step="1">
    <cfoutput>
        <!--- Click the thumbnail image to navigate to the page in the PDF document. --->
        <a href="#mypdf#.pdf##page=#LoopCount#" target="_blank">
            <img src="#mypdf#_thumbnails/#mypdf#_page_#LoopCount#.jpg"></a>
    </cfoutput>
</cfloop>

<cfpdfform

Description
Manipulates existing forms created in Adobe® Acrobat® and Adobe® LiveCycle® Designer. The following list describes some of the tasks you can perform with the cfpdfform tag:

- Embed an interactive form created in Acrobat LiveCycle in a PDF document. You use the cfpdfform tag to embed the PDF form in a cfdocument tag.
- Render an existing form created in Acrobat or LiveCycle. This includes prefilling fields from a database or an XML data file and processing form data from an HTTP post or PDF submission.
- Extract or prefill values in stored PDF forms and save the output to a file or use it to update a data source.

History
ColdFusion 8: Added this tag.

Category
Forms tags
Syntax

**populate**

```
<cfpdfform

required
action = "populate"
source = "PDF file pathname|byte array"

optional
XMLdata = "XML object|XML string|XML data filename|
URL that returns XML data"
destination = "output file pathname"
overwrite = "yes|no"
fdf = "true|false"> <!-- New attribute that populates data in FDF format instead of
XML with subforms and params -->

fdfdata = "file name to be imported" <!-- New attribute populates data in FDF format
from the AcroForm -->

</cfpdfform>
```

**read**

```
<cfpdfform

required
action = "read"
source = "pathname|byte array"

optional
XMLdata = "variable name for XML data"
result = "structure containing form field values"
overwrite = "yes|no"
fdfdata = "filename to be exported to"

</cfpdfform>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

</tbody>
</table>
Usage

ColdFusion supports two types of interactive forms: forms created in Adobe Acrobat 6.0 or earlier, and forms created in Adobe LiveCycle. In Adobe Acrobat Professional and Standard 7.0, Adobe introduced Adobe® LiveCycle® Designer for creating PDF forms. ColdFusion supports forms created in LiveCycle Designer 7.0 and later.

Forms created in Acrobat have a flat structure: a list of fields at the same level. Forms created in LiveCycle Designer are hierarchical, often composed of nested subforms. To map the data to the form field, you use `cfpdfsubform` tags to recreate the structure of the form in ColdFusion. For examples, see the Usage section of the `cfpdfsubform` tag, and “Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications.”

populate action Use the `populate` action to populate PDF form fields from the specified data file. You can specify a destination to write the output to a file or write the populated form directly to the browser. To display the interactive PDF form in the browser, do not specify a destination.

The following example shows how to populate a PDF form with an XML data file and display the completed form in a browser:

```
<cfpdfform source="c:\payslipTemplate.pdf" action="populate" XMLdata="c:\formdata.xml"/>
```

This example shows how to populate a PDF form with an XML data file and write the completed form to a new PDF file:

```
<!--- Specify an XML file to populate a PDF form. --->
<cfpdfform source="c:\payslipTemplate.pdf" destination="c:\employeeid123.pdf" action="populate"
XMLdata="c:\formdata.xml"/>
```

Also, you can specify a URL that returns XML data. In the following example, “http://test1.com/xyz” returns XML content:

```
<cfpdfform source="#sourcefile#" action="populate" XMLdata="http://test1.com/xyz" destination="#resultfile#" overwrite="true"/>
```

For forms created in Acrobat, you can write the output to a PDF file only. For forms created in LiveCycle, you have the option to write the output to an XML Data Package (XDP) file. An XDP file is an XML representation of a PDF file.

**Note:** Supplied values in form fields created in Acrobat or LiveCycle Designer are case sensitive. For example, if a check box in a form requires a “Yes” value, the value “yes” does not populate that field.

The file extension determines the file format: to save the output in XDP format, use an XDP extension in the destination filename:

```
<!--- Specify an XML file to populate a PDF form. --->
<cfpdfform source="c:\payslipTemplate.pdf" destination="c:\employeeid123.xdp" action="populate"
XMLdata="c:\formdata.xml"/>
```

You can use one or more `cfpdfformparam` tags within a `cfpdfform` tag to populate individual fields in a PDF form.

The following example shows how to populate an existing form created in Acrobat (payslipTemplate.pdf) and create a PDF form (employeeid123.pdf) with the employeeID and salary fields filled in:

```
<!--- This example shows how to populate two fields in a form created in Acrobat. --->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate">
  <cfpdfformparam name="employeeId" value="123">
  <cfpdfformparam name="salary" value="$85,000">
</cfpdfform>
```

ColdFusion requires that you reproduce the exact structure of the source PDF form to populate fields. To verify the structure of a PDF form in ColdFusion, use the `read` action of `cfpdfform` tag, and then use the `cfdump` tag to display
the result structure. Use a `cfpdfsubform` tag for each level within the structure. For more information, see Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications.

The following example shows how to populate a form created in LiveCycle. Many forms created from templates in LiveCycle contain a subform called form1. Use the `cfpdfsubform` tag to create a subform in ColdFusion.

```xml
<!--- This example shows how to populate two fields in a LiveCycle form. --->
<cfpdfform source="c:\payslipTemplate.pdf" destination="c:\employeeid123.pdf" action="populate">
  <cfpdfsubform name="form1">
    <cfpdfformparam name="employeeId" value="123">
    <cfpdfformparam name="salary" value="$85,000">
  </cfpdfsubform>
</cfpdfform>

You can now import files in FDF format using the `populate` action. The following example shows how:

```xml
<cfpdfform source= "write_acrroform.pdf" action="populate" fdfdata="abc.fdf" destination="hello.pdf">
</cfpdfform>
```

If the `fdf` attribute for the populate action is set to `true`, it allows you to populate data in FDF format with subforms and params instead of XML, as shown in the following example:

```xml
<cfpdfform source="acroform2.pdf" destination="source_result17.pdf" action="populate" overwrite="true" fdf="true">
  <cfpdfsubform name="Text1">
    <cfpdfsubform name="0">
      <cfpdfformparam name="0" value="Test1.0.0">
      <cfpdfformparam name="1" value="Test1.0.1">
      <cfpdfformparam name="2" value="Test1.0.2">
    </cfpdfsubform>
    <cfpdfsubform name="1">
      <cfpdfformparam name="0" value="Test1.1.0">
      <cfpdfformparam name="1" value="Test1.1.1">
      <cfpdfformparam name="2" value="Test1.1.2">
    </cfpdfsubform>
  </cfpdfsubform>
  <cfpdfsubform name="Text2">
    <cfpdfformparam name="0" value="Test2.0">
    <cfpdfformparam name="1" value="Test2.1">
    <cfpdfformparam name="2" value="Test2.2">
    <cfpdfformparam name="3" value="Test2.3">
    </cfpdfsubform>
  </cfpdfsubform>
  <cfpdfformparam name="Text3" value="Test3">
  <cfpdfformparam name="Text4" value="Test4">
  <cfpdfformparam name="checkbox1" value="Yes">
  <cfpdfformparam name="listbox1" value="item4">
  <cfpdfformparam name="radiobutton1" value="2">
</cfpdfform>
```

**read action** Use the `read` action to read the data from the source PDF form and generate a result structure that contains the form fields and their values. Also, you can use the `read` action to generate an XML data file from a PDF source file.

The following example shows how to read a PDF file and generate a result structure from the data:
<!--- Use the read action to retrieve the values from the saved PDF. --->
<cfpdfform source="c:\employeidd123.pdf" result="resultStruct" action="read"/>

You can use the cfdump tag to display the result structure:

<cfdump var="#resultStruct#">

You can use the result fields in ColdFusion, for example, #resultStruct.employeeId# and #resultStruct.salary#.

The following example shows how to read a PDF file and write the data to an XML file:

<cfpdfform source="c:\employeidd123.pdf" result="c:\employeidd123.xml" overwrite="yes"
action="read"/>

The following example shows how to read a PDF file into a variable that contains XML data:

<cfpdfform source="c:\employeidd123.pdf" XMData="myXMLdata" action="read"/>

The following example shows how to read a PDF file into an XML data variable and generate a result structure. The cffile tag writes the data to an XML file:

<cfset sourcefile = "Grant Application Updated.pdf">
<cfset resultfile = "Expandpath('datafile_result1.xml')">
<!--- Use the cfpdfform tag to read data extracted from a form into an XML data variable and
generate a result structure. --->
<cfpdfform source="#sourcefile#" action="read" XMData="#XMData#" result="resultstruct"/>
<!--- Use the cffile tag to write the XML data to a file. --->
<cffile action="write" file="#resultfile#" output="#XMData#">
<!---- Use the cfdump tag to display the result structure. --->
<cfdump var="#resultstruct#">

Extracting data from a PDF submission

Use the following code to extract data from a PDF submission and write it to a structure called fields:

<!--- The following code reads the submitted PDF file and generates a result structure called
fields. --->
<cfpdfform source="#PDF.content#" action="read" result="fields"/>

Use the cfdump tag to display the data structure, as follows:

<cfdump var="#fields#">

Note: When you extract data from a PDF submission, always specify "#PDF.content#" as the source.

You can set the form fields to a variable, as the following code shows:

<cfset empForm="#fields.form1#">

Use the populate action of the cfpdfform tag to write the output to a file. Specify "#PDF.content#" as the source. In the following example, the unique filename is generated from a field on the PDF form:

<cfpdfform action= "populate" source="#PDF.content#"
destination="timesheets\#empForm.txsheet#.pdf" overwrite="yes"/>

Extracting data from an HTTP post submission

An HTTP post submission transmits the data from the PDF form, but not the form itself. You can extract data from the PDF form fields, but you cannot write the output directly to a file. To extract the data and update a database, for example, you must map the fields in the database to the structure and HTTP post data exactly.
Note: The structure of the HTTP post data (after submission) is not the same as the structure of the PDF form (before data submission). For examples of both, see Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications.

To determine the structure of the HTTP post data, use the `cfdump` tag with the form name as the variable to display the data structure, as follows:

```cfdump var="#FORM.form1#"
```

Note: When you extract data from an HTTP post submission, always specify the form name as the source. For example, specify "#FORM.form1#" for a form generated from a template in LiveCycle Designer. When data extraction that uses the `cfpdfform` tag results in more than one page, instead of returning one structure, ColdFusion returns one structure per page.

Embedding PDF forms within a PDF document
You can use the `cfpdfform` tag inside the `cfdocument` tag to embed an existing interactive PDF form within a PDF document. Use at least one `cfdocumentsection` tag with the `cfpdfform` tag, but do not place the `cfpdfform` tag within the `cfdocumentsection` tag. For more information about embedding PDF forms, see Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications.

Flattening forms created in Acrobat
You use the `cfpdf` tag to flatten forms created in Acrobat. ColdFusion does not support flattening forms created in LiveCycle. For more information, see Assembling PDF Documents in the Developing ColdFusion Applications.

Printing forms
Use the `cfprint` tag to print forms created in Acrobat. Markups, such as sticky notes, comments, and editorial revisions, are not printed with the form. You cannot use the `cfprint` tag to print forms created in LiveCycle Designer.

Exporting PDF Forms in FDF
You can export PDF forms in FDF format using the `read` action. The following example shows how you can export a PDF form in FDF format:

```cfpdfform source= "acroform_export.pdf" action="read" fdfdata="abc.fdf" >
</cfpdfform>
```

Example
The following example shows how to embed an interactive PDF form in a PDF document created with the `cfdocument` tag:
<!--- The following code extracts data from the cfdocexamples database based on a username entered in a login form. --->
<cfquery name="getEmpInfo" datasource="cfdocexamples">
  SELECT * FROM EMPLOYEES
  WHERE EMAIL = <cfqueryparam value="#form.username#">
</cfquery>

<!--- The following code creates a PDF document with headers and footers. --->
<cfdocument format="pdf">
  <cfdocumentitem type="header">
    <font size="-1" align="center">
      Nondisclosure Agreement
    </font>
  </cfdocumentitem>
  <cfdocumentitem type="footer">
    <font size="-1">
      Page <cfoutput>#cfdocument.currentpagenumber# of
      #cfdocument.totalpagecount#</cfoutput>
    </font>
  </cfdocumentitem>

<!--- The following code creates the first section in the PDF document. --->
<h3>Employee Nondisclosure Agreement</h3>
<p>Please verify the information in the enclosed form. Make any of the necessary changes in the online form and click the <b>Print</b> button. Sign and date the last page. Staple the pages together and return the completed form to your manager.</p>
</cfdocumentsection>

<!--- The following code embeds an interactive PDF form within the PDF document with fields populated by the database query. The cfpdpfform tag automatically creates a section in the PDF document. Do not embed the cfpdpfform within cfdocumentsection tags. --->
<cfpdfsubform name="form1">
  <cfpdfformparam name="txtEmpName" value="#getEmpInfo.FIRSTNAME# #getEmpInfo.LASTNAME#">
  <cfpdfformparam name="txtDeptName" value="#getEmpInfo.DEPARTMENT#">
  <cfpdfformparam name="txtEmail" value="#getEmpInfo.IM_ID#">
  <cfpdfformparam name="txtPhoneNum" value="#getEmpInfo.PHONE#">
  <cfpdfformparam name="txtManagerName" value="Randy Nielsen">
</cfpdfsubform>
</cfpdfform>

<!--- The following code creates the last document section. Page numbering resumes in this section. --->
<p>I, <cfoutput>#getEmpInfo.FIRSTNAME# #getEmpInfo.LASTNAME#</cfoutput>, hereby attest that the information in this document is accurate and complete.</p>
<br />
<table border="0" cellpadding="20">
<tr><td width="300">
<hr />

<hr />
<p><i>Today's Date</i></p></td></tr>
</table>
</cfdocumentsection>
</cfdocument>
cfpdfiformparam

Description
Provides additional information to the cfpdfiform tag.

The cfpdfiformparam tag is always a child tag of the cfpdfiform or cfpdfiformsubform tag. Use the cfpdfiformparam tag to populate fields in a PDF form.

History
ColdFusion 8: Added this tag.

Category
Forms tags

Syntax
```html
<cfpdfiform ...>
  <cfpdfiformparam
    name = "field name"
    value = "ColdFusion variable"
    index = "integer">
  </cfpdfiformparam>
</cfpdfiform>
```

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

See also
cfdocument, cfdocumentsection, cfform, cfinput, cfpdf, cfpdfiform, cfpdfiformparam, cfpdfiformsubform, cfprint, IsPDFFile, IsPDFObject

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Optional</td>
<td>1</td>
<td>Index associated with the field name. If multiple fields have the same name, use the index value to locate one of them. Applies to forms created in LiveCycle only.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Field name on the PDF form.</td>
</tr>
<tr>
<td>value</td>
<td>Required</td>
<td></td>
<td>Value associated with the field name. For interactive fields, specify a ColdFusion variable.</td>
</tr>
</tbody>
</table>

Usage
Use the cfpdfiformparam tag inside the cfpdfiform tag or the cfpdfiformsubform tag to populate fields in a PDF form.

Use the index attribute of the cfpdfiformparam tag to specify fields with the same name and different values, as the following code shows:

```html
<!--- This example shows how to use multiple cfpdffiformparam tags with the same name and different index values for a PDF form that contains fields with same name. --->
<cfpdfiform source="C:\payslipTemplate.pdf"
  destination="C:\\employeeld123.pdf" action="populate">
  <cfpdfiformparam name="phone" value="781-869-1234" index="1"/>
  <cfpdfiformparam name="phone" value="617-273-9021" index="2"/>
</cfpdfiform>
```
Note: Use the index attribute with forms created in LiveCycle only. Forms created in Acrobat cannot contain more than one field with the same name; therefore the index attribute is not valid.

Example
See the cfpdfform tag examples.

cfpdfparam

Description
Provides additional information for the cfpdf tag. The cfpdfparam tag applies only to the merge action of the cfpdf tag and is always a child tag of the cfpdf tag.

History
ColdFusion 8: Added this tag.

Category
Forms tags

Syntax
<cfpdf action = "merge" ..>
   <cfpdfparam
      pages = "page number|page range|comma-separated page numbers"
      password = "user or owner password"
      source = "absolute or relative pathname to a PDF file|PDF document variable|cfdocument variable">
   </cfpdfparam>
   ...
</cfpdf>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfdocument, cfdocumentsection, cfpdf, cfpdfform, cfpdfformparam, cfpdfsformparam, cfprint, IsPDFFile, IsPDFObject

Attributes
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pages</td>
<td>Optional</td>
<td></td>
<td>Page or pages of the PDF source file to merge. You can specify a range of pages, for example, “1–5”, or a comma-separated list of pages, for example, “1,5,9–10,18”.</td>
</tr>
<tr>
<td>password</td>
<td>Optional</td>
<td></td>
<td>User or owner password, if the source PDF file is password-protected.</td>
</tr>
<tr>
<td>source</td>
<td>Required</td>
<td></td>
<td>Source PDF file to merge. You can specify a PDF variable, a cfdocument variable, or the pathname to a file.</td>
</tr>
</tbody>
</table>

Usage
Use the cfpdfparam tag to merge several PDF documents into one file. The cfpdfparam tag lets you specify the order of source files explicitly. You can use this tag to merge pages from multiple PDF document source files in different locations.
The following code creates a single PDF document called combined.pdf that contains pages 1–3 and page 5 of the file abc.pdf, followed by all of the pages in xyz.pdf, a file in memory with the variable name myPDFvariable, and lastly pages 10–90 from the file abc.pdf. The password attribute applies only if the source file is password-protected:

```coldfusion
<cfpdf action="merge" destination="combined.pdf" overwrite="yes">
  <cfpdfparam source="c:\abc.pdf" pages="1-3,5" password="adobe">
  \x
  <cfpdfparam source="myPDFvariable">
  <cfpdfparam source="abc.pdf" pages="10-90" password="adobe">
</cfpdf>
```

**Note:** When you use the `cfpdfparam` tag with the `cfpdfmerge` action, you must specify either the `destination` attribute or the `name` attribute for the `cfpdf` tag.

**Example**
The following ColdFusion page creates a form for downloading tax forms and tax information booklets:

```coldfusion
<h3>Downloading Federal Tax Documents</h3>
<p>Please choose the your type of business.</p>
<!---- Create the ColdFusion form to determine which PDF documents to merge. ---->
<table>
  <cfform action="cfpdfMergeAction.cfm" method="post">
    <tr><td><cfinput type="radio" name="businessType" Value="SoleP">Sole Proprieter</cfinput></td></tr>
    <tr><td><cfinput type="radio" name="businessType" Value="Partner">Partnership</cfinput></td></tr>
    <tr><td><cfinput type="radio" name="businessType" Value="SCorp">S Corporation</cfinput></td></tr>
  </cfform>
</table>
```

The ColdFusion action page merges PDF files in different locations based on the selection in the form:
<!--- Create a merged PDF document based on the selection in the form. --->
<cfpdf action="merge" name="taxDoc">
   <cfif #form.businessType# is "SoleP">
      <cfpdfparam source="taxForms\f2106ez.pdf">
      <cfpdfparam source="taxForms\f1040.pdf">
      <cfpdfparam source="taxForms\f1040sc.pdf">
      <cfpdfparam source="taxInfo\i1040sc.pdf">
      <cfpdfparam source="taxInfo\i2106.pdf">
      <cfpdfparam source="taxInfo\i1140sc.pdf">
      <cfpdfparam source="taxInfo\p535.pdf">
      <cfpdfparam source="taxInfo\p560.pdf">
      <cfpdfparam source="taxInfo\p334.pdf">
   </cfif>
   <cfelseif #form.businessType# is "Partner">
      <cfpdfparam source="taxForms\f1065.pdf">
      <cfpdfparam source="taxForms\f1065b.pdf">
      <cfpdfparam source="taxForms\f1065bsk.pdf">
      <cfpdfparam source="taxForms\f8804.pdf">
      <cfpdfparam source="taxForms\f8825.pdf">
      <cfpdfparam source="taxForms\f8825.pdf">
      <cfpdfparam source="taxInfo\p535.pdf">
      <cfpdfparam source="taxInfo\p560.pdf">
      <cfpdfparam source="taxInfo\i1065bsk.pdf">
   </cfelseif #form.businessType# is "SCorp">
      <cfpdfparam source="taxForms\f1120s.pdf">
      <cfpdfparam source="taxForms\f2553.pdf">
      <cfpdfparam source="taxForms\f8453s.pdf">
      <cfpdfparam source="taxForms\f8825.pdf">
      <cfpdfparam source="taxInfo\i1120s.pdf">
      <cfpdfparam source="taxInfo\p542.pdf">
      <cfpdfparam source="taxInfo\p535.pdf">
      <cfpdfparam source="taxInfo\p560.pdf">
   </cfif>
</cfpdf>

<cfpdf action="write" source="taxDoc" destination="c:\taxDoc.PDF" overwrite="yes"/>

*Note:* ColdFusion automatically flattens form fields when you use the `merge` action of the `cfpdf` tag.

### `cfpdfsubform`

**Description**

Populates a subform within the `cfpdfform` tag.

The `cfpdfsubform` tag can be a child tag of the `cfpdfform` tag or nested in another `cfpdfsubform` tag.

**History**

ColdFusion 8: Added this tag.

**Category**

Forms tags
ColdFusion Tags

Syntax

```
<cfpdfform ..>
    <cfpdfsubform
        name = "field name"
        index = "integer">
    </cfpdfsubform>
</cfpdfform>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfdocument, cfdocumentsection, cfform, cfinput, cfpdf, cfpdfform, cfpdfformparam, cfpdfparam, cfprint, IsPDFFile, IsPDFObject

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Optional</td>
<td>1</td>
<td>Index associated with the field name. If multiple fields have the same name, ColdFusion uses the index value to locate one of them.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Name of the subform corresponding to subform name in the PDF form.</td>
</tr>
</tbody>
</table>

Usage

Use the `cfpdfsubform` tag with the `cfpdfform` tag to populate one or more subforms within a PDF form. The `cfpdfsubform` tag can contain multiple `cfpdfformparam` tags. Also, you can nest subforms, as the following example shows:

```html
<!--- This example shows how to nest cfpdfs subform tags. --->
<cfpdfform source="c:\payslipTemplate.pdf" destination="c:\employeeid123.pdf" action="populate">
    <cfpdfsubform name="employeeDetail">
        <cfpdfform param name="txtAddLine1" value="572 Evergreen Terrace">
        <cfpdfform param name="txtCity" value="Springfield">
        <cfpdfform param name="txtState" value="Oregon">
        <cfpdfform param name="txtZip" value="65412">
        <cfpdfform param name="txtCountry" value="United States">
        </cfpdfform>
        <cfpdfform param name="txtEmployeeId" value="879104">
        <cfpdfform param name="numSalary" value="$85,000">
    </cfpdfsubform>
</cfpdfform>
```

Use subforms to match the exact structure of the source PDF form. If you do not, ColdFusion cannot prefill the form with data and generates an error. Many of the forms generated from templates in LiveCycle contain a subform called `form1`. You must specify this as a subform in your code, as the following example shows:

```html
<cfpdfform source="c:\forms\timesheetForm.pdf" action="populate">
    <cfpdfsubform name="form1">
        <cfpdfformparam name="txtCompanyName" value="Adobe">
        <cfpdfformparam name="txtManager" value="Randy Nielsen">
    </cfpdfsubform>
</cfpdfform>
```
To verify the structure of a PDF form in ColdFusion, use the read action of the `cfpdfform` tag, as the following example shows:

```cfml
<cfpdfform source="c:\forms\timesheetForm.pdf" result="resultStruct" action="read"/>
```

Then use the `cfdump` tag to display the structure:

```cfml
<cfdump var="#resultStruct#">
```

**Example**

See the `cfpdfform` tag examples.

**cfpod**

**Description**

Creates a pod, an area of the browser window or layout area with an optional title bar and a body that contains display elements.

**Category**

Display management tags

**Syntax**

```cfml
<cfpod
    source = "path"
    bodyStyle = "CSS style specification"
    headerStyle = "CSS style specification"
    height = "number of pixels"
    name = "string"
    onBindError = "JavaScript function name"
    title = "string"
    width = "number of pixels"/>
```

OR

```cfml
<cfpod
    bodyStyle = "CSS style specification"
    headerStyle = "CSS style specification"
    height = "number of pixels"
    name = "string"
    onBindError = "JavaScript function name"
    title = "string"
    width = "number of pixels">
    pod contents
</pod>
```

If the tag does not have a body and end tag, close it with `/` character combination.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

ColdFusion Tags

History
ColdFusion 8: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodyStyle</td>
<td>Optional</td>
<td></td>
<td>A CSS style specification for the pod body. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.</td>
</tr>
<tr>
<td>headerStyle</td>
<td>Optional</td>
<td></td>
<td>A CSS style specification for the pod header. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.</td>
</tr>
<tr>
<td>height</td>
<td>Optional</td>
<td>100</td>
<td>Height if the control, including the title bar and borders, in pixels</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td></td>
<td>Name of the pod control.</td>
</tr>
<tr>
<td>onBindError</td>
<td>Optional</td>
<td>See Description</td>
<td>The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message. If you omit this attribute, and have specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), it displays the error message; otherwise a default error pop-up displays.</td>
</tr>
</tbody>
</table>
| overflow    | Optional| auto    | Specifies how to display child content whose size would cause the control to overflow the pod boundaries. The following values are valid:  
  - auto: shows scrollbars when necessary.  
  - hidden: does not allow access to overflowing content.  
  - scroll: always shows horizontal and vertical scroll bars, even if they are not needed.  
  - visible: content can display outside the bounds of the pod.  
  
  **Note:** In Internet Explorer, pods with the visible setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area. |
| source      | Required if the tag does not have a body | A URL that returns the pod contents. ColdFusion uses standard page path resolution rules. If you specify this attribute and the cfpod tag has a body, ColdFusion ignores the body contents. You can use a bind expression with dependencies in this attribute; for more information see Usage.  
  
  **Note:** If a CFML page specified in this attribute contains tags that use AJAX features, such as cfform, cfgrid, and cfwindow, you must use a cfajaximport tag on the page with the cfpod tag. For more information, see cfajaximport. |
| title       | Optional|         | Text to display in the pod's title bar. You can use HTML mark-up to control the title appearance, of example to show the text in red italic font. If you omit this attribute, the pod does not have a title bar. |
| width       | Optional| 500     | Width if the control, including borders, in pixels |

Usage
You use a source attribute or a tag body to specify the pod contents; if you specify both, ColdFusion uses the contents specified by the source attribute and ignores the tag body. If you use a source attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.
If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application’s main page, and not write them inline in code that you get using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a *bind expression* to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only.

To use a bind expression, specify a URL and pass one or more URL parameters the page, including *bind parameters*. In its most basic form, a bind parameter consists of the `name` or `id` attribute of the control to which you are binding in braces (`{ }`). To include the value of the `city` control as a bind parameter, for example, use the following format:

```
source="/myapplication/cityPod.cfm?cityname={city}"
```

For detailed information about using bind expressions, see Binding data to form fields in the *Developing ColdFusion Applications*.

**Example**
The following CFML page displays two pods in a vertical layout. Each pod gets its contents from a `displayforpod.cfm` page that uses the `cffeed` tag to get an Atom feed.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
<title>Untitled Document</title>
</head>
<body>
<cflayout type="hbox" style="background-color:##CCffFF; color:red;">
 <cflayoutarea>
  <cfpod name="pod01" source="displayforpod.cfm?start=1" height="500" width="300" title="Comment 1"/>
 </cflayoutarea>
 <cflayoutarea>
  <cfpod name="pod02" source="displayforpod.cfm?start=2" height="500" width="450" title="Comment 2"/>
 </cflayoutarea>
</cflayout>
</body>
</html>
```

The following code shows the contents of the `displayforpod.cfm` page:
<cffeed action="read" source="http://googleblog.blogspot.com/atom.xml"
    query="feedQuery" properties="feedMetadata" />

<cfloop query = "feedQuery"
    startRow = "#url.start#" endRow = "#url.start#">
    <cfoutput>#feedQuery.content#<br />
    =================================
    </cfoutput>
</cfloop>

**cfpop**

**Description**
Retrieves or deletes e-mail messages from a POP mail server.

**Category**
Communications tags, Internet protocol tags

**Syntax**
<cfpop
    server = "server name"
    action = "getHeaderOnly|getAll|delete"
    attachmentPath = "path"
    debug = "yes|no"
    generateUniqueFilenames = "yes|no"
    maxRows = "number"
    messageNumber = "number"
    name = "query name"
    password = "password"
    port = "port number"
    secure = "yes|no"
    startRow = "number"
    timeout = "seconds"
    uid = "number"
    username = "user name">

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfftp, cfhttp, cfldap, cfmail, cfmailparam, SetLocale; Sending and Receiving E-Mail in the Developing ColdFusion Applications

**History**
ColdFusion 10: Added attribute secure
ColdFusion MX 7.01: Added cids query variable.
ColdFusion MX 6.1:
- Added support for multipart mail messages with Text and HTML parts.
• Changed the attachment name separator: the TAB character is now the separator between attachment names in the attachments and attachmentfiles query fields if a message has multiple attachments. This behavior is identical to ColdFusion 5 and earlier versions.

ColdFusion MX: Changed the attachment name separator: the comma separates names in the attachments and attachmentfiles query fields if a message has multiple attachments.

</tr>
</tbody>
</table>

Last updated 7/9/2012
ColdFusion Tags

Usage
The `cfpop` tag retrieves one or more mail messages from a POP server and populates a ColdFusion query object with the resulting messages, one message per row. Alternatively, it deletes one or more messages from the POP server.

Note: When the `cfpop` tag encounters malformed mail messages, it does not generate errors; instead, it returns empty fields.

To optimize performance, two retrieve options are available. Message header information is typically short, and therefore quick to transfer. Message text and attachments can be long, and therefore take longer to process.

AttachmentPath attribute
Use the following syntax to specify an in-memory directory in the `attachmentPath` attribute. In-memory files speed processing of transient data.

```
ram://path
```

The path can include multiple directories, for example `ram:///petStore/mail/attachments` You must create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The `cfpop` query variables
The following table describes the variables that provide information about the query that is returned by `cfpop`:

<table>
<thead>
<tr>
<th>Variable names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queryname.recordCount</code></td>
<td>Number of records returned by query.</td>
</tr>
<tr>
<td><code>queryname.currentRow</code></td>
<td>Current row that <code>cfoutput</code> is processing.</td>
</tr>
<tr>
<td><code>queryname.columnList</code></td>
<td>List of column names in query.</td>
</tr>
</tbody>
</table>

Query message header and body columns
The following table lists the message header and body columns that are returned if `action = "getHeaderOnly"` or "getAll":

<table>
<thead>
<tr>
<th>Column name</th>
<th><code>getHeaderOnly</code> returns</th>
<th><code>getAll</code> returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queryname.date</code></td>
<td><code>yes</code></td>
<td><code>yes</code></td>
</tr>
<tr>
<td><code>queryname.from</code></td>
<td><code>yes</code></td>
<td><code>yes</code></td>
</tr>
<tr>
<td><code>queryname.messagenumber</code></td>
<td><code>yes</code></td>
<td><code>yes</code></td>
</tr>
<tr>
<td><code>queryname.messageid</code></td>
<td><code>yes</code></td>
<td><code>yes</code></td>
</tr>
</tbody>
</table>
If the mail message includes a part with a Content-Type of text/plain, the `queryname.textBody` column contains the part’s message content. If the mail message includes a part with a Content-Type of text/HTML, the `queryname.HTMLBody` column contains the part’s message content. If no Content-Type matches these types, the columns are empty. The `queryname.Body` column always contains the first message body found.

The `queryname.attachments` column contains a tab-separated list of all the attachment names. The `queryname.attachmentfiles` column contains a tab-separated list of the locations of the attachment files. Use the `cffile` tag to delete these temporary files when you have processed them.

To create a ColdFusion date/time object from the date-time string that is extracted from a mail message in the `queryname.date` column, use the following table:

<table>
<thead>
<tr>
<th>Locale</th>
<th>How to create a ColdFusion date/time object from <code>queryname.date</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>English (US)</td>
<td>Use the <code>ParseDateTime</code> function. If you specify the <code>pop-conversion</code> attribute, the function adjusts the date/time object to UTC.</td>
</tr>
<tr>
<td>Other</td>
<td>Extract the date part of string; pass it to the <code>LSParseDateTime</code> function.</td>
</tr>
</tbody>
</table>

**Note:** To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

For more information on `cfpop`, see Sending and Receiving E-Mail in the Developing ColdFusion Applications.
Example

<!--- This view-only example shows the use of cfpop. --->

<h3>cfpop Example</h3>

<p>cfpop lets you retrieve and manipulate mail in a POP3 mailbox. This view-only example shows how to create one feature of a mail client, to display the mail headers in a POP3 mailbox. To execute this, un-comment this code and run with a mail-enabled CF Server. ---></p>

<cfif IsDefined("form.popserver")>
  <!--- Make sure server, username are not empty. --->
  <cfif form.popserver is not "" and form.username is not ">
    <cfpop server = "#form.popserver#" username = #form.username# password = #form.pwd#
      action = "getHeaderOnly" name = "GetHeaders">
      <h3>Message Headers in Your Inbox</h3>
      <p>Number of Records: #GetHeaders.recordCount#</p>
    </cfpop>
    <ul>
      <cfoutput query = "GetHeaders">

</form>--->

cfpresentation

Description

Defines the look of a dynamic slide presentation and determines whether to write the presentation files to disk. The cfpresentation tag is the parent tag for one or more cfpresentationslide tags, where you define the content for the presentation, and the cfpresenter tags, which provide information about the people presenting the slides.

History

ColdFusion 9: Added format and destination attributes.

ColdFusion 8: Added this tag.

Category

Data output tags
Syntax
<cfpresentation
  title = "text string"
  authPassword = "authentication password"
  authUser = "authentication user name"

## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authPassword</td>
<td>Optional</td>
<td></td>
<td>Sends a password to the target URL for Basic Authentication. Combined with username to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.</td>
</tr>
<tr>
<td>authUser</td>
<td>Optional</td>
<td></td>
<td>Sends a user name to the target URL for Basic Authentication. Combined with password to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.</td>
</tr>
</tbody>
</table>
| autoPlay       | Optional| yes     | Specifies whether to play the presentation automatically:  
  - yes: the presentation automatically runs through the entire presentation at startup.  
  - no: the user must click the Play button to start the presentation and click the Next button to advance to the next slide in the presentation. |
| backgroundColor| Optional| 727971  | Background color of the presentation. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors. |
| control        | Optional| normal  | Presentation control:  
  - normal  
  - brief |
| controlLocation| Optional| right   | Specifies the location of the presentation control:  
  - right  
  - left |
| destination    | Optional|         | Absolute file name or a file path relative to the CFM page. You can use this for both connect presentation and ppt presentations. Required if format="html". |
| directory      | Optional|         | Directory where the presentation is saved. This can be an absolute path or a path relative to the CFM page. Also, ColdFusion creates a subdirectory called data that contains:  
  - A SWF file for each slide  
  - srchdata.xml (which creates the search interface)  
  - vconfig.xml  
  - viewer.xml  
  - images, video clips, and SWF files referenced by the cfpresentationslide tags  
  If you do not specify a directory, ColdFusion writes the files to a temp directory and runs the presentation in the client browser. |
| format         | Optional|         | Specifies the file format for conversion:  
  - ppt: converts html input provided in cfpresentationslide to a PowerPoint file.  
  - html: converts ppt to an HTML presentation. |

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glowColor</td>
<td>Optional</td>
<td>35D334</td>
<td>Color used for glow effects on the buttons. The value is hexadecimal: use the form &quot;##xxxxxx&quot; or &quot;##xxxxxxxx&quot;, where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.</td>
</tr>
<tr>
<td>initialTab</td>
<td>Optional</td>
<td>outline</td>
<td>Specifies which tab displays on top when the presentation is run. This applies only when the control value is normal:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• outline</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• search</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• notes</td>
</tr>
<tr>
<td>lightColor</td>
<td>Optional</td>
<td>4E5D60</td>
<td>Light color used for light-and-shadow effects. The value is hexadecimal: use the form &quot;##xxxxxx&quot; or &quot;##xxxxxxxx&quot;, where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.</td>
</tr>
<tr>
<td>loop</td>
<td>Optional</td>
<td>no</td>
<td>Specifies whether the presentation runs in a loop:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: the presentation restarts automatically after it ends.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: the user must click the Play button to restart the presentation.</td>
</tr>
<tr>
<td>overwrite</td>
<td>Optional</td>
<td>yes</td>
<td>Specifies whether files in the directory are overwritten. Valid only when the directory attribute is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: overwrites files if they are already present</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: creates new files</td>
</tr>
<tr>
<td>primaryColor</td>
<td>Optional</td>
<td>6F8488</td>
<td>Primary color of the presentation. The value is hexadecimal: use the form &quot;##xxxxxx&quot; or &quot;##xxxxxxxx&quot;, where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.</td>
</tr>
<tr>
<td>proxyHost</td>
<td>Optional</td>
<td></td>
<td>Host name or IP address of a proxy server to which to send the request.</td>
</tr>
<tr>
<td>proxyPassword</td>
<td>Optional</td>
<td></td>
<td>Password required by the proxy server.</td>
</tr>
<tr>
<td>proxyPort</td>
<td>Optional</td>
<td>80</td>
<td>The port to connect to on the proxy server.</td>
</tr>
<tr>
<td>proxyUser</td>
<td>Optional</td>
<td></td>
<td>User name to provide to the proxy server.</td>
</tr>
<tr>
<td>shadowColor</td>
<td>Optional</td>
<td>000000</td>
<td>Shadow color used for light-and-shadow effects. The value is hexadecimal: use the form &quot;##xxxxxx&quot; or &quot;##xxxxxxxx&quot;, where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.</td>
</tr>
<tr>
<td>showNotes</td>
<td>Optional</td>
<td>no</td>
<td>Specifies whether the Notes tab is present in the presentation control panel:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>showOutline</td>
<td>Optional</td>
<td>yes</td>
<td>Specifies whether the Outline is present in the presentation control panel:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no</td>
</tr>
</tbody>
</table>
Usage

Use the `<cfpresentation>` tag to create the container for a slide presentation. You can define the position and appearance of the presentation controls, the background color, and the text for the presentation. Also, use this tag to determine whether to write the presentation to files or to run it directly in the client browser.

The settings in the `<cfpresentation>` tag do not affect the appearance of the content defined in the `<cfpresentationslide>` tags.

**destination attribute**

Use the following syntax to specify an in-memory file, which is not written to disk in the `destination` attribute. In-memory files speed processing of transient data.

```
ram://filepath
```

The filepath can include directories, for example `ram:///petStore/presentations/quarterlyresults.html`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

**Named colors**

The `<cfpresentation>` tag supports the following named colors for use with the `backgroundColor`, `glowColor`, `lightColor`, `primaryColor`, `shadowColor`, and `textColor` attributes:

<table>
<thead>
<tr>
<th>Named color</th>
<th>Hexadecimal value</th>
</tr>
</thead>
<tbody>
<tr>
<td>red</td>
<td>FF0000</td>
</tr>
<tr>
<td>green</td>
<td>008000</td>
</tr>
<tr>
<td>blue</td>
<td>0000FF</td>
</tr>
<tr>
<td>black</td>
<td>000000</td>
</tr>
<tr>
<td>white</td>
<td>FFFFFF</td>
</tr>
<tr>
<td>yellow</td>
<td>FFF000</td>
</tr>
<tr>
<td>gray</td>
<td>808080</td>
</tr>
<tr>
<td>darkgray</td>
<td>A9A9A9</td>
</tr>
<tr>
<td>lightgray</td>
<td>D3D3D3</td>
</tr>
<tr>
<td>cyan</td>
<td>00FFFF</td>
</tr>
</tbody>
</table>
### Named color | Hexadecimal value
--- | ---
magenta | FF00FF
orange | FFA500
pink | FFC0CB

**Example**

```html
<!--- This example shows how to create a slide presentation from --->
<!--- an HTML file and from HTML code on the CFM page and write --->
<!--- the presentation files to a directory called myPresentation, --->
<!--- which is relative to the CFM page. --->
<cfpresentation title="Sales Presentation" directory="myPresenation">
    <cfpresenter name="Shyam" title="Vice President" email="shyam@somecompany.com"
                 image="shyam.jpg">
    <cfpresenter name="Ram" title="Sr. Vice President" email="ram@somecompany.com">

    <!--- The following code creates a slide from an HTML file --->
    <!--- located on the ColdFusion server. --->
    <cfpresentationslide src="introduction.htm" title="Introduction" presenter="Shyam"
                        audio="myAudio.mp3" duration="36"/>

    <!--- The following code creates a slide from HTML code in the CFM file. --->
    <cfpresentationslide>
        <h3>Sales</h3>
        <ul>
            <li>Overview</li>
            <li>Q1 Sales Figures</li>
            <li>Projected Sales</li>
            <li>Competition</li>
            <li>Advantages</li>
            <li>Long Term Growth</li>
        </ul>
    </cfpresentationslide>

    <!--- The following code creates a slide from HTML and CFML code. --->
    <cfpresentationslide title="Q1 Sales Figures" duration="14" presenter="Ram"
                        audio="myAudio2.mp3">
        <h3>Q1 Sales Figures</h3>
        <cfchart format="png" showborder="yes" chartheight="250" chartwidth="300"
                 pioeslicestyle="sliced">
            <cfchartseries type="pie">
                <cfchartdata item="Europe" value="9">
                <cfchartdata item="Asia" value="20">
                <cfchartdata item="North America" value="50">
                <cfchartdata item="South America" value="21">
            </cfchartseries>
        </cfchart>
    </cfpresentationslide>
</cfpresentation>
```
cfpresentationslide

Description
Creates a slide dynamically from a source file or HTML and CFML code on the ColdFusion page. The cfpresentationslide is a child tag of the cfpresentation tag.

History
ColdFusion 9: Added the slides attribute. Added PowerPoint file support to the src attribute.
ColdFusion 8: Added this tag.

Category
Data output tags

Syntax
<cfpresentation ...>
   <cfpresentationslide
       advance = "auto|never|click"
       audio = "pathname relative to the CFM page or the web root for audio file"
       authPassword = "authentication password"
       authUser = "authentication user name"
       duration = "duration of slide in seconds"
       marginBottom = "margin in pixels"
       marginLeft = "margin in pixels"
       marginRight = "margin in pixels"
       marginTop = "margin in pixels"
       notes = "text string"
       presenter = "presenter name"
       scale = "decimal"
       src = "absolute path|URL|path relative to CFM page"
       title = "text string"
       userAgent = "HTTP user agent identifier"
       video = "pathname relative to the CFM page or the web root for video file"
       useExternalProgram = "true|false" />
</cfpresentation>

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| advance     | Optional| See Description | Overrides the `cfpresentation` tag `autoPlay` attribute for the slide:  
  - **auto**: after the slide plays, the presentation advances to the next slide automatically. This is the default value if `cfpresentation autoPlay="yes"`.  
  - **never**: after the slide plays, the presentation does not advance to the next slide until the user clicks the Next button. This is the default value if `cfpresentation autoPlay="no"`.  
  - **click**: after the slide plays, the presentation advances to the next slide if the user clicks anywhere in the main presentation area. |
| audio       | Optional|          | Pathname of the audio file relative to the CFM page or the web root. The audio file must be an MP3 file.  
  You cannot specify both audio and video for a slide. |
| authPassword| Optional|          | Use to pass a password to the target URL for Basic Authentication. Combined with `username` to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication. |
| authUser    | Optional|          | Use to pass a user name to the target URL for Basic Authentication. Combined with `password` to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication. |
| duration    | Optional|          | Duration in seconds that the slide is played. If you do not specify a duration, the slide plays for the duration of the audio clip associated with the slide. |
| marginBottom| Optional| 0        | Bottom margin of the slide. |
| marginLeft  | Optional| 0        | Left margin of the slide. |
| marginRight | Optional| 0        | Right margin of the slide |
| marginTop   | Optional| 0        | Top margin of the slide |
| notes       | Optional|          | Notes used for the slide. Notes are displayed only if the showNotes attribute of the `cfpresentationslide` tag is set to `yes`. |
| presenter   | Optional|          | Presenter of the slide. A slide can have only one presenter. This name must match one of the presenter names in the `cfpresenter` tag. |
| scale       | Optional| 1.0      | Scale used for the HTML content in the slide presentation. If you do not specify the scale, ColdFusion automatically scales the content to fit in the slide. |
| slides      | Optional| All slides | Specifies the slide numbers required to export when the `src` attribute points to a PowerPoint file. Use a hyphen to specify a range; use a comma to specify non-contiguous slides. For example:  
  `slides="1-10"` or `slides="1,10"` |
Usage

Use the `cfpresentationslide` tag within the `cfpresentation` tag to create a slide presentation from individual SWF or HTML source files. If you do not specify a source file, include the HTML or CFML code for the body of the slide within the `cfpresentationslide` tag. You can assign one presenter to each slide. Use the `cfpresenter` tag to define presenters referenced by the `cfpresentationslide` tags.

The following code shows how to create a slide presentation from existing SWF files:

```xml
<!--- The following example shows how to create a slide presentation --->
<!--- from individual SWF files located on the ColdFusion server. --->
<!--- Because no directory is specified, the presentation runs in --->
<!--- the browser. --->
<cfpresentation title="myPresentation">
  <cfpresentationslide title="1st slide" src="slide1.swf" duration="10"/>
  <cfpresentationslide title="2nd slide" src="slide2.swf"
    audio="audio1.mp3" duration="20"/>
  <cfpresentationslide title="3rd slide" src="slide3.swf"
    audio="audio2.mp3" duration="218"/>
</cfpresentation>
```

Note: The `cfpresentationslide` tag requires an end tag. If you specify a source file as the content for the slide instead of CFML and HTML code within start and end tags, use the end slash as a shortcut for the end tag.

You can reference source files from a URL as long as they return HTML content. The following code shows how to create a slide presentation from HTML files located on an external website:

```xml
<!--- The following example shows how to create a slide presentation --->
<!--- from individual HTML files located on an external website. --->
<!--- Because no directory is specified, the presentation runs in --->
<!--- the browser. --->
<cfpresentation title="myPresentation">
  <cfpresentationslide title="1st slide"
    src="http://example.com/slide1.html" duration="10"/>
  <cfpresentationslide title="2nd slide"
    src="http://example.com/slide2.html" duration="20"/>
  <cfpresentationslide title="3rd slide"
    src="http://example.com/slide3.html" duration="218"/>
</cfpresentation>
```

</cfpresentation>
Example
<!--- The following example shows how to create a slide presentation --->
<!--- dynamically from HTML in ColdFusion and from HTML files located --->
<!--- on an external site. ColdFusion writes the presentation files --->
<!--- to a directory relative to the CFM page. --->
<cfpresentation title="USGS Naming Conventions" directory="namingConventions">
  <cfpresenter name="Robert L. Payne" title="Executive Secretary">
    <cfpresenter name="Trent Palmer" title="Executive Secretary Foreign Names">
      <cfpresentationslide presenter="Robert L. Payne">
        <h3>USGS Naming Conventions</h3>
        <ul>
          <li>Overview</li>
          <li>General Naming Conventions</li>
          <li>Domestic Naming Conventions</li>
          <li>Foreign Naming Conventions</li>
        </ul>
      </cfpresentationslide>
      <duration="10" presenter="Robert L. Payne"/>
      <cfpresentationslide src="http://geonames.usgs.gov/domestic/index.html"
          duration="15" presenter="Robert L. Payne"/>
      <cfpresentationslide src="http://geonames.usgs.gov/foreign/index.html"
          duration="15" presenter="Trent Palmer"/>
    </cfpresenter>
  </cfpresenter>
</cfpresentation>

cfpresenter
Description
Describes a presenter in a slide presentation. A slide presentation can have multiple presenters. The presenters must be referenced from the slides defined by the cfpresentationslide tag.

History
ColdFusion 8: Added this tag.

Category
Data output tags

Syntax
<cfpresenter
  biography = "text string"
  email = "e-mail address of the presenter"
  image = "relative pathname for JPG"
  name = "text string"
  logo = "relative pathname for JPG"
  title = "text string">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfchart, cfpresentation, cfpresentationslide
Use the `cfpresenter` tag to define the presenters that you specify for each slide. The presenter information appears in the control panel for the slide to which it is assigned. To specify a presenter for a slide, use the `presenter` attribute of the `cfpresentationslide` tag.

You can specify an image of the presenter and the presenter’s company logo by using the `image` and `logo` attributes of the `presenter` tag, respectively. To display a video clip in place of the presenter’s image, you can specify an FLV or SWF file for the `video` attribute of the `cfpresentationslide` tag.

**Example**

```coldfusion
<!--- This example shows how to specify presenters for a slide --->
<!--- presentation and assign a presenter to each slide in the presentation. --->
<cfpresentation title="myPresentation" directory="presentation" overwrite="yes">

<!--- The following code defines three presenters. --->
<cfpresenter name="Shyam" title="President" email="shyam@somecompany.com"
image="images\shyam01.jpg">
<cfpresenter name="Ram" title="V.P. Sales" email="ram@somecompany.com"
image="images\ram01.jpg">
<cfpresenter name="Michelle" title="V.P. Engineering"
email="mhatter@adobe.com" image="images\michelle01.jpg">

<!--- The following code assigns a presenter to each of three slides in the presentation. --->
<cfpresentationslide title="myFirstSlide" src="slide1.swf" duration="10"
presenter="Shyam"/>
<cfpresentationslide title="mySecondSlide" src="slide2.swf" duration="15"
presenter="Michelle"/>
<cfpresentationslide title="myThirdSlide" src="slide3.swf" duration="2"
presenter="Ram"/>

<!--- In the following slide, ColdFusion uses a video clip --->
<!--- instead of the JPEG image for the presenter. --->
<cfpresentationslide title="myFourthSlide" src="slide4.swf" duration="5"
presenter="Shyam" video="video\video1.flv"/>
</cfpresentation>
```

**Attributes**

<table>
<thead>
<tr>

<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>biography</td>
<td>Optional</td>
<td>A text string that provides information about the presenter; for example, “Sally Maverick has been a top seller of Adobe products for the last five years.”</td>
<td></td>
</tr>
<tr>
<td>email</td>
<td>Optional</td>
<td>E-mail address of the presenter. This attribute activates the Contact link in the presentation control panel, which opens an e-mail message when you click it.</td>
<td></td>
</tr>
<tr>
<td>image</td>
<td>Optional</td>
<td>Pathname for the presenter’s image in JPEG format. The JPEG file must be relative to the CFM page. If you specify a video for the <code>cfpresentationslide</code> tag, the video clip overrides this value for that slide.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td>Name of the presenter. Use this value in the <code>presenter</code> attribute of the <code>cfpresentationslide</code> tag to associate the presenter with the slide.</td>
<td></td>
</tr>
<tr>
<td>logo</td>
<td>Optional</td>
<td>Pathname of the image file that represents the presenter’s logo or the logo of the presenter’s organization. The logo must be in JPEG format. The file must be relative to the CFM file website.</td>
<td></td>
</tr>
<tr>
<td>title</td>
<td>Optional</td>
<td>Title of the presenter, for example, “VP of Sales”.</td>
<td></td>
</tr>
</tbody>
</table>
**cfprint**

**Description**
Prints specified pages from a PDF file. Use this tag to perform automated batch print jobs. Use the `cfprint` tag to print any PDF document, including the ones generated by the `cfdocument`, `cfpdf`, and `cfpdfform` tag. Also, you use this tag to print Report Builder reports exported in PDF format.

**History**
ColdFusion 8: Added this tag.

**Category**
Data output tags

**Syntax**
```
<cfprint
    source = "absolute or relative pathname to a PDF file|PDF document variable"
    attributeStruct = "ColdFusion structure that contains standard print request key-value pairs"
    color = "yes|no"
    copies = "number of copies"
    fidelity = "yes|no"
    pages = "page or pages to print"
    password = "PDF source file owner or user password"
    paper = "letter|legal|A4|A5|B4|B5|B4-JIS|B5-JIS|any media supported by the printer"
    printer = "string that specifies the printer name"
    type = "PDF">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**
`cfdocument`, `cfpdf`, `cpdfform`, `cpdfformparam`, `cfpdfparam`, `cfpdfsubform`, `GetPrinterInfo`, `IsPDFFile`, `IsPDFObject`

**Attributes**

<table>
<thead>
<tr>

<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attributeStruct</td>
<td>Optional</td>
<td></td>
<td>ColdFusion structure used to specify additional print instructions. Individually named attributes take precedence over the key-value pairs in the attribute structure. For information about key-value pairs, see the table in the section attributeStruct.</td>
</tr>
<tr>
<td>color</td>
<td>Optional</td>
<td></td>
<td>Color or monochrome printing:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: print in color</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: print in black and white, with colors in shades of gray</td>
</tr>
<tr>
<td>copies</td>
<td>Optional</td>
<td></td>
<td>Number of copies to print. The value must be greater than or equal to 1.</td>
</tr>
</tbody>
</table>
## Usage

Use the `cfprint` tag for automated batch printing of PDF documents. For example, you can run a batch job each evening that generates a report in PDF format and then prints either the entire report or selected pages for review the next morning without user intervention.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| fidelity  | Optional| no      | Whether to print a job based on the print requirements specified. Valid values are:  
  - `yes`: if the job cannot be printed exactly as specified in the print requirements, the job is rejected.  
  - `no`: a reasonable attempt to print the job is acceptable |
| pages     | Optional| all     | Pages in the source file to print. Duplicate pages and pages beyond the total count of pages in the document are ignored as long as there is at least one page between 1 and the total number of pages in the document. You can combine individual page numbers and page ranges, for example, 1–3, 6, 10–20. If you do not specify a value for the `pages` attribute, ColdFusion prints the entire document. |
| paper     | Optional|         | Paper used for the print job. The value can be any returned by the `GetPrinterInfo` function. The following values are valid:  
  - `na-letter`  
  - `na-legal`  
  - `iso-a4`  
  - `iso-a5`  
  - `iso-b4`  
  - `iso-b5`  
  - `jis-b4`  
  - `jis-b5`  
  For more information, see the section Supported paper types. |
| password  | Optional|         | The owner or user password for the PDF source file. If the PDF file is password-protected, specify this attribute for the file to print. |
| printer   | Optional|         | The name of a printer. An example in Windows is `\s1001prn02\NTN2W-HP_BW02`. The default name is the default printer for the account where the ColdFusion server is running. Printer names are case sensitive and must be entered exactly as they appear in the System Information page of the ColdFusion Administrator. For more information, see Usage. |
| source    | Required|         | Source document to print. Specify one of the following:  
  - An absolute or relative pathname to an on-disk or in-memory PDF document file, for example, `c:\work\myPDF.pdf` or `myPDF.pdf`. The default directory is the template directory.  
  - A PDF document variable in memory that is generated by the `cfdocument` tag or the `cfpdf` tag, for example, `"myPDFdoc"`. |
| type      | Optional| PDF     | The file type of the document being printed. The only valid value is PDF. |
Most of the cfprint tag attributes are printer-dependent. If a printer does not support a specified attribute, it ignores the instruction. The default settings for the attributes also are printer-dependent. If you set a default printer, only specify the PDF file source and the password, if the file is password-protected.

**Note:** The particular printer attributes supported are dependent on the operating system, the network printer server, if there is one, and the printer. The cfprint tag is dependent on the Java Print Service (JPS). Many printers support attributes that are not accessible from JPS. For example, the JPS for a Macintosh OSX running JDK 1.5 supports the fewest printer attributes. Upgrading to JDK 1.6 adds some functionality, but finishing attributes are still not supported.

If the fidelity attribute is set to yes, the job does not print if any of the specified attributes are not supported by the printer. If the fidelity attribute is set to no, the printer accepts the print job and either ignores any attribute it does not support or substitutes a reasonable alternative for the attribute.

To determine which attributes are supported on a specified printer, use the GetPrinterInfo function.

**Supported paper types**
You can use the equivalent page types supported by the cfdocument tag, but they are not returned by the GetPrinterInfo function:

<table>
<thead>
<tr>
<th>cfdocument</th>
<th>cfprint</th>
</tr>
</thead>
<tbody>
<tr>
<td>* letter</td>
<td>* na-letter</td>
</tr>
<tr>
<td>* legal</td>
<td>* na-legal</td>
</tr>
<tr>
<td>* A4</td>
<td>* iso-a4</td>
</tr>
<tr>
<td>* A5</td>
<td>* iso-a5</td>
</tr>
<tr>
<td>* B4</td>
<td>* iso-b4</td>
</tr>
<tr>
<td>* B5</td>
<td>* iso-b5</td>
</tr>
<tr>
<td>* B4-JIS</td>
<td>* jis-b4</td>
</tr>
<tr>
<td>* B5-JIS</td>
<td>* jis-b5</td>
</tr>
</tbody>
</table>

**View a list of configured printers**
1 Log on to the ColdFusion Administrator.
2 Click the System Information icon located at the top right of the Administrator Console window. (The icon has an “i” on it.)
3 Scroll to the bottom of the System Information page. Under Printer Details is the Default Printer. Below the default printer is Printers, which lists the configured printers available to ColdFusion, including the default printer.

Printer configuration is operating system-dependent. Configure printers outside of ColdFusion.

**View the print log**
1 Log on to the ColdFusion Administrator.
2 Expand the Debugging and Logging topic.
3 Click the Log Files link. The print.log file appears in the list of log files.
Permissions for printing
If the PDF file is encrypted, the permissions for the file must be set to AllowPrinting, or specify the owner password to print the file. Use the protect action of the cfpdf tag to set permissions and passwords on PDF files. For more information, see Permissions for PDF documents in “cfpdf” on page 487.

If a Security Manager is installed, the following permission is required in the coldfusion.policy file to initiate a print job request:

grant { permission java.lang.RuntimePermission "queuePrintJob"; };

In Windows systems, the account running the ColdFusion server must have PRINTER_ACCESS_USE access rights for each printer it uses. Even if the printer is configured locally on the system, the printer is not available if the account in which ColdFusion is running does not have the proper permissions.

Note: By default, ColdFusion installs and runs as the Local System account, which may not have printer queue access rights. For information on running ColdFusion as a specific user, see the following Tech Note: http://www.adobe.com/cfusion/knowledgebase/index.cfm?id=tn_17279

attributeStruct
The following table lists the optional attributeStruct key-value pairs that you use to specify print requests:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autoRotateAndCenter</td>
<td>Adjusts the document’s orientation to match the orientation specified in the printer attributes and centers the page in the imaging area:</td>
</tr>
<tr>
<td></td>
<td>• yes: the orientation, if specified, is ignored (default)</td>
</tr>
<tr>
<td></td>
<td>• no: the orientation, if specified, is applied to the document</td>
</tr>
<tr>
<td>collate or sheetCollate</td>
<td>Specifies whether the sheets of each copy of each printed document in a job are in sequence when multiple copies of the document are specified by the copies attribute:</td>
</tr>
<tr>
<td></td>
<td>• yes</td>
</tr>
<tr>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>color or chromaticity</td>
<td>Specifies color or monochrome printing. Monochrome printing displays colors in shades of gray:</td>
</tr>
<tr>
<td></td>
<td>• yes: print in color.</td>
</tr>
<tr>
<td></td>
<td>• no: print in monochrome.</td>
</tr>
<tr>
<td>copies</td>
<td>Number of copies of the source document to print. Valid values are integers greater than or equal to 1.</td>
</tr>
<tr>
<td>coverPage or jobSheets</td>
<td>Specifies which job start and end sheets, if any, are printed with a job:</td>
</tr>
<tr>
<td></td>
<td>• none</td>
</tr>
<tr>
<td></td>
<td>• standard</td>
</tr>
<tr>
<td>fidelity</td>
<td>Specifies whether to print a job based on the print requirements specified. The following values are valid values:</td>
</tr>
<tr>
<td></td>
<td>• yes: If the job cannot be printed exactly as specified in the print requirements, the job is rejected.</td>
</tr>
<tr>
<td></td>
<td>• no: A reasonable attempt to print the job is acceptable (default).</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>finishings</td>
<td>Finishing operation to perform after each copy of a document is printed:</td>
</tr>
<tr>
<td></td>
<td>* staple-top-left</td>
</tr>
<tr>
<td></td>
<td>* staple-bottom-left</td>
</tr>
<tr>
<td></td>
<td>* staple-top-right</td>
</tr>
<tr>
<td></td>
<td>* staple-bottom-right</td>
</tr>
<tr>
<td></td>
<td>* edge-stitch-left</td>
</tr>
<tr>
<td></td>
<td>* edge-stitch-bottom</td>
</tr>
<tr>
<td></td>
<td>* edge-stitch-top</td>
</tr>
<tr>
<td></td>
<td>* edge-stitch-bottom</td>
</tr>
<tr>
<td></td>
<td>* dual-right</td>
</tr>
<tr>
<td></td>
<td>* dual-top</td>
</tr>
<tr>
<td></td>
<td>* dual-bottom</td>
</tr>
<tr>
<td></td>
<td>* dual-left</td>
</tr>
<tr>
<td>jobHoldUntil</td>
<td>Date-time attribute for the exact date and time at which the job is available for printing. Valid values are ColdFusion date and time variables.</td>
</tr>
<tr>
<td>jobName</td>
<td>The name of a print job.</td>
</tr>
<tr>
<td>jobPriority</td>
<td>Integer value that represents a print job's priority. Among those jobs that are ready to print, a printer must print all jobs with a priority value of n before printing those with a priority value of n-1 for all n. Valid values are integers from 1 (lowest priority) through 100 (highest priority).</td>
</tr>
<tr>
<td>numberUp</td>
<td>Number of pages to print on a single side of paper. The value must be a number greater than or equal to 1.</td>
</tr>
<tr>
<td>orientationOr</td>
<td>Orientation of the page to be printed. The only valid value for PDF documents is portrait. To change the orientation to landscape, set the autoRotateAndCenter to yes (which is the default value). The autoRotateAndCenter instruction overrides the orientation instruction.</td>
</tr>
<tr>
<td>orientationRequested</td>
<td></td>
</tr>
<tr>
<td>pages</td>
<td>Pages in the source file to print. Duplicate pages and pages beyond the total count of pages in the document are ignored as long as there is at least one page between 1 and the total number of pages in the document. You can combine individual page numbers and page ranges, for example, 1–3, 6, 10–20. If you do not specify a value for the pages attribute, ColdFusion prints the entire document.</td>
</tr>
<tr>
<td>pageScaling</td>
<td>Specifies how pages are scaled on the paper:</td>
</tr>
<tr>
<td></td>
<td>* fit-to-printer-margins: Reduces or enlarges each page to fit the printable area of the currently selected paper size.</td>
</tr>
<tr>
<td></td>
<td>* reduce-to-printer-margins: Shrinks large pages to fit the currently selected paper size but does not enlarge small pages. If an area is selected and is larger than the printable area of the currently selected paper, the page is scaled to fit the printable area (Default).</td>
</tr>
<tr>
<td></td>
<td>* none: Prints the upper left or center of a page (if autorotated and centered) without scaling. Pages that don't fit on the paper are cropped.</td>
</tr>
<tr>
<td>pageSubset</td>
<td>Prints a subset of pages in specified by the pages attribute:</td>
</tr>
<tr>
<td></td>
<td>* all: Prints all the pages in the specified page range (Default).</td>
</tr>
<tr>
<td></td>
<td>* odd: Prints only the odd pages in the specified page range.</td>
</tr>
<tr>
<td></td>
<td>* even: Prints only the even pages in the specified page range.</td>
</tr>
</tbody>
</table>
Example

The following example shows how to use the `attributeStruct` attribute and the `cfprint` tag to print five, double-sided copies of a letter-sized PDF document, which are stapled on the top-left corner and collated:

```cfc
<cfset aset=StructNew()>
<cfset aset["sides"] = "duplex">
<cfprint type="pdf" source="myfile.pdf"
    printer="\s1001prn02\NTN-2W-HP_BW02" copies="5" paper="letter"
    attributeStruct="#aset#">
```

The following example shows how to specify all of the print attributes with the `attributeStruct` attribute:
<cfset aset=StructNew()>
<cfset aset["paper"] = "letter">
<cfset aset["sides"] = "duplex">
<cfset aset["copies"] = "5">
<cfset aset["printer"] = "\s1001prn02\NTN-2W-HP_BW02">
<cfprint type="pdf" source="myfile.pdf" attributeStruct="#aset#">
Printers have a setting called autoRotateAndCenter, which is set to yes by default. The following example shows how to override the default autoRotateAndCenter setting and use the orientation setting instead:
<cfset aset=StructNew()>
<cfset aset["autoRotateAndCenter"] = "no">
<cfset aset["orientation"] = "portrait">
<cfprint printer="myprinter" source="_mydoc.pdf" attributeStruct="#aset#">
To run a print job asynchronously, start a print job in a thread. Do not wait for the print job to be sent to the printer before proceeding. To start a print job in a thread, enclose the cfprint tag within cfthread start and end tags, as the following example shows:
<cfthread name="mythread" action="run">
<cfprint type="pdf" source="myfile.pdf" printer="\s1001prn02\NTN-2W-HP_BW02">
</cfthread>
....
For more information, see “cfthread” on page 668.

See also cfcol, cfcontent, cfoutut, cfsetting, cfsilent, cftable; Developing Globalized Applications in the Developing ColdFusion Applications

Last updated 7/9/2012
History
ColdFusion MX:
• Changed `suppresswhitespace` attribute value behavior: you can specify the `suppresswhitespace` attribute value as a string variable. (ColdFusion 5 supported setting it only as a constant.)
• Added the `pageEncoding` attribute.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| pageEncoding           | Optional| Character encoding identified by the page byte order mark, if any; otherwise, system default encoding | A string literal; cannot be a variable. Identifies the character encoding of the current CFML page. This attribute affects the entire page, not just the `cfprocessing` tag body. The value may be enclosed in single- or double-quotation marks, or none. The following list includes commonly used values:  
  • utf-8  
  • iso-8859-1  
  • windows-1252  
  • us-ascii  
  • shift_jis  
  • iso-2022-jp  
  • euc-jp  
  • euc-kr  
  • big5  
  • euc-cn  
  • utf-16  
  For more information on character encodings, see [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html). |
| suppressWhiteSpace     | Optional| Boolean; whether to suppress white space characters within the `cfprocessingdirective` block that are generated by CFML tags and often do not affect HTML appearance. Does not affect any white space in HTML code. |

Usage
The `cfprocessingdirective` tag has limitations that depend on the attribute you use. For this reason, Adobe recommends that you include either the `pageencoding` or `suppresswhitespace` attribute in a `cfprocessingdirective` tag, not both. To specify both values, use separate tags.

In a ColdFusion component (.cfc file), the `cfprocessingdirective` tag must follow the `cfcomponent` tag.

If you use the `pageEncoding` attribute, the following rules apply:
• You must put the tag within the first 4096 bytes of a page. It can be positioned after a `cfsetting` or `cfsilent` tag.
• If you use the tag on a page that includes other pages by using the `cfinclude` or `cfmodule` tags, custom tag invocation, and so on, the tag has no effect on the included pages.
• You cannot embed the tag within conditional logic, because the pageEncoding attribute is evaluated when ColdFusion compiles a page (not when it executes the page). For example, the following code has no effect at execution time, because the cfprocessingdirective tag has already been evaluated:

```coldfusion
<cfif dynEncoding is not "dynamic encoding is not possible">
  <cfprocessingdirective pageencoding=#dynEncoding#>
</cfprocessingdirective>
</cfif>
```

• If you have multiple cfprocessingdirective tags in one page that specify the pageEncoding attribute, they must all specify the same value; if not, ColdFusion throws an error.

• If you specify only the pageencoding attribute, do not use a separate end tag.

• ColdFusion accepts character encoding names that are supported by the Java platform. If an invalid name is specified, ColdFusion throws an InvalidEncodingSpecification exception.

• If a page has a byte order mark (BOM), and a pageencoding attribute specifies an encoding that differs from the BOM, ColdFusion generates an error.

The following rules apply to the suppressWhiteSpace attribute:

• You can specify the suppresswhitespace attribute value as a constant or a variable. To use a variable: define the variable (for example, whitespaceSetting), assign it the value yes or no, and code a statement such as the following:

```coldfusion
<!--- ColdFusion allows suppression option to be set at runtime --->
<cfprocessingdirective suppresswhitespace=#whitespaceSetting#>
  code to whose output the setting is applied
</cfprocessingdirective>
```

• The suppresswhitespace attribute only affects code that you put between the `<cfprocessingdirective>` begin tag and the `<cfprocessingdirective>` end tag.

The following example shows the use of a nested cfprocessingdirective tag. The outer tag suppresses unnecessary whitespace during computation of a large table; the inner tag retains whitespace, to output a preformatted table.

**Example**

```coldfusion
<cfprocessingdirective suppressWhiteSpace = "Yes">
  <!--- CFML code --->
  <cfprocessingdirective suppressWhiteSpace = "No">
    <cfoutput>#table_data#</cfoutput>
  </cfprocessingdirective>
</cfprocessingdirective>
```

The following example shows the use of the pageencoding attribute:

```coldfusion
<cfprocessingdirective pageencoding = "shift_jis">
```

**cfproccparam**

**Description**

Defines stored procedure parameters. This tag is nested within a cfstoredproc tag.

**Category**

Database manipulation tags
ColdFusion Tags

Syntax
<cfprocparam
   CFSQlType = "parameter data type"
   maxLength = "length"
   null = "yes|no"
   scale = "decimal places"
   type = "in|out|inout"
   value = "parameter value"
   variable = "variable name">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

See also
cfinsert, cfprocresult, cfquery, cfqueryparam, cfstoredproc, cftransaction, cfupdate; Optimizing ColdFusion applications in Designing and Optimizing a ColdFusion Application in the Developing ColdFusion Applications

History
ColdFusion MX:

- The maxrows attribute is obsolete.
- Changed the dbvarname attribute behavior: it is now ignored for all drivers. ColdFusion uses JDBC 2.2 and does not support named parameters. This is deprecated.
- Changed the maxLength attribute behavior: it now applies to IN and INOUT parameter values.
## Attributes

<table>

<td>• CF_SQL_TIMESTAMP</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• CF_SQL_TINYINT</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• CF_SQL_VARCHAR</td>
</tr>
</tbody>
</table>

For a mapping of ColdFusion SQL data types to JDBC data types, see `cfqueryparam`.

| maxLength   | Optional | 0 | Maximum length of a string or character IN or INOUT value attribute. A `maxLength` of 0 allows any length. The `maxLength` attribute is not required when specifying `type=out`. |

<table>
<thead>
<tr>
<th>null</th>
<th>Optional</th>
<th>no</th>
<th>Whether the parameter is passed in as a null value. Not used with OUT type parameters.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>yes</code> tag ignores the <code>value</code> attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• <code>no</code></td>
</tr>
</tbody>
</table>
Usage
Use this tag to identify stored procedure parameters and their data types. Code one `cfprocparam` tag for each parameter. The parameters that you code vary based on parameter type and DBMS. ColdFusion supports positional parameters. If you use positional parameters, you must code `cfprocparam` tags in the same order as the associated parameters in the stored procedure definition.

Output variables are stored in the ColdFusion variable specified by the `variable` attribute.

You cannot use the `cfprocparam` tag for Oracle 8 and 9 reference cursors. Instead, use the `cfprocresult` tag.

Example
The following examples list the equivalent Oracle and Microsoft SQL Server stored procedures that insert data into the database. The CFML to invoke either stored procedure is the same.

The following example shows the Oracle stored procedure:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale</td>
<td>Optional</td>
<td>0</td>
<td>Number of decimal places in numeric parameter. A <code>scale</code> of 0 limits the value to an integer.</td>
</tr>
</tbody>
</table>
| type      | Optional | in      | • `in`: the parameter is used to send data to the database system only. Passes the parameter by value.  
• `out`: the parameter is used to receive data from the database system only. Passes the parameter as a bound variable.  
• `inout`: the parameter is used to send and receive data. Passes the parameter as a bound variable. |
| value     | Required if `type=“IN”` | | Value that ColdFusion passes to the stored procedure. This is optional for `inout` parameters. |
| variable  | Required if `type=“OUT” or “INOUT”` | | ColdFusion variable name; references the value that the output parameter has after the stored procedure is called. This is ignored for `in` parameters. |
CREATE OR REPLACE PROCEDURE Insert_Book (  
    arg_Title Books.Title%type,  
    arg_Price Books.Price%type,  
    arg_PublishDate Books.PublishDate%type,  
    arg_BookID OUT Books.BookID%type)  
AS  

    num_BookID NUMBER;  
BEGIN  

    SELECT seq_Books.NEXTVAL  
    INTO num_BookID  
    FROM DUAL;  

    INSERT INTO  
    Books (  
      BookID,  
      Title,  
      Price,  
      PublishDate )  

    VALUES (  
      num_BookID,  
      arg_Title,  
      arg_Price,  
      arg_PublishDate );  

    arg_BookID := num_BookID;  
END;  
/  

The following example shows the SQL Server stored procedure:

CREATE PROCEDURE Insert_Book (  
    @arg_Title VARCHAR(255),  
    @arg_Price SMALLMONEY,  
    @arg_PublishDate DATETIME,  
    @arg_BookID INT OUT)  
AS  
BEGIN  

    INSERT INTO  
    Books (  
      Title,  
      Price,  
      PublishDate )  

    VALUES (  
      @arg_Title,  
      @arg_Price,  
      @arg_PublishDate );  

    SELECT @arg_BookID = @@IDENTITY;  
END;  
/  

You use the following CFML code to call either stored procedure:
<cfset ds = "sqltst">
<!--- <cfset ds = "oratst"> --->

<!--- If submitting a new book, insert the record and display confirmation --->
<cfif isDefined("form.title")>
  <cfstoredproc procedure="Insert_Book" datasource="#ds#">
    <cfprocparam cfsqltype="cf_sql_varchar" value="#form.title#">
    <cfprocparam cfsqltype="cf_sql_numeric" value="#form.price#">
    <cfprocparam cfsqltype="cf_sql_date" value="#form.price#">
    <cfprocparam cfsqltype="cf_sql_numeric" type="out" variable="bookId"/>
  </cfstoredproc>
  <cfoutput>
    <h3>"form.title" inserted into database. The ID is #bookId#.</h3>
  </cfoutput>
</cfif>

<cfform action="#CGI.SCRIPT_NAME#" method="post">
  <h3>Insert a new book</h3>
  Title:
  <cfinput type="text" size="20" required="yes" name="title"/>
  <br/>

  Price:
  <cfinput type="text" size="20" required="yes" name="price" validate="float"/>
  <br/>

  Publish Date:
  <cfinput type="text" size="5" required="yes" name="publishDate" validate="date"/>
  <br/>

  <input type="submit" value="Insert Book"/>
</cfform>

cfprocresult

Description
Associates a query object with a result set returned by a stored procedure. Other ColdFusion tags, such as cfoutput and cftable, use this query object to access the result set. This tag is nested within a cfstoredproc tag.

Category
Database manipulation tags

Syntax
<cfprocresult
    name = "query name"
    maxRows = "number"
    resultSet = "1-n">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.
ColdFusion Tags

See also cfinsert, cfprocparam, cfquery, cfqueryparam, cfstoredproc, cftransaction, cfupdate; Optimizing database use in Designing and Optimizing a ColdFusion Application in the Developing ColdFusion Applications

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Name for the query result set.</td>
</tr>
<tr>
<td>maxRows</td>
<td>Optional</td>
<td>-1 (All)</td>
<td>Maximum number of rows returned in result set.</td>
</tr>
<tr>
<td>resultSet</td>
<td>Optional</td>
<td>1</td>
<td>Names one result set, if stored procedure returns more than one.</td>
</tr>
</tbody>
</table>

Usage

To enable access to data returned by the stored procedure, specify one or more cfprocresult tags. If the stored procedure returns more than one result set, use the resultSet attribute to specify which of the stored procedure’s result sets to return.

The resultSet attribute must be unique within the scope of the cfstoredproc tag. If you specify a result set twice, the second occurrence overwrites the first.

CFML supports Oracle 8 and 9 Reference Cursor type, which passes a parameter by reference. Parameters that are passed this way can be allocated and deallocated from memory within the execution of one application. To use reference cursors in packages or stored procedures, use the cfprocresult tag. This causes the ColdFusion JDBC database driver to put Oracle reference cursors into a result set. (You cannot use this method with Oracle’s ThinClient JDBC drivers.)
Example

<!--- This example executes a Sybase stored procedure that returns three result sets, two
which we want. The stored procedure returns status code and one output parameter, which
we display. We use named notation for parameters. --->

<cfstoredproc procedure = "foo_proc"
    dataSource = "MY_SYBASE_TEST" username = "sa"
    password = "" dbServer = "scup" dbName = "pubs2"
    returnCode = "Yes" debug = "Yes">
    <cfprocresult name = RS1>
    <cfprocresult name = RS3 resultSet = 3>
    <cfprocparam type = "IN" CFSQLType = CF_SQL_INTEGER value = "1">
    <cfprocparam type = "OUT" CFSQLType = CF_SQL_DATE variable = FOO>
    <cfstoredproc statusCode = "status code">
</cfstoredproc>

<cfoutput>
The output param value: '#foo#'<br>
</cfoutput>

<h3>The Results Information</h3>
<cfoutput query = RS1>#name#, #DATE_COL#<br>
</cfoutput>

<p></p>
<cfoutput>
<hr>
<p>Record Count: #RS1.recordCount# Columns: #RS1.columnList#</p>
<hr>
</cfoutput>

<cfoutput query = RS3>#col1#, #col2#, #col3#<br>
</cfoutput>

<p></p>
<cfoutput>
<hr>
<p>Record Count: #RS3.recordCount# Columns: #RS3.columnList#</p>
<hr>
</cfoutput>

The return code for the stored procedure is:
'#$cfstoredproc.statusCode$'</cfoutput>
...

cfprogressbar

Description
Defines a progress bar to indicate the progress of an activity such as a file download.

Category
Display management tags
Syntax
<cfprogressbar
    autoDisplay="true|false"
    name="control identifier"
    bind ="bind expression"
    duration="time value"
    height="height in pixels"
    interval="time in milliseconds"
    onComplete="function name"
    onError="JavaScript function name"
    style="style specification"
    width="pixel value">

History
ColdFusion 9: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autoDisplay</td>
<td>Optional</td>
<td>true</td>
<td>Set to true to display the progress bar.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>The control name. Used to refer to the control in JavaScript, for example in the script that starts the progress.</td>
</tr>
<tr>
<td>bind</td>
<td>Required if duration is not specified</td>
<td></td>
<td>A bind expression specifying a client JavaScript function or server CFC that the control calls to get progress information each time the period defined by the interval attribute elapses. You cannot use this attribute with a duration attribute. If an error occurs, no further bind expression calls are triggered and onError is called (if defined).</td>
</tr>
<tr>
<td>duration</td>
<td>Required if bind is not specified</td>
<td></td>
<td>The time, in milliseconds, between when the bar starts showing progress and when it shows completed progress. Use only on automatic progress bars that do not use a bind expression to get actual progress information. You cannot use this attribute with a bind attribute.</td>
</tr>
<tr>
<td>height</td>
<td>Optional</td>
<td></td>
<td>Height of the bar in pixels.</td>
</tr>
<tr>
<td>interval</td>
<td>Optional</td>
<td>1000</td>
<td>Used if duration is specified. The time interval, in milliseconds, at which the progress bar updates. Although this attribute is optional, specify it to prevent the bar from updating frequently.</td>
</tr>
<tr>
<td>onComplete</td>
<td>Optional</td>
<td></td>
<td>The name of a function to call when progress completes.</td>
</tr>
<tr>
<td>onError</td>
<td></td>
<td></td>
<td>Applies only if you use bind. The JavaScript function to run on an error condition. The error can be a network error or server-side error.</td>
</tr>
<tr>
<td>style</td>
<td>Optional</td>
<td></td>
<td>The following are the supported colors:</td>
</tr>
<tr>
<td>width</td>
<td>Optional</td>
<td>400</td>
<td>The width (length) of the bar in pixels.</td>
</tr>
</tbody>
</table>
Usage
A progress bar has one of two behaviors:

- Manual, where the progress indicator length increases steadily over a time specified by the `duration` attribute.
- Dynamic, where the `bind` attribute specifies a function that determines the indicator length.

If you use a bind expression, the called function takes no parameters, and must return a structure with two values:

- `status` - A decimal completion value, in the range 0-1.0
- `message` - A message to display in the progress bar, such as “Loading...” or “Completed”.

You use two Ajax functions to start and stop the progress bar:

```coldfusion
ColdFusion.ProgressBar.start(barName)
ColdFusion.ProgressBar.stop(barName)
```

You must call the `start` method to start the progress bar.

You call the `stop` method to explicitly stop the progress bar. The bar stops automatically when the bind method returns a `status` value of 1 or the period specified by the `duration` attribute elapses. Therefore, you need to use this method only if a process does not complete, if the process completes before the `duration` period, or in other nonstandard situations, such as error conditions.

Example
The following uses a simple comment form, and uses a timer to simulate the time it would take to process the form.

The Application.cfc page must enable session management.

The main application page contains the following code:

```html
doctype html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd"
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
<title>Untitled Document</title>
</head>
<script type="text/javascript">
// The function that starts the progress bar, 
// called when the user clicks the Send comment button.
function startProgress() {
    ColdFusion.ProgressBar.start("mydataProgressbar");
}

// The function called when the progress bar finishes, 
// specified by the cfprogressbar tag onComplete attribute.
function onfinish() {
    alert("Done");
}
</script>
<body>
<!--- Ensure there is no Session.STATUS value, which is used by 
the progress bar bind CFC, when the page displays. --->
<cfif IsDefined("Session.STATUS")>
    <cfserror>
        StructDelete(Session,"STATUS");
    </cfserror>
</cfif>
```

cfproperty

Description
Defines properties and their annotations for a ColdFusion component (CFC). The properties are used to create
complex data types for web services, while the annotations are used to define Object Relational Model (ORM) for a
CFC. The attributes of this tag are exposed as component metadata and are subject to inheritance rules.

Category
Extensibility tags

Syntax
<cfproperty
    name="name"
    default="default value"
    displayname="descriptive name"
    hint="extended description"
    required="false|true"
    serializable="true|false"
    type="type">

Note: For ORM-related attributes and their usage, see Map the properties in the Developing ColdFusion Applications.

ColdFusion Tags

### Usage
You must position `cfproperty` tags at the beginning of a component, above executable code and function definitions.

If a component is not used as a web service, `<cfproperty>` only provides metadata information of the property. It does not define variables or set values that you can use in your component. However, it creates implicit setters and getters for the property in the CFC depending on whether getter/setter attributes are enabled. For details, see Implicit Get and Set Functions in *Developing ColdFusion Applications*.

For Object Relational Model (ORM), `cfproperty` is used to define relational mapping for the property of the CFC. For details, see ColdFusion ORM in *Developing ColdFusion Applications*.

For web services that you create in ColdFusion, the `cfproperty` tag defines complex variables used by the web service.

| validateparam | Optional |         |            |

Last updated 7/9/2012
Example
The following code defines a component in the file address.cfc that contains properties that represent a street address:

```coldfusion
<cfcomponent>
    <cfproperty name="Number" type="numeric">
    <cfproperty name="Street" type="string">
    <cfproperty name="City" type="string">
    <cfproperty name="State" type="string">
    <cfproperty name="Country" type="string">
</cfcomponent>
```

This component represents a complex data type that can be used in a component that is exported as a web service, such as the following:

```coldfusion
<cfcomponent>
    <cffunction name="echoAddress" returnType="address" access="remote">
        <cfargument name="input" type="address">
        <cfreturn arguments.input>
    </cffunction>
</cfcomponent>
```

**cfquery**

**Description**
Passes queries or SQL statements to a data source.

Adobe recommends that you use the cfqueryparam tag within every cfquery tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, "Multiple SQL Statements in Dynamic Queries," in the Security Zone, [www.adobe.com/go/sn_asb99-04](http://www.adobe.com/go/sn_asb99-04), and Accessing and Retrieving Data in the Developing ColdFusion Applications.

**Category**
Database manipulation tags

**Syntax**
```
cfquery
    name = "query name"
    blockFactor = "block size"
    cachedAfter = "date"
    cacheID = "ID"
    cacheRegion = "region"
    cachedWithin = "timespan"
    dataSource = "data source name"
    dbtype = "query"
    debug = "yes|no"
    fetchClientInfo = "yes|no"
    maxRows = "number"
    ormoptions = #orm options structure#
    password = "password"
    result = "result name"
    timeout = "seconds"
    username = "user name"
</cfquery>
```
Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

Optimizing database use in the Developing ColdFusion Applications

History
ColdFusion 10: Added the following attributes: fetchClientInfo, cacheID, cacheRegion, clientInfo
ColdFusion 9.0.1: Introduced support for HQL queries; added the attribute ormoptions.
ColdFusion 9: Datasource attribute is optional now.
ColdFusion 8: Added the result variable that specifies the ID of a row.
ColdFusion MX 7:
  • Added the result attribute for specifying an alternate name for the structure that holds the result variables.
  • Added result variables for the SQL statement executed (sql), the number of records returned (recordcount), whether the query was cached (cached), an array of cfqueryparam values (sqlparameters), and the list of columns in the returned query (columnlist).
ColdFusion MX:
  • Changed Query of Queries behavior: it now supports a larger subset of standard SQL.
  • Changed dot notation support: ColdFusion now supports dot notation within a record set name. ColdFusion interprets such a name as a structure.
  • Deprecated the connectString, dbName, dbServer, provider, providerDSN, and sql attributes, and all values of the dbtype attribute except query. They do not work, and might cause an error, in releases later than ColdFusion 5.
  • New query object variable: cfquery.ExecutionTime.
  • No longer supports native drivers. It now uses JDBC (and ODBC-JDBC bridge) for database connectivity.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Name of query. Used in page to reference query record set. Must begin with a letter. Can include letters, numbers, and underscores.</td>
</tr>
<tr>
<td>blockFactor</td>
<td>Optional</td>
<td>1</td>
<td>Maximum rows to get at a time from server. Range: 1 - 100. Might not be supported by some database systems.</td>
</tr>
<tr>
<td>cachedAfter</td>
<td>Optional</td>
<td></td>
<td>Date value (for example, April 16, 1999, 4-16-99). If date of original query is after this date, ColdFusion uses cached query data. To use cached data, current query must use same SQL statement, data source, query name, user name, password. A date/time object is in the range 100 AD–9999 AD. When specifying a date value as a string, enclose it in quotation marks.</td>
</tr>
<tr>
<td>cacheID</td>
<td>Optional</td>
<td></td>
<td>ID to be used to store query result in cache. This ID can be used to either retrieve or remove query from cache</td>
</tr>
<tr>
<td>cacheRegion</td>
<td>Optional</td>
<td></td>
<td>Cache region to be used to cache query result. If not specified, by default query is cached in the QUERY region.</td>
</tr>
</tbody>
</table>
Usage

Use this tag to execute a SQL statement against a ColdFusion data source. Although you can use the cfquery tag to execute any SQL Data Definition Language (DDL) or Data Manipulation Language (DML) statement, you typically use it to execute a SQL SELECT statement.

**Note:** To call a stored procedure, use the cfstoredproc tag.

This tag creates a query object, providing this information in query variables:

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_name.currentRow</td>
<td>Current row of query that cfoutput is processing.</td>
</tr>
<tr>
<td>query_name.columnList</td>
<td>Comma-separated list of the query columns.</td>
</tr>
<tr>
<td>query_name.RecordCount</td>
<td>Number of records (rows) returned from the query.</td>
</tr>
</tbody>
</table>
The cfquery tag also returns the following result variables in a structure. You can access these variables with a prefix of the name you specified in the result attribute. For example, if you assign the name myResult to the result attribute, you would retrieve the name of the SQL statement that was executed by accessing #myResult.sql#. The result attribute provides a way for functions or CFCs that are called from multiple pages, possibly at the same time, to avoid overwriting results of one call with another. The result variable of INSERT queries contains a key-value pair that is the automatically generated ID of the inserted row; this is available only for databases that support this feature. If more than one record was inserted, the value can be a list of IDs. The key name is database-specific.

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result_name.sql</td>
<td>The SQL statement that was executed.</td>
</tr>
<tr>
<td>result_name.recordcount</td>
<td>Number of records (rows) returned from the query.</td>
</tr>
<tr>
<td>result_name.cached</td>
<td>True if the query was cached; False otherwise.</td>
</tr>
<tr>
<td>result_name.sqlparameters</td>
<td>An ordered Array of cfqueryparam values.</td>
</tr>
<tr>
<td>result_name.columnList</td>
<td>Comma-separated list of the query columns.</td>
</tr>
<tr>
<td>result_name.ExecutionTime</td>
<td>Cumulative time required to process the query.</td>
</tr>
<tr>
<td>result_name.IDENTITYCOL</td>
<td>SQL Server only. The ID of an inserted row.</td>
</tr>
<tr>
<td>result_name.ROWID</td>
<td>Oracle only. The ID of an inserted row. This is not the primary key of the row, although you can retrieve rows based on this ID.</td>
</tr>
<tr>
<td>result_name.SYB_IDENTITY</td>
<td>Sybase only. The ID of an inserted row.</td>
</tr>
<tr>
<td>result_name.SERIAL_COL</td>
<td>Informix only. The ID of an inserted row.</td>
</tr>
<tr>
<td>result_name.GENERATED_KEY</td>
<td>MySQL only. The ID of an inserted row. MySQL 3 does not support this feature.</td>
</tr>
</tbody>
</table>

You can cache query results and execute stored procedures. For information about this and about displaying cfquery output, see the Developing ColdFusion Applications.

Because the timeout attribute only affects the maximum time for each suboperation of a query, the cumulative time may exceed its value. To set a timeout for a page that might get a very large result set, set the Administrator > Server Settings > Timeout Requests option to an appropriate value or use the RequestTimeout attribute of the cfsetting tag (for example, <cfsetting requestTimeout="300">).

The Caching page of the ColdFusion Administrator specifies the maximum number of cached queries. Setting this value to 0 disables query caching.

You cannot use ColdFusion reserved words as query names.

You cannot use SQL reserved words as variable or column names in a Query of Queries, unless they are escaped. The escape character is the bracket []; for example:

```
SELECT [count] FROM MYTABLE.
```

For a list of reserved keywords in ColdFusion, see Escaping reserved keywords in the Developing ColdFusion Applications.
Example

<!--- This example shows the use of CreateTimeSpan with CFQUERY ----->
<!--- to cache a record set. Define startrow and maxrows to ----->
<!--- facilitate 'next N' style browsing. ---->
<cfparam name="MaxRows" default="10">
<cfparam name="StartRow" default="1">
<!--------------------------------------------------------------------
Query database for information if cached database information has
not been updated in the last six hours; otherwise, use cached data.
--------------------------------------------------------------------->
<cfquery
   name="GetParks" datasource="cfdocexamples"
   cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
SELECT PARKNAME, REGION, STATE
FROM Parks
ORDER BY ParkName, State
</cfquery>
<!--- Build HTML table to display query. ------------------------->
<table cellpadding="1" cellspacing="1">
   <tr>
      <td bgcolor="f0f0f0">
      </td>
      <td bgcolor="f0f0f0">
         <b><i>Park Name</i></b>
      </td>
      <td bgcolor="f0f0f0">
         <b><i>Region</i></b>
      </td>
      <td bgcolor="f0f0f0">
         <b><i>State</i></b>
      </td>
   </tr>
   <!--- Output the query and define the startrow and maxrows parameters.
Use the query variable CurrentRow to keep track of the row you are displaying. ----->
<cfoutput query="GetParks" startrow="#StartRow#" maxrows="#MaxRows#">
   <tr>
      <td valign="top" bgcolor="#f0f0f0">
         #GetParks.CurrentRow#
      </td>
      <td valign="top">
         <font size="-1"#ParkName#</font>
      </td>
   </tr>
</cfoutput>
--- Table. If the total number of records is less than or equal to the total number of rows, then offer a link to the same page, with the startrow value incremented by maxrows (in the case of this example, incremented by 10). --------

<table>
<thead>
<tr>
<th>#Region#</th>
<th>#State#</th>
</tr>
</thead>
</table>

```html
<cfqueryparam

Description
Verifies the data type of a query parameter and, for DBMSs that support bind variables, enables ColdFusion to use bind variables in the SQL statement. Bind variable usage enhances performance when executing a cfquery statement multiple times.

This tag is nested within a cfquery tag, embedded in a query SQL statement. If you specify optional parameters, this tag performs data validation.

Adobe recommends that you use the cfqueryparam tag within every cfquery tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, "Multiple SQL Statements in Dynamic Queries," at www.adobe.com/go/sn_asb99-04, and Accessing and Retrieving Data in the Developing ColdFusion Applications.

Category
Database manipulation tags
Syntax
<cfquery
   name = "query name"
   dataSource = "data source name"
   ...other attributes...
   SQL STATEMENT column_name =
   <cfqueryparam value = "parameter value"
     CFSQLType = "parameter type"
     list = "yes|no"
     maxLength = "maximum parameter length"
     null = "yes|no"
     scale = "number of decimal places"
     separator = "separator character">
   AND/OR ...additional criteria of the WHERE clause...
</cfquery>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

<td>• yes: the value attribute value is a delimited list.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>maxLength</td>
<td>Optional</td>
<td>Length of string in value attribute</td>
<td>Maximum length of parameter. Ensures that the length check is done by ColdFusion before the string is sent to the DBMS, thereby helping to prevent the submission of malicious strings.</td>
</tr>
</tbody>
</table>
Usage

Use the `cfqueryparam` tag in any SQL statement (for example, SELECT, INSERT, UPDATE, and DELETE) that uses ColdFusion variables.

For maximum validation of string data, specify the `maxlength` attribute.

This tag does the following:

- Allows the use of SQL bind parameters, which improves performance.
- Ensures that variable data matches the specified SQL type.
- Allows long text fields to be updated from a SQL statement.
- Escapes string variables in single-quotiation marks.

To benefit from the enhanced performance of bind variables, use `cfqueryparam` for all ColdFusion variables, and your DBMS must support bind variables. If a DBMS does not support bind parameters, ColdFusion validates and substitutes the validated parameter value back into the string. If validation fails, it returns an error message.

The validation rules are as follows:

- For these types, a data value can be converted to a numeric value: `CF_SQL_SMALLINT`, `CF_SQL_INTEGER`, `CF_SQL_REAL`, `CF_SQL_FLOAT`, `CF_SQL_DOUBLE`, `CF_SQL_TINYINT`, `CF_SQL_MONEY`, `CF_SQL_MONEY4`, `CF_SQL_DECIMAL`, `CF_SQL_NUMERIC`, and `CF_SQL_BIGINT`
- For these types, a data value can be converted to a date supported by the target data source: `CF_SQL_DATE`, `CF_SQL_TIME`, `CF_SQL_TIMESTAMP`
- For all other types, if the `maxlength` attribute is used, a data value cannot exceed the maximum length specified.

ColdFusion debug output shows the bind variables as question marks and lists the values beneath the query, in order of usage.

Note: To insert an empty string into a Microsoft Access table using the SequelLink ODBC Socket or SequelLink Access driver, the `CFSQLType` attribute must specify `CF_SQL_LONGVARCHAR`.

The following table shows the mapping of ColdFusion SQL data types with JDBC SQL types and those of the listed database management systems:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>null</td>
<td>Optional</td>
<td>no</td>
<td>Whether parameter is passed as a null value:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• yes: tag ignores the <code>value</code> attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>scale</td>
<td>Optional</td>
<td>0</td>
<td>Number of decimal places in parameter. Applies to <code>CF_SQL_NUMERIC</code> and</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><code>CF_SQL_DECIMAL</code>.</td>
</tr>
<tr>
<td>separator</td>
<td>Required, if you specify a list in <code>value</code> attribute</td>
<td>comma</td>
<td>Character that separates values in list, in <code>value</code> attribute.</td>
</tr>
</tbody>
</table>

### Example

```coldfusion
<!--- This example shows cfqueryparam with VALID input in Course_ID. --->
<h3>cfqueryparam Example</h3>
<cfset Course_ID = 12>
<cfquery name = "getFirst" dataSource = "cfdocexamples">
  SELECT *
  FROM courses
  WHERE Course_ID = <cfqueryPARAM value = "#{Course_ID}" CFSQLType = 'CF_SQL_INTEGER'>
</cfquery>
<cfoutput query = "getFirst">
  <p>Course Number: #{Course_ID}  
  Description: #{descript} </p>
</cfoutput>

<!--- This example shows the use of CFQUERYPARAM when INVALID string data is in Course_ID. --->
<p>This example throws an error because the value passed in the CFQUERYPARAM tag exceeds the MAXLENGTH attribute</p>
<cfset LastName="Peterson; DELETE employees WHERE LastName='Peterson'">
<!------- Note that for string input you must specify the MAXLENGTH attribute for validation. -------------------------------------------------->
<cfquery
  name="getFirst" datasource="cfdocexamples">
  SELECT *
  FROM employees
  WHERE LastName=<cfqueryparam
    value="#{LastName}" cfsqltype="CF_SQL_VARCHAR"
    maxlength="17">
</cfquery>
<cfoutput
  query="getFirst">
  <p>
  Course Number: #{FirstName} #{LastName} 
  Description: #{Department} </p>
</cfoutput>
```

### Tags r-s

#### cfregistry

**Description**
This tag is deprecated for the UNIX platform.
Reads, writes, and deletes keys and values in the system registry. Provides persistent storage of client variables.

**Note:** For this tag to execute, it must be enabled in the ColdFusion Administrator. For more information, see Configuring and Administering ColdFusion.

**Category**
Other tags, Variable manipulation tags

**Syntax**
The tag syntax depends on the action attribute value. See the following sections:

- `cfregistry action = "get"`
- `cfregistry action = "set"`
- `cfregistry action = "getAll"`
- `cfregistry action = "delete"`

**See also**
cfcookie, cfparam, cfsavecontent, cfschedule, cfset; About resource and sandbox security and Using Persistent Data and Locking in the Developing ColdFusion Applications

**History**
ColdFusion MX:

- Deprecated this tag on the UNIX platform. It might not work, and might cause an error, in later releases.
- Changed how persistent data is stored: ColdFusion now stores most persistent data outside the system registry, in XML files.

**cfregistry action = "getAll"**

**Description**
Returns all registry keys and values defined in a branch. You can access the values as you would any record set.

**Syntax**
```
<cfregistry
    action = "getAll"
    branch = "branch"
    name = "query name"
    sort = "asc|desc"
    type = "string|dWord|key|any"
>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
Using Persistent Data and Locking in the Developing ColdFusion Applications

<td></td>
</tr>
</tbody>
</table>
| sort      | Optional| asc | Sorts query column data (case-insensitive). Sorts on Entry, Type, and Value columns as text. Specify a combination of columns from query output, in a comma-delimited list. For example:  
sort = "value desc, entry asc"
  - asc: ascending (a to z) sort order.
  - desc: descending (z to a) sort order. |
| type      | Optional| string |  
- string: returns string values.
- dWord: returns DWord values.
- key: returns keys.
- any: returns keys and values. |

Usage

This tag returns #entry#, #type#, and #value# in a record set that you can access through tags such as cfoutput. To fully qualify these variables, use the record set name, as specified in the name attribute.

If #type# is a key, #value# is an empty string.

If you specify type= "any", getAll also returns binary registry values. For binary values, the #type# variable contains UNSUPPORTED and #value# is blank.

Example

<!--- This example uses cfregistry with the getAll action. --->
<cfregistry action = "getAll"
  branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"
  type = "Any" name = "RegQuery">
<h1>cfregistry action = "getAll"</h1>
<cfregistry action = "get"
  branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"
  type = "Any" name = "RegQuery">
  <cfoutput>
    <!--- This example uses cfregistry with the get action. --->
    <cftable query = "RegQuery" colHeaders HTMLTable border = "yes">
      <cfcol header = "<b>Entry</b>" width = "35" text = "#RegQuery.Entry#">
      <cfcol header = "<b>Type</b>" width = "10" text = "#RegQuery.type#">
      <cfcol header = "<b>Value</b>" width = "35" text = "#RegQuery.Value#">
    </cftable>
  </cfoutput>
</cfregistry>
ColdFusion Tags

Syntax
<cfregistry
    action = "get"
    branch = "branch"
    entry = "key or value"
    variable = "variable"
    type = "string|dWord|key">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

<td>Optional</td>
<td>string</td>
<td>string: returns string value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>dWord: returns DWord value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>key: returns key's default value.</td>
</tr>
</tbody>
</table>

Usage
If the value does not exist, the cfregistry tag does not create an entry.

Example
<!--- This example uses cfregistry with the get action. --->
<cfregistry action = "get"
    branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"
    entry = "ClassPath" type = "String" variable = "RegValue">
<h1>cfregistry action = "get"</h1>
<cfoutput>
    Java ClassPath value is #RegValue#
</cfoutput>

cfregistry action = "set"

Description
Adds a registry key, adds a value, or updates a value.
ColdFusion Tags

Syntax
<cfregistry
    action = "set"
    branch = "branch"
    entry = "key or value"
    type = "string|dWord|key"
    value = "data">

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td>Always set.</td>
<td></td>
</tr>
<tr>
<td>branch</td>
<td>Required</td>
<td>Name of a registry branch.</td>
<td></td>
</tr>
<tr>
<td>entry</td>
<td>Required</td>
<td>Key or value to set.</td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>• string: sets a string value (default).&lt;br&gt;• dWord: sets a DWord value.&lt;br&gt;• key: creates a key.</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>Optional</td>
<td>Value data to set. If you omit this attribute, the cfregistry tag creates default value, as follows:&lt;br&gt;• string: creates an empty string: &quot;&quot;.&lt;br&gt;• dWord: creates a value of 0 (zero).</td>
<td></td>
</tr>
</tbody>
</table>

Usage
If it does not exist, the cfregistry tag creates the key or value.

Example
```<!---- This example uses the cfregistry set action to modify registry value data. --->
<!---- Normally you pass in a filename instead of setting one here. --->
<cfset FileName = "dummy.cfm">
<cfregistry action = "set"
    branch = "HKEY_LOCAL_MACHINE\Software\cflangref"
    entry = "LastCFM01" type = "String" value = "#FileName#">
<h1>cfregistry action = "set"></h1>

**cfregistry action = "delete"**

Description
Deletes a registry key or value.
Syntax

```html
<cfregistry
    action = "delete"
    branch = "branch"
    entry = "key or value">

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Required</td>
<td>Always</td>
<td>Always delete.</td>
</tr>
</tbody>
</table>
| branch    | Required        |         | • For key deletion: name of registry key to delete. Do not specify the entry attribute.  
|           |                 |         | • For value deletion: name of registry branch that contains value to delete. Specify the entry attribute. |
| entry     | Required for value deletion | Value to delete. |

Usage

If you delete a key, the cfregistry tag also deletes values and subkeys defined beneath it.

Example

```html
<cfregistry action = "delete"
    branch = "HKEY_LOCAL_MACHINE\Software\cflangref\tempkey"
    entry = "LastCFM01">

<h1>cfregistry action = "delete"</h1>
```

**cfreport**

Description

Used to do either of the following:

- Execute a report created with the ColdFusion Report Builder, displaying it in PDF, Adobe® FlashPaper®, RTF, HTML, XML or Excel format. Optionally, you can save this report to a file.
- Run a predefined Crystal Reports report. Applies only to Windows systems.

Category

Data output tags
Syntex
ColdFusion Report Builder syntax:
<cfreport
  format = "PDF|FlashPaper|Excel|RTF|HTML|XML"
  template = "absolute pathname or pathname relative to the report file"
  encryption = "128-bit|40-bit|none"
  filename = "output filename"
  name = "ColdFusion variable"
  ownerpassword = "password"
  overwrite = "no|yes"
  permissions = "permission list"
  query = "query variable"
  resourceTimespan = #CreateTimeSpan (days, hours, minutes, seconds)#
  style = "CSS style definition or css file pathname"
  userpassword = "password">
<cfreportparam ...
</cfreport>

Crystal Reports syntax:
<cfreport
  report = "report path"
  dataSource = "data source name"
  formula = "formula"
  orderBy = "result order"
  password = "password"
  timeout = "number of seconds"
  type = "standard|netscape|microsoft"
  username = "username">
</cfreport>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

History
ColdFusion 8: Added the style and resourceTimespan attributes. Added the HTML and XML values to the format attribute.

ColdFusion MX 7.0.1: Added the RTF value to the format attribute, to let you generate reports in RTF format.

ColdFusion MX 7: Added support for the ColdFusion Report Builder.

ColdFusion MX: Changed data source connection behavior: Crystal Reports now establishes an independent connection to the data source. The connection is not subject to any ColdFusion data source-specific restrictions. For example, the Crystal Reports server can access a data source, regardless of whether it is disabled in the ColdFusion Administrator.
# Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Applies to</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datasource</td>
<td>Crystal Reports</td>
<td>Optional</td>
<td>Name of registered or native data source.</td>
<td></td>
</tr>
</tbody>
</table>
| encryption  | Report Builder | Optional | none | (format="PDF" only) Type of encryption for the report output. Valid values are:  
  - 128-bit  
  - 40-bit  
  - none |
| filename    | Report Builder | Optional | Filename to contain the report. You cannot specify both the name and filename attributes. The filename extension must match the value of the format attribute.  
  If you write report output to an HTML file, ColdFusion automatically creates a directory relative to the output file in the format filename files. Also, it generates PNG files for any charts in the report and copies of any image files imported into the report and stores them in this directory. |
| format      | Report Builder | Required | Format of the report output:  
  - PDF  
  - FlashPaper  
  - Excel  
  - RTF  
  - XML  
  - HTML  
  When you write report output directly to the browser in HTML format, ColdFusion generates a temporary directory and files for the images in the report. The location of the temporary directory that contains the image files is:  
  $C:\ColdFusion9\tmpCache\CFFileServlet\_cfreport\_report\[unique_identifier]\$  
  To determine when the images are removed from the browser, use the resourceTimespan attribute. |
| formula     | Crystal Reports | Optional | One or more named formulas. Terminate each formula with a semicolon. Use the format:  
  `formula = "formulaname1 = 'formula1';formulaname2 = 'formula2';"`  
  If you use a semicolon in a formula, escape it by typing it twice (\;). For example:  
  `formula = "Name1 = 'Val_1a:\;Val_1b';Name2 = 'Val2';"` |
<p>| name        | Report Builder | Optional | Name of the ColdFusion variable that contains the report output. You cannot specify both name and filename. This attribute is not valid when format=&quot;HTML&quot;. |
| orderBy     | Crystal Reports | Optional | Orders results according to your specifications. |</p>

</tr>
<tr>
<td>resourceTimespan</td>
<td>Report Builder</td>
<td>Optional</td>
<td>5 minutes</td>
<td>(format=“HTML” only) Life span of the resource directory. When you export a Report Builder report in HTML format, ColdFusion writes any images or other resource files in the report to a temporary resource directory. Use this attribute to determine when the resource directory is deleted. For the value, use the CreateTimeSpan function and specify the time span in days, hours, minutes, and seconds, separated by commas; for example, to delete the resource directory after one hour, specify: #CreateTimeSpan(0,1,0,0)# If the value is set to 0, the resource directory persists until the next server restart. ColdFusion deletes the resource directory only when format=“HTML” and neither the name nor filename attribute is specified. The default setting is 5 minutes: #CreateTimeSpan(0,0,5,0)#</td>
</tr>
<tr>
<td>style</td>
<td>Report Builder</td>
<td>Optional</td>
<td></td>
<td>Style in CSS format that overrides a style defined in the Report Builder report at run time. You can specify an absolute file path, a file path relative to the report, or a string in valid CSS format. For the styles to take effect, the style names must match Style Name attributes assigned to elements in the Report Builder report. You can generate a CSS file in Report Builder and export it or you can create a CSS file with a text editor. For a list of supported CSS styles, see the section Style properties.</td>
</tr>
</tbody>
</table>
ColdFusion Tags

Usage
Use this tag to generate a report using a report definition created in either ColdFusion Report Builder or in Crystal Reports. (For more information on using the ColdFusion Report Builder, display the online help by opening the Report Builder and pressing F1.)

Note: The Excel report output format type provides limited support for the formatting options available in ColdFusion Reporting. Images and charts are not supported and numeric data containing formatting (commas, percents, currency, and so on) appear as plain text in Excel. The Excel output format supports simple reports only and Adobe recommends that you give careful design and layout consideration to reports designed for Excel output.

This tag requires an end tag.

Using Cascading Style Sheets
You can override Cascading Style Sheets (CSS) in Report Builder reports at run time by using the style attribute of the cfreport tag in ColdFusion.

You can create CSS files in one of two ways: by exporting styles with the Export Report Styles icon in Report Builder or by creating a CSS file in any text editor. For the CSS styles to take effect, however, you must use Report Builder to assign the style names to the elements in the report. (The exception is the default style: you can use the style attribute to define the default style in ColdFusion and apply it to the report even if the default style is not defined in Report Builder.)

After you assign the style names in Report Builder, you can update the style definitions in the CSS file at any time and apply them at run time by using the cfreport and cfreportparam tags. If your report contains subreports, the default style applies to the master report and to all of the subreports. If the master report uses CSS styles other than the default style, the CSS styles do not apply to the subreports unless you specify them explicitly.

The following code shows how to apply three different style sheets to the main report and two subreports at run time:

```xml
<cfreport template="myreport.cfr" style="mystyle.css" format="PDF">
<cfreportParam subreport="subreport1" style="subreport1-style.css">
<cfreportParam subreport="subreport2" style="subreport2-style.css">
</cfreport>
```

The following code shows how to apply a CSS style as a value of the style attribute:

```
<cfreport template="myreport.cfr" style="style="some-style.css" format="PDF">
<cfreportParam subreport="subreport1" style="subreport1-style.css">
<cfreportParam subreport="subreport2" style="subreport2-style.css">
</cfreport>
```
The following code shows how to create a variable called `myStyle` and use it as a value of the `style` attribute:

```cfc
<cfset mystyle='mystyle { defaultStyle: false; font-family: "Comic Sans MS"; }'>
<cfreport template="myreport.cfr" style='#mystyle#' format="HTML">
</cfreport>
```

### Style attribute syntax

The style file or string must be valid CSS syntax. For more information, see [http://www.w3.org/Style/CSS/](http://www.w3.org/Style/CSS/). The style must contain one or more rule sets. Each rule set consists of a simple selector, which is the Report Builder style name, followed by a declaration block, which consists of a series of declarations separated by semicolons. A declaration is a property:value pair.

If a selector contains invalid syntax, ColdFusion ignores the selector and its declaration block. Selectors and properties not supported by this feature are ignored. Styles are case-insensitive, except parts not under the control of CSS (such as font names).

The following example shows the CSS definition for the default style:

```css
DefaultStyle
{
    default-style: true;
    color: black;
    font-family: Arial, "Comic Sans MS";
    font-size: 16;
    text-decoration: underline;
}
```

The following example shows the CSS definition for a custom style called `PurpleBoldItalicText`:

```css
PurpleBoldItalicText
{
    color: purple;
    font: italic bold 20px 30px Arial;
}
```

Identifiers for styles must be CSS2-compliant. For example, CSS1 allows `_` in identifiers, but CSS2 does not.

In CSS2, identifiers, including element names, classes, and IDs in selectors, can contain only the characters A-Z, a-z, and 0-9. Also, they can include ISO 10646 characters 161 and higher and the hyphen character (`-`); however, identifiers cannot start with a hyphen or a digit. They can contain escaped characters and any ISO 10646 character as a numeric code. For example, you can write the identifier "B&W?" as "B\&W\?" or "B\26 W\3F".

### Style properties

The following table shows the style properties exported by Report Builder:
<table>
<thead>
<tr>
<th>Property name</th>
<th>Report Builder only</th>
<th>Valid values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>background-color</td>
<td>No</td>
<td>See the section Valid color values</td>
<td>Background color of the specified report element, if the element is not transparent. The default background color is white.</td>
</tr>
<tr>
<td>border</td>
<td>No</td>
<td>[border-width]</td>
<td>A shorthand property that specifies the border-width, border-style, and border-color properties for all of the borders in an element.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[border-style]</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>[border-color]</td>
<td></td>
</tr>
<tr>
<td>border-color</td>
<td>No</td>
<td>See the section Valid color values</td>
<td>Border color for text, images, and charts. You can customize each side of the border. The default color is white.</td>
</tr>
<tr>
<td>border-style</td>
<td>No</td>
<td>solid</td>
<td>A shorthand property that specifies the border-top-style, border-right-style, border-bottom-style, and border-left-style (the comma-separated values must be in this order). If one or more values are not specified, the value for the opposite side is used. If only one value is listed, that value applies to all sides. The none value overrides the border-width value. Any other values, including hidden, dotted, groove, ridge, inset, outset, and double, are displayed as solid.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>dashed</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>border-top-color</td>
<td>No</td>

<tr>
<td>border-bottom-style</td>
<td>No</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>border-right-style</td>
<td>No</td>
<td>solid</td>
<td></td>
</tr>
<tr>
<td>border-top-width</td>
<td>No</td>
<td>thin</td>
<td>Thickness of the top, left, bottom, and right border of an element. Negative values are not valid. For more details see the section Border and margin styles:</td>
</tr>
<tr>
<td>border-left-width</td>
<td></td>
<td>medium</td>
<td>* thin = 1/2 pt</td>
</tr>
<tr>
<td>border-bottom-width</td>
<td></td>
<td>thick</td>
<td>* medium = 2px</td>
</tr>
<tr>
<td>border-right-width</td>
<td></td>
<td>1px</td>
<td>* thick = 4px</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2px</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>4px</td>
<td></td>
</tr>
<tr>
<td>border-width</td>
<td>No</td>
<td>thin</td>
<td>A shorthand property that specifies the border-top-width, border-right-width, and border-bottom-width properties with a single property and value notation (the comma-separated values must be in this order). If one or more values are not specified, the value for the opposite side is used. If only one value is listed, it applies to all sides:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>medium</td>
<td>* thin = 1/2 pt</td>
</tr>
<tr>
<td></td>
<td></td>
<td>thick</td>
<td>* medium = 2px</td>
</tr>
<tr>

<td>1px</td>
<td>* thick = 4px</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2px</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>4px</td>
<td></td>
</tr>
</tbody>
</table>
### Property name | Report Builder only | Valid values | Description |
|----------------|--------------------|--------------|-------------|
| clip           | No                 | auto, stretch, ratio | Specifies how images are resized:  
  - auto: If the dimensions of the source image differ from the element in the report, this attribute crops the image to fit within the element boundaries. The image is not resized. Only the part of the image that fits in the boundaries is displayed.  
  - stretch: If the dimensions of the source image differ from the element in the report, this attribute resizes the image so that it fits within the element boundaries. If the dimensions differ, the image is distorted.  
  - ratio: If the dimensions of the source image differ from the element in the report, this attribute resizes the image to fit within the element boundaries but maintains the aspect ratio of the source so that the image is not distorted. |
| color          | No                 | See the section Valid color values | Color of the text (in text elements) and the border (in graphic elements). The default color is black. |
| corner-radius  | Yes                | integer      | Radius for arcs used to draw the corner of rectangles. The default is 0 (square corners). Values less than 0 are interpreted as 0. |
| default-style  | Yes                | true, false  | Default style for elements that do not or cannot have a style applied. A subreport inherits its parent’s default-style if it does not have one of its own. |
| embed-pdf-font | Yes                | true, false  | Specifies whether fonts are embedded in the PDF document. Embedded fonts insure that the fonts display properly even if the font is not installed on the system where the report is viewed. |
| empty-cells    | No                 | show, hide   | Shows or hides a null value for text expressions:  
  - show: If the text expression returns a null value, the string "null" is displayed.  
  - hide: If the text expression returns a null value, the null value is replaced with an empty string. This is the default. |
| font           | No                 | {font-style}, {font-weight}, {font-size}, {line-height}, {font-family} | Font characteristic specifications. Use this as a shorthand to specifying multiple property values; for example:  
  font: italic 20px Arial;  
  Default values for this property match those used for the individual properties. Default values for the individual properties are applied to the values omitted from the font property. |
| font-family    | No                 | Comma-separated list of font names. | Group of fonts to apply to the element. The first font found in the list is applied to the element. The default is:  
  font-family: Arial, Helvetica, sansserif;  
  If a font name contains spaces, enclose the name in quotation marks, for example:  
  font-family: Courier, "Courier New", Arial; |
<table>
<thead>
<tr>
<th>Property name</th>
<th>Report Builder only</th>
<th>Valid values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font-size</td>
<td>No</td>
<td>[length]</td>
<td>Font size measured in points or pixels. Negative values are not valid. The default value is 10 points. You can specify points or pixels. 1 pixel = 0.75 points. This property also is a component of the font property. Standard CSS supports other types of values not supported by Report Builder.</td>
</tr>
<tr>
<td>font-style</td>
<td>No</td>
<td>normal, italic, oblique</td>
<td>Font style. The italic and oblique values are similar. The default value is normal. Also, this property is a component of the font property.</td>
</tr>
<tr>
<td>font-weight</td>
<td>No</td>
<td>normal, bold, bolder, lighter, 100, 200, 300, 400, 500, 600, 700, 800, 900</td>
<td>Font weight. Report Builder does not support varying degrees of boldness or lightness; therefore, normal and lighter appear as normal; all other values appear as bold. The default is normal. Also, this property is a component of the font property.</td>
</tr>
<tr>
<td>line-height</td>
<td>No</td>
<td>normal, [number], [length], [percentage]</td>
<td>Amount of space between consecutive lines of text:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>normal</strong>: Sets the line-height to single-spacing (default).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>number</strong>: A multiplier that determines the line height as a factor of the element’s font size. To determine the line height from this number, multiply the current element font-size by the number. Negative values are not valid.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>length</strong>: Sets the line height to an explicit length. You can specify points (for example, “20”) or pixels (for example, “20px”). 1 pixel = 0.75 points. Negative values are not valid. Standard CSS allows other units of length not supported by Report Builder.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>percentage</strong>: Defines the line-height as a percentage. The percent symbol is required (for example, 150%). Negative values are invalid.</td>
</tr>
<tr>
<td>line-size</td>
<td>Yes</td>
<td>none, thin, 1px, 2px, 4px, dashed</td>
<td>Type of the border around a graphic element or the type and the thickness of line elements. By default, lines and rectangles have a 1-pixel border; thin is 0.05 pixels.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
<table>
<thead>
<tr>
<th>Property name</th>
<th>Report Builder only</th>
<th>Valid values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>No</td>
<td>[top-integer]</td>
<td>Amount of blank space within the bounding box of an element. This is a shorthand property that specifies the margin-top, margin-right, margin-bottom, and margin-left properties with a single property and value notation (the values must be in this order separated by commas.) If one or more values are not specified, the value for the opposite side is used. If only one value is listed, it applies to all sides. For more details see the section Border and margin styles. CSS margins are transparent, which reveals the background of the parent element. Negative values are valid; this allows for text overlays. Examples: margin: 10,20,30,40; margin: 10; margin: 10,20,30;</td>
</tr>
<tr>
<td>margin-top</td>
<td>No</td>
<td>integer</td>
<td>See margin.</td>
</tr>
<tr>
<td>margin-left</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>margin-bottom</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>margin-right</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>parent-style</td>
<td>Yes</td>
<td>styleName</td>
<td>Name of the parent report style from which this style inherits some or all of its properties. The style name must be defined in either the report or before this style definition in the CSS file or text.</td>
</tr>
<tr>
<td>text-align</td>
<td>No</td>
<td>left, center, right, justify</td>
<td>Alignment of text and images on the horizontal axis. The default value is left.</td>
</tr>
<tr>
<td>text-decoration</td>
<td>No</td>
<td>underline, line-through</td>
<td>Text characteristics not defined with the font-style and font-weight properties. The color of the text-decoration is determined by the color property for the element. Unknown values are ignored.</td>
</tr>
<tr>
<td>text-rotation</td>
<td>Yes</td>
<td>none, left, right</td>
<td>Rotation of text elements. Use it to change the text direction by rotating it 90 degrees to the right or left.</td>
</tr>
</tbody>
</table>
Styles or values that are not supported by Report Builder are ignored in the report, in which case, if a default-style is defined, Report Builder applies the default style to the element.

**Valid color values**

You can specify a color as #RRGGBB. This represents a color that uses a triplet of hexadecimal values concatenated together. The values represent the red, green, and blue components for a given color. The range of each component value is 00-FF in hexadecimal. Also, you can use one of the 140 X11 color names (see http://www.blooberry.com/indexdot/color/x11makerFrameNS.htm). The color name is case-insensitive. This set of names assigns names to specific RGB values. Also, a color name can also be specified as ##RGB, rgb(r,g,b), or rgb(r%,g%,b%). See CSS Color Units for syntax details (see http://www.blooberry.com/indexdot/css/syntax/units/color.htm). UI Name is not supported.

The following example shows the different ways you can represent the color lime:

    color: lime
    color: #00FF00
    color: #0F0
    color: rgb(0,255,0)
    color: rgb(0%,50%,0%)

If you specify a color in hexadecimal format as part of the style attribute for the cfreport tag, use the format ##00FF00. For example:

    <cfreport template="myreport.cfr" style='mystyle { defaultStyle: true;
      font-family: "Comic Sans MS"; color: ##00FF00; }' format="HTML"/>

**Border and margin styles**

Use the border-width, border-style, border-color, and margin properties when all four sides of the element have the same value. You can specify from one to four parameters for these properties:
You can use the properties for each side of a border to override the style specified by the `border-width`, `border-style`, `border-color`, and `margin` properties.

### Example

#### Example 1: This example shows the use of cfreport for the ColdFusion Report Builder.

```coldfusion
<cfquery name="northwindemployees" datasource="localnorthwind">
    SELECT EmployeeID, LastName, FirstName, Title, City, Region, Country 
    FROM Employees 
    ORDER BY Country, City
</cfquery>

<CFREPORT format="PDF" template="FifthReport.cfr" 
query="#northwindemployees#"/>
```

#### Example 2: This view-only example shows the use of cfreport for Crystal Reports.

```coldfusion
<h3>cfreport Tag</h3>
<p>cfreport lets reports from the Crystal Reports Professional report writer display through a ColdFusion interface. To run, the tag requires the name of the report. cfreport can also pass information to the report file displayed, to change the output conditions.</p>
<p>This example would run a report called "monthlysales.rpt " and pass it an optional filter condition to show only the information for a subset of the report.</p>

```coldfusion
cfreport report = '/reports/monthlysales.rpt'
{Departments.Department} = 'International'
```
The `cfreportparam` tag is always a child tag of the `cfreport` on page 589 tag.

**Category**

Data output tags

**Syntax**

```coldfusion
<cfreport template = "...">
  <cfreportparam
    chart = "name of the chart contained in the report or subreport"
    name = "data name"
    query = "query value passed to the chart or subreport"
    series = "ordinal number of a chart series"
    style = "CSS style definition or CSS file pathname"
    subreport = "name of the subreport"
    value = "data value">
</cfreport>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

`cfreport`; Creating Reports with Report Builder in the *Developing ColdFusion Applications*; Report Builder online Help

**History**

ColdFusion 8: Added the chart, query, series, subreport, and style attributes.

ColdFusion MX 7: Added this tag.

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chart</td>
<td>Optional</td>
<td></td>
<td>Name of the chart contained in a report or subreport. The value of this attribute must match Name property of a chart defined in the Report Builder report. If you specify the chart attribute, you cannot specify the subreport or name attribute.</td>
</tr>
<tr>
<td>name</td>
<td>Optional</td>
<td></td>
<td>Variable name for data that is passed. The value of this attribute must match the name of an input parameter defined in the Report Builder report. If you specify the name attribute, you cannot specify the chart or subreport attribute.</td>
</tr>
<tr>
<td>query</td>
<td>Optional</td>
<td></td>
<td>Query value to pass to a subreport or chart. The ColdFusion query must contain at least all of the columns included in the Report Builder query. Charts and subreports require this attribute.</td>
</tr>
<tr>
<td>series</td>
<td>Optional</td>
<td>1</td>
<td>Ordinal number of a chart series to use for the query. This attribute is valid only when the chart attribute is specified.</td>
</tr>
</tbody>
</table>
Usage
You can specify only one of the following attributes in a `cfreportparam` tag:

- `name`
- `subreport`
- `chart`

You can use the `query`, `subreport`, and `chart` attributes to override Report Builder queries and chart information at run time. This way you can customize subreport and chart data from the CFM page without having to change the queries built into your report.

For example, in Report Builder, you can create a master report that contains several subreports and populate each subreport with a different query. Instead of modifying the queries in Report Builder, you can customize your reports by creating modified queries on the ColdFusion calling page. The ColdFusion query must contain at least all of the columns included in the Report Builder query.

**Note:** You cannot specify a subreport query that depends on arguments from the master report. Instead, you can define a CFML function or CFC method that returns the subreport query given the arguments from the master report. ColdFusion calls this code when it executes the subreport.

On the calling CFM page, you can specify a `cfreportparam` tag for any subreport and chart in the Report Builder report. The value of the `subreport` or `chart` attribute must match the Name property of the subreport or chart defined in the Report Builder report. (Charts are treated like subreports.)

The following code shows a master report that contains two subreports and a chart with two chart series:

```cfml
<cfreport template="myreport.cfr" query="master" format="RTF">
  <cfreportParam subreport="subreport1" query="subquery1">
  <cfreportParam subreport="subreport2" query="subquery2">
  <cfreportParam chart="chart1" series="1" query="chartquery1">
  <cfreportParam chart="chart1" series="2" query="chartquery2">
  <cfreportParam name="ReportDate" value="#DateFormat(Now())#, #TimeFormat(Now())#">
</cfreport>
```

The `cfreportparam` tag also lets you override CSS styles assigned to subreports in Report Builder. Use the `style` attribute with the `subreport` attribute; the value of the `subreport` attribute must match the name of the subreport in Report Builder. The following code applies a style sheet to the master report and two different style sheets to the subreports:
<cfreport template="myreport.cfr" style="myStyle.css" format="PDF">
  <cfreport Param subreport="subreport1" style="subreport-style.css">
  <cfreport Param subreport="subreport2" style="subreport-style.css">
</cfreport>

For more information, see the section Using Cascading Style Sheets.

Example

<!--- The following example shows how to override a query in a Report Builder report from the
CFM page. The cfreportparam tag adds the current date and time to the report.--->
<cfquery name="coursedept" datasource="cfdocexamples">
  SELECT Departments.Dept_ID as dDept_ID, Departments.Dept_Name,
  CourseList.Course_ID, CourseList.Dept_ID as cDept_ID,
  CourseList.CorNumber, CourseList.CorName,
  CourseList.CorLevel
  FROM Departments, CourseList
  WHERE Departments.Dept_ID = CourseList.Dept_ID
  ORDER BY CourseList.Dept_ID
</cfquery>

<cfreport format="PDF" template="FourthReport.cfr" query="#coursedept#" overwrite="yes">
  <cfreport Param name="ReportTime" value="#DateFormat(Now())#, #TimeFormat(Now())#">
</cfreport>

cfrethrow

Description
Rethrows the currently active exception. Preserves the exception’s cfcatch.type and cfcatch.tagContext variable values.

Category
Exception handling tags, Extensibility tags

Syntax
<cfrethrow>

See also
cferror, cfthrow, cftry; Handling runtime exceptions with ColdFusion tags in the Developing ColdFusion Applications

Usage
Use this tag within a cfcatch block. This tag is useful in error handling code, if the error handler cannot handle an error that it catches. For example, if cfcatch type = "any" gets a DATABASE exception, and the code is designed to handle only CFX exceptions, the handler raises the exceptions again, with details intact, so that a higher-level handler can process the error information. If you used the cfthrow tag, the type and details of the original exception would be lost.
Example

```coldfusion
<h3>cfrethrow Example</h3>
<!--- Rethrow a DATABASE exception. --->
<cftry>
  <cftry>
    <cfquery name = "GetMessages" dataSource = "cfdocexamples">
      SELECT*
      FROM Messages
    </cfquery>
    <cfcatch type = "DATABASE">
      <!--- If database signalled a 50555 error, ignore; otherwise, rethrow exception. --->
      <cfif cfcatch.sqlstate neq 50555>
        <cfrethrow>
      </cfif>
    </cfcatch>
  </cftry>
  <cfcatch>
    <h3>Sorry, this request can't be completed</h3>
    <h4>Catch variables</h4>
    <cfoutput>
      <cfloop collection = #cfcatch# item = "c">
        <br>
        <cfif IsSimpleValue(cfcatch[c])>#c# = #cfcatch[c]#
      </cfloop>
    </cfoutput>
  </cfcatch>
</cftry>
```

cfreturn

**Description**

Returns result values from a component method. Contains an expression returned as result of the function.

**Return value**

An expression; the result of the function from which this tag is called.

**Category**

Extensibility tags

**Syntax**

```coldfusion
<cfreturn expr>
```

**See also**

`cfargument, cfcomponent, cffunction, cfinvoke, cfinvokeargument, cfobject, cfproperty`; Building and Using ColdFusion Components in the Developing ColdFusion Applications

**History**

ColdFusion MX: Added this tag.
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr</td>
<td>Required</td>
<td></td>
<td>Function result; value of any type.</td>
</tr>
</tbody>
</table>

Usage
This tag is equivalent to a `return` statement within a `cfscript` tag. It accepts one return variable argument. To return more than one value, populate a structure with name-value-pairs, and return the structure with this tag.

To access the result value from this tag, you use the variable scope that is the value of the `cfinvoke` tag `returnVariable` attribute.

You can code a maximum of one `cfreturn` tag within a function.

For example code, see Building and Using ColdFusion Components in the Developing ColdFusion Applications.

Example
```xml
<cfcomponent>
  <cffunction name="getEmp">
    <cfquery name="empQuery" datasource="ExampleApps" >
      SELECT FIRSTNAME, LASTNAME, EMAIL
      FROM tblEmployees
    </cfquery>
    <cfreturn empQuery>
  </cffunction>
  <cffunction name="getDept">
    <cfquery name="deptQuery" datasource="ExampleApps" >
      SELECT *
      FROM tblDepartments
    </cfquery>
    <cfreturn deptQuery>
  </cffunction>
</cfcomponent>
```

cfsavecontent

Description
Saves the generated content of the `cfsavecontent` tag, including the results of evaluating expressions and executing custom tags, in the specified variable.

Category
Variable manipulation tags

Syntax
```xml
<cfsavecontent
  variable = "variable name">
  the content
</cfsavecontent>
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.
See also
Caching parts of ColdFusion pages in the *Developing ColdFusion Applications*

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>Required</td>
<td></td>
<td>Name of the variable in which to save the generated content of the tag.</td>
</tr>
</tbody>
</table>

Usage
This tag requires an end tag.

You cannot use this tag to suppress output from a tag library.

Example
The following example uses a custom tag to generate a report and saves the report in the variable CONTENT. It replaces all instances of the word "report" with the phrase "MyCompany Quarterly Report" and outputs the result.

```cfml
<cfsavecontent variable="content">
  <CF_OutputBigReport>
</cfsavecontent>
<cfoutput>
  #replace(content, "report", "MyCompany Quarterly Report", "all")#
</cfoutput>
```

cfschedule

Description
Provides a programmatic interface to the ColdFusion scheduling engine. Can run a CFML page at scheduled intervals, with the option to write the page output to a static HTML page. This feature enables you to schedule pages that publish data, such as reports, without waiting while a database transaction is performed to populate the page.

Category
*Variable manipulation tags*
Syntax

```xml
<cfschedule
    action = "run|update|pause|resume|delete|pauseall|resumeall|list"
    task = "task name"
    endDate = "date"
    endTime = "time"
    file = "filename"
    interval = "seconds"
    operation = "HTTPRequest"
    password = "password"
    path = "path to file"
    port = "port number"
    proxyPassword = "password"
    proxyPort = "port number"
    proxyServer = "host name"
    proxyUser = "user name"
    publish = "yes|no"
    requestTimeOut = "seconds"
    resolveURL = "yes|no"
    isDaily = "yes|no"
    overwrite = "yes|no"
    startDate = "date"
    startTime = "time"
    url = "URL"
    username = "user name">
    <group="group1"
        oncomplete="how to handle exception"
        eventhandler="path_to_event_handler"
        onException="refire|pause|invokeHandler"
        cronTime="time"
        repeat="number"
        priority="integer"
        exclude="date|date_range|comma-separated_dates"
        onMisfire = ""
        cluster="yes|no"
        mode="server|application"
        retryCount="number"
    </group1>
</cfschedule>

OR

```xml
<cfschedule
    action = "delete"
    task = "task name">
</cfschedule>

OR

```xml
<cfschedule
    action = "run"
</cfschedule>
```
task = "task name">

OR

<cfschedule
    action = "pauseAll"
    mode = "server|application">

OR

<cfschedule
    action = "resumeAll"
    mode = "server|application">

OR

<cfschedule
    action = "list"
    mode = "server|application"
    result = "res">

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

History
ColdFusion 10: Added the actions list, pauseAll, and resumeAll. Also, added the attributes group, onComplete, eventHandler, onException, cronTime, repeat, priority, exclude, onMisfire, cluster, mode, isDaily, overwrite, and retryCount.

ColdFusion MX 6.1: Changed the way intervals are calculated. The day length now reflects changes between standard and daylight saving times. The month length is now the calendar month length, not four weeks. The scheduler handles leap years correctly.

<td>The number of reattempts if the task fails. The value must be greater than or equal to 0 and less than or equal to 3.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Usage
This tag and the ColdFusion Administrator Scheduled task page schedule ColdFusion tasks. Tasks that you add or change using this tag are visible in the Administrator. You can disable this tag in the Administrator Sandbox/Resource security page. This tag’s success or failure status is written to the schedule.log file in the cf_root/logs directory (cf_webapp_root/WEB-INF/cfusion/logs in the multiserver and J2EE configurations).

When you create a task, you specify the URL of the ColdFusion page to execute, the date, time and frequency of execution, and whether to publish the task output to an HTML file. If the output is published, you specify the output file path and file.

If you schedule a job to run monthly on any date in the range 28-31, the scheduler does the following:

- If you schedule a monthly job to run on the last day of a month, the scheduled job will run on the last day of each month. For example, if you schedule a monthly job to start on January 31, it will run on January 31, February 28 or 29, March 31, April 30, and so on.

- If you schedule a monthly job to run on the 29th or 30th of the month, the job will run on the specified day of each month for 30 or 31-day months, and the last day of February. For example, if you schedule a monthly job to start on January 30, the job will run on January 30, February 28 or 29, March 30, April 30, and so on.

If you schedule a job to run once, the starting time is in the past, and the task has not yet run, it runs immediately. If you schedule a recurring job with a start time in the past, ColdFusion schedules the job to run on the next closest interval in the future.

The Scheduler configuration file, cf_root/lib/neo-cron.xml contains all scheduled events, as individual entries (except the clustered tasks).

Example
<h3>cfschedule Example</h3>
<!--- This read-only example schedules a task. To run the example, remove the comments around the code and change the startDate, startTime, url, file, and path attributes to appropriate values. --->
<html>

<!---<cfschedule action = "update"
    task = "TaskName"
    operation = "HTTPRequest"
    url = "http://127.0.0.1/playpen/history.cfm"

    startTime = "12:25 PM"
    interval = "3600"
    resolveURL = "Yes"
    publish = "Yes"
    file = "sample.html"
    path = "c:\inetpub\wwwroot\playpen"
    requestTimeOut = "600">--->

<cfscript>

</cfscript>

Description
Encloses a code block that contains cfscript statements.
Category
Application framework tags, Other tags

Syntax
<cfscript>

cfscript code here
</cfscript>

See also
cfinvoke, cfmessagebox, CreateObject; Extending ColdFusion Pages with CFML Scripting in the Developing ColdFusion Applications

History
ColdFusion MX:

- Changed how to invoke component methods: this tag can now invoke component methods, using the CreateObject function
- Changed use of reserved words: you cannot use ColdFusion reserved words within this tag
- Added the try and catch statements.

Usage
Performs processing in CFScript. This tag uses ColdFusion functions, expressions, and operators. You can read and write ColdFusion variables within this tag.

For a detailed description of the CFScript scripting language, including documentation of CFScript statements and the CFScript equivalents of CFML tags, see Extending ColdFusion Pages with CFML Scripting in the Developing ColdFusion Applications.

You can use this tag to enclose a series of assignment statements that would otherwise require cfset statements.

Important: If you code a cftry/cfcatch block within this tag using an exception’s Java class name, provide the fully qualified class name.

You cannot use some ColdFusion reserved words in this tag. You cannot put a user-defined function whose name begins with any of these strings within this tag:

- cf
- cf_
- _cf
- coldfusion
- coldfusion_
- _coldfusion

You cannot use the elseif construct within a cfscripct tag. You can use code such as the following:

```cfscript
else if ( condition )
{
  ...
}
```
Keywords
The following words are now treated as keywords:

- import
- finally
- component
- interface
- pageencoding

Exception handling with the cfscript tag
To handle exceptions with this tag, use try and catch statements, which are equivalent to the cftry and cfcatch tags. For each try statement, you must have a catch statement. In the catch block, the variable exceptionVariable contains the exception type. This variable is the equivalent of the cfcatch tag built-in variable cfcatch.Type. For more information, see Extending ColdFusion Pages with CFML Scripting in the Developing ColdFusion Applications.

Invoking ColdFusion components with the cfscript tag
CFScript invokes component methods using the CreateObject function.

The following example shows how to invoke a component object with the cfscript tag, using ordered arguments:

```cfscript
quote = CreateObject( "component", "nasdaq.quote" ) ;
<!--- Invocation using ordered arguments. --->
res = quote.getLastTradePrice( "macr" ) ;
</cfscript>
```

The following example shows how to use an attribute collection within the cfscript tag to pass parameters when invoking a component object. An attribute collection is a structure in which each key corresponds to a parameter name and each value is the parameter value passed for the corresponding key.

```cfscript
stArgs = structNew();
stArgs.zipcode = "55987";
</cfscript>
```

```cfinvoke
webservice = "http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
method = "getTemp"
argumentCollection = "#stArgs#"
returnVariable = "aTemp";
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

In this example, the structure is created in a cfscript block, but you can use any ColdFusion method to create the structure.

Consuming web services with the cfscript tag
The following example shows how to consume a web service with the cfscript tag. You use the CreateObject function to connect to the web service.
<cfscript>
ws = CreateObject("webservice",
    "http://www.xmethods.net/sd/2001/TemperatureService.wsdl");
xlatstring = ws.getTemp("55987");
writeoutput(xlatstring);
</cfscript>

For more information, see Using Web Services in the Developing ColdFusion Applications.

Example
<p>This simple example shows variable declaration and manipulation.
<cfif IsDefined("form.myValue")>
    <cfif IsNumeric(form.myValue)>
        <cfset x = form.myValue>
        <cfscript>
            y = x;
            z = 2 * y;
            StringVar = form.myString;
        </cfscript>
    
    <cfoutput><p>twice #x# is #z#.
    <p>Your string value was: <b><I>#StringVar#</I></p></cfoutput>
<cfelse>
</cfelse>

cfsearch

Description
Searches one or more Solr collections.
A collection must be created and indexed before this tag can return search results.
A collection can be created in these ways:
• With the <i>cfcollection</i> on page 88 tag
• In the ColdFusion Administrator
A collection can be indexed in the following ways:
• In ColdFusion, with the <i>cfindex</i> on page 358 tag
• In the ColdFusion Administrator, which calls the <i>cfindex</i> tag
For more information, see Building a Search Interface in the Developing ColdFusion Applications.

Category
Extensibility tags
Syntax

cfsearch supports script style syntax:

```
new search().search(name="<search_name>", collection="<collection_name>");
```

cfsearch supports script style syntax:

```
<cfsearch
    collection = "collection name"
    name = "search name"
    category = "category[,category2,...]"
    categoryTree = "tree location"
    contextBytes = "number of bytes"
    contextHighlightBegin = "HTML string"
    contextHighlightEnd = "HTML string"
    contextPassages = "number of passages"
    criteria = "search expression"
    language = "language"
    maxRows = "number"
    orderBy = "rank_order"
    previousCriteria = "criteria"
    startRow = "row number"
    status = ""
    suggestions = "suggestion option"
    type = "criteria">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfcollection, cfexecute, cfindex, cfoject, cfreport, cfwddx

**History**

**ColdFusion 10:** New attribute orderBy

**ColdFusion 9:** Added support for Solr search engine.

**ColdFusion MX 7:**

- Added category, categoryTree, status, suggestions, contextPassages, contextBytes, contextHighlightBegin, contextHighlightEnd, and previousCriteria attributes.
- Added author, category, categoryTree, context, rank, size, recordsSearched, and type result columns.
- Added information on the status structure and its associated keys.
- Removed references to a separate K2 server and k2server.ini file.
- Removed references to unregistered collections.
- Removed references to external collections. ColdFusion MX now manages all collections through the Verity Search service.
- Changed cflock recommendation. It is no longer a best practice to surround the cfsearch tag with a cflock tag.
ColdFusion MX:

- Deprecated the `external` attribute. It might not work, and might cause an error, in later releases. (ColdFusion stores this information about each collection; it automatically detects whether a collection is internal or external.)
  This tag supports absolute (also known as fully qualified) collection pathnames and mapped collection names.
- Changed query result behavior: the `cfindex` tag can index the query results from a `cfsearch` operation.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed multiple collection behavior: this tag can search multiple collections. In a multiple collection search, you cannot combine collections that are registered with K2Server and registered in another way.
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed the following support: this tag supports Verity 2.6.1 and the LinguisitX and ICU locales.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>Name of the search query.</td>
</tr>
<tr>
<td>collection</td>
<td>Required</td>
<td></td>
<td>One or more collection names. You can specify more than one collection unless you are performing a category search (that is, specifying <code>category</code> or <code>categoryTree</code>).</td>
</tr>
<tr>
<td>category</td>
<td>Optional</td>
<td></td>
<td>A list of categories, separated by commas, to which the search is limited. If specified, and the collection does not have categories enabled, ColdFusion throws an exception.</td>
</tr>
<tr>
<td>categoryTree</td>
<td>Optional</td>
<td></td>
<td>The location in a hierarchical category tree at which to start the search. ColdFusion searches at and below this level. If specified, and the collection does not have categories enabled, ColdFusion throws an exception. Can be used in addition to the <code>category</code> attribute.</td>
</tr>
<tr>
<td>criteria</td>
<td>Optional</td>
<td></td>
<td>Search criteria. Follows the syntax rules of the <code>type</code> attribute. If you pass a mixed-case entry in this attribute, the search is case sensitive. If you pass all uppercase or all lowercase, the search is case-insensitive. Follow Solr syntax and delimiter character rules; see Solr search support in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>contextBytes</td>
<td>Optional</td>
<td>300</td>
<td>The maximum number of bytes returned in the context summary.</td>
</tr>
<tr>
<td>contextHighlightBegin</td>
<td>Optional</td>
<td><code>&lt;b&gt;</code></td>
<td>The HTML to prepend to search terms in the context summary. Use this attribute in conjunction with <code>contextHighlightEnd</code> to highlight search terms in the context summary.</td>
</tr>
<tr>
<td>contextHighlightEnd</td>
<td>Optional</td>
<td><code>&lt;/b&gt;</code></td>
<td>The HTML to append to search terms in the context summary. Use this attribute in conjunction with <code>contextHighlightBegin</code> to highlight search terms in the context summary.</td>
</tr>
<tr>
<td>contextPassages</td>
<td>Optional</td>
<td>0</td>
<td>The number of passages/sentences Solr returns in the context summary (that is, the <code>context</code> column of the results). The default is 0, which disables context summary.</td>
</tr>
<tr>
<td>language</td>
<td>Optional</td>
<td><code>english</code></td>
<td>Deprecated. This attribute is now ignored and the language of the collection is used to perform the search.</td>
</tr>
<tr>
<td>maxRows</td>
<td>Optional</td>
<td><code>all</code></td>
<td>Maximum number of rows to return in query results.</td>
</tr>
<tr>
<td>orderBy</td>
<td>Optional</td>
<td></td>
<td>Sorts the custom field column rank order. By default, it sorts in ascending order.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Usage

The `<cfsearch>` tag returns a query object whose columns you can reference in a `<cfoutput>` tag. For example, the following code specifies a search for the exact terms “filming” or “filmed”:

```coldfusion
<cfsearch
    name = "mySearch"
    collection = "myCollection"
    criteria = '<WILDCARD>`film{ing,ed}`'
    type="explicit"
    startrow=1
    maxrows = "100">
<cfdump var = "#mySearch#>
```

In this example, the single-quotation mark (') and backtick (`) characters are used as delimiters.

To optimize search performance, always specify the `maxrows` attribute, setting it to a value that matches your application’s needs. A value less than 300 helps to ensure optimal performance.

Adobe does not recommend using the “`cflock`” on page 412 tag with this tag; Solr provides the locking function. Using the “`cflock`” on page 412 tag slows search performance.
### The cfsearch tag result columns

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>A context summary containing the search terms, highlighted in bold (by default). This is enabled if you set the contextpassages attribute to a number greater than zero.</td>
</tr>
<tr>
<td>url</td>
<td>Value of URLpath attribute in the cfindex tag used to populate a collection.</td>
</tr>
<tr>
<td>key</td>
<td>Value of the key attribute in the cfindex tag used to populate a collection.</td>
</tr>
<tr>
<td>title</td>
<td>Value of title attribute in cfindex tag used to populate the collection, including PDF and Office document titles. If a title is not extracted from the document, the tag uses the cfindex:title attribute value for each row.</td>
</tr>
<tr>
<td>score</td>
<td>Relevancy score of document based on search criteria.</td>
</tr>
<tr>
<td>custom1, custom2, custom3, custom4</td>
<td>Value of custom fields in cfindex tag used to populate a collection.</td>
</tr>
<tr>
<td>size</td>
<td>The number of bytes in the index document.</td>
</tr>
<tr>
<td>rank</td>
<td>The rank of this document in the search results.</td>
</tr>
<tr>
<td>author</td>
<td>Extracted from the HTML, Office, and PDF documents when available.</td>
</tr>
<tr>
<td>type</td>
<td>The MIME type of the document.</td>
</tr>
<tr>
<td>category</td>
<td>A list of the categories that were specified for this document when it was indexed.</td>
</tr>
<tr>
<td>categoryTree</td>
<td>A hierarchical category tree, or serial list of categories, that was specified for this document when it was indexed. Only a single tree is returned.</td>
</tr>
<tr>
<td>summary</td>
<td>Contents of automatic summary generated by cfindex.</td>
</tr>
<tr>
<td>recordCount</td>
<td>Number of records returned in record set.</td>
</tr>
<tr>
<td>currentRow</td>
<td>Current row that cfoutput is processing.</td>
</tr>
<tr>
<td>columnList</td>
<td>List of column names within record set.</td>
</tr>
<tr>
<td>recordsSearched</td>
<td>Number of records searched. This is the same value for each row in the record set. Corresponds to the searched key in the status structure.</td>
</tr>
</tbody>
</table>

### Status structure keys

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>found</td>
<td>The number of documents that contain the search criteria.</td>
</tr>
<tr>
<td>searched</td>
<td>The number of documents searched. Corresponds to the recordsSearched column in the search results.</td>
</tr>
<tr>
<td>time</td>
<td>The number of milliseconds the search took.</td>
</tr>
<tr>
<td>suggestedQuery</td>
<td>An alternative query that might produce better results. This often contains corrected spellings of search terms. Present only when the suggestions tag attribute criteria is met.</td>
</tr>
<tr>
<td>keywords</td>
<td>A structure containing each search term as a key to an array of up to five possible alternative terms, in order of preference. Present only when the suggestions attribute criteria is met.</td>
</tr>
<tr>
<td>keywordScore</td>
<td>A structure in the same format as for keywords.</td>
</tr>
</tbody>
</table>

    custom1=#book.custom1#<br>
    custom2=#book.custom2#<br>
    summary=#book.summary#<br>
    recordcount=#book.recordcount#<br>
    currentrow=#book.currentrow#<br>
    columnlist=#book.columnlist#<br>
    recordssearched=#book.recordssearched#<br>
</cfoutput>
<cfdump var = #book#>

cfselect

Description
Constructs a drop-down list box form control. Used in a cfform tag. You can populate the list from a query, or by using the HTML option tag.

Category
Forms tags
Syntax
<cfselect
    name="name" bind="bind expression"
    bindAttribute="attribute name"
    bindOnLoad="yes|no"
    display="text" editable="yes|no"
    enabled="yes|no"
    group="query column name" height="number of pixels"
    id="HTML id"
    label="label" message="text" multiple="yes|no"
    onBindError="JavaScript function name"
    onChange="JavaScript or ActionScript"
    onClick="JavaScript function name"
    onError="JavaScript"
    onKeyDown="JavaScript or ActionScript"
    onMouseDown="JavaScript or ActionScript"
    onMouseUp="JavaScript or ActionScript"
    query="query name" queryPosition="above|below"
    required="yes|no"
    selected="value or list" size="integer" sourceForTooltip="URL"
    style="style specification" tooltip="text"
    value="text" visible="yes|no"
    width="number of pixels">
zero or more HTML option tags
</cfselect>

Some attributes apply to only specific display formats. For details see the Attributes table.

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

cfapplet, cfcalendar, cfform, cfformgroup, cfformitem, cfgrid, cfinput, cfslider, cftextarea, cftree;
Introduction to Retrieving and Formatting Data and Using Ajax User Interface Components and Features in the Developing ColdFusion Applications

History
ColdFusion 8:
• Added support for binding in HTML format forms, including the bind, bindAttribute, and bindOnLoad, and onBindError attributes.
• Added support for tool tips in HTML format forms, including the sourceForTooltip attribute.

ColdFusion MX 7:
• When populating a cfselect tag with a query when the database field has spaces instead of a value, the error processing of the cfform tag required field is not triggered as it was in ColdFusion MX 6.1.
• Added support for specifying multiple values to the selected attribute.
• Deprecated the passthrough attribute. The tag now supports all HTML select tag attributes directly.
• Added on-prefixed attributes.
• Added enabled, group, height, label, queryPosition, tooltip, visible, and width attributes.

Attributes
The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML select tag attributes that are not on this list, and passes them directly to the browser.

Note: Attributes that are marked as Flash only are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt: Format</th>

</tr>
<tr>
<td>query</td>
<td>Optional; All</td>
<td></td>
<td>Name of query to populate drop-down list.</td>
</tr>
</tbody>
</table>
| queryPosition | Optional; All | above | If you populate the options list with a query and use HTML option child tags to specify additional entries, this attribute determines the location of the items from the query relative to the items from the option tags:  
  - above: puts the query items above the options items.  
  - below: puts the query items below the options items. |
| required      | Optional; All | no | Note: This attribute has no effect if you omit the size attribute or set it to 1, because the browser always submits the displayed item. You can work around this issue: format forms by having an initial option tag with value=" " (notice the space character between the quotation marks). This workaround applies only for Flash forms and not for HTML forms or XML forms.  
  - yes: a list element must be selected when the form is submitted.  
  - no |
| selected      | Optional; All | | One or more option values to preselect in the selection list. To specify multiple values, use a comma-delimited list. This attribute applies only if selection list items are generated from a query. The cfform preserveData attribute can override this value. |
Usage
For this tag to work properly, the browser must have JavaScript enabled.

This tag requires an end tag and can include HTML option and optgroup child tags.

To ensure that a selected list box item persists across postbacks, use the cfform tag preserveData attribute with a list generated from a query. (This strategy works only with data that is populated from a query.)

If the cfform preserveData attribute is yes and the form posts back to the same page, and if the control is populated by a query, the posted selections for the cfselect control are used instead of the Selected attribute. For controls that are populated with regular HTML option tags, the developer must dynamically add the Selected attribute to the appropriate option tags.

The group option generates a query by using SQL GROUP BY syntax and places the value column entries from each group in an indented list under the group column’s field value. This option generates an HTML optgroup tag for each entry in the group column.

Close each HTML option tag in the cfselect tag body with a </option> end tag. If you do not do so, and you specify queryPosition="below", the first item from the query might not appear in the list.

The bind attribute lets you set cfselect attributes dynamically. Often, it is used to dynamically create the options list based on values that the user enters in the form. For example, you can use the bind attribute to create a Cities option list based on the user’s selection from a States cfselect control.
When you use a bind attribute to populate the selection list, the function or URL that returns the selection values must return one of the following:

- A two-dimensional array, where the first element in each array row is the option value and the second element in the row is the text to display in the option list.
- If the bind specifies a CFC function, a query, or, if the bind specifies a URL, a JSON representation of a query. The query must include columns whose names are the values of the cfselect tag value and display attributes. Although you can return additional columns, you cannot use them in your client-side code. When you call a CFC function, you do not have to convert the query to JSON format yourself; ColdFusion automatically does the conversion.

To use this format, specify a value attribute. If you omit the display attribute, you must have only a single column in the query that contains the values; the values are also used as the displayed text.

For detailed information on binding, see Binding data to form fields in the Developing ColdFusion Applications.

For more information, see the “cfform” on page 254 tag entry.

Example
Example 1: Without data binding

The following example lets you select one or more employee names from a list of all employees, grouped by departments, and displays the selected names and the employee’s e-mail addresses. It includes an option to get data for all employees.

```coldfusion
<!--- Get the employee names from the database. --->
<!--- Use SQL to create a Name field with first and last names. --->
<cfquery name = "GetAllEmployees" dataSource = "cfdocexamples"
cachedwithin="#createTimeSpan(0,1,0,0)#">
    SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName,
    FirstName ||' ' ||lastName as Name
    FROM Employees
    GROUP BY Department, Emp_ID, EMail, Phone, FirstName, LastName, FirstName
</cfquery>

<h2>cfselect Example</h2>
<!-- The cfif statement is true if the form was submitted. -->
<!-- Show the selected names. --->
<cfif IsDefined("form.employeoid")>
    <!--- The form was submitted. --->
    <h3>You Selected the following employees</h3>
    <cfif form.employeoid IS ">
        <!--- Select All option was selected. Show all employees. --->
        <cfoutput query="GetAllEmployees">
            #name#<br>
            Email: #email#<br><br>
        </cfoutput>
    <cfelse>
        <!--- Use a query of queries to get the data for the selected users. Form.employeoid is a comma-delimited list of selected employee IDs. --->
        <cfquery name = "GetSelectedEmployees" dbtype="query">
            SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName, FirstName
```

Example 2: With data binding

The following example uses binding to fill in the options list of the Cities control only after the user selects a state. (In this example, only two states, California and New Jersey, have city entries.)

The CFML page is the simplest part of the example. It consists of the following lines:
<html>
<head>
</head>
<body>
<cfform name="mycfform">
  <cfselect name="state" bind="cfc:bindFcns.getstates()" bindonload="true">
    <option name="0">--state--</option>
  </cfselect>
  <cfselect name="city" bind="cfc:bindFcns.getcities({state})">
    <option name="0">--city--</option>
  </cfselect>
</cfform>
</body>
</html>

The BinFcns CFC has three functions: getstates, to get the states; getcities, to get the cities; and an internal getXmlData function that parses an XML file to get the state and city information. The following examples shows the CFC:

<cfcomponent>
  <cffunction name="getXmlData" output="true">
    <cfset var xmlData = ">
    <cfset xmlData = XmlParse(xmlData)>
    <cfreturn xmlData>
  </cffunction>

  <cffunction name="getstates" access="remote">
    <cfset state = arraynew(2)>
    <cfset state[1][1] = "0">
    <cfset state[1][2] = "--state--">
    <cfset state = ArrayLen(xmlData.states.XmlChildren)>
    <cfloop from="1" to="#numStates#" index="j">
      <cfset state[j+1][1] = ltrim(xmlData.states.state[j].XmlAttributes.abr)>
      <cfset state[j+1][2] = ltrim(xmlData.states.state[j].name.xmlText)>
    </cfloop>
    <cfreturn state>
  </cffunction>

  <cffunction name="getcities" access="remote">
    <cfargument name="state" required="yes">
    <cfset var city = arraynew(2)>
    <cfset var xmlData = getXmlData()>
    <cfset var numStates = 0>
    <cfset var numCities = 0>
    <cflog text="In getcities">
      <cfset city[1][1] = "0">
      <cfset city[1][2] = "--city--">
      <cftry>
        <cfset numStates = ArrayLen(xmlData.states.XmlChildren)>
      </cftry>
    </cflog>
  </cffunction>
</cfcomponent>
<cfloop from="1" to="#numStates#" index="j">  
  <cfif xmlData.states.state[j].XmlAttributes.abr eq state>    
    <cfset numCities = ArrayLen(xmlData.states.state[j].cities.XmlChildren)>    
    <cfloop from="1" to="#numCities#" index="k">      
      <cfset city[k+1][1] = ltrim(xmlData.states.state[j].cities.city[k].XmlAttributes.name)>      
      <cfset city[k+1][2] = ltrim(xmlData.states.state[j].cities.city[k].XmlAttributes.name)>    
    </cfloop>    
    <cfbreak>  
  </cfif>  
</cfloop>  
<cfcatch type="any">    
  <!--- Do nothing. ---><抓住目的</cfcatch>  
</cftry>  
<cfreturn city>  
</cffunction>  
</cfcomponent>  

The states.xml file has the following code. To keep the code short, only two states have cities, and only four states are listed.
<states>
  <state abr="NJ">
    <name>New Jersey</name>
    <cities>
      <city name="Edison" />
      <city name="Rahway" />
      <city name="Atlantic City" />
      <city name="Hoboken" />
      <city name="Jersey City" />
      <city name="Newark" />
      <city name="Trenton" />
      <city name="Union City" />
    </cities>
  </state>
  <state abr="CA">
    <name>California</name>
    <cities>
      <city name="Anaheim" />
      <city name="Beverly Hills" />
      <city name="Elk Grove" />
      <city name="Fairfield" />
      <city name="Fremont" />
      <city name="Indian Wells" />
      <city name="Long Beach" />
    </cities>
  </state>
  <state abr="ME">
    <name>Maine</name>
  </state>
  <state abr="MA">
    <name>Massachusetts</name>
  </state>
</states>

cfservlet

Description
This tag is deprecated. Executes a Java servlet on a JRun engine.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which path specifies a servlet, JSP, or anything else:

GetPageContext().include(path)
GetPageContext().forward(path)

For more information, see the JSP PageContext API or the Servlet RequestDispatcher API.

History
ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.
cfservletparam

Description
This tag is deprecated.

A child tag of the cfservlet tag. Passes data to a servlet. Each cfservletparam tag within the cfservlet block passes a separate item of data to the servlet.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which path specifies a servlet, JSP, or anything else:

```coldfusion
getPageContext().include(path)
getPageContext().forward(path)
```

For more information, see the JSP PageContext API or the Servlet RequestDispatcher API.

History
ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.

cfset

Description
Sets a value in ColdFusion. Used to create a variable, if it does not exist, and assign it a value. Also used to call functions.

Category
Variable manipulation tags

Syntax
```coldfusion
<cfset
    var variable_name = expression>
```

See also
cfcookie, cfparam, cfregistry, cfsavecontent, cfsschedule; Elements of CFML in the Developing ColdFusion Applications

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Required</td>
<td></td>
<td>A variable.</td>
</tr>
<tr>
<td>var</td>
<td>Optional</td>
<td></td>
<td>A keyword. Does not take a value. Identifies the variable as being local to a function. The variable only exists for the time of the current invocation of the function.</td>
</tr>
</tbody>
</table>

Usage
You use the cfset tag in several ways in your applications.

Calling functions
When you use the cfset tag to call a function, you do not have to assign the function return value to a variable if the function does not return a value or you do not have to use the value returned by the function. For example, the following line is a valid ColdFusion cfset tag for deleting the MyVariable variable from the Application scope:
Arrays
The following example assigns a new array to the variable `months`:

```coldfusion
<cfset months = ArrayNew(1)>
```

This example creates a variable `Array_Length` that resolves to the length of the `Scores` array:

```coldfusion
<cfset Array_Length = ArrayLen(Scores)>
```

This example assigns, to index position two in the array `months`, the value `February`:

```coldfusion
<cfset months[2] = "February">
```

Dynamic variable names
In this example, the variable name is itself a variable:

```coldfusion
<cfset myvariable = "current_value";
<cfset "#myvariable#" = 5>
```

Function local variables
The `var` keyword specifies that the variable being defined is only available inside the body of a function that you define by using the `cffunction` tag. The variable value that is set in one invocation of the function is not available in any other invocation of the function. The `var` keyword is the equivalent of the `var` statement in CFScript. The following rules apply to the `var` keyword:

- Any `cfset` tag that uses the `var` keyword must be inside the body of a `cffunction` tag. If you use the `var` keyword in a `cfset` tag outside a `cffunction` tag body, ColdFusion displays an error message.
- Place all `cfset` tags that use the `var` keyword at the beginning of the `cffunction` tag body, before any other ColdFusion tags.

The following example shows how to use the new keyword:

```coldfusion
<cffunction name="myFunct">
   <cfset var myVar = "This is a test">
   <cfreturn myVar & " Message.";
</cffunction>
<cfoutput>#myFunct()#</cfoutput>
```

In this example, the variable `myVar` exists only when the function `myFunct` executes, and it is not available elsewhere on the ColdFusion page.

COM objects
In this example, a COM object is created. A `cfset` tag defines a value for each method or property in the COM object interface. The last `cfset` creates a variable to store the return value from the COM object’s `SendMail` method.
<cfobject action = "Create"
   name = "Mailer"
   class = "SMTPsvg.Mailer">
   <cfset MAILER.FromName = form.fromname>
   <cfset MAILER.RemoteHost = RemoteHost>
   <cfset MAILER.FromAddress = form.fromemail>
   <cfset MAILER.AddRecipient(form.fromname, form.fromemail)>
   <cfset MAILER.Subject = "Testing cfobject">
   <cfset MAILER.BodyText = "form.msgbody">
   <cfset MAILER.SMTPLog = "logfile">
   <cfset success = MAILER.SendMail()>
   <cfoutput> #success# </cfoutput>
</cfobject>

Example

<!--- This example shows how to use cfset. --->
<cfquery name = "GetMessages" dataSource = "cfdocexamples">
   SELECT *
   FROM Messages
</cfquery>

<h3>cfset Example</h3>

<p>cfset sets and reassigns values to local or global variables within a page.

<cfset NumRecords = GetMessages.recordCount>
<p>For example, the variable NumRecords has been declared on this page to hold the number of records returned from query
   (<cfoutput>#NumRecords#</cfoutput>).

<p>In addition, cfset can be used to pass variables from other pages, such as this example, which takes the url parameter Test from this link: <a href = "cfset.cfm?test = <cfoutput>#URLEncodedFormat("hey, you, get off of my cloud")#</cfoutput>"�click here�) to display a message:

<p><cfif IsDefined("url.test") is "True">
   <cfoutput><b><i>#url.test#</i></b></cfoutput>
</cfif>
<cfelse>
   <h3>The variable url.test has not been passed from another page.</h3>
</cfelse>
<p>cfset can also be used to collect environmental variables, such as the time, the IP address of the user, or another function or expression.</p>

```cfml
<cfset the_date = #DateFormat(Now())# & " " & #TimeFormat(Now())#>
<cfset user_ip = CGI.REMOTE_ADDR>
<cfset complex_expr = (23 MOD 12) * 3>
<cfset str_example = Reverse(Left(GetMessages.body, 35))>
<cfoutput>
  <ul>
    <li>The date: #the_date#</li>
    <li>User IP Address: #user_ip#</li>
    <li>Complex Expression ((23 MOD 12) * 3): #complex_expr#</li>
    <li>String Manipulation (the first 35 characters of the body of the first message in our query)
      <br>Reversed: #str_example#
      <br>Normal: #Reverse(str_example)#
    </li>
  </ul>
</cfoutput>
```

### cfsetting

**Description**
Controls aspects of page processing, such as the output of HTML code in pages. The cfsetting tag can also be used in script style.

**Category**
Page processing tags, Variable manipulation tags

**Syntax**
```
<cfsetting
  enableCFoutputOnly = "yes|no"
  requestTimeOut = "value in seconds"
  showDebugOutput = "yes|no" >
```

Script style syntax for cfsetting:
```
setting enablecfoutputonly="true" requesttimeout="0" showdebugoutput="yes";
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**
cfcache, cfflush, cfheader, cfhtmlhead, cfinclude, cfprocessingdirective, cfsilent; Controlling debugging output with the cfsetting tag in the Developing ColdFusion Applications

**History**
ColdFusion MX 6.1: Changed behavior: if the tag has a body, ColdFusion executes its contents.
ColdFusion MX:
- Added the requestTimeOut attribute.
• The `catchExceptionsByPattern` attribute is obsolete. It does not work, and causes an error, in releases later than ColdFusion 5.

• Changed exception handling: the structured exception manager searches for the best-fit `cfcatch` handler. (In earlier releases, an exception was handled by the first `cfcatch` block that could handle an exception of its type.)

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enableCFoutputOnly</code></td>
<td>Optional</td>
<td><code>yes</code></td>
<td>• <code>yes</code>: blocks output of HTML that is outside <code>cfoutput</code> tags.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>no</code></td>
<td>• <code>no</code>: displays HTML that is outside <code>cfoutput</code> tags.</td>
</tr>
<tr>
<td>requestTimeout</td>
<td>Optional</td>
<td><code>integer</code></td>
<td>• <code>integer</code>: number of seconds. Time limit, after which ColdFusion processes the page as an unresponsive thread. Overrides the time-out set in the ColdFusion Administrator. If you specify <code>0</code> as the value, timeout is disabled for the request.</td>
</tr>
<tr>
<td>showDebugOutput</td>
<td>Optional</td>
<td><code>yes</code></td>
<td>• <code>yes</code>: if debugging is enabled in the Administrator, displays debugging information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>no</code></td>
<td>• <code>no</code>: suppresses debugging information that would otherwise display at the end of the generated page.</td>
</tr>
</tbody>
</table>

Usage

The `cfsetting requestTimeout` attribute replaces the use of `requestTimeOut` within a URL. To enforce a page time-out, detect the URL variable and use code such as the following to change the page time-out:

```cfsetting RequestTimeout = "#URL.RequestTimeout#"```

You can use this tag to manage whitespace in ColdFusion output pages.

If you nest `cfsetting` tags: to make HTML output visible, match each `enableCFoutputOnly = "Yes"` statement with an `enableCFoutputOnly = "No"` statement. For example, after five `enableCFoutputOnly = "Yes"` statements, to enable HTML output, you must have five corresponding `enableCFoutputOnly = "No"` statements.

If HTML output is enabled (no matter how many `enableCFoutputOnly = "No"` statements have been processed) the first `enableCFoutputOnly = "Yes"` statement blocks output.

If the debugging service is enabled and `showDebugOutput = "Yes"`, the `IsDebugMode` function returns `Yes`; otherwise, `No`.

**Note:** Releases after ColdFusion MX allow a `</cfsetting>` end tag; however, this end tag does not affect processing. The `cfsetting` attributes affect code inside and outside the `cfsetting` tag body. ColdFusion MX ignored code between `cfsetting` start and end tags.
Example
<p>CFSETTING is used to control the output of HTML code in ColdFusion pages. This tag can be used to minimize the amount of generated whitespace.</p>

```coldfusion
<cfsetting enableCFoutputOnly = "Yes">
 This text is not shown
</cfsetting>
<cfsetting enableCFoutputOnly = "No">
 <p>This text is shown</p>
<cfsetting enableCFoutputOnly = "Yes">
 <cfoutput>
  <p>Text within cfoutput is always shown</p>
 </cfoutput>
<cfsetting enableCFoutputOnly = "No">
 <cfoutput>
  <p>Text within cfoutput is always shown</p>
 </cfoutput>
```

**cfsharepoint**

**Description**
Invokes a feature that SharePoint exposes as a web service action, such as the Document Workspace `getdwsdata` action.

**Category**
Extensibility tags, MS Office Integration tags.

**Syntax**
```coldfusion
<cfsharepoint
 action="webservice action"
 params="parameter structure"
 domain="domain name"
 name="result variable name"
 password="connection password"
 userName="user ID"
 wsdl="WSDL file path">
 or
<cfsharepoint
 action="webservice action"
 params="parameter structure"
 login = "credentials structure"
 name="result variable name"
 wsdl="WSDL file path">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**History**
ColdFusion 9: Added tag.
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>

<td>Optional</td>
<td></td>
<td>The user name required to connect to the SharePoint server. Required if you do not specify a login attribute.</td>
</tr>
<tr>
<td>wsdl</td>
<td>Optional</td>
<td></td>
<td>Path to the service wsdl file. Required to invoke an action that is not in the list of supported actions. See Usage for details.</td>
</tr>
</tbody>
</table>

Usage

The `cfsharepoint` tag invokes a Microsoft SharePoint web service. You call many SharePoint web service actions by specifying the action name in the `action` attribute and passing the web service parameters in the `params` attribute. You access the services and methods that the `cfsharepoint` tag does not support directly by specifying the service WSDL URLs in the `wsdl` attribute.

**Note:** You can use the `cfsharepoint` tag with servers that use basic authentication only.

You request a service and action by specifying the `action` attribute values listed in the following tables. In nearly all cases, these are identical to the SharePoint action names. Notes indicate where the attribute values differ from the action names because multiple services have the same action name.

When the `cfsharepoint` tag receives the results from the SharePoint server and completes, the structure specified by the `name` attribute contains the response. This structure also has a `ResultFlag` entry containing the value `Success` or `Failure`. The entry value is `Success` if there is no Axis Fault or an error is returned in the response, otherwise, the value is `Failure`.

Document Workspace

<table>
<thead>
<tr>
<th>cancreatedwsurl</th>
<th>deletedwfolder</th>
<th>renamedws</th>
</tr>
</thead>
<tbody>
<tr>
<td>createdw</td>
<td>finddwsdoc</td>
<td>updatedwdata</td>
</tr>
<tr>
<td>createdwfolder</td>
<td>getdwdata</td>
<td></td>
</tr>
<tr>
<td>deletedw</td>
<td>removedwuser</td>
<td></td>
</tr>
</tbody>
</table>
Note: The createdwsfolder and deletedwsfolder action attribute values correspond to the createfolder and deletefolder actions of the Document Workspace service.

**Imaging**

<table>
<thead>
<tr>
<th>delete</th>
<th>getitemsbyids</th>
<th>upload</th>
</tr>
</thead>
<tbody>
<tr>
<td>download</td>
<td>listpicturelibrary</td>
<td></td>
</tr>
<tr>
<td>getimaginglistitems</td>
<td>rename</td>
<td></td>
</tr>
</tbody>
</table>

Note: The getimaginglistitems action attribute value correspond to the getlistitems action of the Imaging service.

**Lists**

<table>
<thead>
<tr>
<th>addattachment</th>
<th>getattachmentcollection</th>
<th>updatelist</th>
</tr>
</thead>
<tbody>
<tr>
<td>addlist</td>
<td>getlist</td>
<td>updatelistitems</td>
</tr>
<tr>
<td>deletemutation</td>
<td>getlistcollection</td>
<td></td>
</tr>
<tr>
<td>deletelist</td>
<td>getlistitems</td>
<td></td>
</tr>
</tbody>
</table>

**Search or spsearch**

Note: spsearch/search is not present in Windows Sharepoint Services 2.0.

In Windows SharePoint Services 3.0, if the action attribute specifies any of the following actions, the spsearch.asmx web service is used to perform the search. In Microsoft Office SharePoint Portal Server 2003 or Microsoft Office SharePoint Server 2007, search.asmx is used to perform the search. In Windows Sharepoint Services 2.0, an exception is thrown.

<table>
<thead>
<tr>
<th>query</th>
<th>registration</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryex</td>
<td>status</td>

</thead>
<tbody>
<tr>
<td>addrole</td>
<td>getrolecollection</td>
<td>removeusercollectionfromgroup</td>
</tr>
<tr>
<td>addusercollectiontogroup</td>
<td>getusercollectionfromrole</td>
<td>removeuserfromgroup</td>
</tr>
<tr>
<td>addusercollectiontorole</td>
<td>getusercollectionfromrole</td>
<td></td>
</tr>
<tr>
<td>addusertogroup</td>
<td>getuserinfo</td>
<td></td>
</tr>
</tbody>
</table>

**Views**

<table>
<thead>
<tr>
<th>addview</th>
<th>getview</th>
<th>updateview</th>
</tr>
</thead>
<tbody>
<tr>
<td>deleteview</td>
<td>getviewcollection</td>
<td></td>
</tr>
</tbody>
</table>

**Data type conversion**

Some web service actions require parameters in a Microsoft data type that does not correspond directly to a ColdFusion data type. The cfsharepoint tag automatically converts between the Microsoft data types and the most appropriate Java data types, which ColdFusion uses internally. The following table lists the conversions, and indicates the corresponding ColdFusion data type.

Last updated 7/9/2012
Example
The following example shows how you can manipulate lists and views. It requires resources on the SharePoint server that are not specified here.

```html
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<html>
<head>
  <title>cfsharepoint Views Example</title>
</head>

<body>
<cfoutput>
  Getting the list collection<br/>
  <!--- All login information is defined using variables in the Application.cfc file. --->
  <cfsharepoint action="getlistcollection" login="#login#" name="result"/>
  result.ResultFlag: #result.ResultFlag#<br><br>
  Deleting mycustomlist from the collection, if it exists.<br>
  <cfloop array=#result.lists# index="list">
    <cfif list.Title EQ "mycustomlist">
      <cfsharepoint action="deletelist" login="#login#"
                     name="result1" params="#{listname="mycustomlist"}#"/>
    </cfif>
  </cfloop>
  Was anything deleted?
  <cfif IsDefined("result1")>
    <b>YES.</b> The result is:
    <cfdump var="#result1#"/>
  </cfelse>
  <b>NO</b>
</cfoutput>

Adding a mycustomlist list<br/>
<cfsharepoint action="addlist" login="#login#" name="result1"
              params="#{listname="mycustomlist",
                         description="Adding a list via cfsharepoint",
                         templateid=100}#"/>
addlist result.ResultFlag: #result1.ResultFlag#<br><br>
<cfset viewFields = xmlparse("<ViewFields>

    </OrderBy>
    </Query>")>

<cfset rowlimit = xmlparse("<RowLimit Paged='True'>50</RowLimit>")>

Adding a myview1 view for the mycustomlist list<br />
<cfsharepoint action="addview" login="#login#" name="result" params="#{listName='mycustomlist',viewname='myview1',viewFields='#viewFields#',query='#query#',rowlimit='#rowlimit#',type='grid',makeViewDefault=false}#"/>

addview result.ResultFlag: #result.ResultFlag#
<br><br>

Adding a myview3 view for the mycustomlist list<br />
<cfsharepoint action="addview" login="#login#" name="result" params="#{listName='mycustomlist',viewname='myview3',viewFields='#viewFields#',query='#query#',rowlimit='#rowlimit#',type='grid',makeViewDefault=false}#"/>

addview result.ResultFlag: #result.ResultFlag#
<br><br>

Getting the updated mycustomlist view collection<br />
<cfsharepoint action="getviewcollection" login="#login#" name="result" params="#{listName='mycustomlist'}"/>

<br><b>getviewcollection result</b><br>
<cfdump var="#result#">
The names of the collection's views:<br>
<cfloop array=#result.views# index=v>
<cfoutput>#v.displayname#</cfoutput>
</cfloop>

Deleting the list<br />
<cfsharepoint action="deletelist" login="#login#" name="result1" params="#{listname='mycustomlist'}"/>

deletelist result.ResultFlag: #result1.ResultFlag#
cfslider

Description
Places a slider control, for selecting a numeric value from a range, in a ColdFusion form. The slider moves over the slider groove. As the user moves the slider, the current value displays. Used within a "cform" on page 254 tag for forms in HTML and applet format. Not supported with Flash forms.

In HTML forms, you can create visually rich sliders that let you modify adjustable values in fixed increments. You can specify maximum, minimum, and increment values, to help you quickly filter complex results.

The sliders are categorized based on the slider control. The available slider controls are:

Vertical  The slider has vertical controls that can be adjusted to the top or bottom.

Horizontal  The slider has horizontal controls that can be adjusted to the left or right.

Tip  The slider displays the values as data tips.

Snapping  The slider moves in incremental values.

Category
Forms tags

Syntax
For HTML

```cfml
<cfslider
    name = "name"
    clickToChange = "true|false"
    format = "html"
    height = "integer"
    increment = "Unit increment value"
    max = "maximum value for the slider"
    min = "minimum value for the slider"
    onChange = "JavaScript function name"
    onDrag = "JavaScript function name"
    tip = "true|false"
    value = "integer"
    vertical = "true|false"
    width = "integer">
```

Syntax
For Applet
ColdFusion Tags

<td>Custom JavaScript function to run when you drag the slider. Specify only the function name.</td>
</tr>
<tr>
<td>onError</td>
<td>Optional</td>
<td></td>
<td>Custom JavaScript function to run if validation fails. Specify only the function name.</td>
</tr>
</tbody>
</table>
### Usage

This tag requires the client to download a Java applet. Using this tag is sometimes slightly slower than using an HTML form element to display the same information. Also, if the client does not have an up-to-date Java plug-in installed, the system sometimes has to download an updated Java plug-in to display the tag.

For this tag to work properly, the browser must be JavaScript-enabled.

If the following conditions are true, a user’s selection from query data that populates this tag’s options continues to display after the user submits the form:

- The `cfformpreserveData` attribute is set to "yes".
- The `cfformaction` attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form.

For more information, see the “`cfform`” on page 254 tag entry.

### Attribute Table

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>onValidate</code></td>
<td>Optional</td>
<td></td>
<td>Custom JavaScript function to validate user input; in this case, a change to the default slider value. Specify only the function name.</td>
</tr>
<tr>
<td><code>range</code></td>
<td>Optional</td>
<td>&quot;0,100&quot;</td>
<td>Numeric slider range values. Separate values with a comma.</td>
</tr>
<tr>
<td><code>scale</code></td>
<td>Optional</td>
<td></td>
<td>Unsigned integer. Defines slider scale, within range. For example, if range=&quot;0,1000&quot; and scale=&quot;100&quot;, the display values are: 0, 100, 200, 300, ... Signed and unsigned integers in ColdFusion are in the range -2,147,483,648 to 2,147,483,647.</td>
</tr>
<tr>
<td><code>textColor</code></td>
<td>Optional</td>
<td></td>
<td>Options: same as for <code>bgcolor</code> attribute.</td>
</tr>
<tr>
<td><code>tip</code></td>
<td>Optional</td>
<td>true</td>
<td>Whether the data value has to display as data tips:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false</td>
<td></td>
</tr>
<tr>
<td><code>value</code></td>
<td>Optional</td>
<td>Minimum in range</td>
<td>Starting slider setting. Must be within the <code>range</code> values.</td>
</tr>
<tr>
<td><code>vertical</code></td>
<td>Optional</td>
<td>no(for applet forms)</td>
<td>For Applet forms:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>false(for HTML forms)</td>
<td>• yes: renders slider in browser vertically. Set <code>width</code> and <code>height</code> attributes; ColdFusion does not automatically swap width and height values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no: renders slider horizontally.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For HTML forms:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• true: renders slider in browser vertically. Set <code>width</code> and <code>height</code> attributes; ColdFusion does not automatically swap width and height values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• false: renders slider horizontally.</td>
</tr>
<tr>
<td><code>vSpace</code></td>
<td>Optional</td>
<td></td>
<td>Vertical spacing above and below slider, in pixels.</td>
</tr>
<tr>
<td><code>width</code></td>
<td>Optional</td>
<td>200, for HTML</td>
<td>Slider control width, in pixels.</td>
</tr>
</tbody>
</table>
Example

<!--- This example shows how to use cfslider</h3>
<br/>
<cfform name="form01">
<cfslider name="slider1"
format="HTML"
vertical="false"
width="350"
value="100"
min="0"
max="200"
increment="10"
tip="true"/>
</cfform>

cfsilent

Description
Suppresses output produced by CFML within a tag's scope.

Category
Data output tags, Page processing tags

Syntax
<cfsilent>
...
</cfsilent>

See also
cfcache, cfflush, cfheader, cfhtmlhead, cfinclude, cfsetting; Writing and Calling User-Defined Functions in the Developing ColdFusion Applications

Usage
This tag requires an end tag.
Example

```html
<h3>cfsilent</h3>

```cfsilent```
```
<cfset a = 100>
<cfset b = 99>
<cfset c = b-a>
<cfoutput>Inside cfsilent block<br>
b-a = #c#</cfoutput>
```

```cfsilent```

```p```
Even information within cfoutput tags does not display within a cfsilent block.<br>
```cfoutput```
b-a = #c#<br>
```cfoutput```
```p```

**cfspreadsheet**

**Description**

Manages Excel spreadsheet files:

- Reads a sheet from a spreadsheet file and stores it in a ColdFusion spreadsheet object, query, CSV string, or HTML string.
- Writes single sheet to a new XLS file from a query, ColdFusion spreadsheet object, or CSV string variable.
- Add a sheet an existing XLS file.

**Category**

Extensibility tags

**Syntax**

The tag syntax depends on the action attribute value:
**Read**

```cfspreadsheet``
  action="read"
  src = "filepath"
  columns = "range"
  columnnames = "comma-delimited list"
  excludeHeaderRow = "true | false"
  format = "CSV|HTML"
  headerrow = "row number"
  name = "text"
  query = "query name"
  rows = "range"
  sheet = "number"
  sheetname = "text">
```

**Update**

```cfspreadsheet``
  action="update"
  filename = "filepath"
  format = "csv"
  name = "text"
  password = "password"
  query = "query name"
  sheetname = "text">
```

**Write**

```cfspreadsheet``
  action="write"
  filename = "filepath"
  format = "csv"
  name = "text"
  overwrite = "true | false"
  password = "password"
  query = "queryname"
  sheetname = "text">
```

**See also**

Spreadsheet functions.

**History**

**ColdFusion 9.0.1:** Added the attribute `excludeHeaderRow`

**ColdFusion 9:** Added this tag.
## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Action</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action       | All            | Required|         | One of the following:  
|              |                |         | • read   | Reads the contents of an XLS format file. |
|              |                |         |         | • update | Adds a new sheet to an existing XLS file. You cannot use the `update` action to change an existing sheet in a file. For more information, see Usage. |
|              |                |         |         | • write  | Writes a new XLS format file or overwrites an existing file. |
| filename     | update, write  | Required|         | The pathname of the file that is written. |
| excludeHeaderRow | read        | Optional| false  | If set to `true`, excludes the headerrow from being included in the query results. The attribute helps when you read Excel as a query. When you specify the `headerrow` attribute, the column names are retrieved from the header row. But they are also included in the first row of the query. To not include the header row, set `true` as the attribute value. |
| name         | All            |         | name or query is required. | • read action: The variable in which to store the spreadsheet file data. Specify name or query. |
|              |                |         |         | • write and `update` actions: A variable containing CSV-format data or an ColdFusion spreadsheet object containing the data to write. Specify the `name` or `query`. |
| query        | All            |         | name or query is required. | • read action: The query in which to store the converted spreadsheet file. Specify format, name, or query. |
|              |                |         |         | • write and `update` actions: A query variable containing the data to write. Specify name or query. |
| src          | read           | Required|         | The pathname of the file to read. |
| columns      | read           | Optional|         | Column number or range of columns. Specify a single number, a hyphen-separated column range, a comma-separated list, or any combination of these; for example: 1,3-6,9. |
| columnnames  | read           | Optional|         | Comma-separated column names. |
| format       | All            | Optional|         | Format of the data represented by the `name` variable.  
|              |                |         | • All: `csv` On read, converts an XLS file to a CSV variable.  
|              |                |         | • On update or write, Saves a CSV variable as an XLS file.  
|              |                |         | • `Read only: html` Converts an XLS file to an HTML variable.  
|              |                |         |         | The `cfspreadsheet` tag always writes spreadsheet data as an XLS file. To write HTML variables or CSV variables as HTML or CSV files, use the `cffile` tag. |
| headerrow    | read           | Optional|         | Row number that contains column names. |
| overwrite    | write          | Optional| false  | A Boolean value specifying whether to overwrite an existing file. |
| password     | update, write  | Optional|         | Set a password for modifying the sheet.  
|              |                |         | Note: Setting a password of the empty string does no unset password protection entirely; you are still prompted for a password if you try to modify the sheet. |
Usage

Each ColdFusion spreadsheet object represents Excel sheet:

- To read an Excel file with multiple sheets, use multiple `cfspreadsheet` tags with the `read` option and specify different `name` and `sheet` or `sheetname` attributes for each sheet.
- To write multiple sheets to a single file, use the `write` action to create the file and save the first sheet and use the `update` action to add each additional sheet.
- To update an existing file, read all sheets in the file, modify one or more sheets, and use the contents, and use the `write` action and `Update` actions (for multiple sheet files) to rewrite the entire file.

The `cfspreadsheet` tag writes only XLS format files. To write a CSV file, put your data in a CSV formatted string variable and use the `cffile` tag to write the variable contents in a file.

Use the ColdFusion Spreadsheet* functions, such as `SpreadsheetNew` on page 1304 and `SpreadsheetAddColumn` on page 1270 to create a new ColdFusion Spreadsheet object and modify the spreadsheet contents.

Example

The following example uses the `cfspreadsheet` tag to read and write Excel spreadsheets using various formats. It also shows a simple use of ColdFusion Spreadsheet functions to modify a sheet.

```cfm
<!--- Read data from two datasource tables. --->
<cfquery
   name="courses" datasource="cfdocexamples"
   cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
   SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
   FROM COURSELIST
</cfquery>

<cfquery
   name="centers" datasource="cfdocexamples"
   cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
   SELECT *
   FROM CENTERS
</cfquery>

<cfscript>
   //Use an absolute path for the files. --->
   theDir=GetDirectoryFromPath(GetCurrentTemplatePath());
   theFile=theDir & "courses.xls";
   //Create two empty ColdFusion spreadsheet objects. --->
   theSheet = SpreadsheetNew("CourseData");
   theSecondSheet = SpreadsheetNew("CentersData");
   //Populate each object with a query. --->
```
SpreadsheetAddRows(theSheet,courses);
SpreadsheetAddRows(theSecondSheet,centers);
</cfscript>

<!--- Write the two sheets to a single file --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheetname="courses" overwrite=true>
<cfspreadsheet action="update" filename="#theFile#" name="theSecondSheet"
    sheetname="centers">

<!--- Read all or part of the file into a spreadsheet object, CSV string,
    HTML string, and query. --->
<cfspreadsheet action="read" src="#theFile#" sheetname="courses" name="spreadsheetData">
<cfspreadsheet action="read" src="#theFile#" sheet=1 rows="3,4" format="csv" name="csvData">
<cfspreadsheet action="read" src="#theFile#" format="html" rows="5-10" name="htmlData">
<cfspreadsheet action="read" src="#theFile#" sheetname="centers" query="queryData">

<h3>First sheet row 3 read as a CSV variable</h3>
<cfdump var="#csvData#">

<h3>Second sheet rows 5-10 read as an HTML variable</h3>
<cfdump var="#htmlData#">

<h3>Second sheet read as a query variable</h3>
<cfdump var="#queryData#">

<!--- Modify the courses sheet. --->
<cfscript>
    SpreadsheetAddRow(spreadsheetData,"03,ENGL,230,Poetry 1",8,1);
    SpreadsheetAddColumn(spreadsheetData,
        3,2,true);
</cfscript>

<!--- Write the updated Courses sheet to a new XLS file --->
<cfspreadsheet action="write" filename="#theDir#updatedFile.xls" name="spreadsheetData"
    sheetname="courses" overwrite=true>

<!--- Write an XLS file containing the data in the CSV variable. --->
<cfspreadsheet action="write" filename="#theDir#dataFromCSV.xls" name="CSVData"
    format="csv" sheetname="courses" overwrite=true>

cfsprydataset

Description
Creates a Spry XML or JSON data set from the results of a bind expression.

Category
Internet protocol tags
Syntax

```xml
<cfsprydataset
    bind = "bind expression"
    name = "data set name"
    onBindError = "JavaScript function name"
    options = "Spry options object"
    type = "xml|json"
    xpath = "XPath expression">
</cfsprydataset>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

See also

cfajaximport, Using Spry with ColdFusion in the *Developing ColdFusion Applications*

History

ColdFusion 8: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind</td>
<td>Required</td>
<td></td>
<td>A bind expression that returns an XML- or JSON-formatted string to populate the Spry data set. The bind expression specifies a CFC function or URL and includes bind parameters that represent the values of ColdFusion controls. For detailed information on bind expressions, see Binding data to form fields in the <em>Developing ColdFusion Applications</em>.</td>
</tr>
<tr>
<td>name</td>
<td>Required</td>
<td></td>
<td>The name of the Spry data set.</td>
</tr>
<tr>
<td>onBindError</td>
<td>Optional; HTML</td>
<td>See Description</td>
<td>The name of a JavaScript function to execute if the bind expression results in an error. The function must take two attributes: an HTTP status code and a message. If you omit this attribute, and specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), the handler displays the error message; otherwise a default error pop-up appears.</td>
</tr>
<tr>
<td>options</td>
<td>Optional</td>
<td></td>
<td>A JavaScript object containing constructor options for the data set. For example, to request the data using the HTTP POST method, specify the following attribute: <code>options={method: 'POST'}</code>. For detailed information on Spry options, see the Spry documentation at <a href="http://www.adobe.com/go/learn_spry_framework_en">www.adobe.com/go/learn_spry_framework_en</a>.</td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>xml</td>
<td>Specifies data set type, corresponding to the format of the data that is returned by the bind expression. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• json</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• xml</td>
</tr>
<tr>
<td>xpath</td>
<td>Required for xml type Not used for JSON</td>
<td>An XPath expression that extracts data from the XML returned by the bind expression. The data set contains only the data that matches the XPath expression.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

Use this tag to use a bind expression to dynamically create the contents of a Spry XML or JSON data set based on the value of a ColdFusion control or another Spry data set. To create a Spry data set without using a bind expression, use the `Spry.Data.JSONDataSet()` and `Spry.Data.XMLDataSet()` JavaScript functions.
This tag cannot create a Spry HTML data set.

To use a filter to select the contents of a JSON data set from a JSON expression, specify a path or subpath option in the options attribute. For example, to create a Spry JSON data set by using only the items.item element from the JSON data, use a tag such as the following:

```cfhtml
<cfsprydataset name="theItems" type="json"
    bind="CFC:DataMgr.getdetails(prodname={myform:mygrid.TITLE})"
    options="{path: 'items.item.'}">
</cfsprydataset>
```

**Example**

The following `cfsprydataset` tag updates the dsProduct Spry XML data set by calling the `GridDataManager.getProductDetails` CFC function each time the selected row in the bookgrid control changes. It passes the TITLE field of the selected row to the CFC function as a `prodname` parameter. For a complete example that uses this tag, see Using Spry with ColdFusion in the Developing ColdFusion Applications.

```cfhtml
<cfsprydataset name="dsProduct"
    type="xml"
    bind="CFC:GridDataManager.getProductDetails(prodname=
        {bookform:bookgrid.TITLE})"
    xpath="products/product"
    options="{method: 'POST'}"
    onBindError="errorHandler">
</cfsprydataset>
```

### cfstoredproc

**Description**

Executes a stored procedure in a server database. It specifies database connection information and identifies the stored procedure.

**Category**

Database manipulation tags

**Syntax**

```cfhtml
<cfstoredproc
dataSource = "data source name"
procedure = "procedure name"
cachedAfter = "date"
cachedWithin = "time span"
debug = "yes|no"
timeOut = "timeout interval"
fetchClientInfo = "yes|no"
blockFactor = "block size"
password = "password"
result = "result name"
returnCode = "yes|no"
username = "user name">
</cfstoredproc>
```

**Note:** You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.
See also

cfinsert, cfqueryparam, cfprocrem, cfprocres, cftransaction, cfquery, cfupdate; Optimizing database use in the Developing ColdFusion Applications

History

ColdFusion 10: Added the following attributes: timeOut, fetchClientInfo, and clientInfo.

ColdFusion MX 7: Added the result attribute.

ColdFusion MX: Deprecated the connectString, dbName, dbServer, dbtype, provider, and providerDSN attributes. They do not work, and might cause an error, in releases later than ColdFusion 5. (Releases starting with ColdFusion MX use Type 4 JDBC drivers.)

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSource</td>
<td>Required</td>
<td></td>
<td>Name of data source that points to database that contains stored procedure.</td>
</tr>
<tr>
<td>procedure</td>
<td>Required</td>
<td></td>
<td>Name of stored procedure on database server.</td>
</tr>
<tr>
<td>blockFactor</td>
<td>Optional</td>
<td>1</td>
<td>Maximum number of rows to get at a time from server. Range is 1 to 100.</td>
</tr>
<tr>
<td>cachedAfter</td>
<td>Optional</td>
<td></td>
<td>A date value (for example, April 16, 2008, 4-16-2008). If the date of original query is after this date, ColdFusion uses cached query data. To use cached data, the current query must use same SQL statement, data source, query name, user name, and password. A date/time object is in the range 100 AD–9999 AD. When specifying a date value as a string, enclose it in quotation marks.</td>
</tr>
<tr>
<td>cachedWithin</td>
<td>Optional</td>
<td></td>
<td>A time span, created using the CreateTimeSpan function. If the original query date falls within the time span, cached query data is used. CreateTimeSpan defines a period from the present, back. Takes effect only if query caching is enabled in the Administrator. To use cached data, the current query must use the same SQL statement, data source, query name, user name, and password.</td>
</tr>
<tr>
<td>clientInfo</td>
<td>Optional</td>
<td></td>
<td>Structure containing properties of the client to be set on the database connection.</td>

<td>fetchClientInfo</td>
<td>Optional</td>
<td>no</td>
<td>If set to yes, returns a struct with the key-value pair passed by the last query.</td>
</tr>
<tr>
<td>password</td>
<td>Optional</td>
<td></td>
<td>Overrides password in data source setup.</td>
</tr>
<tr>
<td>result</td>
<td>Optional</td>
<td></td>
<td>Specifies a name for the structure in which cfstoredproc returns the statusCode and ExecutionTime variables. If set, this value replaces cfstoredproc as the prefix to use when accessing those variables. For more information, see Usage.</td>
</tr>
<tr>
<td>returnCode</td>
<td>Optional</td>
<td>no</td>
<td>• yes: populates cfstoredproc.statusCode with status code returned by the stored procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>timeOut</td>
<td>Optional</td>
<td></td>
<td>Number of seconds each action is permitted to execute, before returning an error. The cumulative time may exceed this value. For JDBC statements, ColdFusion sets this attribute. For other drivers, see the driver documentation.</td>
</tr>
<tr>
<td>username</td>
<td>Optional</td>
<td></td>
<td>Overrides username in data source setup.</td>
</tr>
</tbody>
</table>
Usage
Use this tag to call a database stored procedure. Within this tag, you code “cfprocresult” on page 563 and “cfproccparam” on page 558 tags as follows:

- “cfprocresult” on page 563: If the stored procedure returns one or more result sets, code one cfprocresult tag per result set.
- “cfproccparam” on page 558: If the stored procedure uses input or output parameters, code one cfproccparam tag per parameter, ensuring that you include every parameter in the stored procedure definition.

If you set returnCode = "Yes", this tag sets the variable prefix.statusCode, which holds the status code for a stored procedure. Status code values vary by DBMS. For the meaning of code values, see your DBMS documentation.

This tag sets the variable prefix.ExecutionTime, which contains the execution time of the stored procedure, in milliseconds.

The value of prefix is either cfstoredproc or the value specified by the result attribute, if it is set. The result attribute provides a way for stored procedures that are called from multiple pages, possibly at the same time, to avoid overwriting the results of one call with another. If you set the result attribute to myResult, for example, you would access ExecutionTime as myResult.ExecutionTime. Otherwise, you would access it as cfstoredproc.ExecutionTime.

Before implementing this tag, ensure that you understand stored procedures and their usage.

The following examples use a Sybase stored procedure; for an example of an Oracle 8 or 9 stored procedure, see “cfproccparam” on page 558.

Example
<cfset ds = "sltst">

<!--- If submitting a new book, insert the record and display confirmation --->
<cfif isDefined("form.title")>
<cfstoredproc procedure="Insert_Book" datasource="#ds#">
<cfproccparam
cfsqltype="cf_sql_varchar"
value="#form.title#">
<cfproccparam
cfsqltype="cf_sql_numeric"
value="#form.price#">
<cfproccparam
cfsqltype="cf_sql_date"
value="#form.publishDate#">
<cfproccparam
cfsqltype="cf_sql_numeric"
type="out"
variables="bookId">
</cfstoredproc>
<cfoutput>
<h3>"#form.title#" inserted into database. The ID is #bookId#.</h3>
</cfoutput>

</cfif>

<cfform action="#CGI.SCRIPT_NAME#" method="post">
<h3>Insert a new book</h3>

Title:  
<cfinput type="text" size="20" required="yes" name="title" />
<br/>

Price:  
<cfinput type="text" size="20" required="yes" name="price" validate="float" />
<br/>

Publish Date:  
<cfinput type="text" size="5" required="yes" name="publishDate" validate="date" />
<br/>

<input type="submit" value="Insert Book"/>

</cfform>

<!--
This view-only example executes a Sybase stored procedure that
returns three result sets, two of which we want. The stored
procedure returns the status code and one output parameter,
which we display. We use named notation for the parameters.
-->

<cfstoredproc procedure = "foo_proc"
    dataSource = "MY_SYBASE_TEST" username = "sa"
    password = "" dbServer = "scup" dbName = "pubs2"
    returnCode = "Yes" debug = "Yes">
    <cfprocresult name = RS1>
    </cfprocresult>
    <cfprocresult name = RS3 resultSet = 3>
    </cfprocresult>
    <cfprocparam type = "IN" CFSQLTType = CF_SQL_INTEGER
        value = "1" dbVarName = @param1>
<cfprocparam type = "OUT" CFSQliteType = CF_SQL_DATE
variable = FOO dbVarName = @param2>
</cfstoredproc>

--->
<!----
<cfoutput>The output param value: '#foo#'</cfoutput>
<h3>The Results Information</h3>
<cfoutput query = RS1>#name#, #DATE_COL#<br></cfoutput>
<cfoutput>
<hr>
<p>Record Count: #RS1.recordCount#</p>Columns: #RS1.columnList#<hr>
</cfoutput>
<cfoutput query = RS3>#col1#, #col2#, #col3#<br></cfoutput>
<cfoutput>
<hr>
<p>Record Count: #RS3.recordCount#</p>Columns: #RS3.columnList#<hr>
The return code for the stored procedure is: '#cfstoredproc.statusCode#'</cfoutput>
--->

**cfs**witch

**Description**
Evaluates a passed expression and passes control to the *cfcase* tag that matches the expression result. You can, optionally, code a *cfdefaultcase* tag, which receives control if there is no matching *cfcase* tag value.

**Category**
Flow-control tags

**Syntax**
```
<cfswitch
    expression = "expression">
    one or more cfcase tags
    zero or one cfdefaultcase tags
</cfswitch>
```

**See also**
cfcase, cfdefaultcase, cfabort, cfloop, cfbreak, cfexecute, cfexit, cfif, cflocation, cfrethrow, cfthrow, cftry, cfs**witch, cfcase, and cfdefaultcase in the Developing ColdFusion Applications**

**History**
ColdFusion 8: Changed the way the ColdFusion parses *cfcase* values. Previously, *cfcase* tags with numeric value dates did not return expected results. For example, *cfcase value="00"* and *cfcase value="0A"* were both evaluated to 0. The value "0A" was also evaluated to the value 0. This caused the exception "Context validation error for tag CFSCASE. The CFSWITCH has a duplicate CFSCASE for value "0.0"." The *cfs**witch* tag now returns the expected result.

ColdFusion MX: Changed cfdefaultcase tag placement requirements: you can put the cfdefaultcase tag at any position within a cfs**witch** statement; it is not required to be the last item.
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Required</td>
<td></td>
<td>ColdFusion expression that yields a scalar value. ColdFusion converts integers, real numbers, Booleans, and dates to numeric values. For example, true, 1, and 1.0 are all equal.</td>
</tr>
</tbody>
</table>

Usage

This tag requires an end tag. All code within this tag must be within a cfcase or cfdefaultcase tag. Otherwise, ColdFusion throws an error.

Use this tag followed by one or more cfcase tags. Optionally, include a cfdefaultcase tag. This tag selects the matching alternative from the cfcase and cfdefaultcase tags, jumps to the matching tag, and executes the code between the cfcase start and end tags.

The cfswitch tag provides better performance than a series of cfif/cfelseif tags, and the code is easier to read.

Example

<!---
This example shows the use of cfswitch and cfcase to exercise a case statement in CFML.
--->

<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
  SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
  FROM Employees
</cfquery>

<h3>cfswitch Example</h3>

<!--- By outputting the query and using cfswitch, we classify the output without using a cfloop construct. --->

<p>Each time the case is fulfilled, the specific information is printed; if the case is not fulfilled, the default case is output</p>

<cfoutput query="GetEmployees">
  <cfswitch expression="#Trim(Department)#">
    <cfcase value="Sales">
      #FirstName# #LastName# is in <b>Sales</b><br><br>
    </cfcase>
    <cfcase value="Accounting">
      #FirstName# #LastName# is in <b>Accounting</b><br><br>
    </cfcase>
    <cfcase value="Administration">
      #FirstName# #LastName# is in <b>Administration</b><br><br>
    </cfcase>
    <cfdefaultcase>
      #FirstName# #LastName# is not in Sales, Accounting, or Administration.<br><br>
    </cfdefaultcase>
  </cfswitch>
</cfoutput>
Tags t

cftable

Description
Builds a table in a ColdFusion page. This tag renders data as preformatted text, or, with the `HTMLTable` attribute, in an HTML table. If you don’t want to write HTML table tag code, or if your data can be presented as preformatted text, use this tag.

Preformatted text (defined in HTML with the `<pre>` and `</pre>` tags) displays text in a fixed-width font. It displays white space and line breaks exactly as they are written within the pre tags. For more information, see an HTML reference guide.

To define table column and row characteristics, use the `cfcol` tag within this tag.

Category
Data output tags

Syntax
```coldfusion
<cftable
    query = "query name"
    border
    colHeaders
    colSpacing = "number of spaces"
    headerLines = "number of lines"
    HTMLTable
    maxRows = "maxrows table"
    startRow = "row number">
    ...
</cftable>
```

Note: You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

<tr>
<td>startRow</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**ColdFusion Tags**

**Usage**

This tag aligns table data, sets column widths, and defines column heads.

At least one `cfcol` tag is required within this tag. Put `cfcol` and `cftable` tags adjacent in a page. The only tag that you can nest within this tag is the `cfcol` tag. You cannot nest `cftable` tags.

To display the `cfcolheader` text, specify the `cfcolheader` and the `cftablecolHeader` attribute. If you specify either attribute without the other, the header does not display and no error is thrown.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colSpacing</td>
<td>Optional</td>
<td>2</td>
<td>Number of spaces between columns.</td>
</tr>
<tr>
<td>headerLines</td>
<td>Optional</td>
<td>2</td>
<td>Number of lines to use for table header (the default leaves one line between header and first row of table).</td>
</tr>
<tr>
<td>HTMLTable</td>
<td>Optional</td>
<td></td>
<td>Renders data in an HTML 3.0 table. If you use this attribute (regardless of its value), ColdFusion renders data in an HTML table.</td>
</tr>
<tr>
<td>maxRows</td>
<td>Optional</td>
<td></td>
<td>Maximum number of rows to display in the table.</td>
</tr>
<tr>
<td>startRow</td>
<td>Optional</td>
<td>1</td>
<td>The query result row to put in the first table row.</td>
</tr>
</tbody>
</table>
Example

<!--- This example shows the use of cfcol and cftable to align information
      returned from a query. --->
<!--- This query selects employee information from cfdocexamples datasource. --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
   SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
   FROM Employees
</cfquery>

<html>
<body>
<h3>cftable Example</h3>

<!--- Note use of HTMLTable attribute to display cftable as an HTML table,
      rather than as PRE formatted information. --->
<cftable query = "GetEmployees" startRow = "1" colSpacing = "3" HTMLTable>
   <!--- Each cfcol tag sets width of a column in table, and specifies header
         information and text/CFML with which to fill cell. --->
   <cfcol header = "<b>ID</b>"
          align = "Left"
          width = 2
          text= "#Emp_ID#">

   <cfcol header = "<b>Name/Email</b>"
          align = "Left"
          width = 15
          text= "<a href = 'mailto:#Email#'>#FirstName# #LastName#</A>">

   <cfcol header = "<b>Phone Number</b>"
          align = "Center"
          width = 15
          text= "#Phone#">
</cftable>
</body>
</html>

cftextarea

Description

Puts a multiline text entry box in a cfform tag and controls its display characteristics. Optionally, displays a rich text editor with configurable controls for formatting HTML text.

Category

Forms tags
ColdFusion Tags

Syntax

```cftextarea
  name="name"
  basepath="path"
  bind="bind expression"
  bindAttribute="attribute name"
  bindOnLoad="false|true"
  disabled="true|false" or no attribute value
  enabled="yes|no"
  fontFormats="comma separated list"
  fontNames="comma separated list"
  fontSizes="comma separated list"
  height="number of pixels"
  html="no|yes"
  label="text"
  maxlength="number"
  message="text"
  onBindError = "JavaScript function name"
  onChange="JavaScript or ActionScript"
  onClick="JavaScript or ActionScript"
  onError="script name"
  onKeyUp="JavaScript or ActionScript"
  onValidate="script name"
  pattern="regexp"
  range="minimum value, maximum value"
  required="yes|no"
  richtext="no|yes"
  secureUpload="true|false"
  skin="default|silver|office2003|custom skin"
  sourceForToolTip="URL"
  style="style specification"
  stylesXML="path"
  templatesXML="path"
  toolbar="Default|Basic|custom toolbar"
  toolbarOnFocus="no|yes"
  tooltip="tip text"
  validate="data type"
  validateAt= one or more of "onBlur, onServer, onSubmit"
  value="text"
  visible="yes|no"
  width="number of pixels"
  wrap="off|hard|soft|virtual|physical">
  text
</cftextarea>
```

Some attributes apply to only specific display formats. For details see the Attributes table.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

History
ColdFusion 8:
- Added support for the bind attribute in HTML format forms, including the bindAttribute, bindOnLoad, and onbindError attributes.
- Added support for tool tips in HTML format, including the sourceForTooltip attribute.
- Added support for a rich text editor in HTML format, including the richtext, basepath, fontFormats, fontNames, fontSizes, skin, stylesXML, templatesXML, toolbar, and toolbarOnFocus attributes and support for the height and width attributes.

ColdFusion MX 7: Added this tag.

Attributes
The following table lists attributes that ColdFusion uses directly. In HTML format, the tag also supports all HTML textarea tag attributes that are not on this list, and passes them directly to the browser.

Note: Attributes that are not marked as All or XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; Format</th>
<th>Default</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>name</td>
<td>Required; All</td>
<td></td>
<td>Name of the cftextinput control.</td>
</tr>
<tr>
<td>basepath</td>
<td>Optional; HTML</td>
<td>/CFIDE/scripts/ajax/FCKEeditor</td>
<td>Path to the directory that contains the rich text editor. The editor configuration files are at the top level of this directory. Meaningful only if the richtext attribute is true.</td>
</tr>
<tr>
<td>bind</td>
<td>Optional; Flash, HTML</td>
<td></td>
<td>A bind expression that dynamically sets an attribute of the control. For details, see Usage.</td>
</tr>
<tr>
<td>bindAttribute</td>
<td>Optional; HTML</td>
<td>value</td>
<td>Specifies the HTML tag attribute whose value is set by the bind attribute. You can only specify attributes in the browser's HTML DOM tree, not ColdFusion-specific attributes. Ignored if there is no bind attribute.</td>
</tr>
<tr>
<td>bindOnLoad</td>
<td>Optional; HTML</td>
<td>no</td>
<td>A Boolean value that specifies whether to execute the bind attribute expression when first loading the form. Ignored if there is no bind attribute.</td>
</tr>
<tr>
<td>disabled</td>
<td>Optional; All</td>
<td>not disabled</td>
<td>Enables user input, making the control read-only. To disable input, specify disabled without an attribute, or disabled=&quot;Yes&quot; (or any ColdFusion positive Boolean value, such as True). To enable input, omit the attribute or specify disabled=&quot;No&quot; (or any ColdFusion negative Boolean value, such as False).</td>
</tr>
<tr>

<td>Req/Opt; Format</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>enabled</td>
<td>Optional; Flash</td>
<td>yes</td>
<td>Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. The inverse of the disabled attribute.</td>
</tr>
</tbody>
</table>
| fontFormats | Optional; HTML   | All valid formats | A comma-separated list of the font names to display in the rich text editor Formats selector. The formats specify the HTML tags to apply to typed or selected text. You can specify any subset of the following list: “p,div,pre,address,h1,h2,h3,h4,h5,h6”.
| fontNames   | Optional; HTML   | All valid font names | A comma-separated list of the font names to display in the rich text editor Font selector. You can specify any subset of the following list: “Arial,Comic Sans MS,Courier New,Tahoma,Times New Roman,Verdana”.
<p>| FontSizes   | Optional; HTML   | See Description | A comma-separated list of the font sizes to display in the rich text editor Size selector. List entries must have the format of numeric font size/descriptive text. For example, to display the text “small font” to indicate a font size of 1, specify “1/small font”. By default, the following values appear in the selector: 1/xx-small,2/x-small,3/small,4/medium,5/large,6/x-large,7/xx-large. |
| height      | Optional; Flash, HTML | In Flash forms, height of the control, in pixels. In HTML forms, this attribute has an effect only if you specify richtext=”true”; in this case, it is the height, in pixels, of the control, including the control bar and text box. |
| html        | Optional; Flash  | no      | Boolean value that specifies whether the text area contains HTML. |
| label       | Optional; Flash and XML | Label to put beside the control on a form. |
| maxLength   | Optional; All    | The maximum length of text that can be entered. ColdFusion uses this attribute only if you specify maxlength in the validate attribute. |
| message     | Optional; All    | Message text to display if validation fails. |
| onBindError | Optional; HTML   | See Description | The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message. (The status code is -1 if the error is not an HTTP error.) If you omit this attribute, and have specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), it displays the error message; otherwise a default error pop-up displays. |
| onChange    | Optional; All    | JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action. |
| onClick     | Optional; HTML and XML | JavaScript to run when the user clicks the control. |</p>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt; Format</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onError</td>
<td>Optional; HTML and XML</td>
<td></td>
<td>Custom JavaScript function to execute if validation fails.</td>
</tr>
<tr>
<td>onKeyDown</td>
<td>Optional; All</td>
<td></td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a keyboard key in the control.</td>
</tr>
<tr>
<td>onKeyUp</td>
<td>Optional; All</td>
<td></td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.</td>
</tr>
<tr>
<td>onMouseDown</td>
<td>Optional; All</td>
<td></td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.</td>
</tr>
<tr>
<td>onMouseUp</td>
<td>Optional; All</td>
<td></td>
<td>JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.</td>
</tr>
<tr>
<td>onValidate</td>
<td>Optional; HTML and XML</td>
<td></td>
<td>Custom JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to the function, which must return True if validation succeeds, False otherwise. If you specify this attribute, ColdFusion ignores the validate attribute.</td>
</tr>
<tr>
<td>pattern</td>
<td>Required if validate = &quot;regular_expression&quot; HTML and XML</td>
<td></td>
<td>JavaScript regular expression pattern to validate input. Omit leading and trailing slashes. ColdFusion uses this attribute only if you specify regex in the validate attribute. For examples and syntax, see Building Dynamic Forms with cfform Tags in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>range</td>
<td>Optional; All</td>
<td></td>
<td>Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify range in the validate attribute. If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.</td>
</tr>
<tr>

<tr>
<td>style</td>
<td>Optional; All</td>
<td></td>
<td>In HTML or XML format forms, ColdFusion passes the <code>style</code> attribute to the browser or XML. In Flash format forms, must be a style specification in CSS format, with the same syntax and contents as used in Flex for the corresponding Flash element.</td>
</tr>
<tr>
<td>stylesXML</td>
<td>Optional; HTML</td>
<td>/CFIDE/scripts/ajax/FCKEditor/fckstyles.xml</td>
<td>The path of the file that defines the styles in the rich text editor. Styles selector. Relative paths start at the directory that contains the fckeditor.html file, normally cf_webRoot/CFIDE/scripts/ajax/FCKeditor/editor. You can specify an absolute path starting at the web root, such as /myApps/RTEeditor.mystyles.xml. For information on configuring styles, see Using the rich text editor in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>templatesXML</td>
<td>Optional; HTML</td>
<td>/CFIDE/scripts/ajax/FCKeditor/fcktemplates.xml</td>
<td>The path of the file that defines the templates that are displayed when you click the rich text editor Templates icon. For pathing details, see stylesXML. For information on configuring templates, see Using the rich text editor in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>toolbar</td>
<td>Optional; HTML</td>
<td>Default</td>
<td>Specifies the rich text editor toolbar. By default, the valid values for this attribute are: Default, a complete set of controls, and Basic, a minimal configuration. You can add configurations; for details see Using the rich text editor in the Developing ColdFusion Applications. <strong>Note:</strong> This attribute’s value is case sensitive.</td>
</tr>
<tr>
<td>toolbarOnFocus</td>
<td>Optional; HTML</td>
<td>no</td>
<td>A Boolean value that specifies whether the rich text editor toolbar expands and displays its controls only when the rich text editor has the focus.</td>
</tr>
<tr>
<td>tooltip</td>
<td>Optional; Flash, HTML</td>
<td></td>
<td>Text to display when the mouse pointer hovers over the control. Can include HTML formatting. Ignored if you specify a <code>sourceForTooltip</code> attribute.</td>
</tr>
<tr>
<td>validate</td>
<td>Optional; All</td>
<td></td>
<td>The type or types of validation to perform. Available validation types and algorithms depend on the format. For details, see the Usage section of the <code>cfinput</code> tag reference.</td>
</tr>
<tr>
<td>validateAt</td>
<td>Optional; HTML and XML</td>
<td>onSubmit</td>
<td>How to do the validation; one or more of the following:   * onSubmit   * onServer   * onBlur   For Flash format forms, onSubmit and onBlur are identical; for both, validation is done when the user submits the form. For multiple values, use a comma-delimited list. For details, see the Usage section of the <code>cfinput</code> tag reference.</td>
</tr>
</tbody>
</table>
Usage
For this tag to work properly in HTML format, the browser must be JavaScript-enabled.

If you put text in the tag body, the control displays all text characters between the `cftextarea` opening and closing tags; therefore, if you use line feeds or white space to format your source text, they appear in the control.

If the `cfform preserveData` attribute is "yes", and the form posts back to the same page, the posted value (not the value of the `value` attribute) of the `cftextinput` control is used.

Validation
For a detailed description of the `validation` attribute and the types of validation supported by ColdFusion, see the Usage section of the `cfinput` tag reference. For more details on ColdFusion validation techniques, see Validating Data in the Developing ColdFusion Applications.

Flash form data binding
The `bind` attribute lets you populate form fields using the contents of other form fields. To specify text from another Flash form field in a `cftextarea` `bind` attribute, use the following format:

```
{sourceTagName.text}
```

For example, the following line uses the value of the text that the user enters in the from the userName field in the greeting in the comment text box. The user can change or replace this message with a typed entry.
<cfform format="flash" height="300">
  <cfformitem type="text">
    Enter your name here</cfformitem>
  <cftextarea name="userName" height="20" Width="500" />
  <cftextarea name="comment" height="100" Width="500" bind="Hello {userName.text}! Enter your comments here." />
</cfform>

**HTML form data binding**

The `bind` attribute lets you set any `cftextarea` attribute dynamically from the value of another form control or by calling a CFC or JavaScript function. By default it sets the control's `value` attribute, but you can specify a different attribute to set by using the `bindAttribute` attribute. For more information on binding, see Binding data to form fields in the *Developing ColdFusion Applications*.

**Example**

This example has two `cftextarea` controls. When you submit the form, ColdFusion copies the text from the first control into the second. The `onBlur` `maxlength` validation prevents you from entering more than 100 characters. The `>` character that closes the `cftextarea` opening tag, the text in the tag body, and the `cftextarea` closing tag are on a single line to ensure that only the desired text displays, but the line is split in this example for formatting purposes.

```cfml
<h3>cftextarea Example</h3>
<cfparam name="text2" default="">
<cfif isdefined("form.textarea1") AND (form.textarea1 NEQ ")">
  <cfset text2=form.textarea1>
</cfif>
</cfparam>
<cfform name="form1">
  <cftextarea name="textarea1" wrap="virtual" rows="5" cols="25" validate="maxlength" validateAt="onBlur" maxlength="100">
    Replace this text. Maximum length is 100 Characters, and this text is currently 99 characters long.</cftextarea>
  <cftextarea name="textarea2" wrap="virtual" rows="5" cols="50" value="#text2#" />
</cfform>

**cftextinput**

**Description**

Puts a single-line text entry box in a `cfform` tag and controls its display characteristics.

This tag is deprecated, and is not supported in XML format forms. In its place, you must use a `cfinput` or `cftextarea` tag and use a cascading style sheet (CSS) to specify the text style characteristics.

**History**

ColdFusion MX 7: This tag is deprecated. In later releases it might not work, and might cause an error.

ColdFusion MX 6.1: Changed the `validate = "creditcard"` option requirements: the text entry must have 13-16 digits.
cftread

Description
The cftread tag enables you to create threads, independent streams of code execution, in your ColdFusion application. You use this tag to run or end a thread, temporarily stop thread execution, or join together multiple threads.

Category
Application framework tags

Syntax
join
<cfthread
  required
  name="thread name[, thread name]..."
  optional
  action="join"
  timeout="milliseconds"/>
run
<cfthread
  required
  name="thread name"
  optional
  action="run"
  priority="NORMAL|HIGH|LOW"
  zero or more application-specific attributes>
    Thread code
  </cfthread>
sleep
<cfthread
  required
  action="sleep"
  duration="milliseconds"/>
terminate
<cfthread
  required
  action="terminate"
  name="thread name"/>

For all actions except run, the cftread tag must have an empty body and be followed immediately by a </cfthread> end tag, or must have no end tag and have a slash before the tag closure, as in <cfthread action="sleep" duration="1000"/>.

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<td></td>
<td></td>
<td></td>
<td>• LOW</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• NORMAL</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Higher priority threads get more processing time than lower priority threads. Page-level code, the code that is outside of cfthread tags, always has NORMAL priority.</td>
</tr>
<tr>
<td>timeout</td>
<td>Optional</td>
<td>0</td>
<td>join</td>
<td>The number of milliseconds that the current thread waits for the thread or threads being joined to finish. If any thread does not finish by the specified time, the current thread proceeds. If the attribute value is 0, the following action occurs:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• The current thread continues waiting until all joining threads finish.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• If the current thread is the page thread, the page continues waiting until the threads are joined, even if you specify a page time-out.</td>
</tr>
</tbody>
</table>

Usage
Page-level code (code outside any cfthread tags) executes in its own thread, referred to as the page thread. Only the page thread can create other threads. A thread that you create cannot create a child thread.
Note: If a thread never completes processing (is hung), it continues to occupy system resources. You can use the ColdFusion Sever Monitor to check for and terminate hung threads.

ColdFusion makes a complete (deep) copy of all the attribute variables before passing them to the thread, so the values of the variables inside the thread are independent of the values of any corresponding variables in other threads, including the page thread. Thus, the values passed to threads are thread safe because the attribute values cannot be changed by any other thread.

Thread scopes
Each thread has three special scopes:

- The thread-local scope is an implicit scope that contains variables that are available only to the thread, and exist only for the life of the thread.
- The Thread scope is available to the page and to all other threads started from the page. Its data remains available until the page and all threads started from the page finish, even if the page finishes before the threads complete processing.
- The Attributes scope contains attributes that are passed to the scope, and is available only within the thread and only for the life of the thread.

For detailed information about using ColdFusion scopes in threads, see Using ColdFusion Threads in the Developing ColdFusion Applications.

All threads in a page share a single Variables scope, so you can use it for data that is common across all threads. You must be careful to lock access to the variables, if necessary, to prevent deadlocks or race conditions between threads.

Note: When ColdFusion uses a connector to access the web server, after the page gets completed, the CGI and Request scopes are not accessible to threads that you create by using the cfthread tag. This limitation does not apply if you use the integrated web server or if you run ColdFusion as a J2EE application.

Metadata variables
The thread scope contains the following variables that provide information about the thread (metadata):

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ElapsedTime</td>
<td>The amount of processor time that was spent handling the thread.</td>
</tr>
<tr>
<td>Error</td>
<td>The structure that is generated if an error occurs during thread execution. The structure contains the keys that you can access in a cfcatch tag. If an error occurs in a thread, page-level processing is not affected, and ColdFusion does not generate an error message. The thread with the error terminates and the page-level code or other threads can get the error information from the Error field and handle the error appropriately. For detailed information, see Handling ColdFusion thread errors in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>Name</td>
<td>The thread name.</td>
</tr>
<tr>
<td>Output</td>
<td>Output that is generated by the thread. A thread cannot display output; page-level code must use this variable to display thread results. For detailed information, see Handling thread output in the Developing ColdFusion Applications.</td>
</tr>
</tbody>
</table>
The following example uses three threads to get the results of three RSS feeds. The user must submit the form with all three feeds specified. The application joins the threads with a time-out of 6 seconds, and displays the feed titles and the individual item titles as links.

```cfml
<!--- Run this code if the feed URL form has been submitted. --->
<cfif isDefined("Form.submit")>
  <cfloop index="i" from="1" to="3">
    <!--- Use array notation and string concatenation to create a variable for this feed. --->
    <cfset theFeed = Form["Feed"&i]>
    <cfif theFeed NEQ ">
      <!--- Use a separate thread to get each of the feeds. --->
      <cfthread action="run" name="t#i#" feed="#theFeed#">
        <cffeed source="#feed#" properties="thread.myProps" query="thread.myQuery">
      </cfthread>
    <cfelse>
      <!--- If the user didn't fill all fields, show an error message. --->
      <h3>This example requires three feeds.<br />
      Click the Back button and try again.</h3>
      <cfabort>
    </cfif>
  </cfloop>

  <!--- Join the three threads. Use a 6 second time-out. --->
  <cfthread action="join" name="t1,t2,t3" timeout="6000" />

  <!--- Use a loop to display the results from the feeds. --->
  <cfloop index="i" from="1" to="3">
    <!--- Use the cfthread scope and associative array notation to get the Thread scope dynamically. --->
```

### ColdFusion Tags

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| Priority | The thread processing priority, as specified in the `cfthreadpriority` attribute. The following values are valid:  
- HIGH  
- LOW  
- NORMAL |
| Starttime | The time at which the thread began processing, in ColdFusion date-time format. |
| Status | The current status of the thread; one of the following values:  
- NOT_STARTED: The thread has been queued but is not processing yet.  
- RUNNING: The thread is running normally.  
- TERMINATED: The thread stopped running due to a `cfthread` tag with a `terminate` action, an error, or an administrator action.  
- COMPLETED: The thread ended normally.  
- WAITING: The thread has executed a `cfthread` tag with `action=",join",` but one or more threads being joined has not completed. |

### Example

The following example uses three threads to get the results of three RSS feeds. The user must submit the form with all three feeds specified. The application joins the threads with a time-out of 6 seconds, and displays the feed titles and the individual item titles as links.
<cfset feedResult=cfthread["t#i#"]>

<!--- Display feed information only if you got items, for example the feed must complete before the join. --->
<cfif isDefined("feedResult.myQuery")>
  <cfoutput><h2>#feedResult.myProps.title#</h2></cfoutput>
  <cfoutput query="feedResult.myQuery">
    <p><a href="#RSSLINK#">#TITLE#</a></p>
  </cfoutput>
</cfif>
</cfloop>

<!--- The form for entering the feeds to aggregate. --->
<cfform>
  <h3>Enter three RSS Feeds</h3>
  <cfinput type="text" size="100" name="Feed1" validate="url" value="http://rss.adobe.com/events.rss?locale=en"><br/>
  <cfinput type="text" size="100" name="Feed2" validate="url" value="http://weblogs.macromedia.com/dev_center/index.rdf"><br/>
  <cfinput type="text" size="100" name="Feed3" validate="url" value="http://rss.adobe.com/studio.rss?locale=en"><br/>
  <cfinput type="submit" name="submit">
</cfform>

### cfthrow

**Description**

Throws a developer-specified exception, which can be caught with a cfcatch tag that has any of the following type attribute options:

- `type = "custom_type"`
- `type = "Application"`
- `type = "Any"`

**Category**

Exception handling tags, Flow-control tags

**Syntax**

```cfthrow
message = "message"
<cfthrow
type = "exception type"
detail = "detail description"
errorCode = "error code"
extendedInfo = "additional information"
object = "java except object">

OR

```cfthrow
object = #object_name#>

Last updated 7/9/2012
Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

cferror, cfrethrow, cftry, onError; Handling Errors in the Developing ColdFusion Applications

History
ColdFusion MX: Changed thrown exceptions: this tag can throw ColdFusion component method exceptions.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>Optional</td>
<td></td>
<td>Description of the event. ColdFusion appends error position to description; server uses this parameter if an error is not caught by your code.</td>
</tr>
<tr>
<td>errorCode</td>
<td>Optional</td>
<td></td>
<td>A custom error code that you supply.</td>
</tr>
<tr>
<td>extendedInfo</td>
<td>Optional</td>
<td></td>
<td>A custom error code that you supply.</td>
</tr>
<tr>
<td>message</td>
<td>Optional</td>
<td></td>
<td>Message that describes exception event.</td>
</tr>
<tr>
<td>object</td>
<td>Optional</td>
<td></td>
<td>Requires the value of the cfobject tag name attribute. Throws a Java exception from a CFML tag. This attribute is mutually exclusive with all other attributes of this tag.</td>
</tr>
</tbody>
</table>
| type      | Optional| Application | • A custom type  
               • Application  
               Do not enter another predefined type; types are not generated by ColdFusion applications. If you specify Application, you need not specify a type for cfcatch. |

Usage

Use this tag within a cftry block, to throw an error. The cfcatch block can access accompanying information, as follows:

- Message, with cfcatch.message
- Detail, with cfcatch.detail
- Error code, with cfcatch.errorcode

To get more information, use cfcatch.tagContext. This array shows where control switches from one page to another in the tag stack (for example, cfinclude, cfmodule).

To display the information displayed by tagContext variable, select the “Enable Robust Exception Information” option on the Debugging & Logging > Debug Output Settings page of the ColdFusion Administrator.

To use this tag with the object parameter, first use a cfobject tag that specifies a valid Java exception class. For example, the following cfobject tag defines an object, obj, of the exception class myException (which you must create in Java):

```
<cfobject
    type="java"
    action="create"
    class="myException"
    name="obj">
```
If your exception class has constructors that take parameters, such as a message, you can use the special `init` method to invoke the constructor, as in the following line. If you do not need to specify any constructor attributes, you can omit this step.

```cfset obj.init("You must save your work before proceeding")```

You can then use the, the `cfthrow` statement to throw the exception as follows:

```cfthrow object=#obj#```

For more information on using Java objects in ColdFusion, see Integrating J2EE and Java Elements in CFML Applications in the Developing ColdFusion Applications.

**Example**

```<h3>cfthrow Example</h3>
<!--- Open a cftry block. --->
<cftry>
<!--- Define a condition upon which to throw the error. --->
<cfif NOT IsDefined("URL.myID")>
    <!--- throw the error --->
    <cfthrow message = "ID is not defined">
</cfif>
<!--- Perform the error catch. --->
<cfcatch type = "application">
<!--- Display your message. --->
 <h3>You've Thrown an <b>Error</b></h3>
<cfoutput>
<!--- And the diagnostic feedback from the application server. --->
<p>#cfcatch.message#</p>
The contents of the tag stack are:
<cfloop
index = i
from = 1 to = #ArrayLen(cfcatch.tagContext)#
    <cfset sCurrent = cfcatch.tagContext[i]#
    <br/>i# #sCurrent["ID"]#  
    ("LINE"#,#sCurrent["COLUMN"]#)
    #sCurrent["TEMPLATE"]#
</cfloop>
</cfoutput>
<cfcatch>
<cftry>
```

The following example shows how to throw an exception from a component method:
<cfcomponent>
  <cffunction name="getEmp">
    <cfargument name="lastName" required="yes">
      <cfquery name="empQuery" datasource="cfdocexamples">
        SELECT LASTNAME, FIRSTNAME, EMAIL
        FROM tblEmployees
        WHERE LASTNAME LIKE '#arguments.lastName#'
      </cfquery>
      <cfif empQuery.recordcount LT 1>
        <cfthrow type="noQueryResult"
          message="No results were found. Please try again.">
      </cfelse>
      <cfreturn empQuery>
    </cfif>
  </cffunction>
</cfcomponent>

For an explanation of the example and more information, see Building and Using ColdFusion Components in the Developing ColdFusion Applications.

cftimer

Description
Displays execution time for a specified section of CFML code. ColdFusion displays the timing information along with any output produced by the timed code.

Note: To permit this tag to execute, enable the Enable Debugging and the Timer Information options on the Debugging Settings page in the ColdFusion Administrator. Also, the IP address of the machine that runs ColdFusion must be added to the list of debugging IP addresses in the Debugging IP Addresses page if the request is sent by a remote machine. If the request is from a localhost, the IP address 127.0.0.1 must be present in the list of debugging IP addresses.

Category
Debugging tags

Syntax
<cfargument label="text" type = "inline|outline|comment|debug" >

CFML statement(s)

</cfargument>

Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

<cftrace>; Debugging and Troubleshooting Applications in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this tag.
ColdFusion Tags

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Optional</td>
<td>&quot; &quot;</td>
<td>Label to display with timing information.</td>
</tr>
<tr>
<td>type</td>
<td>Optional</td>
<td>debug</td>
<td>• inline: displays timing information inline, following the resulting HTML.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• outline: displays timing information and also displays a line around the output produced by the timed code. The browser must support the FIELDSET tag to display the outline.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• comment: displays timing information in an HTML comment in the format &lt;!-- label: elapsed-time ms --&gt;. The default label is cftimer.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• debug: displays timing information in the debug output under the heading CFTimer Times.</td>
</tr>
</tbody>
</table>

Usage

Use this tag to determine how long it takes for a block of code to execute. You can nest cftimer tags.

This tag is useful for debugging CFML code during application development. In production, you can leave cftimer tags in your code as long as you have disabled the debugging option in the ColdFusion Administrator.

Example

```xml
...  
<!--- type="inline" --->
<cftimer label="Query and Loop Time Inline" type="inline">
  <cfquery name="empquery" datasource="cfdocexamples">
    SELECT *
    FROM Employees
  </cfquery>

  <cfloop query="empquery">
    <cfoutput>#lastname#, #firstname#</cfoutput><br>
  </cfloop>
</cftimer>
<hr><br>

<!--- type="outline" --->
<cftimer label="Query and CFOUTPUT Time with Outline" type="outline">
  <cfquery name="coursequery" datasource="cfdocexamples">
    SELECT *
    FROM CourseList
  </cfquery>

  <table border="1" width="100%">
    <cfoutput query="coursequery">
      <tr>
        <td>#Course_ID#</td>
        <td>#CorName#</td>
        <td>#CorLevel#</td>
      </tr>
    </cfoutput>
  </table>
</cftimer>
<hr><br>

<!--- type="comment" --->
```

Last updated 7/9/2012
<cftimer label="Query and CFOUTPUT Time in Comment" type="comment">
    <cfquery name="parkquery" datasource="cfdocexamples">
        SELECT *
        FROM Parks
    </cfquery>
<p>Select View &gt; Source to see timing information</p>
    <table border="1" width="100%">
        <cfoutput query="parkquery">
            <tr>
                <td>#Parkname#</td>
            </tr>
        </cfoutput>
    </table>
</cftimer>
<hr><br>
<!---- type="debug" --->
<cftimer label="Query and CFOUTPUT Time in Debug Output" type="debug">
    <cfquery name="deptquery" datasource="cfdocexamples">
        SELECT *
        FROM Departments
    </cfquery>
<p>Scroll down to CFTimer Times heading to see timing information</p>
    <table border="1" width="100%">
        <cfoutput query="deptquery">
            <tr>
                <td>#Dept_ID#</td>
                <td>#Dept_Name#</td>
            </tr>
        </cfoutput>
    </table>
</cftimer>
...

**cftooltip**

**Description**
Specifies tool tip text that displays when the user hovers the mouse pointer over the elements in the tag body. This tag does not require a form and is not used inside Flash forms.

**Category**
Display management tags
Syntax
<cftooltip
autoDismissDelay="5000"
hideDelay="250"
preventOverlap="true|false"
showDelay="200"
sourceForTooltip="URL"
style="CSS style specification"
tooltip="text">

Display tags
</cftooltip>

This tag must have an end tag.

Note: You can specify this tag’s attribute in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute name as structure key.

cfajaximport, Using Ajax User Interface Components and Features in the Developing ColdFusion Applications

History
ColdFusion 8: Added this tag

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autoDismissDelay</td>
<td>Optional</td>
<td>5000</td>
<td>The number of milliseconds between the time when the user moves the mouse pointer over the component (and leaves it there) and when the tool tip disappears.</td>
</tr>
<tr>
<td>hideDelay</td>
<td>Optional</td>
<td>250</td>
<td>The number of milliseconds to delay between the time when the user moves the mouse pointer away from the component and when the tool tip disappears.</td>
</tr>
<tr>
<td>preventOverlap</td>
<td>Optional</td>
<td>true</td>
<td>A Boolean value specifying whether to prevent the tool tip from overlapping the component that it describes.</td>
</tr>
<tr>
<td>showDelay</td>
<td>Optional</td>
<td>200</td>
<td>The number of milliseconds to delay between the time when the user moves the mouse pointer over the component and when the tool tip appears.</td>
</tr>
<tr>
<td>sourceForTooltip</td>
<td>Optional</td>
<td></td>
<td>The URL of a page with the tool tip contents. The page can include HTML markup to control the format, and the tip can include images. If you specify this attribute, an animated icon appears with the text “Loading...” while the tip is being loaded.</td>
</tr>
<tr>
<td>style</td>
<td>Optional</td>
<td></td>
<td>A CSS style specification for the tooltip. Use this attribute to set the width, text color, background color, padding, and other style properties.</td>
</tr>
<tr>
<td>tooltip</td>
<td>Optional</td>
<td></td>
<td>Tip text to display. The text can include HTML formatting. Ignored if you specify a sourceForTooltip attribute.</td>
</tr>
</tbody>
</table>

Usage
Specify a tooltip or a sourceForTooltip attribute; otherwise, this tag has no effect.
If you specify the path to a CFML page in the `sourceForTooltip` attribute, ColdFusion processes the page and uses its output in the tip text. You can therefore use CFML programming, in addition to HTML formatting, to control the contents and appearance of the tip text.

You must use the `cftooltip` tag for text and simple components, such as images, not for complex Ajax components such as windows, pods, or layout areas. If you use the `cftooltip` tag with complex components, you might get unexpected behavior; for example, the tool tip might overlap window contents, even if you specify the `preventoverlap` attribute.

You can nest tool tips within the `cfinput`, `cfgrid`, and `cfform` tags, although this may result in multiple tool tips obscuring one another.

**Example**

The following simple example can dynamically display different tool-tip text based on the value of the `theItem` variable on the main CFML page.

The main CFML page:

```cfml
<!--- These variables could be set dynamically --->
<cfset theItem="left-handed & other specialty wrenches">
<cfset theImage="lhbwrench.jpg">

<!--- The theItem string has an ampersand, so you must URL-encode it. --->
<cftooltip sourceForTooltip="tiptext.cfm?itemid=#URLEncodedFormat(theItem)#">
  <cfoutput>
  <b>Try this one!</b>
  <img src="#theImage#" />
  </cfoutput>
</cftooltip>
```

The `tiptext.cfm` page could have a single CFML tag:

```cfml```
</cfoutput> <b>Click to find more about #URL.itemid#</b></cfoutput>

**cftrace**

**Description**
Displays and logs debugging data about the state of an application at the time the `cftrace` tag executes. Tracks runtime logic flow, variable values, and execution time. Displays output at the end of the request or in the debugging section at the end of the request; or, in Dreamweaver MX and later, in the Server Debug tab of the Results window.

ColdFusion logs `cftrace` output to the file `logs\cftrace.log`, in the ColdFusion installation directory.

**Note:** To permit this tag to execute, enable debugging in the ColdFusion Administrator. Optionally, to report trace summaries, enable the Trace section

**Category**
Debugging tags, Variable manipulation tags
Syntax

```xml
<cftrace
    var = "variable name"
    text = "string"
    type = "format"
    category = "string"
    inline = "yes|no"
    abort = "yes|no">
</cftrace>
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

|           |         |         | • no         |
| category  | Optional|         | User-defined string that identifies trace groups. |
| inline    | Optional| no      | • yes: displays trace code inline on the page in the location of the cftrace tag, in addition to the debugging information output.  
|           |         |         | • no         |
| text      | Optional|         | User-defined string, which can include simple variables, but not complex variables such as arrays. Outputs to the cflogtext attribute. |
| type      | Optional| Information | Corresponds to the cflogtype attribute; displays an appropriate icon:  
|           |         |         | • Information  
|           |         |         | • Warning       
|           |         |         | • Error         
|           |         |         | • Fatal Information |
| var       | Optional|         | The name of a simple or complex variable to display.  
|           |         |         | Useful for displaying a temporary value, or a value that does not display on any CFM page. |

Usage

You cannot put application code within this tag. (This avoids problems that can occur if you disable debugging.)

This tag is useful for debugging CFML code during application development.

You can display cftrace tag output in the following ways:

- As a section in the debugging output
In an application page, and as a section in debugging output. If you specify inline tracing, ColdFusion flushes all output up to the `cftrace` tag, and displays the trace output when it encounters the tag.

The following is an example of a log file entry:

```
"Information","web-4","04/08/02","23:21:30", ,"[30 ms (1st trace)]
[C:\CFusion\wwwroot\generic.cfm @ line: 9] -
   [thisPage = /generic.cfm]
"Information","web-0","04/08/02","23:58:58", ,"[5187 ms (10)]
[C:\CFusion\wwwroot\generic.cfm @ line: 14] - [category]
   [thisPage = /generic.cfm] [ABORTED] thisPage 
```

For a complex variable, ColdFusion lists the variable name and the number of elements in the object; it does not log the contents of the variable.

**Example**

The following example traces a FORM variable that is evaluated by a `cfif` block:

```
<cftrace var="FORM.variable"
   text="doing equivalency check for FORM.variable"
   category="form_vars"
   inline="true">
<cfif isDefined("FORM.variable") AND #FORM.variable# EQ 1>
   <h1>Congratulations, you're a winner!</h1>
<cfelse>
   <h1>Sorry, you lost!</h1>
</cfif>
</cftrace>
```

**cftransaction**

**Description**

For enterprise database management systems that support transaction processing, instructs the database management system to treat multiple database operations as a single transaction. Provides database commit and rollback processing. See the documentation for your database management system to determine whether it supports SQL transaction processing.

**Category**

Database manipulation tags

**Syntax**

```
<cftransaction
   action = "begin|commit|rollback|setsavepoint"
   isolation = "read_uncommitted|read_committed|repeatable_read"
   savepoint = "savepoint name">
</cftransaction>
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

**See also**

`cfinsert`, `cfprocparam`, `cfprocresult`, `cfquery`, `cfqueryparam`, `cfstoredproc`, `cfupdate`; Commits, rollbacks, and transactions and Tags as functions and operators in Developing ColdFusion Applications
History
ColdFusion 8: Added the `setsavepoint` value to the `action` attribute. Added the `savepoint` attribute.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action        | Optional| begin   | • `begin`: The start of the block of code to execute.  
• `commit`: Commits a pending transaction.  
• `rollback`: Rolls back a pending transaction.  
• `setsavepoint`: Saves a specific state within a transaction |
| isolation     | Optional|         | Isolation level, which indicates which type of read can occur during the execution of concurrent SQL transactions. The possible read actions include dirty read, in which a second SQL transaction reads a row before the first SQL transaction executes a COMMIT; non-repeatable read, in which a SQL transaction reads a row and then a second SQL transaction modifies or deletes the row and executes a COMMIT; and phantom, in which a SQL transaction reads rows that meet search criteria, a second SQL transaction then generates at least one row that meets the first transaction's search criteria, and then the first transaction repeats the search, resulting in a different result set.  
• `read_uncommitted`: Allows dirty read, non-repeatable read, and phantom  
• `read_committed`: Allows non-repeatable read and phantom. Does not allow dirty read.  
• `repeatable_read`: Allows phantom. Does not allow dirty read or non-repeatable read.  
• `serializable`: Does not allow dirty read, non-repeatable read, or phantom. |
| savepoint     | Optional|         | The name of the savepoint in the transaction. Setting savepoints lets you roll back portions of a transaction. For example, if your transaction includes an insert, an update, and a delete, and you set a savepoint after the update, you can roll back the transaction to exclude the delete. |
| nested        | Optional| true    | This attribute specifies whether the `cftransaction` tag can be nested inside another `cftransaction` tag. If the attribute value is false and there is a parent `cftransaction` tag, ColdFusion generates an error. |

Usage
If you do not specify a value for the `action` attribute, automatic transaction processing proceeds as follows:

- If the `cfquery` operations within the transaction block complete without an error, the transaction is committed.
- If a `cfquery` tag generates an error within a `cftransaction` block, all `cfquery` operations in the transaction roll back.

If you do not specify a value for the `isolation` attribute, ColdFusion uses the default isolation level for the associated database.

By using CFML error handling and the `action` attribute, however, you can explicitly control whether a transaction is committed or rolled back, based on the success or failure of the database query. In a transaction block, you can do the following:

- Commit a database transaction by nesting the `<cftransaction action = "commit"/>` tag in the block.
- Roll back a transaction by nesting the `<cftransaction action = "rollback"/>` tag in the block.

(In these examples, the slash is an alternate syntax that is the equivalent of an end tag.)

In a transaction block, you can write queries to more than one database, but you must commit or roll back a transaction to one database before writing a query to another.
To control how the database engine performs locking during the transaction, use the isolation attribute.

The cftransaction tag does not work as expected if you use the cfthread tag in it to make query calls.

- You can now nest cftransaction tags. Typically, ColdFusion 9 does not support nested transactions, but you can embed one cftransaction tag inside another. If you nest these tags, only the outermost cftransaction tag takes effect.

This feature lets you write functions that must run in a transaction without considering whether the function is called by code that is inside a cftransaction tag. Use a cftransaction tag in the function. If the calling code is in a transaction, the tag has no effect. If the calling code is not in a transaction, the tag starts the transaction.

The following code shows nested transaction tags.

```cfml
<cftransaction>
  <cfquery name="iquery" datasource="dsn">
    insert into region(regionid, regiondescription) values('111', 'YPR')
  </cfquery>
</cftransaction>

<cftransaction>
  <cfquery name="iquery" datasource="dsn">
    update region set regiondescription = 'new' where regionid='111'
  </cfquery>
</cftransaction>
</cftransaction>

Note: In a realistic situation, the second cftransaction and cfquery can be written in a CFC that are, in turn, called by the first cftransaction and cfquery by passing the regionid value.

Example

<p>The cftransaction tag can be used to group multiple queries that use the cfquery tag into one business event. Changes to data that is requested by the queries are not committed to the datasource until all actions within the transaction block have executed successfully.</p>

<p>This a view-only example.</p>

<cftransaction>
  <cfquery name='makeNewCourse' datasource='Snippets'>
    INSERT INTO Courses
    (Number, Descript)
    VALUES
    ('#myNumber#', '#myDescription#')
  </cfquery>

  <cfquery name='insertNewCourseToList' datasource='Snippets'>
    INSERT INTO CourseList
    (CorNumber, CorDesc, Dept_ID, CorName, CorLevel, LastUpdate)
    VALUES
    ('#myNumber#', '#myDescription#', '#myDepartment#', '#myDescription#', '#myCorLevel#', #Now()#)
  </cfquery>
</cftransaction>

You can set savepoints at the completion of insert, update, and delete actions of a transaction. You then use error handling logic to determine whether it is necessary to roll back to a previous savepoint.
Example

<!--- This example performs batch processing of withdrawals --->
<!--- from a bank account. The withdrawal amounts are stored --->
<!--- in an array. --->
<!--- There is a CFC named bank.cfc whose contains appear --->
<!--- after the example. --->

<cftransaction>
    <!--- Get the account balance. --->
    <cfinvoke component="bank" method="getBalance"
        returnvariable="getacctbalance" accountnum=1>
        <cfloop index="withdrawnum" from="1" to="#ArrayLen(withdrawals)#">
            <!--- Set a savepoint before making the withdrawal. --->
            <cfset noxfer = "point" & #withdrawnum#>
            <cftransaction action = "setsavepoint" savepoint = "#noxfer#"/>
            <!--- Make the withdrawal. --->
            <cfinvoke component="bank" method="makewithdrawal"
                returnvariable="getacctbalance" accountnum=1
                withdrawamount="#withdrawals[withdrawnum]#">
            <!--- Get the account balance. --->
            <cfinvoke component="bank" method="getBalance"
                returnvariable="getacctbalance" accountnum=1>
            <!--- If the balance is negative, roll back the transaction. --->
            <cfif getacctbalance.balance lt 0>
                <cftransaction action="rollback" savepoint="#noxfer#" />
            </cfif>
        </cfloop>
    </cftransaction>
</cftransaction>

<!--- The bank.cfc contains the following: --->

cfcomponent>
    <cffunction name="getBalance" access="public" returntype="query">
        <cfargument name="accountnum" type="numeric" required="yes">
        <cfargument name="accountnum" type="numeric" required="yes"
<cfquery name="getacctbalance" datasource="testsqlserver">
    SELECT * FROM dbo.mybank
    WHERE accountid = #accountnum#
</cfquery>
<cfreturn getacctbalance>
</cffunction>

<cffunction name="makewithdrawal" access="public" returntype="query">
    <cfargument name="accountnum" type="numeric" required="yes">
    <cfargument name="withdrawamount" type="numeric" required="yes">
    <cfquery name="withdrawfromacct" datasource="testsqlserver">
        UPDATE dbo.mybank SET balance = balance - #withdrawamount#
        WHERE accountid = 1
    </cfquery>
    <cfinvoke method="getBalance" returnvariable="getacctbalance" accountnum=1>
        <cfreturn getacctbalance>
    </cfinvoke>
</cffunction>
</cfcomponent>

--->

cftree

Description
Inserts a tree control in a form. Validates user selections. Used within a cfform tag block. Use a ColdFusion query to supply data to the tree.

Category
Forms tags
Syntax

```cftree
  name="name"
  align="top|left|bottom|baseline|texttop|absbottom|
    middle|absmiddle|right"
  appendKey="yes|no"
  bold="yes|no"
  border="yes|no"
  cache="yes|no"
  completePath="yes|no"
  delimiter="delimiter"
  enabled="yes|no"
  font="font"
  fontSize="size"
  format="applet|flash|html|object|xml"
  height="integer"
  highlightHref="yes|no"
  hScroll="yes|no"
  hSpace="integer"
  italic="yes|no"
  lookAndFeel="motif|windows|metal"
  message="text"
  notSupported="text"
  onBlur="ActionScript to invoke"
  onChange="ActionScript to invoke"
  onError="text"
  onFocus="ActionScript to invoke"
  onValidate="script name"
  required="yes|no"
  style= "style specification"
  tooltip="text"
  visible="yes|no"
  vScroll="yes|no"
  vSpace="integer"
  width="integer">

</cftree>
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**History**

ColdFusion 8: Added support for Ajax based HTML trees, including the cache attribute and the html value for format attribute.

ColdFusion MX7.01: Added support for onBlur and onFocus events.

ColdFusion MX 7:

- Added the format attribute and support for generating Flash and XML and object output.
- Added enabled, onChange, style, tooltip, and visible attributes (Flash format only).
ColdFusion MX: Changed behavior: ColdFusion renders a tree control regardless of whether there are any treeitems within it.

Attributes

Note: In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt Format</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required; All</td>
<td></td>
<td>Name for a tree control.</td>
</tr>
</tbody>
</table>
| align      | Optional; Applet, object |         | • top  
• left  
• bottom  
• baseline  
• texttop  
• abobottom  
• middle  
• absmiddle  
• right |
| appendKey  | Optional; All  | yes     | • yes: if you use cftreeitemhref attributes, ColdFusion appends a CFTREEITEMKEY query string variable with the value of the selected tree item to the cfform action URL.  
• no: does not append the tree item value to the URL. |
| bold       | Optional; Applet, Flash, HTML | no      | • yes: displays tree control text in bold.  
• no |
| border     | Optional; Applet, object | yes     | • yes: displays a border around the tree control.  
• no |
| cache      | Optional; HTML  | yes     | Applies only if the tree's child treeitem tag uses a bind expression.  
A Boolean value that specifies whether to get new data each time the user expands tree nodes, as follows:  
• yes: fetches a node's child items only once, when the node is first expanded  
• no: fetches child items each time the node is expanded. |
### ColdFusion Tags

**COLDFUSION 10 CFML REFERENCE**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt Format</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| `completePath` | Optional; Applet, HTML, object | no       | - *yes*: starts the Form.treename.path variable with the root of the tree path when `cftree` is submitted.
- *no*: omits the root level from the Form.treename.path variable; the value starts with the first child node in the tree.
For the `preserveData` attribute of `cfform` to work with the tree, set this attribute to *yes*.
For tree items populated by a query, if you use the `cftreeitemqueryasroot` attribute to specify a root name, that value is returned. If you do not specify a root name, ColdFusion returns the query name. |
| `delimiter`   | Optional; All | `\`     | Character to separate elements in the Forms.treename.path variable of the action page. |
| `enabled`     | Optional; Flash | yes     | Flash format only: Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. |
| `font`        | Optional; Applet, HTML |         | Font name for text in the tree control. |
| `fontSize`    | Optional; Applet, Flash, HTML |         | Font size for text in the tree control, in pixels. |
| `format`      | Optional; All | `applet` | - *applet*: displays the tree using a Java applet in the browser.
- *flash*: displays the tree using a Flash control
- *html*: displays the tree uses Ajax-based HTML
- *object*: returns the tree as a ColdFusion structure with the name specified by the name attribute. For details of the structure contents, see the section `object format`.
- *xml*: generates an XML representation of the tree. In XML format forms, includes the generated XML in the form. In HTML format forms, puts the XML in a string variable with the name specified by the name attribute. |
| `height`      | Optional; Applet, Flash | 320(applet only) | Tree control height, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree. |
| `highlightHref` | Optional; Applet, Object | yes     | - *yes*: highlights as a link the displayed value for any `cftreeitem` tag that specifies an `href` attribute.
- *no*: disables highlighting. |
| `hScroll`     | Optional; Applet, object | yes     | - *yes*: permits horizontal scrolling.
- *no* |
| `hSpace`      | Optional; Applet |         | Horizontal spacing to left and right of tree control, in pixels. |

Last updated 7/9/2012
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt Format</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| italic    | Optional; Applet, Flash, HTML | no | - yes: displays tree control text in italics.  
- no |
| label     | Optional; HTML | | |
| lookAndFeel | Optional; Applet, object | windows | - motif: renders the tree in Motif style.  
- windows: renders the tree in Windows style.  
- metal: renders the tree in Java Swing style.  
If the platform does not support a style option, the tag uses the default style for the platform. |
| message   | Optional; Applet, HTML | | Message to display if validation fails. |
| notSupported | Optional; Applet | See Description | Text to display if a page that contains a Java applet-based cfform control is opened by a browser that does not support Java or has Java support disabled, for example:  
"<b>Browser must support Java to view ColdFusion Java Applets</b>"  
Default message:  
"<b>Browser must support Java to view ColdFusion Java Applets!</b>" |
| onBlur    | Optional; Flash | | ActionScript to run when the tree loses focus. |
| onChange  | Optional; Flash | | ActionScript to run when the control changes due to user action.  
If you specify an onChange event handler, the Form scope of the ColdFusion action page does not automatically get information about selected items. The ActionScript onChange event handler must handle all changes and selections. |
| onError   | Optional; Applet, HTML | | A JavaScript function to run if validation fails. |
| onFocus   | Optional; Flash | | ActionScript to run when the tree gets focus. The JavaScript DOM form object, value of the name attribute, value that failed validation, and any error text specified by the message attribute are passed to the method. |
| onValidate | Optional; Applet, HTML | | JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to the specified routine, which must return true if validation succeeds; false, otherwise. |
| required  | Optional; Applet, Flash, HTML | no | - yes: users must select an item in the tree control.  
- no |
ColdFusion Tags

Note: All attributes are passed to the XML generated in XML format, but no ColdFusion skin interprets cftree XML.

Usage
This tag must be in a cfform tag block.

The applet format tree requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plug-in installed, the system might also have to download an updated Java plug-in to display an applet format tree. The Flash format tree uses a Flash control, and can be embedded in an HTML format cfform tag. For this tag to work properly in Flash, HTML, or applet format, the browser must also be JavaScript-enabled.

Note: If you specify Flash format for this tag in an HTML format form, and you do not specify height and width attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the tree, including any form controls, users must scroll to see it. Therefore, if you follow a Flash tree in an HTML form with additional output, specify height and width values.

If the following conditions are true, a user’s selection from query data that populates this tag’s options continues to display after the user submits the form:

- The cfformpreserveData attribute is set to "yes"
- The cfformaction attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form

For more information, see the cfform tag entry.

Form variables
When you select a tree item and submit the form that contains the tree, ColdFusion creates a structure with two variables in the action page Form scope. The structure name is the tree name. The following table lists the fields:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt Format</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>style</td>
<td>Optional; Flash, HTML</td>
<td></td>
<td>Must be a style specification in CSS format. In HTML format, this attribute corresponds to the value of an HTML style attribute. In Flash format, use the same syntax and contents as used in Flex for the corresponding Flash element.</td>
</tr>
<tr>
<td>tooltip</td>
<td>Optional; Flash</td>
<td></td>
<td>Flash format only: Text to display when the mouse pointer hovers over the control.</td>
</tr>
<tr>
<td>value</td>
<td>Optional; HTML</td>
<td></td>
<td></td>
</tr>
<tr>
<td>visible</td>
<td>Optional; Flash</td>
<td>yes</td>
<td>Flash format only: Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.</td>
</tr>
</tbody>
</table>
| vScroll   | Optional; Applet, object | yes | • yes: permits vertical scrolling.  
• no |
| vSpace    | Optional; Applet | | Vertical margin above and below tree control, in pixels. |
| width     | Optional; Applet, Flash | 200 (applet only) | Tree control width, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree. |

Last updated 7/9/2012
object format

If you specify object in the format attribute, ColdFusion returns the tree as a ColdFusion structure, and does not send the tree to the browser. You can, for example, loop over the structure to populate a menu, generate “breadcrumb” links for page navigation, or create a DHTML tree.

Note: If you specify an object format tree in an XML format form, ColdFusion does not generate the tree.

The structure variable name is specified by the cftree name attribute. The top level of the structure has two types of entries:

- Attribute settings
- A children array

Attribute settings

The structure has top-level entries with the values of the following cftree attributes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path through the tree to the selected node, in the form [root\node_1\node_2...]. In applet format, the path includes the root node only if the completePath attribute is true. In Flash format, the path always includes the root node.</td>
</tr>
<tr>
<td>node</td>
<td>The value of the selected tree node.</td>
</tr>
</tbody>
</table>

Children array

The top-level children entry is an array of items entries. Each item has the following entries:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>children</td>
<td>This item’s child items; an array of item structures.</td>
</tr>
<tr>
<td>display</td>
<td>Tree item label, as determined by the cftreeitemDisplay attribute.</td>
</tr>
<tr>
<td>expand</td>
<td>Whether to expand the item to display any children; value of cftreeitemExpand attribute.</td>
</tr>
<tr>
<td>href</td>
<td>The URL to link to when the user selects the item; value of the cftreeitemHref attribute.</td>
</tr>
<tr>
<td>img</td>
<td>The tree image icon Image to display as an icon for the tree item; value of cftreeitemImg attribute. You can use the img attribute to display custom icons only in the Applet version; not in the Flash version.</td>
</tr>
<tr>
<td>imgOpen</td>
<td>Image to display when the tree item is open (expanded); value of cftreeitemImgOpen attribute.</td>
</tr>
<tr>
<td>parent</td>
<td>Value of this item’s parent item in the tree.</td>
</tr>
<tr>
<td>path</td>
<td>The node path from the tree root to the current element.</td>
</tr>
<tr>
<td>queryAsRoot</td>
<td>Whether the query is the root of the item; value of cftreeitemQueryAsRoot attribute.</td>
</tr>
<tr>
<td>target</td>
<td>The link target, such as _blank; value of the item’s cftreeitemTarget attribute.</td>
</tr>
<tr>
<td>value</td>
<td>The item’s value, as determined by the cftreeitemValue attribute.</td>
</tr>
</tbody>
</table>
Example

The following example creates a tree that shows available courses from the CourseList table of the cfdocexamples database, and puts each department’s courses in a folder. This example is displayed in Flash and uses the Departments list to get department names.

```cfml
<cfquery name="getCourses" datasource="cfdocexamples">
    SELECT d.dept_name, c.course_id, c.CorName, c.CorLevel, c.corName || ' (' || c.corLevel || ')
    AS corLabel
    FROM CourseList c, Departments d
    WHERE d.Dept_ID = c.Dept_ID
    ORDER BY d.dept_Name, c.corName, c.corLevel
</cfquery>

<cfform name="studentForm" format="flash" width="400" height="450">
    <cftree name="courseTree" width="350" height="400">
        <cftreeitem
            query="getCourses"
            value="dept_name,Course_id"
            display="dept_name,CorLabel" queryasroot="NO" expand="yes,no">
        </cftreeitem>
    </cftree>
</cfform>

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the Path and node values for the selection.

```cfml
<!--- Query the datasource to get employee information. --->
<!--- Group the output by Department. (All fields are required in Group By clause.) --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
    GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>

<html>
<body>
<h3>cftree Example</h3>

<!--- The following runs if the user clicked on a link in the tree. A complete application would use the ID for additional processing. --->
<cfif isdefined("Form.fieldnames")>
    <b>Selected item information</b><br>
    <cfoutput>
        <b>Path: </b>#form.Employees.Path#<br>
        <b>node: </b>#form.Employees.node#<br>
    </cfoutput>
</cfif>

<!--- Display the tree. The cftree tag must be in a cfform. --->
<cfform action="#cgi.script_name#" preservedata="Yes" format="Flash">
    <cftree name = "Employees" height = "400" width = "400"

ColdFusion Tags

The `<cfoutput>` tag loops over the records for the department. The `<cfoutput>` tag does not need any attributes. --->

<!--- Create an item for each employee in the department. Do not expand children. Each employee name links to this page, and sends the employee ID in the query string.--->

<!--- Each Employee entry has Id, and contact info children. --->

<!--- Each node must be unique value, so use Emp_ID om value. --->

<!--- ContactInfo has two children --->

</cfoutput>

</cfoutput>

</cftree>

</cfform>

**cftreeitem**

Description

Populates a form tree control, created with the `cftree` tag, with one or more elements.

Category

Forms tags

Syntax

```
<cftreeitem
    value = "text"
    bind = "bind expression"
    display = "text"
    expand = "yes|no"
    href = "URL"
    img = "filename"
    imgopen = "filename"
    parent = "parent name"
    query = "queryname"
    queryAsRoot = "yes|no"
    target = "URL target">

OR

<cftreeitem
    bind = "bind expression">
    onBindError = "JavaScript function name"
```

Last updated 7/9/2012
Note: You can specify this tag's attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag's attribute names as structure keys.

History
ColdFusion 8: Added the bind and onBindError attributes.

See also
cfapplet, cfform, cfformgroup, cfformitem, cfgrid, cfinput, cfselect, cfslider, cftextarea, cftree;

Building tree controls with the cftree tag and Using HTML trees in the Developing ColdFusion Applications

Attributes
Note: In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt:</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Required for applet, Flash, XML value or bind is required for HTML</td>
<td>Value passed when the form containing the tree is submitted. When populating a tree with data from a cfquery, you can specify multiple columns to use in a delimited list; for example, value=&quot;dept_id,emp_id&quot;. In this case, each column generates an item that is a child of the column that precedes it in the list.</td>
<td></td>
</tr>
<tr>
<td>bind</td>
<td>value or bind is required for HTML</td>
<td>A bind expression specifying a CFC function, JavaScript function, or URL that dynamically gets all tree nodes. You can use this attribute only at the top level of the tree, and in this case, the tree can have only cftreeitem tag. If you use the bind attribute, the only other allowed attribute is onBindError. For details creating trees that using binding, see Using HTML trees in the Developing ColdFusion Applications.</td>
<td></td>
</tr>
</tbody>
</table>
| display   | Optional; All | value | Tree item label. When populating a tree with data from a query, specify names in a delimited list, for example:

display = "dept_name,emp_name"

| expand    | Optional; All | yes | • yes: expands tree to show tree item children.
• no: keeps tree item collapsed. |
| href      | Optional; All | | URL to link to if the user clicks the tree item. If you use a query attribute, the href attribute can specify a query column that contains URLs. If href is not a query column, the attribute text must be a URL or list of URLs. When populating a tree with data from a query, specify the URLs in a comma-delimited list, for example:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt:</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| img       | Optional; Applet, HTML, object | folder | Image name, filename, or file URL for tree item icon. The following values are provided:  
  - cd  
  - computer  
  - document  
  - element  
  - folder  
  - floppy  
  - fixed  
  - remote  
  You can also specify a custom image. To do so, include path and file extension; for example:  
  ```javascript
  img = "../images/page1.gif"
  ```
  You can also specify a path relative to the web root. Custom images are not supported for Flash format.  
  To specify more than one image in a tree, or an image at the second or subsequent level, use commas to separate names, corresponding to level; for example:  
  ```javascript
  img = "folder,document"
  ```
  ```javascript
  img = ",document" (example of second level)
  ``` |
| imgopen   | Optional; Applet, HTML, object | | Icon displayed with open tree item, as described for the img attribute. |
| onbindError | Optional; HTML | see Description | The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.  
  If you omit this attribute, and you specified a global error handler (by using the `ColdFusion.setGlobalErrorHandler` function), it displays the error message; otherwise a default error pop-up appears. |
| parent | Optional; All | | Value of the tree item parent. Determines the item's placement in the tree hierarchy. If omitted, the item is placed at the tree root level, or if the `queryAsRoot` attribute is True, directly under the query. |
ColdFusion Tags

Usage
For this tag to work properly, the browser must be JavaScript-enabled. This tag must be a child of a cftree tag.

The cftreeitem tag has three basic formats:

- If you do not use a query or bind attribute to populate this tag, it creates a single tree item.
- If you use a query, it creates multiple items; each row of the query creates a hierarchically nested set of items with one item per column.
- If you use the bind attribute, the client side tree dynamically gets the data for the tree item’s immediate children, and creates the child items, when a tree item expands. For detailed information on using the bind attribute to populate an HTML format tree, see Using HTML trees in the Developing ColdFusion Applications.

Example
The following example creates a simple tree by using a single cftreeitem tag and a query:

```cfc
<cfform action = "#cgi.script_name#">
  <cftree name = "Employees" height = "400" width = "200">
    <cftreeitem value="LastName, FirstName, Emp_ID" query="getEmployees" queryAsRoot="False">
    </cftreeitem>
  </cftree>
</cfform>
```

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the selected employee’s ID.
<!--- Query the datasource to get employee information.--->
<!--- Group the output by Department.  
(All fields are required in Group By clause.) --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
   SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
   FROM Employees
   GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>
<html>
<body>
<h3>cftreeitem Example</h3>

<!--- The following runs if the user clicked on a link in the tree.  
A complete application would use the ID for additional processing. --->
<cfif isdefined("URL.user_ID")>
   <cfoutput>
      <!--- URL.cftreeitemkey is the selected tree item's value attribute. --->
      You Requested information on #URL.cftreeitemKey#; User ID #URL.user_ID#
   </cfoutput>
   <br><br>
</cfif>
<!--- Display the tree. The cftree tag must be in a cfform. --->
<cfform>
   <cftree name = "Employees" height = "400" width = "200"
      font = "Arial Narrow" highlightref="No" hscroll="No">
      <!--- cfoutput tag with a group attribute loops over the departments. --->
      <cfoutput group="Department" query = "GetEmployees">
         <!--- This cfoutput tag loops over the records for the department.  
The cfoutput tag does not need any attributes. --->
         <cfoutput>
            <!--- Create an item for each employee in the department.  
Do not expand children. Each employee name links to this page, 
and sends the employee ID in the query string. --->
            <cftreeitem value="#LastName#, #FirstName#"
               display = "#LastName#, #FirstName#"
               parent = "#Department#" expand="no"
               href="#cgi.script_name#?user_id=#emp_id#">
               <!--- Each Employee entry has ID and ContactInfo children. --->
               <cftreeitem value="#Emp_ID#" display = "Employee ID: #Emp_ID#"
                  parent = "#LastName#, #FirstName#">
                  <!--- ContactInfo has two children. --->
                  <cftreeitem value="#Phone# parent = "#Emp_ID#_ContactInfo">
                  <cftreeitem value="#Email# parent = "#Emp_ID#_ContactInfo">
               </cftreeitem>
            </cftreeitem>
         </cfoutput>
      </cfoutput>
   </cftree>
</cfform>
cftry

Description
Used with one or more cfcatch tags. Together, they catch and process exceptions in ColdFusion pages. Exceptions are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

Category
Exception handling tags

Syntax
<cftry>
  Code that might throw an exception
  One or more cfcatch blocks
</cftry>

See also
cfcatch,cffinally,cferror,cfthrow,cfthrow,onError;Handling Errors in the Developing ColdFusion Applications

History
ColdFusion MX: Changed cfscript to include try and catch statements that are equivalent to the cftry and cfcatch tags.

Usage
Within a cftry block, put the code that might throw an exception, followed by one or more cfcatch tags that catch and process exceptions. This tag requires an end tag.
Example

<!--- cftry example, using TagContext to display the tag stack. --->
<h3>cftry Example</h3>
<!--- Open a cftry block. --->
<cftry>
    <!--- Note misspelled tablename "employees" as "employeeas". --->
    <cfquery name = "TestQuery" dataSource = "cfdocexamples">
        SELECT *
        FROM EMPLOYEES
    </cfquery>

    <!--- ... other processing goes here --->
    <!--- specify the type of error for which we search --->
    <cfcatch type = "Database">
    <!--- the message to display --->
    <h3>You've Thrown a Database <b>Error</b></h3>
    <cfoutput>
        <!--- and the diagnostic message from the ColdFusion server --->
        <p>#cfcatch.message#</p>
        <p>Caught an exception, type = #CFCATCH.TYPE#</p>
        <p>The contents of the tag stack are:</p>
        <cfloop index = i from = 1
to = #ArrayLen(CFCATCH.TAGCONTEXT)#
    <cfset sCurrent = #CFCATCH.TAGCONTEXT[i]#>
    <br> #i# #sCurrent["ID"]#<br>
    (#sCurrent["LINE"],#sCurrent["COLUMN"]#)
    #sCurrent["TEMPLATE"]#
</cfloop>
</cfoutput>
</cfcatch>
</cftry>

Tags u-z

cfupdate

Description
Updates records in a data source from data in a ColdFusion form or form Scope.

Category
Database manipulation tags

Syntax
<cfupdate
dataSource = "ds_name"
tableName = "table_name"
formFields = "field_names"
password = "password"
tableOwner = "name"
tableQualifier = "qualifier"
username = "username"
Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfinset, cfprocparam, cfprocesult, cfquery, cfqueryparam, cfstoredproc, cftransaction; Creating an update action page with cfupdate in the Developing ColdFusion Applications.

History
ColdFusion 10: Added the clientInfo attribute.
ColdFusion MX: Deprecated the connectString, dbName, dbServer, dbtype, provider, and providerDSN attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientInfo</td>
<td>Optional</td>
<td>Structure containing properties of the client to be set on the database connection.</td>
<td></td>
</tr>
<tr>
<td>dataSource</td>
<td>Required</td>
<td>Name of the data source that contains the table.</td>
<td></td>
</tr>
<tr>
<td>tableName</td>
<td>Required</td>
<td>Name of table to update.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For Oracle drivers, must be uppercase.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For Sybase driver, case sensitive; must be in same case as used when the table was created.</td>
<td></td>
</tr>
<tr>
<td>formFields</td>
<td>Optional</td>
<td>(all on form, except keys)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Comma-delimited list of form fields to update.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If a form field is not matched by a column name in the database, ColdFusion throws an error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The formFields list must include the database table primary key field, which must be present in the form. It can be hidden.</td>
<td></td>
</tr>
<tr>
<td>password</td>
<td>Optional</td>
<td>Overrides the password value specified in ODBC setup.</td>
<td></td>
</tr>
<tr>
<td>tableOwner</td>
<td>Optional</td>
<td>For data sources that support table ownership (for example, SQL Server, Oracle, Sybase SQL Anywhere), the table owner.</td>
<td></td>
</tr>
<tr>
<td>tableQualifier</td>
<td>Optional</td>
<td>For data sources that support table qualifiers. The purpose of table qualifiers is as follows:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SQL Server and Oracle: name of the database that contains the table</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Intersolv dBASE driver: directory of DBF files</td>
<td></td>
</tr>
<tr>
<td>username</td>
<td>Optional</td>
<td>Overrides username value specified in ODBC setup.</td>
<td></td>
</tr>
</tbody>
</table>
Example

<!--- This example lets you update a person's telephone number in the employee table. --->
<cfif isDefined("form.phone")>
  <cfupdate datasource="cfdocexamples" tabname="EMPLOYEES">
</cfif>

<cfquery name="empTable" datasource="cfdocexamples">
  SELECT * FROM EMPLOYEES
</cfquery>

<!--- This code shows the contents of the employee table and allows you to choose a row for updating. --->
<table border="1">
  <cfoutput query="empTable">
    <tr>
      <td>#firstName#</td>
      <td>#lastName#</td>
      <td>#phone#</td>
      <td><a href="cfupdate.cfm?id=#emp_id#">Edit</a></td>
    </tr>
  </cfoutput>
</table>

<cfif isDefined("url.id")>
  <cfquery name="phoneQuery" datasource="cfdocexamples">
    SELECT * FROM employees WHERE emp_id=#url.id#
  </cfquery>
  <!--- This code displays the row to edit for update. --->
  <cfoutput query="phoneQuery">
    <form action="cfupdate.cfm" method="post">
      #phoneQuery.firstName# #phoneQuery.lastName#
      <input name="phone" type="text" value="#phone#" size="12">
      <input type="submit" value="Update">
      <input name="emp_id" type="hidden" value="#emp_id#">
      <!--- The emp_id is passed as a hidden field to be used as a primary key in the CFUPDATE. --->
    </form>
  </cfoutput>
</cfif>

Note: The cfupdate tag internally uses parameterized queries.

cfwddx

Description
Serializes and deserializes CFML data structures to the XML-based WDDX format. The WDDX is an XML vocabulary for describing complex data structures in a standard, generic way. Implementing it lets you use the HTTP protocol to such information among application server platforms, application servers, and browsers.

This tag generates JavaScript statements to instantiate JavaScript objects equivalent to the contents of a WDDX packet or CFML data structure. Interoperates with Unicode.

Category
Extensibility tags
Syntax

```cfwddx``

  ```
  action = "cfml2wddx|wddx2cfml|cfml2js|wddx2js"
  input = "inputData"
  output = "result variable name"
  topLevelVariable = "top-level variable name for JavaScript"
  useTimeZoneInfo = "yes|no"
  validate = "yes|no"
  ```

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

See also
cfcollection, cfdump, cfexecute, cfindex, cfobject, cfreport, cfsearch, ToScript; Using XML and WDDX in the Developing ColdFusion Applications

History

ColdFusion MX

- Changed column name case behavior: ColdFusion preserves the case of column names in JavaScript. (Earlier releases converted query column names to lowercase.)
- Changed encoding format support: this tag supports several encoding formats. The default encoding format is UTF-8. The tag interoperates with Unicode.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| action          | Required|         | cfml2wddx: serializes CFML to WDDX.  
|                 |         |         | wddx2cfml: deserializes WDDX to CFML.  
|                 |         |         | cfml2js: serializes CFML to JavaScript.  
|                 |         |         | wddx2js: deserializes WDDX to JavaScript.  
| input           | Required|         | A value to process. |
| output          | Required if action="wddx2cfml" |         | Name of variable for output. If action="WDDX2JS" or "CFML2JS", and this attribute is omitted, result is output in HTML stream. |
| topLevelVariable| Required if action="wddx2js" or "cfml2js" |         | Name of top-level JavaScript object created by deserialization. The object is an instance of the WddxRecordset object. |
| useTimeZoneInfo | Optional| yes     | Whether to output time-zone information when serializing CFML to WDDX.  
|                 |         |         | yes: the hour-minute offset, represented in ISO8601 format, is output.  
|                 |         |         | No: the local time is output.  
| validate        | Optional| no      | Applies if action="wddx2cfml" or "wddx2js".  
|                 |         |         | yes: validates WDDX input with an XML parser using WDDX DTD. If parser processes input without error, packet is deserialized. Otherwise, an error is thrown.  
|                 |         |         | no: does not perform input validation.  

Last updated 7/9/2012
Usage
ColdFusion preserves the case of column names cases in JavaScript.

The wddx2js and cfml2js actions create a WddxRecordset javascript object when they encounter a RecordSet java object. The serialized JavaScript code requires a wddx.js file.

This tag performs the following conversions:

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFML</td>
<td>WDDX</td>
</tr>
<tr>
<td>CFML</td>
<td>JavaScript</td>
</tr>
<tr>
<td>WDDX</td>
<td>CFML</td>
</tr>
<tr>
<td>WDDX</td>
<td>JavaScript</td>
</tr>
</tbody>
</table>

For more information, and a list of the ColdFusion array and structure functions that you can use to manage XML document objects and functions, see Using XML and WDDX in the Developing ColdFusion Applications.

Note: The cfwddx tag throws an exception if you attempt to serialize a CFC or user-defined function (UDF).

Example
<!--- This example shows basic use of the cfwddx tag. --->
<html>
<body>
<!--- Create a simple query. --->
<cfquery name = "q" dataSource = "cfdocexamples">
   SELECT Message_Id, Thread_id, Username FROM messages
</cfquery>

The recordset data is:...
<cfoutput query = q>
   #Message_ID# #Thread_ID# #Username#
</cfoutput>

<!--- Serialize data to WDDX format. --->
Serializing CFML data...
<cfwddx action = "cfml2wddx" input = #q# output = "wddxText">

<!--- Display WDDX XML packet. --->
Resulting WDDX packet is:
<xmp><cfoutput>#wddxText#</cfoutput></xmp>

<!--- Deserialize to a variable named wddxResult. --->
Deserializing WDDX packet...
<cfwddx action = "wddx2cfml" input = #wddxText# output = "qnew">

The recordset data is:...
<cfoutput query = qnew>
   #Message_ID# #Thread_ID# #Username#
</cfoutput>
</body>
</html>
cfwebsocket

Description
Lets you create the WebSocket object in your CFM template. The tag creates a reference to the WebSocket JavaScript object at the client-side.

Category
Internet protocol tags

Syntax
<cfwebsocket
    name="websocketName"
    onMessage="JavaScript function name"
    onOpen="JavaScript function name"
    onClose="JavaScript function name"
    onError="JavaScript function name"
    useCfAuth=true|false
    subscribeTo="channel_list">

Attribute

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required</td>
<td>The name of the WebSocket object. This is the reference to the JavaScript objects that are used to call WebSocket JavaScript functions.</td>
</tr>
<tr>
<td>onMessage</td>
<td>Required</td>
<td>The JavaScript function that is called when the WebSocket receives a message from the server. The following are the two supported arguments: • aEvent: The WebSocket event that is dispatched from the server. • aToken: Used to get data received from the server.</td>
</tr>
<tr>
<td>onOpen</td>
<td>Optional</td>
<td>The JavaScript function that is called when the WebSocket establishes a connection.</td>
</tr>
<tr>
<td>onClose</td>
<td>Optional</td>
<td>The JavaScript function that is called when the WebSocket closes a connection.</td>
</tr>
<tr>
<td>onError</td>
<td>Optional</td>
<td>The JavaScript function that is called if there is an error while performing an action over the WebSocket connection.</td>
</tr>
<tr>
<td>useCfAuth</td>
<td>Optional</td>
<td>If set to true (default), users need not authenticate for WebSocket connection (provided they have already logged in to the application). This is the default value. If false, users have to specify the credentials for the WebSocket connection.</td>
</tr>
<tr>
<td>subscribeTo</td>
<td>Optional</td>
<td>Comma-separated list of channels to subscribe to. You can specify any or all channels set in the Application.cfc.</td>
</tr>
</tbody>
</table>

History
ColdFusion 10: Added this tag.

Example
In the following example,

- The user is automatically subscribed to the stocks channel.
You have specified the channel name in the Application.cfc.

The example uses the default channel listener.

In the Index.cfm, you specify the channels to which the user can automatically subscribe to (using the attribute subscribeTo) and also define the message handler.

**Application.cfc**

```cfcomponent

class
{
    this.name="websocketsampleapp1";
    this.wschannels=[{name="stocks"}];
}
```

**Index.cfm**

```javascript
<cfwebsocket name="mycfwebsocketobject" onmessage="mymessagehandler" subscribeto="stocks">
<cfdiv id="myDiv"></cfdiv>
</cfwebsocket>
```

The code creates a JavaScript WebSocket object named `mycfwebsocketobject`. If the server sends a message, it calls `mymessagehandler` function.

Since you have specified `subscribeTo` in the `cfwebsocket` tag, the WebSocket object automatically subscribes you to the channel `stocks`.

**cfwindows**

**Description**

Creates a pop-up window in the browser. Does not create a separate browser pop-up instance.

**Category**

Display management tags
Syntax

```xml
<cfwindow
  bodyStyle = "CSS style specification"
  center="true|false"
  closable="true|false"
  destroyOnClose = "true|false"
  draggable="true|false"
  headerStyle = "CSS style specification"
  height="number of pixels"
  initShow="false|true"
  minHeight="number of pixels"
  minWidth="number of pixels"
  modal="true|false"
  name="String"
  onBindError = "JavaScript function name"
  refreshOnShow = "false|true"
  resizable="true|false"
  source="path"
  title="String"
  width="number of pixels"
  x="numeric pixel coordinate"
  y="numeric pixel coordinate">
  window contents
</cfwindow>
```

If you use the `source` attribute, ColdFusion ignores any tag body contents. If you do not have a tag body and omit the `</window>` end tag, close the `cfwindow` tag with the `/` character combination.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

**See also**

**History**

ColdFusion 8: Added this tag.
## Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodyStyle</td>
<td>Optional</td>
<td></td>
<td>A CSS style specification for the window body. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.</td>
</tr>
</tbody>
</table>
| center        | Optional| false   | A Boolean value that specifies whether to center the window over the browser window.  
- If true, ColdFusion ignores the x and y attribute values.  
- If false, and you do not specify x and y attributes, ColdFusion centers the window. |
| closable      | Optional| true    | A Boolean value that specifies whether the user can close the window. If true, the window has an X close icon. |
| destroyOnClose| Optional| false   | If true, destroys the window when it is closed. |
| draggable     | Optional| true    | A Boolean value that specifies whether the user can drag the window. To drag the window, click the mouse on the title bar and hold the button down while dragging. If the window does not have a title, users cannot drag it. |
| headerStyle   | Optional|         | A CSS style specification for the window header. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output. |
| height        | Optional| 300     | Height of the window in pixels. If you specify a value greater than the available space, the window occupies the available space and the resize handles do not appear. |
| initShow      | Optional| false   | A Boolean value that specifies whether to display the window when the containing page first appears. If this value is false, use the ColdFusion.Window.showJavaScript function to display the window. |
| minHeight     | Optional| 0       | The minimum height, in pixels, to which users can resize the window. |
| minWidth      | Optional| 0       | The minimum width, in pixels, to which users can resize the window. |
| modal         | Optional| false   | A Boolean value that specifies whether the window is modal, that is, whether the user can interact with the main window while this window is displayed. If true, the user cannot interact with the main window. |
| name          | Optional|         | The name of the window. Must be unique on the pages. This attribute is required to interact with the window, including to dynamically show or hide it. |
| onMouseError  | Optional| see Description | The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.  
If you omit this attribute, and specified a global error handler (by using the ColdFusion.setGlobalErrorHandler function), it displays the error message; otherwise a default error pop-up appears. |
Usage
You cannot use this tag in a form or as a child of a cflayout, or cflayoutarea tag.

Define the cfwindow tag on the page that displays it (or a page that is included by using the cfinclude tag). So, you cannot use the cfwindow tag on a page that is specified by a cfmenuitem tag http attribute, cfdiv tag bind attribute, or cflayoutarea or cfpod tag source attribute. Instead, for example, you can display a window when a user clicks a menu item by defining the window on the same page as your menu and using a JavaScript function in the cfmenuitem tag http attribute to call the window's show function. The cfwindow tag uses its source attribute to get its contents from another page.
You can use a `source` attribute or a tag body to specify the window contents; if you specify both, ColdFusion uses the contents specified by the `source` attribute and ignores the tag body. If you use a `source` attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.

If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application’s main page, and not write them inline in code that you get by using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a `bind expression` to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only. For detailed information on using bind expressions, see Binding data to form fields in the Developing ColdFusion Applications.

### JavaScript functions

You can use the following JavaScript functions to manage an HTML format window:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ColdFusion.Window.create</code></td>
<td>Creates a window without using a <code>cfwindow</code> tag.</td>
</tr>
<tr>
<td><code>ColdFusion.Window.getWindowObject</code></td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified HTML format <code>cfwindow</code> control.</td>
</tr>
<tr>
<td><code>ColdFusion.Window.hide</code></td>
<td>Closes a window.</td>
</tr>
<tr>
<td><code>ColdFusion.Window.onHide</code></td>
<td>Specifies a function to run each time a specific window closes.</td>
</tr>
<tr>
<td><code>ColdFusion.Window.onShow</code></td>
<td>Specifies a function to run each time a specific window opens.</td>
</tr>
<tr>
<td><code>ColdFusion.Window.show</code></td>
<td>Opens a window.</td>
</tr>
</tbody>
</table>

### Example

The following example shows several features of the `cfwindow` tag and dynamic binding of the `cfwindow` tag `source` attribute to form controls. It shows how you can use `x` and `y` attributes to position the windows and how several attributes, such as `closable` and `resizable` affect the window appearance. It also shows how you can use bind expressions to dynamically update window contents when form control values change, including different ways to trigger updating the window contents.
<html>
<head>
</head>
<body>
<cfform name="myform">
  <cfinput type="hidden" name="hiddentext" value="This is hidden text from the main page">
  <cfinput name="text1"><br />
  Click the mouse on the control to show its text in window 1.
  <cfinput name="text1"><br />

  Click the button to show the input control text in window 2.
  <cfinput name="text2">
    <cfinput type="button" name="mybutton" value="Show Text"
      onclick="javascript:ColdFusion.Window.show('mywindow2')"><br />

  Click the Checkbox to change and show its status in window 3
  <cfinput name="check1" type="checkbox"><br />

  Click the button to open a window containing the page
  specified by the input control.
  <cfinput name="text3" value="windowsource.cfm">
    <cfinput type="button" name="mybutton3" value="Open Window"
      onclick="javascript:ColdFusion.Window.show('mywindow4')">
</cfform>

<!--- This window shows initially and cannot be closed, dragged, or resized.
    The value of the text URL parameter, and therefore, the contents of the
text displayed in the window changes each time the user clicks the
mouse over the text1 control. --->
<cfwindow x="0" y="100" width="200" height="150"
  name="mywindow" title="My First Window"
  closable="false" draggable="false" resizable="false" initshow="true"
  source="windowsource.cfm?text={myform:text1@mousedown}" />

<!--- This window shows initially and cannot be dragged, or resized, but can
    be closed.
    The text URL parameter represents the text2 input control value. --->
<cfwindow x="0" y="250" width="200" height="150"
  name="mywindow2" title="My Second Window"
  initshow="true" draggable="false" resizable="false"
  source="windowsource.cfm?text={myform:text2}" />

<!--- This window shows initially and cannot be resized, but can be dragged
    or closed.
    The value of the text URL parameter, and therefore, Boolean value
    displayed in the window changes each time the user clicks the mouse

Last updated 7/9/2012
in the check1 control to change the check box status.
The bind expression binds to the check box checked attribute;
it specifies a click event because Internet Explorer does not
generate a change event when the user clicks the box.--->

```html
<cfwindow x="0" y="400" width="200" height="150"
name="mywindow3" title="My Third Window"
initshow="true" resizable="false"
source="windowsource.cfm?text=<b>Checkbox: </b>{myform:check1.checked@click}" />

<!--- This window does not display initially.
The Open Window button control opens it.
It can be closed, dragged, and resized.
The value text URL parameter represents the value of a hidden text
field. --->
<cfwindow x="210" y="100" width="500" height="480" name="mywindow4"
minHeight="400" minWidth="400"
title="My Fourth Window" initshow="false"
source="{myform:text3}?text={myform:hiddentext}" />
</body>
</html>
```

The windowsource.cfm page that the cfwindow tag source attributes specify to display in the windows contains the
following code:

```html
<h3>Main page input:</h3>
<cfoutput>
#url.text#
</cfoutput>
```

### cfxml

**Description**

Creates a ColdFusion XML document object that contains the markup in the tag body. This tag can include XML and
CFML tags. ColdFusion processes the CFML code in the tag body, and then assigns the resulting text to an XML
document object variable, which is always stored in Unicode.

**Category**

Extensibility tags

**Syntax**

```cfxml
<cfxml
    variable="xmlVarName"
    caseSensitive="yes|no">
```

**Note:** You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the
structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

**See also**

IsXmlNode, IsXmlNodeElen, IsXmlNodeRoot, ToString, XmlNodePos, XmlNew, XmlParse, XmlSearch, XmlTransform; Using
XML and WDDX in the Developing ColdFusion Applications

**History**

ColdFusion MX 7: Added support for using an XML declaration at the start of the text.
ColdFusion MX: Added this tag.

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td></td>
<td></td>
<td>Name of the document object.</td>
</tr>
</tbody>
</table>
| caseSensitive| Optional| no      | • yes: maintains the case of document elements and attributes.  
|              |         |         | • no                                              |

Usage

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as xmlChildren[1]) instead. In the following code, the first line works with a case-sensitive XML object. The second and third lines cause errors:

```coldfusion
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

Use the XmlFormat function to escape special characters such as &, > and <.

To convert an XML document object back into a string, use the ToString function, at which time ColdFusion automatically prepends the ```<?xml version="1.0" encoding="UTF-8" ?>``` XML declaration.

To change the declaration to specify another encoding, use the Replace function. To specify the encoding of the text that is returned to a browser or other application, use the cfcontent tag.

The following example illustrates this process:

```coldfusion
<cfprocessingdirective suppresswhitespace="Yes">
  <cfcontent type="text/xml; charset=utf-16">
    <cfxml variable="xmlobject">
      <breakfast_menu>
        <food>
          <name quantity="50">Belgian Waffles</name>
          <description>Our famous Belgian Waffles</description>
        </food>
      </breakfast_menu>
    </cfxml>
  </cfcontent>
</cfprocessingdirective>
```

The cfprocessingdirective tag prevents ColdFusion from putting white space characters in front of the XML declaration.
Example
This following example creates a document object whose root element is MyDoc. The object includes text that displays the value of the ColdFusion variable testVar. The code creates four nested child elements, which are generated by an indexed cfloop tag. The cfdump tag displays the XML document object.

```coldfusion
<cfset testVar = True>
<cfxml variable="MyDoc">
  <?xml version='1.0' encoding='utf-8' ?>
  <MyDoc>
    <cfif testVar IS True>
      <cfoutput>The value of testVar is True.</cfoutput>
    </cfif>
    <cfelse>
      <cfoutput>The value of testVar is False.</cfoutput>
    </cfif>
    <cfloop index = "LoopCount" from = "1" to = "4">
      <childNode>
        This is Child node <cfoutput>#LoopCount#.</cfoutput>
      </childNode>
    </cfloop>
  </MyDoc>
</cfxml>
<cfdump var=#MyDoc#>
```

cfzip

Description
Manipulates ZIP and Java Archive (JAR) files. In addition to the basic zip and unzip functions, use the cfzip tag to delete entries from an archive, filter files, read files in binary format, list the contents of an archive, and specify an entry path used in an executable JAR file.

History
ColdFusion 8: Added this tag.

Category
File management tags
ColdFusion Tags

Syntax

**delete**
<cfzip
  **required**
  action = "delete"
  file = "absolute pathname"
  **optional**
  entrypath = "full pathname"
  filter = "file filter"
  recurse = "yes|no">

**list**
<cfzip
  **required**
  action = "list"
  file = "absolute pathname"
  name = "recordset name"
  **optional**
  filter = "file filter"
  recurse = "yes|no"
  showDirectory= "yes|no">

**read**
<cfzip
  **required**
  action = "read"
  entrypath = "full pathname"
  file = "absolute pathname"
  variable = "variable name"
  **optional**
  charset = "encoding type">

**readBinary**
<cfzip
  **required**
  action = "readBinary"
  entrypath = "full pathname"
  file = "absolute pathname"
  variable = "variable name">

**unzip**
<cfzip
  **required**
  action = "unzip"
  destination = "destination directory"
  file = "absolute pathname"
  **optional**
entrypath = "full pathname"
filter = "file filter"
overwrite = "yes|no"
recurse = "yes|no"
storePath = "yes|no">

```
<cfzip
  required
  file = "absolute pathname"
  One of the following:
  source = "source directory"
  <cfzipparam source = "source directory" ...>
  optional
  action = "zip"
  filter = "file filter"
  overwrite = "yes|no"
  prefix = "string"
  recurse = "yes|no"
  storePath = "yes|no">
```

Note: You can specify this tag’s attributes in an attributeCollection attribute whose value is a structure. Specify the structure name in the attributeCollection attribute and use the tag’s attribute names as structure keys.

<td></td>
<td></td>
<td></td>
<td></td>
<td>- no: Updates existing entries and adds new entries to the ZIP or JAR file if it exists.</td>
</tr>
<tr>
<td>prefix</td>
<td>zip</td>
<td>Optional</td>
<td></td>
<td>String added as a prefix to the ZIP or JAR entry. The string is the name of a subdirectory in which the entries are added.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Usage
Use the cfzip tag to zip and unzip files and manipulate existing ZIP or JAR files in ColdFusion. You can use the cfzip tag independently or with one or more cfzipparam tags to manipulate multiple files or directories. The cfzip tag is the parent tag of the cfzipparam tag.

The ZIP format is the standard format for file archiving and compression. The JAR format is based on the ZIP format. JAR files are platform-independent.

Note: The cfzip tag does not create directories. If you specify a directory that does not exist, ColdFusion generates an error.

Use the following syntax to specify an in-memory file or directory in any attribute that takes a path. In-memory files are not written to disk and speed processing of transient data.

ram://filepath

The filepath can include multiple directories, for example ram:///petStore/images/dogImages.zip. You must create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

delete action
Use the delete action to delete entries from a ZIP or JAR file.
<!--- This example shows how to delete all the properties in a JAR file. --->
<cfzip file="e:\work\source.jar" action="delete" filter="*.properties, *.props">
<!--- This example shows how to delete all of the entries in a ZIP file with a JPG, GIF, or PNG extension, including entries in subdirectories. --->
<cfzip file="c:\myApp\images.zip" action="delete" filter="*.jpg, *.gif, *.png" recurse="yes">
<!--- This example shows how to delete the "images" subdirectory (and its contents) from the "myApp.zip" file. --->
<cfzip action="delete" file="c:\myApp.zip" entrypath="images">
<!--- This example shows how to delete all Java source entries in the "work/source" directory and images (*.gif, *.jpg, *.jpeg) from a JAR file. --->
<cfzip file="C:\downloads\source.jar" action="delete">
  <cfzipparam entrypath="work/source" filter="*.java">
  <cfzipparam filter="*.gif,*.jpg,*.jpeg">
</cfzip>

list action
Use the list action to list the entries of a ZIP or JAR file. The following table shows the types of information you can retrieve for entries in the archive:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Text string description saved with the entry source.</td>
</tr>
<tr>
<td>compressedSize</td>
<td>Compressed size of the entry in bytes.</td>
</tr>
<tr>
<td>crc</td>
<td>Checksum for the entry source.</td>
</tr>
<tr>
<td>dateLastModified</td>
<td>Date and time when the source was last modified.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the directory where the entry is stored.</td>
</tr>
<tr>
<td>name</td>
<td>Entry pathname.</td>
</tr>
<tr>
<td>size</td>
<td>Uncompressed size of the entry source in bytes.</td>
</tr>
<tr>
<td>type</td>
<td>Source type for the entry, for example, file.</td>
</tr>
</tbody>
</table>

You can use the cfdump tag to list all of the information in a ZIP or JAR file, as the following example shows:

<cfzip file="c:\myApp.jar" action="list" name="entry">
<cfdump var="#entry#">
</cfzip>

You can use the cfoutput tag to list individual fields for the entries in an archive, as the following example shows:

<cfzip file="c:\zipTest\Test.zip" action="list" name="entry">
<table>
<cfoutput>
<tr>
  <td>Entry Name:</td> #entry.name#</tr>
  <td>Last Modified Date:</td> #dateFormat(entry.dateLastModified)#,#timeFormat(entry.dateLastModified)#</tr>
  <td>Size (uncompressed):</td> #numberFormat(entry.size/1000)# KB</tr>
</cfoutput>
</table>
read action
Use the read action to read the content of the ZIP or JAR file entry in human-readable format. The read action uses the charset value to create the string.

<!--- This example shows how to read a text file in a JAR file. --->
<cfzip action="read" file="/home/sam/work/util.jar" entrypath="info.txt" variable="text">
</cfzip>

readBinary action
Use the readBinary action to read the content of a ZIP or JAR file in binary format.

<!--- This example shows how to use the readBinary action to copy a ZIP entry from one ZIP file to another ZIP file. --->
<cfzip file="c:\work\instr.zip" action="readBinary"
       entryPath="com/test/abc.jpg" variable="xyz">
<cfzip file="c:\work\copy_instr.zip">
  <cfzipparam entryPath="com/test/xyz.jpg" content="#xyz#"/>
</cfzip>

unzip action
Use the unzip action to extract the entries from a ZIP or JAR file.

<!--- This example shows how to extract the class files of a JAR file and save the files to a local drive. --->
<cfzip file="e:\work\tools.jar" action="unzip" filter="*.class"
       destination="c:\temp\tools\classes"/>

<!--- This example shows how to extract files from a JAR file in multiple directories. --->
<cfzip file="e:\work\images.jar" action="unzip" destination="c:\images">
  <cfzipparam entryPath="toWork\small"/>
  <cfzipparam entryPath="final\large"/>
</cfzip>

zip action
Use the zip action to create or update a ZIP or JAR file. This is the default action; you do not have to specify it explicitly. If you specify a ZIP or JAR file that does not exist, ColdFusion creates it. If the ZIP or JAR file exists, ColdFusion adds new entries from the source and updates existing entries if they have changed. If you set the overwrite attribute to yes, all of the entries in the ZIP or JAR file are replaced by the new content.

<!--- This example shows how to zip the directory "c:\temp" into the ZIP file "e:\work\abc.zip". --->
<cfzip file="e:\work\abc.zip" source="c:\temp">
<!--- This example shows how to zip all the class files in a directory and add a subdirectory named "classes" to the JAR file entry name. --->
<cfzip file="e:\work\util.jar" action="zip" source="c:\src\util" prefix="classes"
       filter="*.class"/>

<!--- This example shows how to zip all of the log files in the ColdFusion directory and create a subdirectory called exception where zipped files are archived. --->
<cfzip file="c:\\zipTest\log2.zip" action="zip" source="c:\ColdFusion\" prefix="exception"
       filter="*.log"/>

<!--- This example shows how to overwrite all of the content of a ZIP file with the entries specified in the source. --->
<cfzip file="c:\currentApp.zip" source="c:\myApp\work" overwrite="yes">

Example
The following example shows how to zip image files chosen from a form and e-mail the ZIP file to the person requesting the images.
The first ColdFusion page populates a pop-up menu with the names of artists generated from a database query:

```cfml
<!--- Create a query to extract artist names from the cfartgallery database. --->
<cfquery name="artist" datasource="cfartgallery">
  SELECT FIRSTNAME || ' ' || LASTNAME AS FULLNAME, ARTISTS.ARTISTID
  FROM ARTISTS
</cfquery>

<!--- Create a form that lists the artists generated by the query. --->
<cfform action="zipArt_action.cfm" method="post">
  <h3>Choose an Artist</h3>
  <p>Please choose an artist:</p>
  <cfselect name="artistName" query="artist" display="FULLNAME" value="ARTISTID" required="yes" multiple="no" size="8">
  </cfselect>
  <br/><cfinput type="submit" name="submit" value="OK">
</cfform>
```

The first action page displays the images by the selected artist, zips the files, and writes the ZIP file to a temporary directory. Also, it includes a form to e-mail the ZIP file:

```cfml
<!--- Create a query to extract artwork for the selected artist from the cfartgallery database. --->
<cfquery name="artwork" datasource="cfartgallery">
  SELECT FIRSTNAME, LASTNAME, LARGEIMAGE
  FROM ARTISTS, ART
  WHERE ARTISTS.ARTISTID = ART.ARTISTID
  AND ARTISTS.ARTISTID=#form.artistName#
  ORDER BY ARTNAME
</cfquery>
```

```cfml
<p>You have chosen the work of #artwork.FirstName# #artwork.LastName#.</p>
<cfset thisDir = ExpandPath("")>
<cfset imgDir = ExpandPath("..")>
</cfoutput>
<cfset xctr = 1>
<table border="0" cellpadding="15" cellspacing="0" bgcolor="#FFFFFF">
<cfoutput query="artwork">
  <cfif xctr mod 3 eq 1>
    <tr>
      <td valign="top" align="center" width="200">
        <cfset xctr = xctr + 1>
        <img src="#imgdir#/cfdocs/images/artgallery/#artwork.largeImage#"/>
```
<!---Zip the files by the specified artist. --->
<cfif>
    <cfoutput>
    </cfoutput>
</cfif>
</table>

The second action page mails the ZIP file as an attachment:

<h3>Mail the ZIP file</h3>
<p>Your file has been mailed to you.</p>
<cfset eMail="#form.MailTo#">
<cfset zipPath="#form.zipPath#">
<cfmail from="coldfusion@adobe.com" to="#eMail#" subject="see zipped attachment">
    The images you requested are enclosed in a ZIP file.
</cfmail>

<cfzipparam

**cfzipparam**

**Description**
Provides additional information to the `cfzip` tag.

The `cfzipparam` tag is always a child tag of the `cfzip` tag.

**History**
ColdFusion 8: Added this tag.

**Category**
File management tags
Syntax

```html
<cfzip ..>
  <cfzipparam
    charset = "encoding type"
    content = "variable name"
    entryPath = "full pathname"
    filter = "file filter"
    prefix = "string"
    recurse = "yes|no"
    source = "source directory">
</cfzip>
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

`cfzip`

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| charset   | Optional| default encoding of the host machine | Converts string content into binary data before putting it into a ZIP or JAR file. Used only when `cfzip action="zip"` and the `cfzipparam` content is a string. Examples of character sets:
- JIS
- RFC1345
- UTF-16 |
| content   | Optional| Content written to the ZIP or JAR entry. Used only when `cfzip action="zip"`. Valid content data types are `binary` and `string`. If you specify the content attribute, specify the `entryPath` attribute. |
| entryPath | Optional| Pathname used:
- For `cfzip action="zip"`, it is the entry path used. This is valid only when the source is a file. The entry path creates a subdirectory in the ZIP or JAR file.
- For `cfzip action="unzip"`, it is the path name to unzip.
- For `cfzip action="delete"`, it is the path name to delete from the ZIP or JAR file. |
| filter    | Optional| File filter applied to the action. For example, for the `zip` action, all the files in the `source` directory that match the filter are zipped. |
Usage

Use the `cfzipparam` tag with the `cfzip` tag to zip, extract, or delete multiple files or directories. For example, to zip multiple directories, specify a `cfzipparam` tag for each source directory.

Example

Example 1

```cfml
<!--- This example shows how to zip class files from one subdirectory and class and property files from another directory into a JAR file. --->
<cfzip file="c:\util.jar" source="c:\myproj\classes">
  <cfzipparam source="com\abc\util" filter="*.class">
  <cfzipparam source="com\abc\io" filter="*.class, *.properties">
</cfzip>
```

Example 2

```cfml
<!--- This example shows how to update a ZIP file with files from multiple locations, each with a different filter. --->
<cfzip file="e:\work\test.jar" action="zip">
  <cfzipparam source="c:\temp\abc.txt" prefix="com\abc">
  <cfzipparam source="c:\src\classes" recurse="yes" filter="*.class, *.properties" prefix="classes">
    <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
</cfzip>
```

Example 3

```cfml
<!--- This example shows how to insert the string format for a programmatically generated XML file into a ZIP file. --->
<!--- Create a variable that specifies a time-out period. --->
<cfset myDoc="<system-config><timeout>1500</timeout><pool-max-size>30
</pool-max-size></system-config>">
<!--- Zip the file. --->
<cfzip file="e:\work\test.zip" action="zip">
  <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
    <cfzipparam content="#myDoc#" entrypath="system-config.xml">
</cfzip>
```

Example 4

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Req/Opt</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>Optional</td>
<td></td>
<td>String added as a prefix to the ZIP or JAR entry. Used only when <code>cfzip action=&quot;zip&quot;</code>.</td>
</tr>
<tr>
<td>recurse</td>
<td>Optional</td>
<td>yes</td>
<td>Include the directory to be zipped, unzipped, or deleted, as specified by the <code>cfzip</code> parent tag.</td>
</tr>
<tr>
<td>source</td>
<td>Optional</td>
<td></td>
<td>Source directory or file. Used only when <code>cfzip action=&quot;zip&quot;</code>. Specified files are added to the ZIP or JAR file: • If you specify <code>source</code> attribute for the <code>cfzip</code> tag, the <code>cfzipparam source</code> is relative to it. • If you do not specify a <code>source</code> attribute for the <code>cfzip</code> tag, the <code>cfzipparam source</code> must be an absolute pathname.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
<!--- This example shows how to update a JAR file with a new version of the file and add some new files to the JAR file. --->
<cfzip file="e:\work\admin.jar">
   <cfzipparam source="c:\src\classes" recurse="yes"
            filter="*.class,*.properties">
   <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
</cfzip>

Example 5

The following example shows how to zip multiple image files chosen from a form and e-mail the ZIP file to the person requesting the images.

The first ColdFusion page populates a pop-up menu with the names of artists generated from a database query:

<!--- The following code creates a form for selecting images. --->
<h3>Select the images</h3>
<p>Please choose the images you would like sent to you.</p>
<!--- Create the ColdFusion form to select the images. --->
<table>
cfform action="zip2_action.cfm" method="post"
enctype="multipart/form-data">
   <tr>
      <td><img src="../cfdocs/images/artgallery/elecia01.jpg"/><br/>
   <cfinput type="checkbox" name="ck1" Value=1>Cube</td>
      <td><img src="../cfdocs/images/artgallery/elecia02.jpg"/><br/>
   <cfinput type="checkbox" name="ck2" Value=1>Pentagon</td>
      <td><img src="../cfdocs/images/artgallery/elecia03.jpg"/><br/>
   <cfinput type="checkbox" name="ck3" Value=1>Surfer Dude</td>
      <td><img src="../cfdocs/images/artgallery/elecia04.jpg"/><br/>
   <cfinput type="checkbox" name="ck4" Value=1>Surfer Girl</td>
   </tr>
   <tr><td><cfinput type = "Submit" name = "OK" label="OK" label="OK"></td></tr>
</table>
</cfform>

The first action page zips the files selected from the form, and writes the ZIP file to the hard drive. Also, it includes a form to e-mail the ZIP file:

<!--- Determine the absolute pathname on the server. --->
<cfset thisDir = ExpandPath("." )>

<!--- Create a ZIP file based on the selections from the form. Use the cfzipparam tag to specify the source for each check box selection. --->
<cfzip file="c:\images.zip" source="#thisDir#" action="zip" overwrite="yes">
   <cfif IsDefined("form.ck1")>
      <cfzipparam source="..\cfdocs\images\artgallery\elecia01.jpg">
      </cfif>
   <cfif IsDefined("form.ck2")>
      <cfzipparam source="..\cfdocs\images\artgallery\elecia02.jpg">
      </cfif>
   <cfif IsDefined("form.ck3")>
      <cfzipparam source="..\cfdocs\images\artgallery\elecia03.jpg">
      </cfif>
   <cfif IsDefined("form.ck4")>
      <cfzipparam source="..\cfdocs\images\artgallery\elecia04.jpg">
      </cfif>
   </cfzip>

<h3>Mail the ZIP File</h3>
<p>Please enter your e-mail address so we can send you the ZIP file as an attachment.</p>
<cfif IsDefined("form.mailto")>
  <cfif form.mailto is not ">
    <cfoutput>
      <cfmail from="coldfusion@adobe.com" to="#form.mailto#"
               subject="see zipped attachment">
        The images you requested are enclosed in a ZIP file.
        <cfmailparam file="#thisDir#/images.zip"/>
      </cfmail>
    </cfoutput>
  </cfif>
</cfif>

<cfform action = "zipArt_action2.cfm" method="post">
  Your e-mail address: <cfinput type = "Text" name = "MailTo">
  <!--- Specify the required field. --->
  <cfinput type = "hidden" name = "MailTo_required"
           value = "You must enter your email address">
  <cfinput type = "hidden" name="zipPath" value = "c:\images.zip">
  <p><cfinput type = "Submit" name = "OK" label="Mail"></p>
</cfform>

The second action page mails the ZIP file as an attachment:

<h3>Mail the ZIP file</h3>
<p>Your file has been mailed to you.</p>
<cfset eMail="#form.MailTo#">
<cfset zipPath="#form.zipPath#">
<cfmail from="coldfusion@adobe.com" to="#eMail#"
        subject="see zipped attachment">
    The images you requested are enclosed in a ZIP file.
    <cfmailparam file="#zipPath#"></cfmail>
# Chapter 4: ColdFusion Functions

The following tables list and categorize ColdFusion Markup Language (CFML) functions.

## New Functions in ColdFusion 10

String functions

History-
ColdFusion MX: ColdFusion now supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)

String-processing functions process any of these characters (including ASCII 0 (NUL) characters), and continue counting subsequent characters of the string, if any. (In earlier releases, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

See also “Conversion functions” on page 727.

## Deprecated functions, parameters, and values

The following functions, parameters, and values are deprecated. Do not use them in ColdFusion applications. They might not work, and might cause an error, in releases later than ColdFusion MX.

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter or value</th>
<th>Deprecated as of this ColdFusion release</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetMetricData</td>

Functions a-b

Abs

Description
Absolute-value function. The absolute value of a number is the number without its sign.

Returns
The absolute value of a number.

Category
Mathematical functions

Function syntax
Abs(number)

See also
Sgn

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A number</td>
</tr>
</tbody>
</table>

Example

```
<h3>Abs Example</h3>
<p>The absolute value of the following numbers: 1, 3, -4, -3.2, 6 is
<cfoutput>
#Abs(1)#, #Abs(3)#, #Abs(-4)#, #Abs(-3.2)#, #Abs(6)#
</cfoutput>
<p>The absolute value of a number is the number without its sign.</p>
```
**ACos**

**Description**
Arccosine function. The arccosine is the angle whose cosine is `number`.

**Returns**
The arccosine, in radians, of a number.

**Category**
Mathematical functions

**Function syntax**

```
ACos(number)
```

**See also**
`Cos`, `Sin`, `ASin`, `Tan`, `Atn`, `Pi`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Cosine of an angle. The value must be between -1.0 and 1.0, inclusive.</td>
</tr>
</tbody>
</table>

**Usage**
The range of the result is 0 to π.

To convert degrees to radians, multiply degrees by π/180. To convert radians to degrees, multiply radians by 180/π.

**Example**

```html
<h3>ACos Example</h3>
<!--- Output the arccosine value. --->
<cfif IsDefined("FORM.CosNum")>
  <cfif IsNumeric(FORM.CosNum)>
    <cfif Abs(FORM.CosNum) LESS THAN OR EQUAL TO 1>
      <cfoutput>ACos(#FORM.CosNum#) = #ACos(FORM.cosNum)# Radians</cfoutput>
    </cfif>
    <br>
    <cfoutput>ACos(#FORM.CosNum#) = #ACos(FORM.cosNum) * 180/PI()#</cfoutput>
  </cfif>
  <cfelse>
    <!--- If it is empty, output an error message. --->
    <h4>Enter a number between -1 and 1</h4>
  </cfif>
</cfif>

<form method="post" action = "acos.cfm">
  <p>Enter a number to get its arccosine in Radians and Degrees. 
  <br><input type = "Text" name = "cosNum" size = "25">
  <p><input type = "Submit" name = "" > <input type = "RESET" ></form>
```

Last updated 7/9/2012
AddSOAPRequestHeader

Description
Adds a SOAP header to a web service request before making the request.

Returns
Nothing.

Category
XML functions

Function syntax
AddSOAPRequestHeader(webservice, namespace, name, value [, mustunderstand])

See also
AddSOAPResponseHeader, GetSOAPRequest, GetSOAPRequestHeader, GetSOAPResponse, GetSOAPResponseHeader, IsSOAPRequest; Basic web service concepts in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webservice</td>
<td>A web service object as returned from the cfobject tag or the CreateObject function.</td>
</tr>
<tr>
<td>namespace</td>
<td>A string that is the namespace for the header.</td>
</tr>
<tr>
<td>name</td>
<td>A string that contains the name of the SOAP header in the request.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the SOAP header; this can be a CFML XML value.</td>
</tr>
<tr>
<td>mustunderstand</td>
<td>Optional. True or False (default). Sets the SOAP mustunderstand value for this header.</td>
</tr>
</tbody>
</table>

Usage
Used within CFML code by a consumer of a web service before it calls the web service.

If you pass XML in the value parameter, ColdFusion ignores the namespace and name parameters. If you require a namespace, define it within the XML itself.

Example
There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for AddSOAPResponseHeader.

Execute the following example as a client to see how the AddSOAPRequestHeader function operates.
AddSOAPRequestHeader Example

```cfs```

```cfs```
Function syntax

AddSOAPResponseHeader(namespace, name, value[, mustunderstand])

See also
AddSOAPRequestHeader, GetSOAPRequest, GetSOAPRequestHeader, GetSOAPResponse, GetSOAPResponseHeader, IsSOAPRequest; Basic web service concepts in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>A string that is the namespace for the header.</td>
</tr>
<tr>
<td>name</td>
<td>A string that contains the name of the SOAP header in the request.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the SOAP header; this can be a CFML XML value.</td>
</tr>
<tr>
<td>mustunderstand</td>
<td>Optional. True or False (default). Sets the SOAP mustunderstand value for this header.</td>
</tr>
</tbody>
</table>

Usage

Call this function only from within a CFC web service function. It throws an error if it is invoked in a context that is not a web service request.

If you pass XML in the value parameter, ColdFusion ignores the namespace and name parameters. If you require a namespace, define it within the XML itself.

Use the IsSOAPRequest function to determine if the CFC is running as a web service.

Example

This example creates a CFC web service that illustrates the operation of the AddSOAPResponseHeader function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as headerservice.cfc in a folder called soapheaders under your web root. Test its operation, and specifically the operation of the AddSOAPResponseHeader function, by executing the examples that invoke this web service. For example, see the example for AddSOAPRequestHeader.
<h3>AddSOAPResponseHeader Example</h3>

<!--- The headerservice.cfc CFC Web Service.--->

```cfcomponent displayname="tester" hint="Test for SOAP headers">
<cffunction name="echo_me"
    access="remote"
    output="false"
    returntype="string"
    displayname="Echo Test" hint="Header test">
    <cfargument name="in_here" required="true" type="string">

    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>
        <!--- Get the first header as a string and as XML. --->
        <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
        <cfset return = "The service saw username: " & username>
        <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username", "TRUE")>
        <cfset return = return & " as XML: " & xmlusername>

        <!--- Get the second header as a string and as XML. --->
        <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
        <cfset return = return & "The service saw password: " & password>
        <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password", "TRUE")>
        <cfset return = return & " as XML: " & xmlpassword>

        <!--- Add a header as a string. --->
        <cfset addSOAPResponseHeader("http://www.tomj.org/myns",
            "returnheader", "AUTHORIZED VALUE", false)>

        <!--- Add a second header using a CFML XML value. --->
        <cfset doc = XmlNew()>
        <cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
        <cfset x.XmlText = "hey man, here I am in XML">
        <cfset x.XmlAttributes["xsi:type"] = "xsd:string">
        <cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>
    </cfif>
    <cfelse>
        <!--- Add a header as a string - Must generate error! --->
        <cfset addSOAPResponseHeader("http://www.tomj.org/myns",
            "returnheader", "AUTHORIZED VALUE", false)>
        <cfreturn return = "Not invoked as a web service">
    </cfelse>
</cffunction>
</cfcomponent>

AjaxLink

**Description**

Causes an HTML href attribute to display link results in the current Ajax container. When the browser follows a link that is specified by this function, the HTTP response does not replace the current page; instead, it populates the containing cfdiv, cflayoutarea, cfpod, or cfwindow control.
ColdFusion Functions

Returns
Code that causes the linked page to be displayed in the containing control.

Category
Display and formatting functions

Function syntax
AjaxLink(URL)

See also
cfdiv, cflayoutarea, cfpod, cfwindow, Using Ajax User Interface Components and Features in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL of the link.</td>
</tr>
</tbody>
</table>

Usage
This function has an effect only when it is used to specify the URL of an href attribute when the HTML a tag is inside a cfdiv, cflayoutarea, cfpod, or cfwindow control. Otherwise, the link has its normal effect.

To prevent cross-site scripting, ColdFusion does not load a remote web page.

Example
```html
<cfpod height="600" width="600" name="podTest">
  <a href="<cfoutput>#AjaxLink('HelloWorld.cfm')#</cfoutput>">Click me</a>
</cfpod>
```

AjaxOnLoad

Description
Causes the specified JavaScript function to run when the page loads.

Returns
This function does not return a value.

Category
Display and formatting functions

Function syntax
AjaxOnLoad(functionName)
ColdFusion Functions

See also
cfdiv, cflayoutarea, cfpod, cfwindow, Using Ajax User Interface Components and Features in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>functionName</td>
<td>The name of the function to run when the page loads. The specified function does not take a parameter.</td>
</tr>
</tbody>
</table>

Usage
This function causes a JavaScript function to run when a page loads in the browser. The JavaScript function can perform any initialization actions that are required for the page to function properly. For example, a login window might open on a page if the user is not already logged in. You can use the AjaxOnLoad function to specify a JavaScript function that determines the login status and opens the window only if needed.

You can use this function on top-level pages, or on pages that you dynamically include in your application by using the source attribute of the cfpod and cfwindow tags.

Example
The following example uses the AjaxOnLoad function to call an init function each time the page loads. The init function displays a login window.

```html
<html>
<head>
<title>Enter Mail Login Details</title>
<script>
init = function() {
    ColdFusion.Window.show('loginwindow');
}
</script>
</head>

<body>
<cfwindow name="loginwindow" title="Enter Login Details"
    draggable="false" closable="false" resizable="false"
    width="450" height="200">
<cfoutput>
<form action="#cgi.script_name#" method="post" name="loginform">
<table width="400" class="loginTable" cellpadding="5">
<tr>
    <td style="text-align: right">mail server:</td>
    <td><input type="text" name="server"></td>
</tr>
</table>
</form>
</cfoutput>
</cfwindow>
</body>
</html>
```
<tr>
  <td style="text-align: right">username:</td>
  <td><input type="text" name="username"></td>
</tr>
<tr>
  <td style="text-align: right">password:</td>
  <td><input type="password" name="password"></td>
</tr>
<tr>
  <td>&nbsp;</td>
  <td><input type="submit" name="login" value="Login"></td>
</tr>
</table>
</form>
</cfoutput>
</cfwindow>

<cfset AjaxOnLoad("init")>
</body>
</html>

**ApplicationStop**

**Description**
Stops or resets the current application. The application is restarted on the next request to the application.

**Returns**
void

**Category**
“Other functions” on page 732

**Function Syntax**
applicationstop()

**History**
Added in ColdFusion 9.
Example
<!---- get artist by id ---->
<cftry>
...
<!--- stops the application to reset the artistid, if the artworks for the artist do not exist-->
<cfset applicationstop()/>
<cfset artist = EntityLoad( "artist", url.artistid, True ) />
<cfoutput>
<h2>#artist.getFullName()#</h2>
<table width="400">
<tr>
  <th>Item</th>
  <th>Price</th>
  <th>Sold</th>
</tr>
<cfloop array="#artist.getArt()#" index="index">
  <tr>
    <td>#index.getArtName()#</td>
    <td>#index.getPrice()#</td>
    <td>#index.getIsSold()#</td>
  </tr>
</cfloop>
</table>
<p><a href="index.cfm">View list</a></p>
<cfcatch type = "any">
<cfoutput>Artworks for the selected artists are not available</cfoutput>
</cfcatch>
</cftry>

ArrayAppend

Description
Appends an array element to an array.

Returns
True, on successful completion.

Category
Array functions

Function syntax
ArrayAppend(array, value [,merge])

See also
ArrayPrepend; Adding elements to an array in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: this function can be used on XML objects.
ArrayAppend Example

```cfml
<h3>ArrayAppend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>

<!--- Create an array --->
<cfset myArray = ArrayNew(1)>

<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">

<!--- Loop through the query; append these names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
    <cfoutput>#ArrayAppend(myArray, "#FirstName# #LastName#")#</cfoutput>, Array was appended<br>
</cfloop>

<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>

<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:</p>
    <p>#myList#</p>
</cfoutput>
```

### ArrayAvg

**Description**
Calculates the average of the values in an array.

**Returns**
Number. If the array parameter value is an empty array, returns zero.

**Category**
Array functions, Mathematical functions

**Function syntax**
ArrayAvg(array)

**See also**
ArraySum; Basic array techniques in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Usage

The following example uses the ColdFusion built-in variable `Form.fieldNames`, which is available on the action page of a form. It contains a comma-delimited list of the names of the fields on the form.

Example

```coldfusion
<!--- This example shows the use of ArrayAvg. --->
<!--- The following lines of code keep track of the form fields that can --
be dynamically generated on the screen. It uses the Fieldnames variable --
with the ListLen function to determine the number of fields on the form. --->
<cfset FormElem = 2>
  <cfif Isdefined("Form.Submit")>
    <cfif Form.Submit is "More">
      <cfset FormElem = ListLen(Form.Fieldnames)>
    </cfif>
  </cfif>
</cfif>

<html>
<head>
  <title>ArrayAvg Example</title>
</head>
<body>
  <h3>ArrayAvg Example</h3>
  <p> This example uses ArrayAvg to find the average of the numbers that you enter --
  into an array.<br>
  To enter more than two numbers click the <b>more</b> button. </p>
  <form action = "arrayavg.cfm">
    <!--- The following code initially creates two fields. It adds fields if the --
    user presses MORE. FormElem is initialized to two at the beginning of this --
    code to show that the form has two fields. ------>
    <input type = "submit" name = "submit" value = "more">
    <table cellspacing = "2" cellpadding = "2" border = "0">
      <cfloop index = "LoopItem" from = "1" to = "#FormElem#">
        <tr>
          <cfoutput>
            <th align = "left">Number #LoopItem#</th>
            <td><input type = "text" name = "number#LoopItem#"></td>
          </cfoutput>
        </tr>
      </cfloop>
    </table>
    <input type = "submit" name = "submit" value = "get the average">
  </form>
  <!--- Create an array. --->
  <cfif IsDefined("FORM.submit")>
```

Last updated 7/9/2012
<cfset myNumberArray = ArrayNew(1)>
<cfset Count = 1>
<cfloop index = "ListItem" list = "#Form.Fieldnames#">
   <cfif Left(ListItem,3) is "Num">
      <cfset myNumberArray[Count] = Val("number#Count#")>
      <cfset count = IncrementValue(Count)>
   </cfif>
</cfloop>

<cfif Form.Submit is "get the average">
   <!--- use ArrayAvg to get the average of the two numbers --->
   <p>The average of the numbers that you entered is #ArrayAvg(myNumberArray)#.</p>
<cfelse>
   <cfoutput>Try again. You must enter at least two numeric values.</cfoutput>
</cfif>
</cfif>
</body>
</html>

**ArrayClear**

**Description**
Deletes the data in an array.

**Returns**
True, on successful completion.

**Category**
Array functions

**Function syntax**
ArrayClear(array)

**See also**
ArrayDeleteAt; Functions for XML object management in the Developing ColdFusion Applications

**History**
ColdFusion MX: Changed behavior: This function can be used on XML objects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>
Example

```coldfusion
<h3>ArrayClear Example</h3>
<!--- Create a new array. --->
<cfset MyArray = ArrayNew(1)>
<!--- Populate an element or two. --->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!--- Output the contents of the array. --->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray)#</cfoutput>
<!--- Check to see if the array is empty. --->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
<!--- Now clear the array. --->
<cfset Temp = ArrayClear(MyArray)>
<!--- Check to see if the array is empty. --->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
```

ArrayContains

**Description**
Searches an array for the presence of a specified object. The function searches simple objects such as strings and numbers or complex objects such as structures. String searches are case-sensitive. This function does not support search for COM and CORBA objects.

**Returns**
Yes, if the specified object exists in the array.

**Category**
Array functions

**Function Syntax**
```
#ArrayContains(array,object)
```

**See Also**
ArrayFind, ArrayFindNoCase

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array.</td>
</tr>
<tr>
<td>object</td>
<td>Object to search</td>
</tr>
</tbody>
</table>
Example
<h3>ArrayContains Example</h3>
<h3>2-dimensional array example</h3>
<!--Creating a 2-dimensional array-->
<cfset dayarray = ArrayNew(2)>
<cfset dayarray[1][1] = "Sunday">  
<cfset dayarray[1][2] = "Monday">  
<cfset dayarray[1][3] = "Tuesday">  
<cfset dayarray[2][1] = "Wednesday">  
<cfset dayarray[2][2] = "Thursday">  
<cfset dayarray[2][3] = "Friday">  
<cfoutput>
  <p>Array contains</p>
  #dayarray[1][1]#, #dayarray[1][2]#, #dayarray[1][3]#, #dayarray[2][1]#,  
  #dayarray[2][2]#, #dayarray[2][3]#  
  <p>Checking value in the array</p>
  #ArrayContains(dayarray[1], "Tuesday")#
</cfoutput>
<!--Creating a one-dimensional array-->
<h3>1-dimensional array example</h3>
<cfset montharray = ArrayNew(1)>
<cfset montharray[1] = "April">  
<cfset montharray[2] = "July">  
<cfset montharray[3] = "October">  
<cfset montharray[4] = "December">  
<p>Checking if value exists</p>
<cfoutput>
  #ArrayContains(montharray, "December")#
</cfoutput>

ArrayDelete

Description
Deletes an element from an array. It does not support COM and CORBA objects.

Returns
Yes, on successful deletion of the array element.

Category
Array functions

Function syntax
ArrayDelete(array, object)

See Also
ArrayDeleteAt, ArrayClear
ArrayDeleteAt

Description
Deletes an element from a specified position in an array.
When an element is deleted, ColdFusion recalculates index positions. For example, in an array that contains the months of the year, deleting the element at position 5 removes the entry for May. After this, to delete the entry for June, you would delete the element at position 5 (not 6).

Returns
True, on successful completion.

Category
Array functions

Function syntax
ArrayDeleteAt(array, position)

See also
ArrayInsertAt; Functions for XML object management in the Developing ColdFusion Applications

History
ColdFusion MX:
- Changed behavior: This function can be used on XML objects.
- Changed thrown exceptions: This function can throw the InvalidArrayIndexException error.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>position</td>
<td>Array position</td>
</tr>
</tbody>
</table>

Throws

If this function attempts to delete an element at position 0, or specifies a value for position that is greater than the size of array, this function throws an InvalidArrayIndexException error.

Example

```cfml
<h3>ArrayDeleteAt Example</h3>
<p>
<!--- Create an array. --->
<cfset DaysArray = ArrayNew(2)>
<!--- Populate an element or two. --->
<cfset DaysArray[1][1] = "Monday">
<cfset DaysArray[2][1] = "Tuesday">
<cfset DaysArray[3][1] = "Wednesday">
<cfset DaysArray[1][2] = "April 12">
<cfset DaysArray[2][2] = "April 13">
<cfset DaysArray[3][2] = "April 14">
<p>This is what the array looks like before delete:<br>
<cfoutput>
#DaysArray[1][1]#nbsp;&nbsp;#DaysArray[1][2]#<br>
#DaysArray[2][1]#nbsp;&nbsp;#DaysArray[2][2]#<br>
#DaysArray[3][1]#nbsp;&nbsp;#DaysArray[3][2]#<br>
</cfoutput>
<p>We delete this element of the array:<br>
<ArrayDeleteAt(DaysArray,2)><br>
</cfoutput>
<p>This is what the array looks like after delete:<br>
<cfoutput>
#DaysArray[1][1]#nbsp;&nbsp;#DaysArray[1][2]#<br>
#DaysArray[2][1]#nbsp;&nbsp;#DaysArray[2][2]#<br>
#DaysArray[3][1]#nbsp;&nbsp;#DaysArray[3][2]#<br>
</cfoutput>
</p>
```

ArrayEach

Description

Used to loop over an array.

Returns

Nothing

Category

Closure functions
Syntax
arrayEach(array,function(any currentObj) {});

See also
Other closure functions.

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array.</td>
</tr>
</tbody>
</table>

ArrayFilter

Description
Used to filter the elements of an array.

Returns
A new array

Category
Closure functions

Syntax
arrayFilter(array,function(arrayElement){return true|false;});

See also
Other closure functions.

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array. Returns true if the array element has to be included in the resultant array.</td>
</tr>
<tr>
<td>arrayElement</td>
<td>Array element being accessed.</td>
</tr>
</tbody>
</table>
ArrayFind

Description
This function performs a case-sensitive search on an array for a specified object. The function can search for simple objects such as strings or numbers and complex objects such as structures. It does not support COM and CORBA objects.

Returns
Index in the array of the first match, or 0, if there is no match.

Category
Array functions

Function syntax
ArrayFind(array, function(currentObj), object)

See Also
ArrayFindNoCase

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array. Returns true if the array elements match the search criterion.</td>
</tr>
<tr>
<td>object</td>
<td>Object to search</td>
</tr>
</tbody>
</table>

Example
<cfoutput>
  #ArrayFind(MyArray, 2)#
</cfoutput>

ArrayFindAll

Description
Used to find elements in an array.

Returns
Indices in which the elements were found.

Category
Closure functions

Syntax
ArrayFindAll(array, function(currentObj) {return true|false;});
See also
Other closure functions.

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array. Returns true if the array elements match the search criterion.</td>
</tr>
<tr>
<td>arrayElement</td>
<td>Array element being accessed.</td>
</tr>
</tbody>
</table>

ArrayFindAllNoCase

Description
This function provides case-insensitive search to find elements in an array.

Returns
Indices in which the elements were found.

Category
Closure functions

Syntax
ArrayFindAllNoCase(array,function(currentObj) {return true|false;});

See also
Other closure functions.

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array. Returns true if the array elements match the search criterion.</td>
</tr>
<tr>
<td>arrayElement</td>
<td>Array element being accessed.</td>
</tr>
</tbody>
</table>
ArrayFindNoCase

Description
This function performs a case-insensitive search on an array for a specified object. The function can search for simple objects such as strings or numbers and complex objects such as structures. It does not support COM and CORBA objects.

Returns
Index in the array of the first match, or 0, if there is no match.

Category
Array functions

Function syntax
ArrayFindNoCase(array, object)

See Also
ArrayFind

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>object</td>
<td>Object to search</td>
</tr>
</tbody>
</table>

Example
<cfoutput>
    #ArrayFindNoCase(MyArray, 2)#
</cfoutput>

ArrayInsertAt

Description
Inserts a value into an array. Array elements whose indexes are equal to or greater than the new position are incremented by one. The array length increases by one.

Returns
True, on successful completion.

Category
Array functions

Function syntax
ArrayInsertAt(array, position, value)

See also
ArrayDeleteAt; Functions for XML object management in the Developing ColdFusion Applications

Last updated 7/9/2012
History
ColdFusion MX:

- Changed behavior: This function can be used on XML objects.
- Changed thrown exceptions: This function can throw the InvalidArrayIndexException error.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>position</td>
<td>Index position at which to insert value</td>
</tr>
<tr>
<td>value</td>
<td>Value to insert</td>
</tr>
</tbody>
</table>

Usage
To apply the `ArrayInsertAt()` function to a multidimensional array, you must specify all but the last index in the `array` parameter. The following example inserts an element at `myarray[2][4]`:

```cfset ArrayInsertAt(myarray[2], 4, "test")```

Throws
If this function attempts to insert an element at position 0, or specifies a value for `position` that is greater than the size of `array`, this function throws an InvalidArrayIndexException error.

Example

```cftmpl
<h3>ArrayInsertAt Example</h3>
<cfset DaysArray = ArrayNew(1)>
<!--- Create a new array. --->
<cfset DaysArray[1] = "Monday">
<!--- Populate an element or two. --->
<cfset DaysArray[2] = "Tuesday">
<cfset DaysArray[3] = "Thursday">
<!--- Add an element before position 3. --->
<p>Add an element before position 3:</p>
<cfoutput>#ArrayInsertAt(DaysArray,3,"Wednesday")#</cfoutput>
<p>Now output the array as a list:</p>
<cfoutput>#ArrayToList(DaysArray)#</cfoutput>
<!--- The array now has four elements. Element 3, "Thursday", has become element four. --->
```

ArrayIsDefined

Description
Determines whether an array element is defined.

Returns
True, if the array element is defined (exists); false, otherwise.

Category
Array functions
Function syntax

```
ArrayIsDefined(array, elementIndex)
```

See also

```
ArrayIsEmpty
```

History

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of a one-dimensional array, or the array name and indexes into higher-order dimensions of a multidimensional array.</td>
</tr>
<tr>
<td>elementIndex</td>
<td>Index of the element in a one-dimensional array, or the index of the element in the final dimension of a multidimensional array.</td>
</tr>
</tbody>
</table>

Usage

The index value of an element must be less than the length of the array.

To test the existence of an element in a multidimensional array, specify all but the last dimension of the array in the first parameter. For example, the following line tests the existence of element `MyArray[2][4][1]`:

```
ArrayIsDefined(MyArray[2][4], 1)
```

Example

```html
<h3>ArrayIsDefined Example</h3>
<!--- Create a sparse new array. --->
<cfset MyArray = ArrayNew(1)>
<!--- Populate an element or two. --->
<cfset MyArray[1] = "Test">
<cfset MyArray[3] = "Other Test">

<cfoutput>
  <!--- Display the contents of the array. --->
  <p>Your array contents are:
  <cfdump var="#MyArray#"></p>

  <!--- Check if an existing element is defined. --->
  <p>Does element 3 exist?:&nbsp;#ArrayIsDefined(MyArray, 3)#</p>

  <!--- Check if a non-existent element is defined. --->
  <p>Does element 2 exist?&nbsp;#ArrayIsDefined(MyArray, 2)#</p>
</cfoutput>
```

ArrayIsEmpty

Description

Determines whether an array is empty of data elements.
ColdFusion Functions

Returns
True, if the array is empty; False, otherwise.

Category
Array functions

Function syntax
ArrayIsEmpty(array)

See also
ArrayIsDefined, ArrayLen, Functions for XML object management in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: this function can be used on XML objects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Usage
You can test whether an element of a higher level dimension of a multidimensional array is empty by specifying the element in the ArrayIsEmpty function. To test whether the first row of the two-dimensional array MyArray is empty, use the following function:

```
ArrayIsEmpty(MyArray[1])
```

Example

```html
<h3>ArrayIsEmpty Example</h3>
<!---- Create a new array. ---->
<cfset MyArray = ArrayNew(1)>
<!---- Populate an element or two. ---->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!---- Output the contents of the array. ---->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray)#</cfoutput>
<!---- Check to see if the array is empty. ---->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
<p>Now, clear the array:
<!---- Now clear the array. ---->
<cfset Temp = ArrayClear(MyArray)>
<!---- Check to see if the array is empty. ---->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
```
ArrayLen

Description
Determines the number of elements in an array.

Returns
The number of elements in an array.

Category
Array functions

Function syntax
ArrayLen(array)

See also
ArrayIsEmpty; Functions for XML object management in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: This function can be used on child XML objects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Example

```cfml
<h3>ArrayLen Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
   SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>  
<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">  
<!--- Loop through the query and append these names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
   <cfset temp = ArrayAppend(myArray, 
                              
                              
                              "#FirstName# #LastName#")>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Output the array as a list. --->
<cfoutput>
   <p>The contents of the array are as follows:</p>
   <p>#myList#</p>
   <p>This array has #ArrayLen(myArray)# elements.</p>
</cfoutput>
```
ArrayMax

Description
Array maximum function.

Returns
The largest numeric value in an array. If the array parameter value is an empty array, returns zero.

Category
Array functions

Function syntax
ArrayMax(array)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Example
<h3>ArrayMax Example</h3>
This example uses ArrayMax to find the largest number in an array.<br />
<!---- After checking whether the form has been submitted, the code creates an array
and assigns the form fields to the first two elements in the array. ---->
<cfif IsDefined("FORM.submit")>
   <cfset myNumberArray = ArrayNew(1)>
   <cfset myNumberArray[1] = number1>
   <cfset myNumberArray[2] = number2>
   <cfif Form.Submit is "Maximum Value">
     <!---- Use ArrayMax to find the largest number in the array. --->
     <p>The largest number that you entered is</p>
     <cfoutput>#ArrayMax(myNumberArray)#.</cfoutput>
   </cfif>
</cfif>
<!---- The following form provides two numeric fields that are compared when the
form is submitted. --->
<form action = "arraymax.cfm">
   <input type = "hidden" name = "number1_Float"/>
   <input type = "hidden" name = "number2_Float"/>
   <input type = "text" name = "number1"><br/>
   <input type = "text" name = "number2"><br/>
   <input type = "submit" name = "submit" value = "Maximum Value">
</form>

ArrayMin

Description
Array minimum function.
Returns
The smallest numeric value in an array. If the array parameter value is an empty array, returns zero.

Category
Array functions

Function syntax
ArrayMin(array)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Example
<h3>ArrayMin Example</h3>
<p>This example uses ArrayMin to find the smallest number in an array.</p>
<p>After checking whether the form has been submitted, this code creates an array and assigns the form fields to the first two elements. </p>
<cfif IsDefined("FORM.submit")>
  <cfset myNumberArray = ArrayNew(1)>
  <cfset myNumberArray[1] = FORM.number1>
  <cfset myNumberArray[2] = FORM.number2>
  <cfif Form.Submit is "Minimum Value">
    <!--- Use ArrayMin to find the smallest number in the array. --->
    <p>The smallest number that you entered is</p>
    <cfoutput>#ArrayMin(myNumberArray)#</cfoutput>
  </cfif>
</cfif>

<!---- The following form provides two numeric fields that are compared when the form is submitted. ---->
<form action = "arraymin.cfm">
  <input type = "hidden" name = "number1_Float">
  <input type = "hidden" name = "number2_Float">
  <input type = "text" name = "number1">
  <input type = "text" name = "number2">
  <input type = "submit" name = "submit" value = "Minimum Value">
</form>

ArrayNew

Description
Creates an array of 1–3 dimensions. Index array elements with square brackets: [ ].

ColdFusion arrays expand dynamically as data is added.

Returns
An array

Category
Array functions
Function syntax

\[ \text{ArrayNew}(\text{dimension}) \]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>Number of dimensions in new array: 1, 2, or 3</td>
</tr>
</tbody>
</table>

Example

```coldfusion
<h3>ArrayNew Example</h3>

<!--- Create an array. --->
<cfset MyNewArray = ArrayNew(1)>

<!--- ArrayToList does not function properly if the Array is not initialized with ArraySet --->
<cfset temp = ArraySet(MyNewArray, 1, 6, "")>

<!--- Set some elements. --->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "41">
<cfset MyNewArray[6] = "Another Value">

<!--- Is it an array? --->
<cfoutput>
  <p>Is this an array? #IsArray(MyNewArray)#</p>
  <p>It has #ArrayLen(MyNewArray)# elements.</p>
  <p>Contents: #ArrayToList(MyNewArray)#</p>
</cfoutput>

<!--- The array has expanded dynamically to six elements with the use of ArraySet, even though we only set three values. --->
```

**ArrayPrepend**

Description

Inserts an array element at the beginning of an array.

Returns

True, on successful completion.

Category

Array functions

Function syntax

\[ \text{ArrayPrepend}(\text{array}, \text{value}) \]

See also

ArrayAppend; Adding elements to an array in the Developing ColdFusion Applications

Last updated 7/9/2012
Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>value</td>
<td>Value to insert at beginning of array</td>
</tr>
</tbody>
</table>

Example:

```cfml
<h3>ArrayPrepend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>  
<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">  
<!--- Loop through query. Append names successively before last element.  
(The list reverses itself from the standard queried output, because it keeps  
prepending the array entry.) --->
<cfloop query = "GetEmployeeNames">
    <cfoutput>$ArrayPrepend(myArray, "#FirstName# #LastName#")$</cfoutput>, Array was prepended<br>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>  
<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:
    <p>$myList$  
</cfoutput>
```

ArrayResize

Description

Resets an array to a specified minimum number of elements. Resetting can improve performance, if used to size an array to its expected maximum. For more than 500 elements, use ArrayResize immediately after using the ArrayNew tag.

ColdFusion arrays expand dynamically as data is added.

Returns

True, on successful completion.

Category

Array functions

Function syntax

ArrayResize(array, minimum_size)
### ArraySet

**Description**
In a one-dimensional array, sets the elements in a specified index range to a value. Useful for initializing an array after a call to `ArrayNew`.

**Returns**
True, on successful completion.

**Category**
Array functions

**Function syntax**
```coldfusion
ArraySet(array, start_pos, end_pos, value)
```

**See also**
`ArrayNew`; Populating arrays with data in the *Developing ColdFusion Applications*

**History**
ColdFusion MX: Changed behavior: This function can be used on XML objects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array.</td>
</tr>
</tbody>
</table>
ColdFusion Functions

Example

<h3>ArraySet Example</h3>

<!--- Create an array. --->
<cfset MyNewArray = ArrayNew(1)>
<!--- ArrayToList does not function properly if the Array has not been initialized with ArraySet. --->
<cfset temp = ArraySet(MyNewArray, 1,6, "Initial Value")>

<!--- Set some elements. --->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "43">
<cfset MyNewArray[6] = "Another Value">
...

ArraySlice

Description
Returns part of an array with only the elements you need.

Returns
Portion of an array based on the offset and length settings.

Syntax
arraySlice(array, offset, [length])

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of the array that you want to slice.</td>
</tr>
<tr>
<td>offset</td>
<td>Specifies the position from which to slice the array. Negative value indicates that the array is sliced, with sequence starting from array’s end.</td>
</tr>
<tr>
<td>length</td>
<td>Element count from offset.</td>
</tr>
</tbody>
</table>

Example
<cfscript>
array = [1, 2, 3, 4, 5, 6, 7, 8];
newArray = arraySlice(array, 2, 3); //returns 2,3,4
newArray = arraySlice(array, 4); //returns 4,5,6, 7, 8
newArray = arraySlice(array, -5, 3); //returns 4,5,6
</cfscript>
ArraySort

Description
Sorts array elements numerically or alphanumerically.

Returns
True, if sort is successful; False, otherwise.

Category
Array functions, List functions

Function syntax
ArraySort(array, sort_type[, sort_order])

History
ColdFusion 10: Added the localeSensitive attribute.

ColdFusion MX:
- Changed thrown exceptions: This function can throw the ArraySortSimpleValueException error and ValueNotNumeric error.
- Changed the order in which sorted elements are returned: In a textnocase, descending sort, this function might return elements in a different sort order than in earlier releases. If sort_type = "textnocase" and sort_order = "desc", ColdFusion processes elements that differ only in case differently from earlier releases, as follows:
  - ColdFusion reverses the elements' original order.
  - Releases earlier than ColdFusion MX do not change the elements' original order.
For example, in a textnocase, desc sort of d,a,a,b,A, the following occurs:
  - ColdFusion MX and later returns d,b,A,a,a
  - Releases earlier than ColdFusion MX return d,b,a,a,A

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>
Throws
If an array element is something other than a simple element, this function throws an ArraySortSimpleValueException error. If sort_type is numeric and an array element is not numeric, this function throws a ValueNotNumeric error.

Usage
In ColdFusion 10, added support for all Java supported locale-specific characters (including support for umlaut characters). A flag for this support has been added for sorttype = "text" or sorttype = "textnocase".

Example
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>
<!--- Loop through the query and append these names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, #FirstName# #LastName#)>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Sort that array in descending order alphabetically. --->
<cfset isSuccessful = ArraySort(myArray, "textnocase", "desc")>
...
ArraySum

Description
Array sum function.

Returns
The sum of values in an array. If the array parameter value is an empty array, returns zero.

Category
Array functions, Mathematical functions

Function syntax
ArraySum(array)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
</tbody>
</table>

Example

```coldfusion
<h3>ArraySum Example</h3>
<p>This example uses ArraySum to add two numbers.<br></p>
<!---- After checking whether the form has been submitted, the code creates an array and assigns the form fields to the first two elements in the array. --->
<cfif IsDefined("FORM.submit")>
  <cfset myNumberArray = ArrayNew(1)>
  <cfset myNumberArray[1] = number1>
  <cfset myNumberArray[2] = number2>

  <cfif Form.Submit is "Add">
    <!---- Use ArraySum to add the number in the array. --->
    <p>The sum of the numbers is 
    <cfoutput>#ArraySum(myNumberArray)#.</cfoutput>
  </cfif>
</cfif>

<!---- This form provides two numeric fields that are added when the form is submitted. --->
<form action = "arraysum.cfm" method="post">
  <input type = "hidden" name = "number1_Float">
  <input type = "hidden" name = "number2_Float">
  <input type = "text" name = "number1">
  <br>
  <input type = "text" name = "number2">
  <br>
  <input type = "submit" name = "submit" value = "Add">
</form>
```

ArraySwap

Description
Swaps array values of an array at specified positions. This function is more efficient than multiple cfset tags.
ColdFusion Functions

Arrays

Returns
True, on successful completion.

Category
Array functions

Function syntax
ArraySwap(array, position1, position2)

See also
Functions for XML object management in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of an array</td>
</tr>
<tr>
<td>position1</td>
<td>Position of first element to swap</td>
</tr>
<tr>
<td>position2</td>
<td>Position of second element to swap</td>
</tr>
</tbody>
</table>

Example

```html
<h3>ArraySwap Example</h3>

<cfset month = ArrayNew(1)>
<cfset month[1] = "February">
<cfset month[2] = "January">
<cfset temp = ArraySwap(month, 1, 2)>
<cfset temp = ArrayToList(month)>

<p>Show the results: <cfoutput>#temp#</cfoutput>
```

ArrayToList

Description
Converts a one-dimensional array to a list.

Returns
Delimited list, as a string.

Category
Array functions, Conversion functions, List functions

Function syntax
ArrayToList(array[, delimiter])
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>Name of array</td>
</tr>
<tr>
<td>delimiter</td>
<td>Character or multicharacter string to separate list elements. The default value is comma.</td>
</tr>
</tbody>
</table>

Example

<h3>ArrayToList Example</h3>

```cfml
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
  SELECT FirstName, LastName FROM Employees
</cfquery>

<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>

<!--- Loop through the query, append names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
  <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>

<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>

<!--- Sort that array in descending order alphabetically. --->
<cfset myAlphaArray = ArraySort(myArray, "textnocase", "desc")>

<!--- Show the resulting alphabetized array as a list. --->
<cfset myAlphaList = ArrayToList(myArray, ",")>

<!--- Output the array as a list. --->
<cfoutput>
  <p>The contents of the array are as follows:
  <p>#myList#
  <p>This array, alphabetized by first name (descending):
  <p>#myAlphaList#
  <p>This array has #ArrayLen(MyArray)# elements.
</cfoutput>

Asc

Description
Determines the value of a character.

Returns
The value of the first character of a string; if the string is empty, returns zero.

Category
String functions
Function syntax

`Asc(string)`

See also

`Chr`

History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65536. (Earlier releases supported 1-255.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string</td>
</tr>
</tbody>
</table>

Example

```coldfusion
<h3>Asc Example</h3>
<!--- If the character string is not empty, output its ASCII value. --->
<cfif IsDefined("FORM.charVals")>
  <cfif FORM.charVals is not ">
    <cfoutput>#Left(FORM.charVals,1)# = #Asc(FORM.charVals)#</cfoutput>
  <cfelse>
    <!--- If it is empty, output an error message. --->
    <h4>Enter a character</h4>
  </cfif>
</cfif>
</h3>
<form action = "asc.cfm" method=post>
  <p>Enter a character to see its ASCII value
     <br><input type = "Text" name = "CharVals" size = "1" maxlenghth = "1"></p>
  <input type = "Submit" name = ">
</form>
```

**ASin**

Description

Determines the arcsine of a number. The arcsine is the angle whose sine is `number`.

Returns

The arcsine, in radians, of a number.

Category

Mathematical functions

Function syntax

`ASin(number)`
See also
Sin, Cos, ACos, Tan, Atn, Pi

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Sine of an angle. The value must be between -1 and 1, inclusive.</td>
</tr>
</tbody>
</table>

Usage
The range of the result is -p/2 to p/2 radians. To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.

Example

```cfml
<h3>ASin Example</h3>
<!--- Output its arcsine value. --->
<cfif IsDefined("FORM.SinNum")>
    <cfif IsNumeric(FORM.SinNum)>
        <cfif FORM.SinNum LESS THAN OR EQUAL TO 1>
            <cfif FORM.SinNum GREATER THAN OR EQUAL TO -1>
                ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
                <cfoutput>#ASin(FORM.sinNum)# Radians</cfoutput>
            <br> or <br>ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
                <cfoutput>#ASin(FORM.sinNum) * 180/Pi()# Degrees</cfoutput>
        </cfif>
    </cfif>
</cfif>
<!--- If it is less than negative one, output an error message. --->
<h4>Enter the sine of the angle to calculate, in degrees and radians.
The value must be between 1 and -1, inclusive.</h4>
</cfif>
<!--- If it is greater than one, output an error message. --->
<h4>Enter the sine of the angle to calculate, in degrees and radians.
The value must be between 1 and -1, inclusive.</h4>
</cfif>
<!--- If it is empty, output an error message. --->
<h4>Enter the sine of the angle to calculate, in degrees and radians.
The value must be between 1 and -1, inclusive.</h4>
</cfif>
<form action="./evaltest.cfm" method="post">
<p>Enter a number to get its arcsine in Radians and Degrees.
<br><br><br>input type = "Text" name = "SinNum" size = "25">
<p><input type = "Submit" name = "> input type = "RESET">
</form>

Atn

Description
Arctangent function. The arctangent is the angle whose tangent is number.
Returns
The arctangent, in radians, of a number.

Category
Mathematical functions

Function syntax
\text{Atn}(number)

See also
\text{Sin}, \text{ASin}, \text{Cos}, \text{ACos}, \text{Pi}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Tangent of an angle</td>
</tr>
</tbody>
</table>

Usage
The range of the result is -p/2 to p/2 radians. To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.

Example
\begin{verbatim}
<h3>Atn Example</h3>
<!--- Output its Atn value. --->
<cfif IsDefined("FORM.AtnNum")>
  <cfif IsNumeric(FORM.AtnNum)>
    \text{Atn}(\text{#FORM.AtnNum#}) is \text{#Atn(FORM.AtnNum * 180/PI())# Degrees}
  <cfelse>
    <!--- If it is empty, output an error message. --->
    <h4>Enter a number</h4>
  </cfif>
</cfif>
<form action = "evaltest.cfm" method="post">
  <p>Enter a number to get its arctangent in Radians and Degrees</p>
  <br>
  <input type = "Text" name = "atnNum" size = "25"></p>
  <p><input type = "Submit" name = ">
  <input type = "RESET"></p>
</form>
\end{verbatim}

AuthenticatedContext

Description
This function is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications.

History
ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.
AuthenticatedUser

Description
This function is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications.

History
ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

BinaryDecode

Description
Converts a string to a binary object. Used to convert binary data that has been encoded into string format back into binary data.

Returns
A binary object.

Category
Conversion functions, String functions

Function syntax
BinaryDecode(string, binaryencoding)

See also
BinaryEncode, CharsetEncode, CharsetDecode

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string containing encoded binary data.</td>
</tr>
<tr>
<td>binaryencoding</td>
<td>A string that specifies the algorithm used to encode the original binary data into a string; must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Hex: the characters 0-9 and A-F represent the hexadecimal value of each byte; for example, 3A.</td>
</tr>
<tr>
<td></td>
<td>• UU: data is encoded using the UNIX UUencode algorithm.</td>
</tr>
<tr>
<td></td>
<td>• Base64: data is encoded using the Base64 algorithm, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</td>
</tr>
</tbody>
</table>

Usage
Use this function to convert a binary-encoded string representation of binary data back to a binary object for use in your application. Binary data is often encoded as a string for transmission over many Internet protocols, such as HTTP and SMTP, or for storage in a database.

Adobe recommends that you use the BinaryDecode function, not the ToBinary(base64data) function, to convert Base64-encoded data to binary data in all new applications.

Last updated 7/9/2012
See the following pages for additional information on handling binary data:

- `cffile` for loading and reading binary data in files
- `cfwddx` for serializing and deserializing binary data
- `IsBinary` for checking variables for binary format
- `Len` for determining the length of a binary object

**Example**

The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data and writes the result to a file. It displays the encoded string and the image in the output file.

```
<h3>Binary Encoding Conversion Example</h3>

<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.binEncoding")>

<!--- Read in a binary data file. --->
<cffile action="readbinary" file="C:\images\help.gif" variable="binimage">

<!--- Convert the read data to binary encoding and back to binary data. --->
<cfscript>
    binencode=BinaryEncode(binimage, Form.binEncoding);
    bindecode=BinaryDecode(binencode, Form.binEncoding);
</cfscript>

<!--- Write the converted results to a file. --->
<cffile action="write" file="C:\temp\help.gif" output="#bindecode#" addnewline="No" >

<!--- Display the results. --->
<cfoutput>
    <p><b>The binary encoding:</b> #Form.binEncoding#</p>
    <p><b>The image converted into a binary-encoded string by BinaryEncode</b><br>
    #binencode#</p>
    <p><b>The image as written back to a file after converting back to binary using BinaryDecode</b><br>
    <img src="C:\temp\help.gif"></p>
</cfoutput>
</cfif>

<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select binary encoding</b><br>
    <select size="1" name="binEncoding" >
        <option selected>UU</option>
        <option>Base64</option>
        <option>Hex</option>
    </select><br>
    <input type = "Submit" value = "convert my data">
</form>
```
BinaryEncode

Description
Converts binary data to a string.

Returns
An encoded string representing the binary data.

Category
Conversion functions, String functions

Function syntax
BinaryEncode(binarydata, encoding)

See also
BinaryDecode, CharsetEncode, CharsetDecode

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binarydata</td>
<td>A variable containing the binary data to encode.</td>
</tr>
<tr>
<td>encoding</td>
<td>A string that specifies the encoding method to use to represent the data; one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Hex: use the characters 0-9 and A-F to represent the hexadecimal value of each byte; for example, 3A.</td>
</tr>
<tr>
<td></td>
<td>• UU: use the UNIX UUencode algorithm to convert the data.</td>
</tr>
<tr>
<td></td>
<td>• Base64: use the Base64 algorithm to convert the data, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</td>
</tr>
</tbody>
</table>

Usage
Binary objects and, in some cases, 8-bit characters, cannot be transported over many Internet protocols, such as HTTP and SMTP, and might not be supported by some database systems. By Binary encoding the data, you convert the data into a format that you can transfer over any Internet protocol or store in a database as character data. To convert the data back to a binary format, use the BinaryDecode function.

Adobe recommends that you use the BinaryEncode function, and not the ToBase64(binarydata) function, to convert binary data to Base64 data in all new applications.

This function provides a superset of the functionality of the ToBase64(binarydata) function.

See the following pages for additional information on handling binary data:
•cffile for loading and reading binary data
•cfwddx for serializing and deserializing binary data
•IsBinary for checking variables for binary format
•Len for determining the length of a binary object

Last updated 7/9/2012
Example
The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data, and writes the result to a file. It displays the encoded string and the image in the output file.

<h3>Binary Encoding Conversion Example</h3>

<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.binEncoding")>
    <!--- Read in a binary data file. --->
    <cffile action="readbinary"
        file="C:\images\help.gif"
        variable="binimage">
    <!--- Convert the read data to binary encoding and back to binary data. --->
    <cfscript>
        binencode=BinaryEncode(binimage, Form.binEncoding);
        bindecode=BinaryDecode(binencode, Form.binEncoding);
    </cfscript>
    <!---Write the converted results to a file. --->
    <cffile action="write" file="C:\temp\help.gif" output="#bindecode#" addnewline="No" >
    <!--- Display the results. --->
    <cfoutput>
        <p><b>The binary encoding:</b> #Form.binEncoding#</p>
        <p><b>The image converted into a binary-encoded string by BinaryEncode</b><br>
        #binencode#</p>
        <p><b>The image as written back to a file after converting back to binary using BinaryDecode</b><br>
        <img src="C:\temp\help.gif"> </p>
    </cfoutput>
</cfif>
<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
    Select binary encoding<br>
    <select size="1" name="binEncoding">
        <option selected>UU</option>
        <option>Base64</option>
        <option>Hex</option>
    </select><br>
    <input type = "Submit" value = "convert my data">
</form>

BitAnd

Description
Performs a bitwise logical AND operation.

**ColdFusion 10 CFML Reference**

**ColdFusion Functions**

---

### BitAnd

**Returns**
The bitwise AND of two long integers.

**Category**
Mathematical functions

**Function syntax**

\[
\text{BitAnd}(\text{number1}, \text{number2})
\]

**See also**

BitNot, BitOr, BitXor

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>number2</td>
<td>32-bit signed integer</td>
</tr>
</tbody>
</table>

**Usage**
Bit functions operate on 32-bit signed integers, in the range -2,147,483,648 – 2,147,483,647.

**Example**

```html
<h3>BitAnd Example</h3>

<p>\text{BitAnd(5,255): } \text{#BitAnd(5,255)#}</p>
<p>\text{BitAnd(5,0): } \text{#BitAnd(5,0)#}</p>
<p>\text{BitAnd(128,128): } \text{#BitAnd(128,128)#}</p>
```

---

### BitMaskClear

**Description**

Performs a bitwise mask clear operation.

**Returns**

A number, bitwise cleared, with length bits beginning at start.

**Category**
Mathematical functions

**Function syntax**

\[
\text{BitMaskClear}(\text{number}, \text{start}, \text{length})
\]

**See also**

BitMaskRead, BitMaskSet

---

Last updated 7/9/2012
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>start</td>
<td>Integer, in the range 0-31, inclusive; start bit for mask</td>
</tr>
<tr>
<td>length</td>
<td>Integer, in the range 0-31, inclusive; length of mask</td>
</tr>
</tbody>
</table>

Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

Example

```<h3>BitMaskClear Example</h3>
<p>Returns number bitwise cleared with length bits beginning from start.</p>

<p>BitMaskClear(255, 4, 4): <cfoutput>#BitMaskClear(255, 4, 4)#</cfoutput></p>
<p>BitMaskClear(255, 0, 4): <cfoutput>#BitMaskClear(255, 0, 4)#</cfoutput></p>
<p>BitMaskClear(128, 7): <cfoutput>#BitMaskClear(128, 7)#</cfoutput></p>```

**BitMaskRead**

Description

Performs a bitwise mask read operation.

Returns

An integer, created from length bits of number, beginning at start.

Category

Mathematical functions

Function syntax

BitMaskRead(number, start, length)

See also

BitMaskClear, BitMaskSet

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer to mask</td>
</tr>
<tr>
<td>start</td>
<td>Integer, in the range 0-31, inclusive; start bit for read</td>
</tr>
<tr>
<td>length</td>
<td>Integer, in the range 0-31, inclusive; length of mask</td>
</tr>
</tbody>
</table>

Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.
Example

```
 BitMaskRead Example

<p>Returns integer created from <em>length</em> bits of <em>number</em>, beginning with <em>start</em>.</p>

<cfoutput>
BitMaskRead(255, 4, 4): #BitMaskRead(255, 4, 4)#
BitMaskRead(255, 0, 4): #BitMaskRead(255, 0, 4)#
BitMaskRead(128, 0, 7): #BitMaskRead(128, 0, 7)#
</cfoutput>
```

**BitMaskSet**

**Description**
Performs a bitwise mask set operation.

**Returns**
A number, bitwise masked with <em>length</em> bits of <em>mask</em> beginning at <em>start</em>.

**Category**
Mathematical functions

**Function syntax**

```
BitMaskSet( number, mask, start, length )
```

**See also**
BitMaskClear, BitMaskRead

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>mask</td>
<td>32-bit signed integer; mask</td>
</tr>
<tr>
<td>start</td>
<td>Integer, in the range 0-31, inclusive; start bit for mask</td>
</tr>
<tr>
<td>length</td>
<td>Integer, in the range 0-31, inclusive; length of mask</td>
</tr>
</tbody>
</table>

**Usage**
Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

Example

```
 BitMaskSet Example

<p>Returns number bitwise masked with length bits of mask beginning at start.</p>

<cfoutput>
BitMaskSet(255, 255, 4, 4): #BitMaskSet(255, 255, 4, 4)#
BitMaskSet(255, 0, 4, 4): #BitMaskSet(255, 0, 4, 4)#
BitMaskSet(0, 15, 4, 4): #BitMaskSet(0, 15, 4, 4)#
</cfoutput>
```
**BitNot**

**Description**
Performs a bitwise logical NOT operation.

**Returns**
A number; the bitwise NOT of a long integer.

**Category**
Mathematical functions

**Function syntax**
\[
\text{BitNot}(\text{number})
\]

**See also**
BitAnd, BitOr, BitXor

**Parameters**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer</td>
</tr>
</tbody>
</table>

**Usage**
Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

**Example**

```plaintext
BitNot Example

Returns the bitwise NOT of a long integer.

<p>BitNot(0): <cfoutput>#BitNot(0)#</cfoutput></p>
<p>BitNot(255): <cfoutput>#BitNot(255)#</cfoutput></p>
```

**BitOr**

**Description**
Performs a bitwise logical OR operation.

**Returns**
A number; the bitwise OR of two long integers.

**Category**
Mathematical functions

**Function syntax**
\[
\text{BitOr}(\text{number1}, \text{number2})
\]
See also
BitAnd, BitNot, BitXor

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>number2</td>
<td>32-bit signed integer</td>
</tr>
</tbody>
</table>

Usage
Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

Example

```html
<h3>BitOr Example</h3>
<p>Returns the bitwise OR of two long integers.</p>

<p>BitOr(5,255): <cfoutput>#BitOr(5,255)#</cfoutput></p>
<p>BitOr(5,0): <cfoutput>#BitOr(5,0)#</cfoutput></p>
<p>BitOr(7,8): <cfoutput>#BitOr(7,8)#</cfoutput></p>
```

**BitSHLN**

Description
Performs a bitwise shift-left, no-rotation operation.

Returns
A number, bitwise shifted without rotation to the left by `count` bits.

Category
Mathematical functions

Function syntax

`BitSHLN(number, count)`

See also
BitSHRN

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>count</td>
<td>Integer, in the range 0-31, inclusive; number of bits to shift the number</td>
</tr>
</tbody>
</table>

Usage
Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.
Example
<h3>BitSHLN Example</h3>
<p>Returns the number, bitwise shifted, without rotation, to the left by count bits.</p>

```cfml
BitSHLN(1,1): <cfoutput>#BitSHLN(1,1)#</cfoutput></p>
BitSHLN(1,30): <cfoutput>#BitSHLN(1,30)#</cfoutput></p>
BitSHLN(1,31): <cfoutput>#BitSHLN(1,31)#</cfoutput></p>
BitSHLN(2,31): <cfoutput>#BitSHLN(2,31)#</cfoutput></p>
```

**BitSHRN**

**Description**
Performs a bitwise shift-right, no-rotation operation.

**Returns**
A number, bitwise shifted, without rotation, to the right by `count` bits.

**Category**
Mathematical functions

**Function syntax**

```
BitSHRN(number, count)
```

**See also**
BitSHLN

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>count</td>
<td>integer, in the range 0-31, inclusive. Number of bits to shift the number</td>
</tr>
</tbody>
</table>

**Usage**
Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

**Example**

```cfml
BitSHRN(1,1): <cfoutput>#BitSHRN(1,1)#</cfoutput></p>
BitSHRN(255,7): <cfoutput>#BitSHRN(255,7)#</cfoutput></p>
BitSHRN(-2147483548,1): <cfoutput>#BitSHRN(-2147483548,1)#</cfoutput></p>
```

**BitXor**

**Description**
Performs a bitwise logical XOR operation.
Returns
Bitwise XOR of two long integers.

Category
Mathematical functions

Function syntax
\texttt{BitXor(number1, number2)}

See also
BitAnd, BitNot, BitOr

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1</td>
<td>32-bit signed integer</td>
</tr>
<tr>
<td>number2</td>
<td>32-bit signed integer</td>
</tr>
</tbody>
</table>

Usage
Bit functions operate on 32-bit signed integers, in the range \([-2^{31} – 2^{31}]\).

Example

```plaintext
<h3>BitXor Example</h3>
<p>Returns the bitwise XOR of two long integers.</p>

<p>BitXor(5,255): <cfoutput>#BitXor(5,255)#</cfoutput></p>
<p>BitXor(5,0): <cfoutput>#BitXor(5,0)#</cfoutput></p>
<p>BitXor(128,128): <cfoutput>#BitXor(128,128)#</cfoutput></p>
```

Functions c-d

CacheldExists

Description
Used to find if a cached object exists in the cache region. The region can be the default cache region (either at server or application level) or the custom region you specify.

Returns
True, if the cached object exists in the specified cache region.

Syntax
\texttt{cacheldExists(id [, region])}
Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Required) The ID of the cached object.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) The cache region where you check for the cached object.</td>
</tr>
</tbody>
</table>

Example: Checks if the cache object is present in the user-defined cache region
```
<!--- Creating a new object ---'
<cfset obj1 = structNew()>
<cfset obj1.name = "xyz">

<!---Defining the time to live and time to Idle parameters --'
<cfset timeToLive=createtimespan(0,0,0,30)>
<cfset timeToIdle=createtimespan(0,0,0,30)>

<cfoutput>Starting to write to cache..</cfoutput>
<cfset cachePut("obj1",obj1,timeToLive,timeToIdle,"customcache")>
<br/>
<cfoutput>Done!!</cfoutput>

<cfoutput>Trying to check if the cached item is present...</cfoutput>
<cfoutput>#cacheIdExists("obj1","customcache")#</cfoutput>
```

Example: Checks if the cache object is present in the default cache region
```
<cfset obj2 = structNew()>
<cfset obj2.name = "xyz">
<cfoutput>Starting to write to cache..</cfoutput>
<cfset cachePut("obj2",obj2)>
<br/>
<cfoutput>Done!!</cfoutput>

<cfoutput>Trying to fetch cached item...</cfoutput>
<cfset obj = cacheGet("obj2")>
<cfoutput>#cacheIdExists("obj2","OBJECT")#</cfoutput>
```

**CacheGet**

**Description**
Gets an object that is stored in the cache.

**Returns**
The object stored in the cache.

**Category**
Cache functions

**Function syntax**
`CacheGet(id, [region])`
See also
cfcache, CachePut, CacheGetAllIds, CacheGetMetadata, CacheGetProperties, CacheRemove, CacheSetProperties

History
ColdFusion 10: Added the region parameter.
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID value assigned to the cache object when it was created.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) Specifies the cache region where you can place the cache object.</td>
</tr>
</tbody>
</table>

**CacheGetAllIds**

Description
Gets the IDs of all objects stored in the cache.

Returns
An array containing the IDs of all the objects that are stored in the cache.

Category
Cache functions

Function syntax
CacheGetAllIds()
Returns
A structure containing the cached object metadata. The structure has the following fields:

<table>
<thead>
<tr>
<th>Structure element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache_hitcount</td>
<td>The number of cache entries have been used.</td>
</tr>
<tr>
<td>cache_misscount</td>
<td>Number of times the object was requested, but was not in the cache or was not up to date (was stale).</td>
</tr>
<tr>
<td>createdtime</td>
<td>The time when the element or object was cached.</td>
</tr>
<tr>
<td>hitcount</td>
<td>Number of times the cached object has been used.</td>
</tr>
<tr>
<td>idletime</td>
<td>The remaining time, in seconds, after which the cached object is purged if it is idle.</td>
</tr>
<tr>
<td>lasthit</td>
<td>The time the cached object was last used, as a date-time object, or the empty string.</td>
</tr>
<tr>
<td>lastupdated</td>
<td>The time the cached object was last modified, as a date-time object, or the empty string.</td>
</tr>
<tr>
<td>size</td>
<td>The number of bytes the object takes up when serialized.</td>
</tr>
<tr>
<td>timespan</td>
<td>The remaining time, in seconds, during which the cached object is valid.</td>
</tr>
</tbody>
</table>

Category
Cache functions

Function syntax
CacheGetMetadata(id, template)

See also
cfcache, CachePut, CacheGet, CacheGetAllIds, CacheGetProperties, CacheRemove, CacheSetProperties

History
ColdFusion 10: Added the attribute region
ColdFusion 9.0.1: Added the parameter template.
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID of the cached object.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) The name of the cache region</td>
</tr>
<tr>
<td>template</td>
<td>Gets metadata for template caches.</td>
</tr>
</tbody>
</table>

Example
cacheTemp.cfm

```cfmcache action="cache" timespan="#CreateTimeSpan(0,0,10,0)#" useQueryString="true" metadata="cachemetadata">
  <cfoutput>-This date/time IS cached: #Now()#<br /></cfoutput>
</cfcache>

getMetaDataTemplate.cfm

Last updated 7/9/2012
<cfcache action="flush">
<!-- construct the templatecacheid to pass to the getcachemetadata function -->
<cfset baseurl =
  "http://#cgi.server_name#:#cgi.server_port##getDirectoryFromPath(cgi.script_name)#cacheTemp.cfm">
<cfset pageid = hash(expandpath('cacheTemp.cfm'))>
<cfset lineno = 1>
<cfset templateCacheId = trim(ucase("#baseurl#_PAGEID:#pageid#_LINE:#lineno#"))>
<!--- cache the template -->
<cfhttp url="#baseurl#" />
<cfdump var="#getAllTemplateCacheIds()#"><br>
<!--- work with the returned metadata -->
<cfset templateMetaData = cachegetmetadata(templatecacheid,'Template')>
<cfdump var="#templateMetaData#">

### CacheGetProperties

#### Description

Gets the cache properties for the object cache, the page cache, or both. The information is application-specific.

#### Returns

An Array of structures containing the cache properties. Each structure has the properties for the cache type: object or page. If you specify either type in the parameter, the array has a single structure entry. Each structure has the following fields:

<table>
<thead>
<tr>
<th>Structure element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diskpersistent</td>
<td>A Boolean value specifying whether to persist caches stored on disk through JVM restarts.</td>
</tr>
<tr>
<td>eternal</td>
<td>A Boolean value specifying whether no timeout or idle time applies. A true value indicates that the object or page is cached without any timespan being specified.</td>
</tr>
<tr>
<td>maxelementsinmemory</td>
<td>The maximum number of objects that can be cached in memory. If the number is exceeded and overflowtodisk is false, the new objects entered replace old elements using algorithm specified in the memoryevictionpolicy entry.</td>
</tr>
<tr>
<td>maxelementsondisk</td>
<td>The maximum number of objects that can be stored on disk if overflowtodisk is true.</td>
</tr>
<tr>
<td>memoryevictionpolicy</td>
<td>The algorithm to used to evict old entries when maximum limit is reached, such as LRU (least recently used) or LFU (least frequently used).</td>
</tr>
<tr>
<td>objecttype</td>
<td>The cache type: object or template.</td>
</tr>
<tr>
<td>overflowtodisk</td>
<td>A Boolean value specifying whether when the maximum number of elements allowed in memory is reached, objects can be moved to disk, as determined by the memoryevictionpolicy value.</td>
</tr>
<tr>
<td>statistics</td>
<td>true indicates that statistics collection for Ehcache is enabled.</td>
</tr>
<tr>
<td>timetoidleseconds</td>
<td>The idle time in seconds. Used if a cfcache tag does not specify an idleTime attribute.</td>
</tr>
<tr>
<td>timetolivesecond</td>
<td>The timeout time in seconds. Used if a cfcache tag does not specify a timespan attribute.</td>
</tr>
</tbody>
</table>

The cacheGetProperties function also supports the following **ehCache Structure Elements**:  

- cacheloadertimeoutmillis  
- clearonflush  
- copyonread
• copyonwrite
• diskaccessstripes
• diskexpirythreadintervalseconds
• diskpersistent
• diskspoolbuffersizemb
• eternal
• logging
• maxbyteslocaldisk
• maxbyteslocaldiskasstring
• maxbyteslocaldiskpercentageset
• maxbyteslocalheap
• maxbyteslocalheapasstring
• maxbyteslocalheappercentageset
• maxbyteslocaloffheap
• maxbyteslocaloffheapasstring
• maxbyteslocaloffheappercentageset
• maxelementsinmemory
• maxelementsondisk
• maxentrieslocaldisk
• maxentrieslocalheap
• maxmemoryoffheap
• maxmemoryoffheapanbytes
• memoryevictionpolicy
• name
• objecttype
• overflowtodisk
• overflowtooffheap
• overflowtooffheapset
• statistics
• timetoidleseconds
• timetoliveseconds

For more information on the above mentioned structure elements, refer to EhCache Documentation.

**Category**
Cache functions

**Function syntax**
CacheGetProperties([[type]])
See also
cfcache, CachePut, CacheGet, CacheGetAllIds, CacheGetMetadata, CacheRemove, CacheSetProperties

History
ColdFusion 10: Added the attribute region
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>(Optional) The cache type:</td>
</tr>
<tr>
<td></td>
<td>• template - Get properties for the page cache, which contains cached pages and page segments.</td>
</tr>
<tr>
<td></td>
<td>• object - Get properties for the object cache.</td>
</tr>
<tr>
<td></td>
<td>• no parameter - Get properties for both cache types.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) The name of the cache region</td>
</tr>
</tbody>
</table>

**cacheGetSession**

Description
Lets you retrieve the underlying cache object to access additional cache functionality that is not implemented in the tag cfcache.

*Note: Caution* Using the cacheGetSession function might pose security vulnerabilities. If you wish to disable the usage of this function, add it to Sandbox Security. For more information, see Using sandbox security.

Returns
The underlying cache object.

Syntax
```
cacheGetSession()
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectType</td>
<td>Any of the following values:</td>
</tr>
<tr>
<td></td>
<td>• object</td>
</tr>
<tr>
<td></td>
<td>• template</td>
</tr>
<tr>
<td></td>
<td>• name of the user-defined cache</td>
</tr>
<tr>
<td>isKey</td>
<td>Set to true if objectType is user-defined cache. The default value is false.</td>
</tr>
</tbody>
</table>

Category
Cache functions

Last updated 7/9/2012
See also
cfcache, CachePut, CacheGet, CacheGetAllIds, CacheGetMetadata, CacheRemove, CacheSetProperties

History
ColdFusion 9.0.1: Added this function

Example 1
The following example shows how to create a user-defined cache by adding an entry in ehCache.xml:

```cfc
<cache
    name="customcache"
    maxElementsInMemory="1000"
    eternal="false"
    timeToIdleSeconds="720"
    timeToLiveSeconds="720"
    overflowToDisk="true"
    diskSpoolBufferSizeMB="10"
    maxElementsOnDisk="100000"
    diskPersistent="true"
    diskExpiryThreadIntervalSeconds="3600"
    memoryStoreEvictionPolicy="LRU"/>
```

After you specify the details in the ehCache.xml, you can use the user-defined cache as shown here:

```cfc
<!--- put an object into user-defined object cache --->
<cfset cachePut("cache1","hello",15,15,customCache)>

<!--- get underlying user-defined object cache --->
<cfset objectCache = cacheGetSession(customCache,true)>

<!--- get/print user-defined object cache properties --->
<cfset config = objectCache.getCacheConfiguration()>
<cfoutput>
    getMaxElementsInMemory() :: #config.getMaxElementsInMemory()#
    isEternal() ::    #config.isEternal()#
    getTimeToIdleSeconds() :: #config.getTimeToIdleSeconds()#
    getTimeToLiveSeconds() :: #config.getTimeToLiveSeconds()#
    isOverflowToDisk() :: #config.isOverflowToDisk()#
    getDiskSpoolBufferSizeMB() :: #config.getDiskSpoolBufferSizeMB()#
    getMaxElementsOnDisk() :: #config.getMaxElementsOnDisk()#
    isDiskPersistent() :: #config.isDiskPersistent()#
    getDiskExpiryThreadIntervalSeconds() :: #config.getDiskExpiryThreadIntervalSeconds()#
    getMemoryStoreEvictionPolicy() :: #config.getMemoryStoreEvictionPolicy()#
    isClearOnFlush() :: #config.isClearOnFlush()#
</cfoutput>
```

Example 2
The following example shows how to use the function `cacheGetSession` to operate on default caches:
<!--- put an object into user-defined object cache --->
<cfset cachePut("cache1","hello",15,15)>

<!--- get/underlying user-defined object cache --->
<cfset objectCache = cacheGetSession("object",true)>

<!--- get/print user-defined object cache properties --->
<cfset config = objectCache.getCacheConfiguration()>

### CachePut

**Description**
Stores an object in the cache.

**Returns**
Nothing

**Category**
Cache functions

**Function syntax**
CachePut(id, value, [timeSpan], [idleTime], [region], [throwOnError])

**See also**
cfcache, CacheGet, CacheGetAllIds, CacheGetProperties, CacheRemove, CacheSetProperties

**History**
ColdFusion 10: Added the region and throwOnError parameters.
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The ID for the cache object.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the object. Can be any data type supported by ColdFusion</td>
</tr>
<tr>
<td>timeSpan</td>
<td>(Optional) The interval until the object is flushed from the cache, as a decimal number of days. One way to set the value is to use the return value from the CreateTimeSpan function. The default is to not time out the object.</td>
</tr>
<tr>
<td>idleTime</td>
<td>(Optional) A decimal number of days after which the object is flushed from the cache if it is not accessed during that time. One way to set the value is to use the return value from the CreateTimeSpan function.</td>
</tr>
<tr>
<td>region</td>
<td>Optional. Specifies the cache region where you can place the cache object.</td>
</tr>
<tr>
<td>throwOnError</td>
<td>Optional. If True and if region does not exist, throws an error.</td>
</tr>
</tbody>
</table>

### CacheRegionExists

**Description**
Checks if the cache region exists.
Returns
True if the cache region exists.

Syntax
`cacheRegionExists(region)`

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>region</td>
<td>Name of the cache region.</td>
</tr>
</tbody>
</table>

Example
```cfs
<!--- Checking if the region is present in the Cache --->
<cfif #cacheRegionExists("testregion")# EQ "YES">
    <cfset cacheRegionRemove("testregion")>
    <cfif #cacheRegionExists("testregion")# EQ "NO">
        <cfoutput>Region is deleted<br></cfoutput>
    </cfif>
</cfif>
<cfelse>
    <cfset cacheRegionNew("testregion")>
    <cfset cacheRegionRemove("testregion")>
    <cfif #cacheRegionExists("testregion")# EQ "NO">
        <cfoutput>Region is deleted<br></cfoutput>
    </cfif>
</cfif>
```

CacheRegionNew

Description
Creates a new custom cache region (if no cache region exists).

Returns
An error if `throwOnError` parameter is set to `true`, provided cache region already exists.

Syntax
`cacheRegionNew(region, [properties], [throwOnError])`

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>region</td>
<td>Name of the new cache region to be created.</td>
</tr>
<tr>
<td>properties</td>
<td>Optional. Struct that contains the cache region properties.</td>
</tr>
<tr>
<td>throwOnError</td>
<td>Optional. A Boolean value specifying if to throw an exception if the cache region name you specify already exists. The default value is <code>true</code>.</td>
</tr>
</tbody>
</table>
**Example**

<!--- Defining properties for the struct --->
```coldfusion
<cfset defaultCacheProps = StructNew()>
  <cfset defaultCacheProps.CLEARONFLUSH = "true">
  <cfset defaultCacheProps.DISKEXPIRYTHREADINTERVALSECONDS = "3600">
  <cfset defaultCacheProps.DISKPERSISTENT = "false">
  <cfset defaultCacheProps.DISKPERSISTENT = "false">
  <cfset defaultCacheProps.ETERNAL = "false">
  <cfset defaultCacheProps.MAXELEMENTSINMEMORY = "5">
  <cfset defaultCacheProps.MAXELEMENTSINMEMORY = "5">
  <cfset defaultCacheProps.MAXELEMENTSONDISK = "10">
  <cfset defaultCacheProps.MAXELEMENTSONDISK = "10">
  <cfset defaultCacheProps.OVERFLOWTODISK = "true">
  <cfset defaultCacheProps.OVERFLOWTODISK = "true">
  <cfset defaultCacheProps.TIMETOLIVESECONDS = "5">
  <cfset defaultCacheProps.TIMETOLIVESECONDS = "5">
  <cfset cacheRegionNew("testregion",#defaultCacheProps#,false)>
```

<!--- Defining a struct object --->
```coldfusion
<cfset obj1 = structNew()>
  <cfset obj1.name = "xyz">
  <cfset timeToLive = CreateTimeSpan(0,0,5,0)>
  <cfset timeToIdle = CreateTimeSpan(0,0,10,0)>
```

<!--- Putting Cache in the USD specific cache --->
```coldfusion
<cfoutput>Starting to write to cache..</cfoutput>
<cfset cachePut("obj1",obj1,timeToLive,timeToIdle,"testregion")>
<cfoutput>Trying to fetch cached item...</cfoutput>
<cfset obj = cacheGet("obj1","testregion")>
```

<!--- End of example --->

**CacheRegionRemove**

**Description**

Removes a specified cache region.

**Returns**

Nothing

**Syntax**

```coldfusion
cacheRegionRemove(region)
```

**Properties**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>region</td>
<td>Name of the cache region that has to be removed.</td>
</tr>
</tbody>
</table>

**Example**

See the example for “CacheRegionExists” on page 797.
CacheRemove

Description
Removes an object from the cache.

Returns
Nothing.

Category
Cache functions

Function syntax
CacheRemove(ids, [throwOnError]])

See also

History
ColdFusion 10: Added the attributes region and exact
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exact</td>
<td>(Optional) If true, the search narrows down to values that exactly match the IDs (for removal). The default value is true.</td>
</tr>
<tr>
<td>ids</td>
<td>A comma delimited string of IDs of the cached objects to remove.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) Name of the cache region from which to remove the cached objects.</td>
</tr>
<tr>
<td>throwOnError</td>
<td>A Boolean value specifying whether to throw an exception if any ID does not specify a cached element. The default value is false.</td>
</tr>
</tbody>
</table>
Example with parameter exact set to true

<!--- clear all object caches --->
<cfif ArrayLen(cacheGetAllIds()) gt 0>
    <cfset cacheRemove(ArrayToList(cacheGetAllIds())))>
</cfif>

<!--- create few caches --->
<cfloop from="1" to="10" index="i">
    <cfset id = "cache_#i#">
    <cfset timeToLive = CreateTimeSpan(0,0,30,0)>
    <cfset timeToIdle = CreateTimeSpan(0,0,30,0)>
        <cfset cachePut(id,createQryObj(i),timeToLive,timeToIdle)>
    </cfloop>

<cfoutput>Before cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br></cfoutput>

<!--- clear all objects from the cache --->
<cfset cacheRemove("cache",true,"object",true)>

<cfoutput>(List of cache Ids - #ListSort(ArrayToList(cacheGetAllIds())),"textnocase","ASC")#</cfoutput><br>
<cfoutput>After cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br><br></cfoutput>

Example with parameter exact set to false

<!--- create few caches --->
<cfloop from="1" to="10" index="i">
    <cfset id = "cache_#i#">
    <cfset timeToLive = CreateTimeSpan(0,0,30,0)>
    <cfset timeToIdle = CreateTimeSpan(0,0,30,0)>
        <cfset cachePut(id,createQryObj(i),timeToLive,timeToIdle)>
    </cfloop>

<cfoutput>Before cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br></cfoutput>

<!--- clear all objects from the cache --->
<cfset cacheRemove("cache",true,"object",false)>

<cfoutput>(List of cache Ids - #ListSort(ArrayToList(cacheGetAllIds())),"textnocase","ASC")#</cfoutput><br>
<cfoutput>After cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br><br></cfoutput>

CacheRemoveAll

Description
Removes all stored objects in a cache region. If no cache region is specified, objects in the default region are removed.

Returns
Nothing

Syntax

cacheRemoveAll(region)
Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>region</td>
<td>(Optional) Indicates the cache region from which to remove the stored objects. If no value is specified, default cache region is considered by default.</td>
</tr>
</tbody>
</table>

Example

```cfml
<cfif ArrayLen(cacheGetAllIds()) gt 0>
    <cfset cacheRemove(ArrayToList(cacheGetAllIds()))>
</cfif>

<cfloop from="1" to="10" index="i">
    <cfset id = "cache_#i#">
    <cfset timeToLive = CreateTimeSpan(0,0,30,0)>
    <cfset timeToIdle = CreateTimeSpan(0,0,30,0)>
    <cfset cachePut(id,createQryObj(i),timeToLive,timeToIdle)>
</cfloop>
<cfoutput>Before cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br></cfoutput>

<cfset cacheRemoveAll()>
<cfoutput>After cacheRemove() :: Number of objects in the cache: #ArrayLen(cacheGetAllIds())#<br><br></cfoutput>

CacheSetProperties

Description
Sets the cache properties for the object cache, the page cache, or both. If a cache does not yet exist, creates it. The cache and properties are application-specific.

Returns
Nothing

Category
Cache functions

Function syntax
CacheSetProperties(propStruct)

See also
cfcache, CacheGet, CachePut, CacheGetAllIds, CacheGetProperties, CacheGetMetadata, CacheRemove

History
ColdFusion 10: Added the attribute region
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propsStruct</td>
<td>A structure specifying the cache properties plus identifying information</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) The name of the cache region</td>
</tr>
</tbody>
</table>

The propsStruct structure can have any or all of the following fields:

<table>
<thead>
<tr>
<th>Structure element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diskstore</td>
<td>The disk store.</td>
</tr>
<tr>
<td>diskpersistent</td>
<td>A Boolean value specifying whether to persist caches stored on disk through JVM restarts.</td>
</tr>
<tr>
<td>eternal</td>
<td>A Boolean value specifying whether no timeout or idle time applies. A true value indicates that the object or page is cached without any timespan being specified.</td>
</tr>
<tr>
<td>maxelementsinmemory</td>
<td>The maximum number of objects that can be cached in memory. If the number is exceeded and overflowtodisk is false, the new objects entered replace old elements using algorithm specified in the memoryevictionpolicy entry.</td>
</tr>
<tr>
<td>maxelementsondisk</td>
<td>The maximum number of objects that can be stored on disk if overflowtodisk is true.</td>
</tr>
<tr>
<td>memoryevictionpolicy</td>
<td>The algorithm to used to evict old entries when maximum limit is reached, such as LRU (least recently used) or LFU (least frequently used).</td>
</tr>
<tr>
<td>objecttype</td>
<td>The cache type: object or template.</td>
</tr>
<tr>
<td>overflowtodisk</td>
<td>A Boolean value specifying whether when the maximum number of elements allowed in memory is reached, objects can be moved to disk, as determined by the memoryevictionpolicy value.</td>
</tr>
<tr>
<td>statistics</td>
<td>true indicates that statistics collection for Ehcache is enabled.</td>
</tr>
<tr>
<td>timetoidoleconds</td>
<td>The idle time in seconds. Used if a cfcache tag does not specify an idleTime attribute.</td>
</tr>
<tr>
<td>timetolivesecond</td>
<td>The timeout time in seconds. Used if a cfcache tag does not specify a timespan attribute.</td>
</tr>
<tr>
<td>objecttype</td>
<td>The type of cache: one of the following:</td>
</tr>
<tr>
<td></td>
<td>• template - Set properties for the page cache, which contains cached pages and page segments.</td>
</tr>
<tr>
<td></td>
<td>• object - Set properties for the object cache.</td>
</tr>
<tr>
<td></td>
<td>• all - Set properties for both cache types.</td>
</tr>
</tbody>
</table>

**CallStackGet**

**Description**

Returns an array of structs. Each struct contains template name, line number, and if applicable the function name.

**Syntax**

```coldfusion
callStackGet()
```

**Usage**

Callstack is a snapshot of all function calls or invocations. For your ColdFusion application, callstack provides the template name, line number, and if applicable, the function name.

The feature is helpful in scenarios where you want to track the recursive calls that you made.
For example,

- `a.cfm` does an include of `b.cfm`.
- `b.cfm` invokes the function `callStackGet` at line 15.

This results in a callstack that returns a struct that contains the template name, line number, and the function name.

**Example**

In this example, the factorial of a number is computed.

Here,

1. The function `callStackGet` is called on line 9 in function `factorial` in the template `fact.cfm`.
2. In turn, it is called from line 14 from the template `fact.cfm`.
3. In turn, it is called from template `callfact.cfm` (line 2).
4. And so on, for other values of `n`.

```cfscript
numeric function factorial(n)
{
    if(n == 1)
    {
        writedump(callStackGet());
        writeoutput("<br>");
        return 1;
    }
    else
    {
        writedump(callStackGet());
        writeoutput("<br>");
        return n * factorial(n - 1);
    }
}
factorial(5);
```

**CallStackDump**

**Description**

Similar to the function `callStackGet` except that it returns a string representation of the call stack.
Syntax

callStackDump(destination)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Optional parameter that takes one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• console</td>
</tr>
<tr>
<td></td>
<td>• browser: This is the default destination.</td>
</tr>
<tr>
<td></td>
<td>• file: If you do not provide the complete path to the file, the file is</td>
</tr>
<tr>
<td></td>
<td>written to the temp directory as determined by the function getTempDirectory.</td>
</tr>
</tbody>
</table>

Usage

Callstack is a snapshot of all function calls or invocations. For your ColdFusion application, callstack provides the template name, line number, and if applicable, the function name.

The feature is helpful in scenarios where you want to track the recursive calls that you made.

Example

In this example, the factorial of a number is computed. The example is similar to the example for CallStackGet except that the function used here is callStackDump.

callfact.cfm

<cftry>
   <cfinclude template="fact.cfm">
<cfcatch type="any">
   <cfoutput>
      #cfcatch.message#
      #cfcatch.detail#
   </cfoutput>
</cfcatch>
</cftry>

fact.cfm

<cffunction name="factorial" hint="returns the factorial of a number" output="true">
   <cfargument name="n" required="yes" type="numeric" hint="The number for which the factorial is returned"/>
   <cfif n eq 1>
      <cfset callStackDump()>
      <cfreturn 1>
   <cfelse>
      <cfset callStackDump()>
      <cfreturn n * factorial(n - 1)>
   </cfif>
</cffunction>
<cfoutput> Factorial of 5 - #factorial(5)#</cfoutput>
**Canonicalize**

**Description**
Canonicalize or decode the input string.

**Returns**
Decoded form of input string.

**Category**
Display and formatting functions

**Syntax**
canonicalize(inputString, restrictMultiple, restrictMixed)

**History**
ColdFusion 10: Added this function.

**See also**
EncodeForHTML, EncodeForHTMLAttribute, EncodeForJavaScript, EncodeForCSS, EncodeForURL

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to be encode.</td>
</tr>
<tr>
<td>restrictMultiple</td>
<td>Required. If set to true, multiple encoding is restricted.</td>
</tr>
<tr>
<td>restrictMixed</td>
<td>Required. If set to true, mixed encoding is restricted.</td>
</tr>
</tbody>
</table>

**Example**
<cfoutput>#canonicalize("&lt;",false,false)#</cfoutput><br/>
<cfoutput>#canonicalize("%26lt; %26lt; %2526lt%253B %2526lt%253B %2526lt%253B",false,false)#</cfoutput><br/>
<cfoutput>#canonicalize("&##X25;3c",false,false)#</cfoutput><br/>
<cfoutput>#canonicalize("&##x25;3c",false,false)#</cfoutput><br/>

**Ceiling**

**Description**
Determines the closest integer that is greater than a specified number.

**Returns**
The closest integer that is greater than a given number.

**Category**
Mathematical functions
Function syntax
Ceiling(number)

See also
Int, Fix, Round

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A real number</td>
</tr>
</tbody>
</table>

Example
<h3>Ceiling Example</h3>

<cfoutput>
   <p>The ceiling of 3.4 is #ceiling(3.4)#</p>
   <p>The ceiling of 3 is #ceiling(3)#</p>
   <p>The ceiling of 3.8 is #ceiling(3.8)#</p>
   <p>The ceiling of -4.2 is #ceiling(-4.2)#</p>
</cfoutput>

CharsetDecode

Description
Converts a string to a binary representation.

Returns
A binary object that represents the string.

Category
Conversion functions, String functions

Function syntax
CharsetDecode(string, encoding)

See also
BinaryDecode, BinaryEncode, CharsetEncode; Determining the page encoding of server output in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string containing data to encode in binary format.</td>
</tr>
</tbody>
</table>
| encoding  | A string that specifies encoding of the input data. Must be a character encoding name recognized by the Java runtime. The following list includes commonly used values:  
  - utf-8  
  - iso-8859-1  
  - windows-1252  
  - us-ascii  
  - shift_jis  
  - iso-2022-jp  
  - euc-jp  
  - euc-kr  
  - big5  
  - euc-cn  
  - utf-16  
For a complete list of character encoding names supported by Sun Java runtimes, see http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html and http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html. |

Usage
This function converts a string directly to a binary object. In releases of ColdFusion through ColdFusion MX 6.1, you had to use the ToBase64 function to convert the string to Base64 and then use the ToBinary function to convert strings to binary data.

Example
The following example uses the CharsetDecode function to convert a string from a form to a binary object, and uses the CharSetEncode function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. If you select the Asian language encodings, characters that are not in the specified character set are successfully converted.
<h3>Character Encoding Conversion Example</h3>

<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myString")>
  <!--- Do the conversions. --->
  <cfscript>
    chardecode=CharsetDecode(Form.myString, Form.charEncoding);
    charencode=CharsetEncode(chardecode, Form.charEncoding);
  </cfscript>
  <!--- Display the input values and results. --->
  <cfoutput>
    <h3>Parameter Settings</h3>
    <p><b>The string:</b> #Form.myString#</p>
    <p><b>The character encoding:</b> #Form.charEncoding#</p>
    <h3>Results of the operations:</h3>
    <p><b>Dump of the string converted to a binary object by CharsetDecode:</b></p>
    <cfdump var="#chardecode#"></p>
    <p><b>The binary object converted back to a string by CharsetEncode:</b></p>
    #charencode#</p>
  </cfoutput>
</cfif>

<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the character encoding</b><br>
  <!--- This is a subset, additional encodings are available. --->
  <select size="1" name="charEncoding" >
    <option selected>UTF-8</option>
    <option>ASCII</option>
    <option>ISO8859_1</option>
    <option>CP1252</option>
    <option>SJIS</option>
    <option>MS932</option>
    <option>EUC_CN</option>
    <option>Big5</option>
  </select><br>
  <br>
  <b>Enter a string</b><br>
  <textarea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">
  The following four characters are not in all character encodings: ½àç÷
  </textarea><br>
  <br>
  <input type = "Submit" value = "convert my data">
</form>

**CharsetEncode**

**Description**
Uses the specified encoding to convert binary data to a string.
Returns
A string representation of the binary object.

Category
Conversion functions, String functions

Function syntax
CharsetEncode(binaryobject, encoding)

See also
BinaryDecode, BinaryEncode, CharsetDecode; Determining the page encoding of server output in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binaryobject</td>
<td>A variable containing binary data to decode into text.</td>
</tr>
</tbody>
</table>
| encoding | The character encoding that was used to encode the string into binary format. It must be a character encoding name recognized by the Java runtime. The following list includes commonly used values:  
  * utf-8  
  * iso-8859-1  
  * windows-1252  
  * us-ascii  
  * shift_jis  
  * iso-2022-jp  
  * euc-jp  
  * euc-kr  
  * big5  
  * euc-cn  
  * utf-16  
For a complete list of character encoding names supported by Sun Java runtimes, see [http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html](http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html). |

Usage
Adobe recommends that you use this function, and not the ToString function, to convert binary data to strings in all new applications.
Example
The following example uses the `CharsetDecode` function to convert a string from a form to a binary object, and uses the `CharsetEncode` function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. If you select the Asian language encodings, characters that are not in the specified character set are successfully converted.

```
<cfif IsDefined("Form.myString")>
  <!--- Do the conversions. --->
  <cfscript>
    chardecode=CharsetDecode(Form.myString, Form.charEncoding);
    charencode=CharsetEncode(chardecode, Form.charEncoding);
  </cfscript>
  <!--- Display the input values and results. --->
  <cfoutput>
    <h3>Parameter Settings</h3>
    <p><b>The string:</b><br>#Form.myString#</p>
    <p><b>The character encoding:</b> #Form.charEncoding#</p>
    <h3>Results of the operations:</h3>
    <p><b>Dump of the string converted to a binary object by CharsetDecode:</b></p>
    <cfdump var="#chardecode#"></p>
    <p><b>The binary object converted back to a string by CharsetEncode:</b></p>
    <b>#charencode#</b></p>
  </cfoutput>
</cfif>
<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the character encoding</b><br>
  <!--- This is a subset, additional encodings are available. --->
  <select size="1" name="charEncoding" >
    <option selected>UTF-8</option>
    <option>ASCII</option>
    <option>ISO8859_1</option>
    <option>CP1252</option>
    <option>SJIS</option>
    <option>MS932</option>
    <option>EUC_CN</option>
    <option>Big5</option>
  </select><br>
  <br>
  <b>Enter a string</b><br>
  <textarea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">The following four characters are not in all character encodings: ½àç÷</textarea><br>
  <br>
  <input type = "Submit" value = "convert my data">
</form>
```
**Chr**

**Description**
Converts a numeric value to a UCS-2 character.

**Returns**
A character with the specified UCS-2 character code.

**Category**
String functions

**Function syntax**

```
Chr(number)
```

**See also**
Asc

**History**
ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65535. (Earlier releases supported 1-255.)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A value (a number in the range 0 - 65535, inclusive)</td>
</tr>
</tbody>
</table>

**Usage**
The values 0 – 31 are standard, nonprintable codes. For example:

- `Chr(10)` returns a linefeed character
- `Chr(13)` returns a carriage return character
- The two-character string `Chr(13) & Chr(10)` returns a Windows newline

*Note: For a complete list of the Unicode characters and their codes, see [www.unicode.org/charts/] (www.unicode.org/charts/)*
Example

```cfc
c<cfif IsDefined("form.charVals")>
  <cfoutput>#form.charVals# = #Chr(form.charVals)#</cfoutput>
</cfif>
</cfif>
</cfform>

<!--- If the character string is not empty, output its Chr value. --->

Type an integer character code from 1 to 65535 to see its corresponding character.

```
<cfinput type="Text"
name="CharVals"
range="1,65535"
message="Enter an integer from 1 to 65535"
validate="integer"
required="Yes"
size="5"
maxlength="5"
>
</cfinput>
```

<input type="Submit" name="" > <input type="RESET">

CJustify

**Description**
Centers a string in a field length.

**Returns**
String, center-justified by adding spaces before or after the input parameter. If `length` is less than the length of the input parameter string, the string is returned unchanged.

**Category**
Display and formatting functions, String functions

**Function syntax**
`Cjustify(string, length)`

**See also**
`LJustify, RJustify`
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. May be empty. If it is a variable that is defined as a number, the function processes it as a string.</td>
</tr>
</tbody>
</table>
| length    | A positive integer or a variable that contains one. Length of field. Can be coded as:  
- A number; for example, 6  
- A string representation of a number; for example, "6"  
Any other value causes ColdFusion to throw an error. |

Example

```html
<!--- This example shows how to use CJustify. --->
<CFPARAM name = "jstring" DEFAULT = ">

<cfif IsDefined("FORM.submit")>
  <cfset jstring = CJustify("#FORM.justifyString#", 35)>
</cfif>

<html>
<head>
<title>CJustify Example</title>
</head>
<body>
<h3>CJustify</h3>
<p>Enter a string; it will be center-justified within the sample field.</p>
<form action = "cjustify.cfm" method="post">
  <p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>" size = 35 name = "justifyString">
  <input type = "Submit" name = "submit">
  <input type = "RESET"/>
</form>
</body>
</html>
```

Compare

Description
Performs a case sensitive comparison of two strings.

Returns
- -1, if string1 is less than string2
- 0, if string1 is equal to string2
- 1, if string1 is greater than string2

Category
String functions
Function syntax

\[ \text{Compare}(\text{string1}, \text{string2}) \]

See also

CompareNoCase, Find

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string1</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>string2</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

Usage

Compares the values of corresponding characters in \text{string1} and \text{string2}.

Example

```html
<h3>Compare Example</h3>
<p>The compare function performs a <i>case-sensitive</i> comparison of two strings.</p>

<cfif IsDefined("FORM.string1")>
    <cfset comparison = Compare(FORM.string1, FORM.string2)>
    <!--- Switch on the variable to give various responses. --->
    <cfswitch expression = #comparison#>
        <cfcase value = "-1">
            <h3>String 1 is less than String 2</h3>
            <i>The strings are not equal</i>
        </cfcase>
        <cfcase value = "0">
            <h3>String 1 is equal to String 2</h3>
            <i>The strings are equal!</i>
        </cfcase>
        <cfcase value = "1">
            <h3>String 1 is greater than String 2</h3>
            <i>The strings are not equal</i>
        </cfcase>
        <cfdefaultcase>
            <h3>This is the default case</h3>
        </cfdefaultcase>
    </cfswitch>
</cfif>
<form action = "compare.cfm" method="post">
    <p>String 1<br>\(<i>\text{input type = "Text" name = "string1"}</i>\)</p>
    <p>String 2<br>\(<i>\text{input type = "Text" name = "string2"}</i>\)</p>
</form>
```
**CompareNoCase**

**Description**
Performs a case-insensitive comparison of two strings.

**Returns**
An indicator of the difference:

- A negative number, if `string1` is less than `string2`
- 0, if `string1` is equal to `string2`
- A positive number, if `string1` is greater than `string2`

**Category**
String functions

**Function syntax**
```
CompareNoCase(string1, string2)
```

**See also**
`Compare`, `FindNoCase`; Evaluation and type conversion issues in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string1</code></td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td><code>string2</code></td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>
Example

```cfml
<H3>CompareNoCase Example</H3>
<P>This function performs a <I>case-insensitive</I> comparison of two strings.
<cfif IsDefined("form.string1")>
<cfset comparison = CompareNoCase(form.string1, form.string2)>
<!--- switch on the variable to give various responses --->
<cfswitch expression=#comparison#>
  <cfcase value="-1">
    <H3>String 1 is less than String 2</H3>
    <I>The strings are not equal</I>
  </cfcase>
  <cfcase value="0">
    <H3>String 1 is equal to String 2</H3>
    <I>The strings are equal!</I>
  </cfcase>
  <cfcase value="1">
    <H3>String 1 is greater than String 2</H3>
    <I>The strings are not equal</I>
  </cfcase>
  <cfdefaultcase>
    <H3>This is the default case</H3>
  </cfdefaultcase>
</cfswitch>
</cfif>
<form action="comparenocase.cfm" method="POST">
  <P>String 1
  <BR><input type="text" name="string1">
  <P>String 2
  <BR><input type="text" name="string2">
  <P><input type="submit" value="Compare these Strings" name="">
  <input type="reset">
</form>

Cos

Description
Calculates the cosine of an angle that is entered in radians.

Returns
A number; the cosine of the angle.

Category
Mathematical functions

Function syntax
Cos(<i>number</i>)

See also
ACos, Sin, ASin, Tan, Atn, Pi
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Angle, in radians, for which to calculate the cosine</td>
</tr>
</tbody>
</table>

Usage

The range of the result is -1 to 1.

To convert degrees to radians, multiply degrees by \( \pi/180 \). To convert radians to degrees, multiply radians by \( 180/\pi \).

Note: Because the function uses floating point arithmetic, it returns a small number (such as 6.1232399574E-017) for angles that must produce 0. To test for a 0 value, check whether the value is less than 0.0000000000001.

Example

```cfml
<h3>Cos Example</h3>
<!--- Calculate cosine if form has been submitted. --->
<cfif IsDefined("FORM.cosNum")>
<!--- Make sure input is a number. --->
<cfif IsNumeric(#FORM.cosNum#)>
<!--- Convert degrees to radians, call the Cos function. --->
<cfset cosValue=#Cos((#FORM.cosNum# * PI()) / 180)#>
<!--- 0.0000000000001 is the function's precision limit. If the absolute value of the returned cosine value is less, set result to 0 .--->
<cfif Abs(cosValue) LT 0.0000000000001>
<cfset cosValue=0>
</cfif>
<cfoutput>Cos(#FORM.cosNum#) = #cosValue#<br><br></cfoutput>
<cfelse>
<!--- If input is not a number, show an error message. --->
<h4>You must enter a numeric angle in degrees.</h4>
</cfif>
</cfif>
<form action="#CGI.script_name#" method="post">
Enter an angle in degrees to get its cosine:
<br><input type="Text" name="cosNum" size="15"><br><br>
<input type="Submit" name=""&nbsp;&nbsp;><input type="RESET"</form>

CreateDate

Description

Creates a date/time object.

Returns

A date/time value.

Category

Date and time functions

Function syntax

CreateDate(year, month, day)
See also
CreateDate, CreateODBCDateTime; Evaluation and type conversion issues in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>year</td>
<td>Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100.</td>
</tr>
<tr>
<td>month</td>
<td>Integer in the range 1 (January)-12 (December)</td>
</tr>
<tr>
<td>day</td>
<td>Integer in the range 1-31</td>
</tr>
</tbody>
</table>

Usage
CreateDate is a subset of CreateDateTime.

The time in the returned object is set to 00:00:00.

Example

```html
<h3>CreateDate Example</h3>
<cfif IsDefined("form.year")>
<p>Your date value, generated with CreateDate:</p>
<cfset yourDate = CreateDate(form.year, form.month, form.day)>
<cfoutput>
<ul>
<li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
<li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month, form.day, 12,13,0)#</li>
<li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
<li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
<li>Formatted with CreateDate and DateFormat: #DateFormat(CreateDate(form.year, form.month, form.day), "mmm-dd-yyyy")#</li>
<li>Formatted with CreateDateTime and DateFormat: #DateFormat(CreateDateTime(form.year, form.month, form.day, 12,13,0))#</li>
<li>Formatted with CreateODBCDate and DateFormat: #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#</li>
<li>Formatted with CreateODBCDateTime and DateFormat: #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#</li>
</ul>
</cfoutput>
</cfif>
<cfform action="createdate.cfm" METHOD="POST">
<p>Enter the year, month, and day, as integers:
<pre>
Year<cfinput type="Text" name="year" value="1998" validate="integer" required="Yes">
Month<cfinput type="Text" name="month" value="6" validate="integer" required="Yes">
Day<cfinput type="Text" name="day" value="8" validate="integer" required="Yes">
</pre>
<p><input type="Submit" name="" > <input type="RESET" ></cfform>
```
CreateDateTime

**Description**
Creates a date-time object.

**Returns**
A date/time value.

**Category**
Date and time functions

**Function syntax**
CreateDateTime(year, month, day, hour, minute, second)

**See also**
CreateDate, CreateTime, CreateODBCDateTime, Now; Evaluation and type conversion issues in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>year</td>
<td>Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100.</td>
</tr>
<tr>
<td>month</td>
<td>Integer in the range 1 (January)–12 (December)</td>
</tr>
<tr>
<td>day</td>
<td>Integer in the range 1–31</td>
</tr>
<tr>
<td>hour</td>
<td>Integer in the range 0–23</td>
</tr>
<tr>
<td>minute</td>
<td>Integer in the range 0–59</td>
</tr>
<tr>
<td>second</td>
<td>Integer in the range 0–59</td>
</tr>
</tbody>
</table>
Example

<h3>CreateDateTime Example</h3>

<cfif IsDefined("form.year")>
Your date value, generated with CreateDateTime:
<cfset yourDate = CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second)>

<cfoutput>
<ul>
<li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
<li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second)#</li>
<li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
<li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
<li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year, form.month, form.day), "mmm-dd-yyyy")#</li>
<li>Formatted with CreateDateTime and DateFormat:
    #DateFormat(CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second))#</li>
<li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#</li>
<li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#</li>
</ul>
</cfoutput>
</cfif>
</cfform>
**CreateObject**

**Description**
Creates a ColdFusion object, of a specified type.

**Returns**
An object, of the specified type.

**Category**
Extensibility functions

**History**
ColdFusion 10: Added the parameter wsVersion

ColdFusion 9:
- ColdFusion 9 does not require the type argument.

ColdFusion 8:
- Added the .NET/dotnet type
- For web service object, added the WSDL2Java and argstruct parameters

ColdFusion MX 7: For web service object: added the portName parameter, which specifies a port named in the service element of the WSDL.

ColdFusion MX:
1. Changed instantiation behavior: this function, and the cfobject tag, can instantiate ColdFusion components and web services. Executing operations on a CFC object executes CFML code that implements the CFC’s method in the CFC file.
   For more information, see the *Developing ColdFusion Applications*.

2. For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if "context=NameService", for a class, use either of the following formats for the class parameter:
   - "/Eng/CF"
   - ".current/Eng.current/CF"
   (In earlier releases, the format was ".Eng.CF".)

3. For CORBA object: changed the locale parameter; it specifies the Java config that contains the properties file.

**CreateObject object types**
For information about using this function, see these sections:
- CreateObject: .NET object
- CreateObject: COM object
- CreateObject: component object
- CreateObject: CORBA object
- CreateObject: Java or EJB object
- CreateObject: web service object
Note: On UNIX, this function does not support COM objects.

CreateObject: .NET object

Description
Creates a .NET object, that is, a ColdFusion proxy for accessing a class in a local or remote .NET assembly.

Returns
A .NET object, that is, a ColdFusion reference to a local or remote .NET assembly class.

Function syntax
CreateObject(type, class, assembly[, server, port, protocol, secure])

See also
cfobject: .NET object, DotNetToCFType, Using Microsoft .NET Assemblies in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>component</td>
<td>Object type. Must be .NET or dotnet for .NET objects.</td>
</tr>
<tr>
<td>class</td>
<td></td>
<td>Name of the .NET class to represent as an object.</td>
</tr>
</tbody>
</table>
| assembly  |mscorlib.dll which contains the .NET core classes | For local .NET assemblies, the absolute path or paths to the assembly or assemblies (.exe or .dll files) from which to access the .NET class and its supporting classes. If a class in an assembly requires supporting classes that are in other assemblies, specify those assemblies also. You can, however, omit the supporting assemblies for the following types of supporting classes:
• .NET core classes (classes in mscorlib.dll)
• classes in assemblies that are in the global assembly cache (GAC)
To specify multiple assemblies, use a comma-delimited list.

For remote .NET assemblies, specify the absolute path or paths of the local proxy JAR file or files that represent the assemblies.
If you omit this parameter, and there is no local .NET installation, the function fails without generating an error. If you omit this parameter, there is a local .NET installation, and the specified class is not in the .NET core classes, ColdFusion generates an error. |
| server    | localhost | Host name or IP address of the server where the .NET-side agent is running. Can be in any of these forms:
• server name (for example, myserver)
• IP address (for example, 127.0.0.1)
Specify this attribute to access .NET components on a remote server. |
Usage
The `CreateObject` function and `cfobject` tag differ only in syntax. For more information on creating ColdFusion .NET objects, see “`cfobject .NET object`” on page 469. For detailed information on using the .NET assemblies in ColdFusion, see Using Microsoft .NET Assemblies in the Developing ColdFusion Applications.

CreateObject: COM object

Description
The `CreateObject` function can create a Component Object Model (COM) object.

To create a COM object, provide the following information:
- The object’s program ID or filename
- The methods and properties available to the object through the IDispatch interface
- The arguments and return types of the object’s methods

For most objects, you can get this information from the OLEView utility.

*Note:* On UNIX, this function does not support COM objects.

Returns
A COM object.

Function syntax
```
CreateObject(type, class, context, serverName)
```

See also
`ReleaseComObject`, `cfobject`; Integrating COM and CORBA Objects in CFML Applications in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of object to create.</td>
</tr>
<tr>
<td>class</td>
<td>Component ProgID for the object to invoke.</td>
</tr>
<tr>
<td>context</td>
<td>InProc, Local, Remote</td>
</tr>
<tr>
<td>serverName</td>
<td>Server name, using UNC or DNS convention, in one of these forms:</td>
</tr>
</tbody>
</table>

Usage

The following example creates the Windows Collaborative Data Objects (CDO) for NTS NewMail object to send mail. You use this code in a cffscript tag.

```coldfusion
Mailer = CreateObject("COM", "CDONTS.NewMail");
```

CreateObject: component object

Description

The CreateObject function can create an instance of a ColdFusion component (CFC) object.

Returns

A component object.

Function syntax

`CreateObject(type, component-name)`

See also

Building and Using ColdFusion Components in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of object to create.</td>
</tr>
<tr>
<td></td>
<td>• com</td>
</tr>
<tr>
<td></td>
<td>• corba</td>
</tr>
<tr>
<td></td>
<td>• java</td>
</tr>
<tr>
<td></td>
<td>• component</td>
</tr>
<tr>
<td></td>
<td>• webservice</td>
</tr>
<tr>
<td></td>
<td>The default value of type is component.</td>
</tr>
<tr>
<td>component-name</td>
<td>The CFC name; corresponds to the name of the file that defines the component; for example, use engineComp to specify the component defined in the engineComp.cfc file</td>
</tr>
</tbody>
</table>

Usage

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a filename that matches the component name exactly, with the identical character casing.

In the following example, the CFScript statements assign the tellTimeCFC variable to the tellTime component using the CreateObject function. The CreateObject function references the component in another directory. To invoke component methods, you use function syntax.

```
<b>Server's Local Time:</b>
<cfscript>
tellTimeCFC=CreateObject("component","appResources.components.tellTime");
tellTimeCFC.getLocalTime();
</cfscript>
<br>
<b>Calculated UTC Time:</b>
<cfscript>
tellTimeCFC.getUTCTime();
</cfscript>
```

CreateObject: CORBA object

Description
The CreateObject function can call a method on a CORBA object. The object must be defined and registered for use.

Returns
A handle to a CORBA interface.

Function syntax
```
CreateObject(type, context, class, locale)
```

See also
Integrating COM and CORBA Objects in CFML Applications in the Developing ColdFusion Applications
History
See the History section of the main CreateObject function page.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of object to create.</td>
</tr>
<tr>
<td>context</td>
<td>IOR: ColdFusion uses IOR to access CORBA server</td>
</tr>
<tr>
<td>class</td>
<td>Absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it must be local to ColdFusion server or accessible on network.</td>
</tr>
<tr>
<td>locale</td>
<td>The name of the Java config that holds the properties file. For more information, see Configuring and Administering ColdFusion.</td>
</tr>
</tbody>
</table>

Usage
In the class parameter, if "context=NameService", use a dot separator for the first part of the string. Use either of the following formats:

- "/Eng/CF"
- ".current/Eng.current/CF"

ColdFusion supports CORBA through the Dynamic Invocation Interface (DII). To use this function with CORBA objects, provide the name of the file that contains a string version of the IOR, or the object’s naming context in the naming service. Provide the object’s attributes, method names, and method signatures.

This function supports user-defined types (structures, arrays, and sequences).

Example
myobj = CreateObject("corba", "d:temp\tester.ior", "ior", "visibroker") // uses IOR

myobj = CreateObject("corba", "/Eng/CF", "nameservice", "visibroker") // uses nameservice

myobj = CreateObject("corba", "d:temp\tester.ior", "nameservice") // uses nameservice and default configuration
**CreateObject: Java or EJB object**

**Description**
The CreateObject function can create a Java object, and, by extension, an EJB object.

**Returns**
A Java object.

**Function syntax**
CreateObject(type, class)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of object to create.</td>
</tr>
<tr>
<td>class</td>
<td>A Java class name</td>
</tr>
</tbody>
</table>

**Usage**
Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion with the CreateObject function.

To access Java methods and fields:

1. Call the CreateObject function or the cfobject tag to load the class.
2. Use the init method, with appropriate arguments, to call an instance of the class. For example:
   `<cfset ret = myObj.init(arg1, arg2)>`

Calling a public method on the object without first calling the “init” method invokes a static method. Arguments and return values can be any Java type (simple, array, object). If strings are passed as arguments, ColdFusion does the conversions; if strings are received as return values, ColdFusion does no conversion.

Overloaded methods are supported if the number of arguments is different. Future enhancements will let you use cast functions that allow method signatures to be built more accurately.

**CreateObject: web service object**

**Description**
This function can create a web service object.
Returns
A web service object.

Function syntax
CreateDateObject(type, urltowsdl[, portname, wsd12JavaArgs])

OR
CreateDateObject(type, urltowsdl, argStruct)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of object to create.</td>
</tr>
<tr>
<td>portname</td>
<td>The port name for the web service. This value is case-sensitive and</td>
</tr>
<tr>
<td></td>
<td>corresponds to the port element’s name attribute under the service</td>
</tr>
<tr>
<td></td>
<td>element. Specify this parameter if the web service contains multiple ports.</td>
</tr>
<tr>
<td></td>
<td>If no port name is specified, ColdFusion uses the first port found in the</td>
</tr>
<tr>
<td></td>
<td>WSDL.</td>
</tr>
<tr>
<td>urltowsdl</td>
<td>Specifies the URL to web service WSDL file. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• The absolute URL of the web service</td>
</tr>
<tr>
<td></td>
<td>• The Name (string) assigned in the ColdFusion Administrator to the web</td>
</tr>
<tr>
<td></td>
<td>service</td>
</tr>
<tr>
<td>wsd12JavaArgs</td>
<td>A string containing a space-delimited list of arguments to pass to the</td>
</tr>
<tr>
<td></td>
<td>WSDL2Java tool that generates Java stubs for the web services. Useful</td>
</tr>
<tr>
<td></td>
<td>arguments include the following:</td>
</tr>
<tr>
<td></td>
<td>• -W or --noWrapped: Turns off the special treatment of wrapped document/literal</td>
</tr>
<tr>
<td></td>
<td>style operations.</td>
</tr>
<tr>
<td></td>
<td>• -a or --all: Generates code for all elements in the WSDL, even unreferenced</td>
</tr>
<tr>
<td></td>
<td>ones.</td>
</tr>
<tr>
<td></td>
<td>• -w or --wrapArrays: Prefers building beans to straight arrays for wrapped</td>
</tr>
<tr>
<td></td>
<td>XML array types. This switch is not included in the Axis documentation.</td>
</tr>
<tr>
<td></td>
<td>For detailed information on valid arguments, see the Apache Axis WSDL2Java</td>
</tr>
<tr>
<td></td>
<td>Reference.</td>
</tr>
<tr>
<td>argStruct</td>
<td>A structure containing web service configuration arguments. For more</td>
</tr>
<tr>
<td></td>
<td>information see Usage.</td>
</tr>
</tbody>
</table>

Usage
You can use the CreateObject function to create a web service.

The argStruct structure can contain any combination of the following values:
Example

```cfs
<cfscript>
    ws = CreateObject("webservice",
        "http://www.xmethods.net/sd/2001/TemperatureService.wsdl");
    xlatstring = ws.getTemp(zipcode = "55987");
    writeoutput("The temperature at 55987 is " & xlatstring);
</cfscript>
```

CreateODBCDate

Description

Creates an ODBC date object.

Returns

A date object, in normalized ODBC date format.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>Password set in the Administrator, if any</td>
<td>The password to use to access the web service. If the <code>webservice</code> attribute specifies a web service name configured in the Administrator, overrides any user name specified in the Administrator entry.</td>
</tr>
<tr>
<td>port</td>
<td></td>
<td>See <code>portname</code> in the Syntax Parameter table.</td>
</tr>
<tr>
<td>proxyPassword</td>
<td>http.proxyPassword system property, if any</td>
<td>The user's password on the proxy server.</td>
</tr>
<tr>
<td>proxyPort</td>
<td>http.proxyPort system property, if any</td>
<td>The port to use on the proxy server.</td>
</tr>
<tr>
<td>proxyServer</td>
<td>http.proxyHost system property, if any</td>
<td>The proxy server required to access the <code>webservice</code> URL.</td>
</tr>
<tr>
<td>proxyUser</td>
<td>http.proxyUser system property, if any</td>
<td>The user ID to send to the proxy server.</td>
</tr>
</tbody>
</table>
| refreshWSDL       | no                                | • yes: Reload the WSDL file and regenerate the artifacts used to consume the web service  
• no                                                                                                                                                                                                                                                                                                                                  |
| saveJava          | no                                | • yes: Save the Java generated by the WSDL2Java converter that generates Java web service stubs. This code can be useful in debugging errors.

Category
Date and time functions

Function syntax
CreateODBCDate(date)

See also
CreateDate, CreateODBCDateTime

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date or date/time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
This function does not parse or validate values. To ensure that dates are entered and processed correctly (for example, to ensure that a day/month/year entry is not confused with a month/day/year entry, and so on), Adobe recommends that you parse entered dates with the DateFormat function, using the mm-dd-yyyy mask, into three elements. Ensure that values are within appropriate ranges; for example, to validate a month value, use the attributes validate = "integer" and range = "1,12".

Example

```html
<h3>CreateODBCDate Example</h3>
<cfif IsDefined("form.year")>
<p>Your date value, generated with CreateDateTime:</p>
<cfset yourDate = CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second)>
<cfoutput>
<ul>
<li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
<li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second)#</li>
<li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
<li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>
</ul>
<p>The same value can be formatted with DateFormat:</p>
<ul>
<li>Formatted with CreateDate and DateFormat: #DateFormat(CreateDate(form.year,form.month, form.day), "mmm-dd-yyyy")#</li>
<li>Formatted with CreateDateTime and DateFormat: #DateFormat(CreateDateTime(form.year, form.month, form.day, form.hour, form.minute, form.second))#</li>
<li>Formatted with CreateODBCDate and DateFormat: #DateFormat(CreateODBCDate(yourDate), "mmmm d, yyyy")#</li>
<li>Formatted with CreateODBCDateTime and DateFormat: #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#</li>
</ul>
</cfoutput>
</cfif>
</cfform>

Enter the year, month and day, as integers:
CreateODBCDateTime

Description
Creates an ODBC date-time object.

Returns
A date-time object, in ODBC timestamp format.

Category
Date and time functions

Function syntax
CreateODBCDateTime(date)

See also
CreateDate, CreateODBCDate, CreateODBCTime, Now; Evaluation and type conversion issues in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date-time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date-time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.
Example
<!--- This example shows how to use CreateDate, CreateDateTime, CreateODBCDate, and CreateODBCDateTime --->
<h3>CreateODBCDateTime Example</h3>

<cfif IsDefined("form.year")>
Your date value, generated using CreateDateTime:
<cfset yourDate = CreateDateTime(form.year, form.month, form.day,
form.hour,form.minute, form.second)>
<cfoutput>
<ul>
<li>Formatted with CreateDate: #CreateDate(form.year, form.month,form.day)#
<li>Formatted with CreateDateTime: #CreateDateTime(form.year,form.month,
form.day,form.hour,form.minute,form.second)#
<li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
<li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>
The same value can be formatted with DateFormat:
<ul>
<li>Formatted with CreateDate and DateFormat:
#DateFormat(CreateDate(form.year,form.month,form.day), "mmm-dd-yyyy")#
<li>Formatted with CreateDateTime and DateFormat:
#DateFormat(CreateDateTime(form.year,form.month,form.day,
form.hour,form.minute,form.second))#  
<li>Formatted with CreateODBCDate and DateFormat:
#DateFormat(CreateODBCDate(yourDate), "mmmm d, yyyy")#  
<li>Formatted with CreateODBCDateTime and DateFormat:
#DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#  
</ul>
</cfoutput>
</cfif>

<!--- This form allows you to enter a date and time, and then see how the date is formatted with CreateDate, CreateDateTime, CreateODBCDate, and CreateODBCDateTime --->
<br>
<CFFORM ACTION="createodbcdatetime.cfm" METHOD="POST">
Enter a year, month and day, as integers:
<br>
<PRE>
Year  <CFINPUT TYPE="Text" NAME="year" VALUE="1998" VALIDATE="integer" REQUIRED="Yes">
Month <CFINPUT TYPE="Text" NAME="month"VALUE="6" RANGE="1,12" 
MESSAGE="Enter a month (1-12)" VALIDATE="integer" REQUIRED="Yes">
Day   <CFINPUT TYPE="Text" NAME="day" VALUE="8" RANGE="1,31" 
MESSAGE="Enter a day of the month (1-31)" VALIDATE="integer" REQUIRED="Yes">
Hour  <CFINPUT TYPE="Text" NAME="hour" VALUE="16" RANGE="0,23" 
MESSAGE="You must enter an hour (0-23)" VALIDATE="integer" REQUIRED="Yes">
Minute<CFINPUT TYPE="Text" NAME="minute" VALUE="12" RANGE="0,59" 
MESSAGE="You must enter a minute value (0-59)" VALIDATE="integer" REQUIRED="Yes">
Second<CFINPUT TYPE="Text" NAME="second" VALUE="0" RANGE="0,59" 
MESSAGE="You must enter a seconds value (0-59)" VALIDATE="integer" REQUIRED="Yes">
</PRE>
<p><INPUT TYPE="Submit" NAME="">
<INPUT TYPE="RESET">
</CFFORM>
CreateODBCTime

Description
Creates an ODBC time object.

Returns
A time object, in ODBC timestamp format.

Category
Date and time functions

Function syntax
CreateODBCTime(date)

See also
CreateODBCDateTime, CreateTime, Evaluation and type conversion issues in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date-time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.

Example

```cfc
c dynamic

<cfif IsDefined("form.hour")>
Your time value, created with CreateTime...
<cfset yourTime =CreateTime(form.hour, form.minute, form.second)>
<cfoutput>
<ul>
<li>Formatted with CreateODBCTime: #CreateODBCTime(yourTime)#</li>
<li>Formatted with TimeFormat: #TimeFormat(yourTime)#</li>
</ul></cfoutput>
</cfif>
</cfdynamic>
```

**Parameter**

**Description**

- **date**: Date/time object in the range 100 AD–9999 AD.
CreateTime

Description
Creates a time variable.

Returns
A time variable.

Category
Date and time functions

Function syntax
CreateTime(hour, minute, second)

See also
CreateTime, CreateDateTime; Evaluation and type conversion issues in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hour</td>
<td>Number in the range 0–23</td>
</tr>
<tr>
<td>minute</td>
<td>Number in the range 0–59</td>
</tr>
<tr>
<td>second</td>
<td>Number in the range 0–59</td>
</tr>
</tbody>
</table>

Usage
CreateTime is a subset of CreateDateTime.

A time variable is a special case of a date-time variable. The date part of a time variable is set to December 30, 1899.
Example

```cfml
<h3>CreateTime Example</h3>
<cfif IsDefined("FORM.hour")>
Your time value, presented using CreateTime time function:
<cfset yourTime = CreateTime(FORM.hour, FORM.minute, FORM.second)>
<cfoutput><ul>
<li>Formatted with timeFormat: #TimeFormat(yourTime)#</li>
<li>Formatted with timeFormat and hh:mm:ss: #TimeFormat(yourTime, 'hh:mm:ss')#</li>
</ul></cfoutput>
</cfif>

```cfm```

```cfset action="createtime.cfm" METHOD="post">
<PRE>
Hour&nbsp;&nbsp;&nbsp;<CFINPUT TYPE="Text" NAME="hour" VALUE="16" RANGE="0,23"
MESSAGE="You must enter an hour (0-23)" VALIDATE="integer" REQUIRED="Yes">
Minute <CFINPUT TYPE="Text" NAME="minute" VALUE="12" RANGE="0,59"
MESSAGE="You must enter a minute value (0-59)" VALIDATE="integer"
REQUIRED="Yes">
Second <CFINPUT TYPE="Text" NAME="second" VALUE="0" RANGE="0,59"
MESSAGE="You must enter a value for seconds (0-59)" VALIDATE="integer"
REQUIRED="Yes">
</PRE>
<p><INPUT TYPE="Submit" NAME="" > <INPUT TYPE="RESET"></p>
</cfform>

CreateTimeSpan

Description

Creates a date/time object that defines a time period. You can add or subtract it from other date-time objects and use it with the cachedWithin attribute of cfquery.

Returns

A date-time object. (A Java Double)

Category

Date and time functions

Function syntax

CreateTimeSpan(days, hours, minutes, seconds)

See also

CreateTime, DateAdd, DateConvert; Defining application-level settings and variables in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>days</td>
<td>Integer in the range 0–32768; number of days in time period</td>
</tr>
</tbody>
</table>
Usage

Creates a special date-time object that should be used only to add and subtract from other date-time objects or with the `cfquery` cachedWithin attribute.

If you use the cachedWithin attribute of `cfquery`, and the original query date falls within the time span you define, cached query data is used. In this case, the CreateTimeSpan function is used to define a period of time from the present backwards. The cachedWithin attribute takes effect only if you enable query caching in the ColdFusion Administrator. For more information, see `cfquery`.

Example

```cfml
<!--- This example shows the use of CreateTimeSpan with cfquery --->
<h3>CreateTimeSpan Example</h3>

<!--- define startrow and maxrows to facilitate 'next N' style browsing --->
<CFPARAM name = "MaxRows" default = "10">
<CFPARAM name = "StartRow" default = "1">

<!--- Query database for information, if cached database information has not been updated in the last six hours. -------->
<cfoutput>
<cfquery name = "GetParks" datasource = "cfdocexamples"
cachedWithin = "#CreateTimeSpan(0, 6, 0, 0)#">
SELECT PARKNAME, REGION, STATE
FROM Parks
ORDER by ParkName, State
</cfquery>
</cfoutput>

<!--- build HTML table to display query --->
<TABLE cellpadding = 1 cellspacing = 1>
  <TR>
    <TD colspan = 2 bgcolor = f0f0f0><B><I>Park Name</i></B></TD>
    <TD bgcolor = f0f0f0><B><i>Region</i></B></TD>
    <TD bgcolor = f0f0f0><B><i>State</i></B></TD>
  </TR>
  <!--- Output query, define startrow and maxrows. Use query variable CurrentCount to track the row you are displaying. --->
  <cfoutput query = "GetParks" StartRow = "#StartRow#" MAXROWS = "#MaxRows#">
    <TR>
      <TD valign = top bgcolor = f0f0f0><B>#GetParks.CurrentRow#</B></TD>
      <TD valign = top><FONT SIZE = "-1">#ParkName#</FONT></TD>
      <TD valign = top><B>#Region#</B></TD>
      <TD valign = top><B>#State#</B></TD>
    </TR>
  </cfoutput>
</TABLE>
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hours</td>
<td>Number of hours in time period</td>
</tr>
<tr>
<td>minutes</td>
<td>Number of minutes in time period</td>
</tr>
<tr>
<td>seconds</td>
<td>Number of seconds in time period</td>
</tr>
</tbody>
</table>
CreateUUID

Description
Creates a Universally Unique Identifier (UUID). A UUID is a 35-character string representation of a unique 128-bit integer.

Returns
A ColdFusion format UUID, in the format xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx, where x is a hexadecimal digit (0-9 or A-F). (The character groups are 8-4-4-16.)

Category
Other functions

Function syntax
CreateUUID()

Usage
The ColdFusion UUID generation algorithm uses the unique time-of-day value, the IEEE 802 Host ID, and a cryptographically strong random number generator to generate UUIDs that conform to the principles laid out in the draft IEEE RFC "UUIDs and GUIDs."

The ColdFusion UUID format is as follows:
xxxxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx (8-4-4-16).

This does not conform to the Microsoft/DCE standard, which is as follows:
xxxxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx (8-4-4-4-12)

There are UUID test tools and a user-defined function called CreateGUID, which converts CFML UUIDs to UUID/Microsoft GUID format, available on the web at www.cflib.org.
Use this function to generate a persistent identifier in a distributed environment. To a very high degree of certainty, this function returns a unique value; no other invocation on the same or any other system returns the same value.

UUIDs are used by distributed computing frameworks, such as DCE/RPC, COM+, and CORBA. In ColdFusion, you can use UUIDs as primary table keys for applications in which data is stored in shared databases. In such cases, using numeric keys can cause primary-key constraint violations during table merges. Using UUIDs, you can eliminate these violations.

**Example**

```html
<h3>CreateUUID Example</h3>
<p>This example uses CreateUUID to generate a UUID when you submit the form.</p>
</p>
<!--- Checks whether the form was submitted; if so, creates UUID. --->
<cfif IsDefined("Form.CreateUUID") Is True>
<hr>
<p>Your new UUID is: <cfoutput>#CreateUUID()#</cfoutput></p>
</cfif>
</h3>
<form action = "createuuid.cfm">
<p><input type = "Submit" name = "CreateUUID"> </p>
</form>

### CSRFGenerateToken

**Description**

Provides a random token and stores it in the session. You can also provide a specific key to store in the session.

**Returns**

Token

**Category**

Display and formatting functions

**Syntax**

`CSRFGenerateToken([key] [,forceNew])`

**See also**

`CSRFVerifyToken`

**History**

ColdFusion 10: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required/Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>optional</td>
<td>A random token is generated based on the key provided. This key is stored in the session.</td>
</tr>
<tr>
<td>forceNew</td>
<td>optional</td>
<td>If set to true, a new token is generated every time the method is called. If false, in case a token exists for the key, the same key is returned.</td>
</tr>
</tbody>
</table>
Usage
Use this function to create a random token and store it in the session.

Example
<cfset csrfToken=CSRFGenerateToken() />
<cfform method="post" action="sayHello.cfm">
    <cfinput name="userName" type="text">
    <cfinput name="token" value="#csrfToken#" type="hidden">
    <cfinput name="submit" value="Say Hello!!" type="submit">
</cfform>

CSRFVerifyToken

Description
Validates the given token against the same stored in the session for a specific key.

Returns
a Boolean value. true is successful.

Category
Display and formatting functions

Syntax
CSRFVerifyToken(token [,key])

See also
CSRFGenerateToken

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required/Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>token</td>
<td>required</td>
<td>Token that to be validated against the token stored in the session.</td>
</tr>
<tr>
<td>key</td>
<td>Optional</td>
<td>The key against which the token be searched.</td>
</tr>
</tbody>
</table>

Usage
Use this function to validate the given token against the same stored in the session for a specific key.

Example
<cfset token=form.token>
    <cfset validate = CSRFverifyToken(token)>
<cfoutput>#validate#</cfoutput>
## DateAdd

**Description**  
Adds units of time to a date.

**Returns**  
A date/time object.

**Category**  
Date and time functions

### Function syntax

```
DateAdd("datepart", number, "date")
```

### See also

DateConvert, DatePart, CreateTimeSpan

### History

ColdFusion MX 6.1: Added the `datepart` character `L` or `l` to represent milliseconds.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>datepart</code></td>
<td>String:</td>
</tr>
<tr>
<td></td>
<td>• <code>yyyy</code>: Year</td>
</tr>
<tr>
<td></td>
<td>• <code>q</code>: Quarter</td>
</tr>
<tr>
<td></td>
<td>• <code>m</code>: Month</td>
</tr>
<tr>
<td></td>
<td>• <code>y</code>: Day of year</td>
</tr>
<tr>
<td></td>
<td>• <code>d</code>: Day</td>
</tr>
<tr>
<td></td>
<td>• <code>w</code>: Weekday</td>
</tr>
<tr>
<td></td>
<td>• <code>ww</code>: Week</td>
</tr>
<tr>
<td></td>
<td>• <code>h</code>: Hour</td>
</tr>
<tr>
<td></td>
<td>• <code>n</code>: Minute</td>
</tr>
<tr>
<td></td>
<td>• <code>s</code>: Second</td>
</tr>
<tr>
<td></td>
<td>• <code>l</code>: Millisecond</td>
</tr>
<tr>
<td><code>number</code></td>
<td>Number of units of <code>datepart</code> to add to <code>date</code> (positive, to get dates in the future; negative, to get dates in the past). Number must be an integer.</td>
</tr>
<tr>
<td><code>date</code></td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

### Usage

The `datepart` specifiers `y`, `d`, and `w` add a number of days to a date.
When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

Example
<cfset date="{ts '2433-09-01 23:59:59'}">  
<cfoutput>#date#</cfoutput>  
<cfset diff=30>  
<cfset posdateresult=DateAdd("s", diff, date)>  
<cfoutput>#posdateresult#</cfoutput>  

Example
<!--- This example shows the use of DateAdd --->
<cfparam name="value" default="70">  
<cfparam name="type" default="m">  
<!--- If numbers passed, then use those. --->
<cfif IsDefined("form.value")>  
<cfset value = form.value>  
</cfif>  
<cfif IsDefined("form.type")>  
<cfset type = form.type>  
</cfif>  

<cfquery name="GetMessages" datasource="cfdocexamples">  
   SELECT UserName, Subject, Posted  
   FROM Messages  
</cfquery>  
<p>This example uses DateAdd to determine when a message in the database will expire. Currently, messages older than <cfoutput>#value#</cfoutput> are expired.</p>  
<cfswitch expression="#type#">  
<cfcase value="yyyy">years</cfcase>  
<cfcase value="q">quarters</cfcase>  
<cfcase value="m">months</cfcase>  
<cfcase value="y">days of year</cfcase>  
<cfcase value="w">weekdays</cfcase>  
<cfcase value="ww">weeks</cfcase>  
<cfcase value="h">hours</cfcase>  
<cfcase value="n">minutes</cfcase>  
<cfcase value="s">seconds</cfcase>  
<cfdefaultcase>years</cfdefaultcase>  
</cfswitch>  
   are expired.  
</table>  
<tr>  
   <td>UserName</td>  
   <td>Subject</td>  
   <td>Posted</td>  
</tr>  
<cfoutput query="GetMessages">  
<tr>
<td>UserName</td>
<td>Subject</td>
<td>Posted <cfif DateAdd(type, value, posted) LT Now()><font color="red">EXPIRED</font></cfif></td>
</tr>
</cfoutput>
</table>

<cfform action="#CGI.Script_Name#" method="post">
Select an expiration value:
<cfinput type="Text" name="value" value="#value#" message="Please enter whole numbers only" validate="integer" required="Yes">
<select name="type">
<option value="yyyy">years</option>
<option value="m" selected>months</option>
<option value="d">days</option>
<option value="ww">weeks</option>
<option value="h">hours</option>
<option value="n">minutes</option>
<option value="s">seconds</option>
</select>
<input type="Submit" value="Submit" />
</cfform>

**DateCompare**

**Description**
Performs a full date/time comparison of two dates.

**Returns**
- -1, if `date1` is earlier than `date2`
- 0, if `date1` is equal to `date2`
- 1, if `date1` is later than `date2`

**Category**
Date and time functions

**Function syntax**
`DateCompare("date1", "date2" [, "datePart"])`

**See also**
CreateDateDateTime, DatePart
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date1</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>date2</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>datePart</td>
<td>Optional. String. Precision of the comparison.</td>
</tr>
<tr>
<td></td>
<td>• s Precise to the second (default)</td>
</tr>
<tr>
<td></td>
<td>• n Precise to the minute</td>
</tr>
<tr>
<td></td>
<td>• h Precise to the hour</td>
</tr>
<tr>
<td></td>
<td>• d Precise to the day</td>
</tr>
<tr>
<td></td>
<td>• m Precise to the month</td>
</tr>
<tr>
<td></td>
<td>• yyyy Precise to the year</td>
</tr>
</tbody>
</table>

Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

Example

```cftmpl
<cfif IsDefined("FORM.date1")>
  <cfif IsDate(FORM.date1) and IsDate(FORM.date2)>
    <cfset comparison = DateCompare(FORM.date1, FORM.date2, FORM.precision)>
    <!--- Switch on the variable to give various responses. --->

```

Last updated 7/9/2012
ColdFusion Functions

DateConvert

Description
Converts local time to Coordinated Universal Time (UTC), or UTC to local time. The function uses the daylight savings settings in the executing computer to compute daylight savings time, if necessary.

Returns
UTC- or local-formatted time object.

Category
Date and time functions

Last updated 7/9/2012
Function syntax
DateConvert("conversion-type", "date")

See also
GetTimeZoneInfo, CreateDateTime, DatePart

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conversion-type</td>
<td>• local2Utc: Converts local time to UTC time.</td>
</tr>
<tr>
<td></td>
<td>• utc2Local: Converts UTC time to local time.</td>
</tr>
<tr>
<td>date</td>
<td>Date and time string or a variable that contains one. To create, use CreateDateTime.</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

Note: You can pass the CreateDate or Now function as the date parameter of this function; for example: #DateConvert(CreateDate(2007, 4, 10))#

Example
<h3>DateConvert Example</h3>
<!--- This shows conversion of current date - time to UTC and back. --->
<cfset curDate = Now()>
<p><cfoutput>The current date and time: #curDate#. </cfoutput></p>
<cfset utcDate = DateConvert("local2utc", curDate)>
<cfoutput>
  <p>The current date and time converted to UTC time: #utcDate#.</p>
</cfoutput>
<!--- This code checks whether form was submitted. If so, the code generates the CFML date with the CreateDateTime function. --->
<cfif IsDefined("FORM.submit")>
  <cfset yourDate = CreateDateTime(FORM.year, FORM.month, FORM.day, FORM.hour, FORM.minute, FORM.second)>
  <p><cfoutput>Your date value, presented as a ColdFusion date/time string:#yourdate#.</cfoutput></p>
  <cfset yourUTC = DateConvert("local2utc", yourDate)>
  <p><cfoutput>Your date and time value, converted to Coordinated Universal Time (UTC): #yourUTC#.</cfoutput></p>
  <cfoutput>Your UTC date and time, converted back to local date and time: #DateConvert("utc2local", yourUTC)#.</cfoutput></p>
<cfelse>
  Type the date and time, and press Enter to see the conversion.
</cfif>

Last updated 7/9/2012
DateDiff

Description
Determine the integer number of units by which \( date1 \) is less than \( date2 \).

Returns
A number of units, of type \( datepart \).

Category
Date and time functions

Function syntax
\[
\text{DateDiff}(\text{"datepart"}, \text{"date1"}, \text{"date2"})
\]

See also
\( \text{DateAdd}, \text{DatePart}, \text{CreateTimeSpan} \)
ColdFusion Functions

History
ColdFusion MX:

- Changed how negative date differences are calculated: this function calculates negative date differences correctly; its output may be different from that in earlier releases.
- Changed the w and ww masks; they determine the number of full weeks between the two dates.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datepart</td>
<td>String that specifies the units in which to count; for example yyyy requests a date difference in whole years.</td>
</tr>
<tr>
<td></td>
<td>- yyyy: Years</td>
</tr>
<tr>
<td></td>
<td>- q: Quarters</td>
</tr>
<tr>
<td></td>
<td>- m: Months</td>
</tr>
<tr>
<td></td>
<td>- y: Days of year (same as d)</td>
</tr>
<tr>
<td></td>
<td>- d: Days</td>
</tr>
<tr>
<td></td>
<td>- w: Weekdays (same as ww)</td>
</tr>
<tr>
<td></td>
<td>- ww: Weeks</td>
</tr>
<tr>
<td></td>
<td>- h: Hours</td>
</tr>
<tr>
<td></td>
<td>- n: Minutes</td>
</tr>
<tr>
<td></td>
<td>- s: Seconds</td>
</tr>
<tr>
<td>date1</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>date2</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
The DateDiff function determines the number of complete datepart units between the two dates; for example, if the datepart parameter is "m" and the dates differ by 55 days, the function returns 1.

Enclose string constant dates in quotation marks. If the text contains only numbers (such 1932), and is not surrounded by quotation marks, ColdFusion interprets it as a date/time object, resulting in an incorrect value.
Example

```html
<cfif IsDefined("form.value")>
  <cfset value = form.value>
</cfif>
<cfif IsDefined("form.type")>
  <cfset type = form.type>
</cfif>
<cfif IsDefined("form.date1") and IsDefined("form.date2")>
  <cfif IsDate(form.date1) and IsDate(form.date2)>
    <cfswitch expression = "#form.type#">
      <cfcase value="yyyy">years</cfcase>
      <cfcase value="q">quarters</cfcase>
      <cfcase value="m">months</cfcase>
      <cfcase value="y">days</cfcase>
      <cfcase value="d">days</cfcase>
      <cfcase value="w">weekdays</cfcase>
      <cfcase value="ww">weeks</cfcase>
      <cfcase value="h">hours</cfcase>
      <cfcase value="m">minutes</cfcase>
      <cfcase value="s">seconds</cfcase>
      <cfdefaultcase>years</cfdefaultcase>
    </cfswitch>
    dateparts between date1 and date2.
    <cfif DateCompare("#form.date1#","#form.date2#") is not 0>
      <p>The difference is <cfoutput>\Abs(DateDiff(type, form.date2, form.date1))</cfoutput></p>
      <cfswitch expression = "#form.type#">
        <cfcase value="yyyy">years</cfcase>
        <cfcase value="q">quarters</cfcase>
        <cfcase value="m">months</cfcase>
        <cfcase value="y">days</cfcase>
        <cfcase value="d">days</cfcase>
        <cfcase value="w">weekdays</cfcase>
        <cfcase value="ww">weeks</cfcase>
        <cfcase value="h">hours</cfcase>
        <cfcase value="m">minutes</cfcase>
        <cfcase value="s">seconds</cfcase>
        <cfdefaultcase>years</cfdefaultcase>
      </cfswitch>.
    </cfif>
    <cfelse>
      <p>The two dates are equal! Try changing one of the values ...</p>
    </cfif>
  </cfif>
</cfif>
<form action="index.cfm" method="post">

<input type="Submit" name="">
<input type="Reset">
</form>

**DateFormat**

**Description**
Formats a date value using U.S. date formats. For international date support, use `LSDateFormat`.

**Returns**
A text string representing the date formatted according to the mask. If no mask is specified, returns the value in `dd-mmm-yy` format.

**Category**
Date and time functions

**Function syntax**
```
DateFormat("date" [, "mask" ])
```

**See also**
`Now, CreateDate, LSDateFormat, LSParseDateTime, LSTimeFormat, TimeFormat, ParseDateTime`

**History**
ColdFusion MX: Added support for the following mask parameter options: short, medium, long, and full.
_printed_text__

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>mask</td>
<td>Characters that show how ColdFusion displays a date:</td>
</tr>
<tr>
<td></td>
<td>• d: Day of the month as digits; no leading zero for single-digit days.</td>
</tr>
<tr>
<td></td>
<td>• dd: Day of the month as digits; leading zero for single-digit days.</td>
</tr>
<tr>
<td></td>
<td>• ddd: Day of the week as a three-letter abbreviation.</td>
</tr>
<tr>
<td></td>
<td>• dddd: Day of the week as its full name.</td>
</tr>
<tr>
<td></td>
<td>• m: Month as digits; no leading zero for single-digit months.</td>
</tr>
<tr>
<td></td>
<td>• mm: Month as digits; leading zero for single-digit months.</td>
</tr>
<tr>
<td></td>
<td>• mmm: Month as a three-letter abbreviation.</td>
</tr>
<tr>
<td></td>
<td>• mmmm: Month as its full name.</td>
</tr>
<tr>
<td></td>
<td>• yy: Year as last two digits; leading zero for years less than 10.</td>
</tr>
<tr>
<td></td>
<td>• yyyy: Year represented by four digits.</td>
</tr>
<tr>
<td></td>
<td>• gg: Period/era string. Ignored. Reserved. The following masks tell how to format the full date and cannot be combined with other masks:</td>
</tr>
<tr>
<td></td>
<td>• short: equivalent to m/d/y</td>
</tr>
<tr>
<td></td>
<td>• medium: equivalent to mmm d, yyyy</td>
</tr>
<tr>
<td></td>
<td>• long: equivalent to mmmm d, yyyy</td>
</tr>
<tr>
<td></td>
<td>• full: equivalent to dddd, mmmm d, yyyy</td>
</tr>
</tbody>
</table>

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the `CreateDate` function or `Now` function as the date parameter of this function; for example: `#DateFormat(CreateDate(2001, 3, 3))#`

Date and time values in database query results can vary in sequence and formatting unless you use functions to format them. To ensure that application users correctly understand displayed dates and times, Adobe recommends that you use this function and the `LSDateFormat`, `TimeFormat`, and `LSTimeFormat` functions to format resultset values. For more information and examples, see TechNote, "ColdFusion Server (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results," on the website at go.adobe.com/kb/ts_tn_18070_en-us.

**Note:** The `DateFormat` function is best used for formatting output, not for formatting input. For formatting input, use one of the date/time creation functions (for example, `CreateDate`) instead.
Example
<cfset todayDate = Now()>
<body>
<h3>Date Format Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using DateFormat, we can display that date in different ways:
<cfoutput>
<ul>
<li>#DateFormat(todayDate)#
<li>#DateFormat(todayDate, "mmm-dd-yyyy")#
<li>#DateFormat(todayDate, "mm/dd/yyyy")#
<li>#DateFormat(todayDate, "d-mmm-yyyy")#
<li>#DateFormat(todayDate, "short")#
<li>#DateFormat(todayDate, "medium")#
<li>#DateFormat(todayDate, "long")#
<li>#DateFormat(todayDate, "full")#
</ul>
</cfoutput>
</body>
</body>

DatePart

Description
Extracts a part from a date value.

Returns
Part of a date, as an integer.

Category
Date and time functions

Function syntax
DatePart("datepart", "date")

See also
DateAdd, DateConvert

History
ColdFusion MX 6.1: Added the datepart character L or l to represent milliseconds.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datepart</td>
<td>String:</td>
</tr>
<tr>
<td></td>
<td>• yyyy: Year</td>
</tr>
<tr>
<td></td>
<td>• q: Quarter</td>
</tr>
<tr>
<td></td>
<td>• m: Month</td>
</tr>
<tr>
<td></td>
<td>• y: Day of year</td>
</tr>
<tr>
<td></td>
<td>• d: Day</td>
</tr>
<tr>
<td></td>
<td>• w: Weekday</td>
</tr>
<tr>
<td></td>
<td>• w: Week</td>
</tr>
<tr>
<td></td>
<td>• h: Hour</td>
</tr>
<tr>
<td></td>
<td>• n: Minute</td>
</tr>
<tr>
<td></td>
<td>• s: Second</td>
</tr>
<tr>
<td></td>
<td>• l: Millisecond</td>
</tr>
</tbody>
</table>

| date     | Date/time object, in the range 100 AD–9999 AD. |

Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

Example

```html
<!--- This example shows information available from DatePart --->
<cfset todayDate = Now()>  
<h3>DatePart Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.</p>
<p>Using datepart, we extract an integer representing the dateparts from that value</p>
<cfoutput>
<ul>
  <li>year: #DatePart("yyyy", todayDate)#</li>
  <li>quarter: #DatePart("q", todayDate)#</li>
  <li>month: #DatePart("m", todayDate)#</li>
  <li>day of year: #DatePart("y", todayDate)#</li>
  <li>day: #DatePart("d", todayDate)#</li>
  <li>weekday: #DatePart("w", todayDate)#</li>
  <li>week: #DatePart("ww", todayDate)#</li>
  <li>hour: #DatePart("h", todayDate)#</li>
  <li>minute: #DatePart("n", todayDate)#</li>
  <li>second: #DatePart("s", todayDate)#</li>
</ul>
</cfoutput>
```
**DateTimeFormat**

**Description**
Formats date and time values using date and time formatting conventions.

**Returns**
A formatted date and time value.

**Syntax**

datetimeFormat (date)
datetimeFormat (date [, mask])
datetimeFormat (date [, mask, timeZone])

**Properties**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Required. A date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>mask</td>
<td>Optional. Mask that has to be used for formatting.</td>
</tr>
<tr>
<td>timeZone</td>
<td>The time-zone information. You can specify in either of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• Abbreviation such as GMT or PST</td>
</tr>
<tr>
<td></td>
<td>• Full name such as Europe/Dublin</td>
</tr>
<tr>
<td></td>
<td>By default, this is the time-zone followed by the system.</td>
</tr>
</tbody>
</table>

**Example**

```
<cfset todayDateTime = Now()>
<body>
<h3>DateTimeFormat Example</h3>
<p>Today's date and time are <cfoutput>#todayDateTime#</cfoutput>.</p>
<p>Using DateTimeFormat, we can display that date and time in different ways:<cfoutput>
<ul>
 <li>#DateTimeFormat(todayDateTime)#</li>
 <li>#DateTimeFormat(todayDateTime, "yyyy.MM.dd G 'at' HH:nn:ss z")#</li>
 <li>#DateTimeFormat(todayDateTime, "EEE, MMM d, ''yy")#</li>
 <li>#DateTimeFormat(todayDateTime, "h:nn a")#</li>
 <li>#DateTimeFormat(todayDateTime, "hh 'o''clock' a, zzzz")#</li>
 <li>#DateTimeFormat(todayDateTime, "K:nn a, z")#</li>
 <li>#DateTimeFormat(todayDateTime, "yyyyMMddHHnnssZ", "GMT")#</li>
</ul>
</cfoutput>
</body>
```

**Day**

**Description**
Determines the day of the month, in a date.
ColdFusion Functions

Returns
The ordinal for the day of the month, ranging from 1 to 31.

Category
Date and time functions

Function syntax
Day("date")

See also
DayOfWeek, DayOfWeekAsString, DayOfYear, DaysInMonth, DaysInYear, FirstDayOfMonth

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

Note: You can pass the CreateDate function or Now function as the date parameter of this function; for example: #Day(CreateDate(2001, 3, 3))#

Example

```cfml
<h3>Day Example</h3>
<cfif IsDefined("FORM.year")>
    <p>More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Date: #DateFormat(yourDate)#. <br>
        It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week. <br>
        This is day #Day(yourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days. <br>
        We are in week #Week(yourDate)# of #Year(YourDate)# (day #DayOfWeek(YourDate)# of #DaysInYear(YourDate)#).<br>
    </cfoutput>
    <cfelse>This is not a leap year</cfif>
</cfif>
```

DayOfWeek

Description
Determines the day of the week, in a date.

Returns
The ordinal for the day of the week, as an integer in the range 1 (Sunday) to 7 (Saturday).
Category
Date and time functions

Function syntax
DayOfWeek("date")

See also
Day, DayOfWeekAsString, DayOfYear, DaysInMonth, DaysInYear, FirstDayOfMonth

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

*Note:* You can pass the CreateDate function or Now function as the date parameter of this function; for example, #DayOfWeek(CreateDate(2001, 3, 3))#

Example

```cfml
<h3>DayOfWeek Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <coutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(YourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(YourDate)# (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
    <cfif IsLeapYear(Year(yourDate))>
      This is a leap year
    <cfelse>
      This is not a leap year</cfif>
  </coutput>
</cfif>
```

**DayOfWeekAsString**

Description
Determines the day of the week, in a date, as a string function.

Returns
The day of the week, as a string in the current locale, that corresponds to *day_of_week*.

Category
Date and time functions, String functions
Function syntax
DayOfWeekAsString(day_of_week [, locale])

See also
Day, DayOfWeek, DayOfYear, DaysInMonth, DaysInYear, FirstDayOfMonth

History
ColdFusion 8: Added the locale parameter.

ColdFusion MX 7: Changed behavior. The returned string is now in the language of the current locale.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>day_of_week</td>
<td>Integer, in the range 1 (Sunday) - 7 (Saturday).</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Example
The following example shows the use of the DayOfWeekAsString function. It is the action page for a form that submits year, month, and day fields.

```cfml
<h3>DayOfWeekAsString Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#. It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of Year(#Year(yourDate)# (day #DayofYear(yourDate)# of #DaysinYear(yourDate)#).
        <cfif IsLeapYear(Year(yourDate))>
            This is a leap year
        <cfelse>
            This is not a leap year</cfif>
    </cfoutput>
<cfif>
</cfoutput>
```

**DayOfYear**

Description
Determines the day of the year, in a date.

Returns
The ordinal value of day of the year, as an integer.

Category
Date and time functions
Function syntax

DayOfYear("date")

See also

Day, DayOfWeek, DayOfWeekAsString, DaysInMonth, DaysInYear, FirstDayOfMonth

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage

This function accounts for leap years.

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the `CreateDate` function or `Now` function as the date parameter of this function; for example, #DayOfYear(CreateDate(2001, 3, 3))#

Example

```cfml
<h3>DayOfYear Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week.
    This is day #Day(yourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
    We are in week #Week(yourDate)# of #Year(yourDate)#.
    <cfif IsLeapYear(Year(yourDate))>
      This is a leap year
    <cfelse>
      This is not a leap year</cfif>
  </cfoutput>
</cfif>
```

**DaysInMonth**

Description

Determines the number of days in a month.

Returns

The number of days in the month in `Date`.

Category

Date and time functions

Last updated 7/9/2012
Function syntax

```
DaysInMonth("date")
```

See also

Day, DayOfWeek, DayOfWeekAsString, DayOfYear, DaysInYear, FirstDayOfMonth

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the `Now` function or the `CreateDate` function as the date parameter of this function; for example: `#DaysInMonth(CreateDate(2001, 3, 3))#`

Example

```
<h3>DaysInMonth Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#. It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week. This is day #Day(YourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days. We are in week #Week(yourDate)# of #Year(YourDate)#. #IsLeapYear(Year(yourDate))#This is a leap year #IsLeapYear(Year(yourDate))#This is not a leap year</cfif>
</cfoutput>
</cfif>
```

DaysInYear

**Description**

Determines the number of days in a year.

**Returns**

The number of days in a year.

**Category**

Date and time functions

**Function syntax**

```
DaysInYear("date")
```
See also
Day, DayOfWeek, DayOfWeekAsString, DayOfYear, DaysInMonth, FirstDayOfMonth, IsLeapYear

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage

DaysInYear accounts for leap years.

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

*Note:* You can pass the `CreateDate` function or the `Now` function as the date parameter of this function; for example: `#DaysInYear(CreateDate(2001, 3, 3))#`

Example

<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
  <coutput>
  Your date, `${FormatDate(yourDate)}`.
  It is ${DayOfWeekAsString(DayOfWeek(yourDate))}, day
  ${DayOfWeek(yourDate)} in the week.
  This is day ${Day(yourDate)} in the month of
  ${MonthAsString(Month(yourDate))}, which has
  ${DaysInMonth(yourDate)} days.
  We are in week ${Week(yourDate)} of ${Year(yourDate)} (day
  ${DayofYear(yourDate)} of ${DaysinYear(yourDate)}).
  </coutput>
</cfif>

DE

Description

Escapes any double-quotation marks in the parameter and wraps the result in double-quotation marks.

Returns

Parameter, surrounded by double-quotation marks, with any inner double-quotation marks escaped.

Category

*Dynamic evaluation functions*

Function syntax

`DE(string)`

See also

*Evaluate, IIf, PrecisionEvaluate*, Using Expressions and Number Signs in the *Developing ColdFusion Applications*
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String to evaluate, after delay</td>
</tr>
</tbody>
</table>

Usage

The `DE` function postpones evaluation of a string that is passed as a parameter to the `IIf`, `Evaluate`, or `PrecisionEvaluate` functions.

This function is especially useful with the `IIf` function, which automatically evaluates its second and third parameters as expressions. You can use the `DE` function to prevent the function from evaluating a string parameter that is to be output as a variable, and must not be treated as an expression. The following example shows this use; it uses `IIF` to alternate table-row background colors, white and gray, and uses the `DE` function to prevent ColdFusion from evaluating the color strings.

```coldfusion
cfoutput
table border="1" cellpadding="3"
cfloop index="i" from="1" to="10"
  tr bgcolor="#IIF( i mod 2 eq 0, DE("white"), DE("gray") )#">
    td>
      hello #i#
    </td>
  </tr>
cfloop
table
cfoutput
```

The `DE` function does not delay evaluation of variable names that are surrounded by number signs (#). The ColdFusion function evaluates the variable regardless of whether the `DE` function is present.

The following example shows how you can use the `DE` function and number signs together, and shows how the function works with an `IIF` function:

```coldfusion
cfoutput
cfset var1="Blue">
cfset var2="Green">
cfset myresult=IIf( 1 eq 2, DE(#Var1#), DE(#Var2#))>
The expression is #myresult#
cfoutput
```

ColdFusion processes this code as follows:

1. ColdFusion sets the variables `var1` and `var2` to be the strings Blue and Green.
2. In the fourth line, ColdFusion evaluates the variables surrounded by number signs first, replacing them with the strings Blue and Green, the values of the variables.
3. The `IIF` function evaluates the test expression, determines that it is False, and then evaluates the third parameter.
4. The third parameter is a `DE` function, which takes the string Green and surrounds it in quotation marks
5. The `IIF` function returns the string "Green", including the quotation marks.
6. The `cfset` tag gets the expression result="Green", and sets the value of the `myresult` variable to the string Green.
7. ColdFusion evaluates `#myresult#` in the output text, replaces the variable with its value, the string Green, and displays the result.
Example

<!--- This example shows the use of DE and Evaluate --->
<h3>DE Example</h3>
<cfif IsDefined("FORM.myExpression")>
  <cftry>
    <!---- Show the expression and the results of evaluating it --->
    <cfoutput>
      <h3>Evaluate the Expression #FORM.MyExpression#</h3>
    </cfoutput>
    The code:<br>
    #Evaluate(FORM.myExpression)#
    <br><br>
    The result:<br>
    <cfoutput>
      #Evaluate(FORM.myExpression)#
    </cfoutput>
  </cfoutput>
  <h3>Use DE to prevent the Evaluate function from evaluating</h3>
  The code:<br>
  #Evaluate(DE(FORM.MyExpression))#
  <br><br>
  The result:<br>
  <cfoutput>
    #Evaluate(DE(FORM.MyExpression))#
  </cfoutput>
  <!---- Error handling code for bad expressions and any other error.----->
  <cfcatch type = "Any">
    <!---- the message to display --->
    <h3>Sorry, there’s been an <B>Error</B>. Try a simple expression, such as "2+2".</h3>
    <cfoutput>
      <!--- Display the diagnostic message from ColdFusion. --->
      <p>#cfcatch.message#</p>
    </cfoutput>
  </cfcatch>
</cftry>
</cfif>

<h3>Enter any valid ColdFusion expression</h3>

  <cfinput name="myExpression" type="Text" size="40">
  <cfinput type="submit" name="submitit">
</cfform>

DecimalFormat

Description
Converts a number to a decimal-formatted string.

Returns
A number as a string formatted with two decimal places and a thousands separator.

Category
Display and formatting functions
Function syntax

DecimalFormat(number)

See also

DollarFormat, NumberFormat

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to format</td>
</tr>
</tbody>
</table>

Example

<h3>DecimalFormat Function</h3>

<p>Returns a number to two decimal places.</p>

<p>&lt;cfloop FROM = 1 TO = 20 INDEX = "counter">
    &lt;cfoutput>
        #counter# * Square Root of 2:
        #DecimalFormat(counter * sqr(2))#
    &lt;/cfoutput>
    &lt;br&gt;
&lt;/cfloop&gt;

DecodeForHTML

Description

Decodes an HTML encoded string.

Returns

Decoded HTML string.

Category

Display and formatting functions.

Function syntax

DecodeForHTML(String encodedinput)

See also

History

ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The encoded string to decode.</td>
</tr>
</tbody>
</table>
Example
<cfif isDefined("form.submit")>
  <b>
  Output:<cfoutput >#DecodeForHTML(form.encodedUserName)#</cfoutput>
  </b>
<cfelse>
  <cfset form.username=""/>
</cfif>
</cfform>

<cfform>
  <cfinput name="encodedUserName" type="text" value="#form.encodedUserName#">
  <cfinput name="submit" type="submit" value="Submit">
</cfform>

DecodeFromURL

Description
Decodes an encoded HTML URL string.

Returns
Decoded HTML URL string.

Category
Display and formatting functions.

Function syntax
DecodeFromURL(String encodedinput)

See also
Canonicalize, EncodeForHTMLAttribute, EncodeForJavaScript, EncodeForCSS, EncodeForURL

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The encoded URL string to decode.</td>
</tr>
</tbody>
</table>

Example
<cfset string = "http://www.adobe.com/">
<cfset urlencoded = encodeforURL(string)>
<cfset urldecoded = decodefromUrl(urlEncoded)>
<cfoutput>
  String: #string#  <br/>
  URL Encoded: #urlencoded#<br/>
  URL Decoded: #urldecoded#<br/>
</cfoutput>
DecrementValue

Description
Decrements the integer part of a number.

Returns
Integer part of number, decremented by one.

Category
Mathematical functions

Function syntax
DecrementValue(number)

See also
IncrementValue

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to decrement</td>
</tr>
</tbody>
</table>

Example

<cfoutput>
Returns the integer part of a number decremented by one.<br/>
DecrementValue(0):<br/>
  #DecrementValue(0)#
DecrementValue("1"):<br/>
  #DecrementValue("1")#
DecrementValue(123.35):<br/>
  #DecrementValue(123.35)#
</cfoutput>

Decrypt

Description
Decrypts a string that is encrypted using a standard encryption technique, including strings encrypted by the Encrypt function.

Returns
An unencrypted string.

Category
Security functions, String functions

Function syntax
Decrypt(encrypted_string, key[, algorithm, encoding, IVorSalt, iterations])
See also
Duplicate, Encrypt

History
ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.
ColdFusion MX 7.01: Added the IVorSalt and iterations parameters.
ColdFusion MX 7: Added the algorithm and encoding parameters.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encrypted_string</td>
<td>String to decrypt.</td>
</tr>
<tr>
<td>key</td>
<td>String. For the CFMX_COMPAT algorithm, the seed that was used to encrypt the string; for all other algorithms, the string generated by the generateSecretKey() method.</td>
</tr>
</tbody>
</table>
| algorithm       | (Optional) The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. For a list of algorithms, see the Encrypt function. The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:  
  • CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).  
  • AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.  
  • BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.  
  • DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.  
  • DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.  
  If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms. |
| encoding        | (Optional; if you specify this parameter, also specify the algorithm parameter.) The binary encoding used to represent the data as a string. Must be the same as the algorithm used to encrypt the string.  
  • Base64: the Base64 algorithm, as specified by IETF RFC 2045.  
  • Hex: the characters A-F and 0-9 represent the hexadecimal byte values.  
  • UU: the UNIX standard UUEncode algorithm (default). |
| IVorSalt        | (Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the algorithm parameter.  
  • For Block Encryption Algorithms: The binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size.  
  • For Password Based Encryption Algorithms: The binary Salt value to transform the password into a key. |
| iterations      | (Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the algorithm parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption Algorithms. Use the same value to encrypt and decrypt the data. |
Usage
This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The parameter values must match the values used to encode string. The security of the encrypted string depends on maintaining the secrecy of the key.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

Example
<h3>Decrypt Example</h3>
<cfif IsDefined("Form.myString")>

</form>
```
DeleteClientVariable

Description
Deletes a client variable. (To test for the existence of a variable, use IsDefined.)

Returns
True, if the variable is successfully deleted; false, otherwise.

Category
Other functions

Function syntax
DeleteClientVariable("name")

See also
GetClientVariablesList

History
ColdFusion MX: Changed behavior: if the variable is not present, this function now returns False. (In earlier releases, it threw an error.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a client variable to delete, surrounded by double- quotation marks</td>
</tr>
</tbody>
</table>

Example
<!--- This view-only example shows DeleteClientVariable --->
<h3>DeleteClientVariable Example</h3>

<p>This view-only example deletes a client variable called "User_ID", if it exists in the list of client variables returned by GetClientVariablesList. This example requires the existence of an Application.cfm file and client management to be in effect.
</p>
<cfset var.somevar = "">
<cfset var.user_id = "">
<p>Client variable list:<cfoutput>$GetClientVariablesList()</cfoutput></p>

DeserializedJSON

Description
Converts a JSON (JavaScript Object Notation) string data representation into CFML data, such as a CFML structure or array.

Returns
The data value in ColdFusion format: a structure, array, query, or simple value.

Category
Conversion functions

Syntax
DeserializedJSON(JSONVar[, strictMapping])

See also

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONVar</td>
<td>A string that contains a valid JSON construct, or variable that represents one.</td>
</tr>
<tr>
<td>strictMapping</td>
<td>A Boolean value that specifies whether to convert the JSON strictly, as follows:</td>
</tr>
<tr>
<td></td>
<td>• true: (Default) Convert the JSON string to ColdFusion data types that correspond directly to the JSON data types.</td>
</tr>
<tr>
<td></td>
<td>• false: Determine if the JSON string contains representations of ColdFusion queries, and if so, convert them to queries.</td>
</tr>
</tbody>
</table>

Usage
This function is useful any time a ColdFusion page receives data as JSON strings. It is useful in ColdFusion applications that use Ajax to represent data on the client browser, and lets you consume on the server JSON format data from the client-side Ajax JavaScript. You can also use it on pages that get data from services that supply data as JavaScript function calls with JSON parameters; the example shows this use case.

The DeserializeJSON function converts each JSON data type directly into the equivalent ColdFusion data type, as follows:

- If the strictMapping parameter is true (the default), all JSON objects become CFML structures.
- If the strictMapping parameter is false, ColdFusion determines if JSON objects represent queries and, if so, converts them to ColdFusion query object. All other JSON objects become ColdFusion structures. The DeserializeJSON function recognizes a JSON structure as a query and converts it properly if the structure uses either of the two query representation formats described in the SerializeJSON reference.
- JSON Arrays, Strings, and Numbers become ColdFusion arrays, strings, and numbers.
- The JSON null value becomes the string null.
JSON string representations of a dates and times remain strings, but ColdFusion date/time handling code can recognize them as representing dates and times.

Example
This example displays weather information from a JSON-format data feed that is generated by the example for the SerializeJSON function. Similar code might consume data that is exported as a JavaScript page. The feed is in the form of a JavaScript function call where the parameter is a JSON string that contains the feed data. The example does the following operations:

1. Uses a cfhttp tag to get the feed (in the cfhttp.fileContent variable).
2. Strips the function call wrapper from the text.
3. Uses the IsJSON function to check whether the result of the previous step is a valid JSON format string. If it is not, it displays a message and stops processing.
4. If the string is valid JSON text, uses the DeserializeJSON function to convert the string to a ColdFusion variable; in this case, a structure that contains two arrays that represent a ColdFusion query. The first array has the query column names, the second has the query data.
5. Parses the object and displays the contents of its arrays.

To run this example, put this file and the example for the SerializeJSON function in an appropriate location under your ColdFusion web root, replace the URL with the correct URL for the serialization example, and run this page.

```coldfusion
<!--- Get the JSON Feed --->
<cfhttp url="http://localhost:8500/My_Stuff/Ajax/Books/CreateJSON_NEW.cfm"

<!--- JSON data is sometimes distributed as a JavaScript function. The following REReplace functions strip the function wrapper. --->
<cfset theData=REReplace(cfhttp.FileContent,
   "^\s*\[[\:word:]\]*\s*\(\s*","")>
<cfset theData=REReplace(theData, "\s*\)\s*$", "")>

<!--- Test to make sure you have JSON data. --->
<cfif !IsJSON(theData)>
   <h3>The URL you requested does not provide valid JSON</h3>
   <cfdump var="#theData#">
<cfelse>
   <cfset cfData=DeserializeJSON(theData)>
   <cfif !IsJSON(cfData)>
      <h3>The URL you requested does not provide valid JSON</h3>
   <cfdump var="#theData#">
<cfelse>
   <cfset cfData=DeserializeJSON(cfData)>
   <!--- Parse the resulting array or structure and display the data. In this case, the data represents a ColdFusion query that has been serialized by the SerializeJSON function into a JSON structure with two arrays: an array column names, and an array of arrays, where the outer array rows correspond to the query rows, and the inner array entries correspond to the column fields in the row. --->
```
ColdFusion Functions

<!--- First, find the positions of the columns in the data array. --->
<cfset colList=ArrayToList(cfData.COLUMNS)>
<cfset cityIdx=ListFind(colList, "City")>
<cfset tempIdx=ListFind(colList, "Temp")>
<cfset fcstIdx=ListFind(colList, "Forecasts")>

<!--- Now iterate through the DATA array and display the data. --->
<cfoutput>
<cfloop index="i" from="1" to="#ArrayLen(cfData.DATA)#">
  <h3>#cfData.DATA[i][cityIdx]#</h3>
  Current Temperature: #cfData.DATA[i][tempIdx]#<br><br>
  <b>Forecasts</b><br><br>
  <cfloop index="j" from="1" to="#ArrayLen(cfData.DATA[i][fcstIdx])#">
    <b>Day #j#</b><br>
    Outlook: #cfData.DATA[i][fcstIdx][j].WEATHER#<br>
    High: #cfData.DATA[i][fcstIdx][j].HIGH#<br>
    Low: #cfData.DATA[i][fcstIdx][j].LOW#<br><br>
  </cfloop>
</cfloop>
</cfoutput>
</cfif>

**DirectoryCopy**

**Description**
Copies the contents of a directory to a destination directory.

**Returns**
Nothing

**Syntax**
directoryCopy (source, destination[ , recurse] [, filter])

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Absolute pathname of directory from which you copy content.</td>
</tr>
<tr>
<td>destination</td>
<td>Path of the destination directory. If not an absolute path, it is relative to the source directory.</td>
</tr>
<tr>
<td>recurse</td>
<td>By default, false. If true, copies the subdirectories.</td>
</tr>
<tr>
<td>filter</td>
<td>File extension filter applied, for example, &quot;.cfm&quot;.</td>
</tr>
</tbody>
</table>

**Example**
directoryCopy(sourceDirExists, destDirExists, true, "*.cfm")

**DirectoryCreate**

**Description**
Creates on-disk or in-memory directory.
Category
System functions

Function Syntax
DirectoryCreate(path)

See Also
DirectoryDelete, DirectoryExists, DirectoryList, DirectoryRename

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Absolute path of the directory to be created. Alternatively, you can specify IP address, as in the following example: DirectoryCreate('//12.3.123.123/c_drive/test');</td>
</tr>
</tbody>
</table>

Usage
Ensure that you have the required permissions to run this function.

Example
The following code illustrates how to create a directory:

```html
<h2>DirectoryCreate Example</h2>
<h3>Enter a directory to create.</h3>
<cfform action = "directorycreate.cfm" method="post" preservedata="true" >
  <cfinput type = "text" required="true"  name = "createDirectory">
  <br/>
  <cfinput type = "submit" value = "submit" name = "submit">
</cfform>

<cfif IsDefined("FORM.createDirectory")>
  <cfif FORM.createDirectory is not "">
    <cfset createDirectory = FORM.createDirectory>
    <cftry>
      <cfset DirectoryCreate(createDirectory)>
      <cfoutput><b>Directory #createDirectory# successfully created.</b></cfoutput>
    </cfcatch>
    <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
    <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
    </cfcatch>
  </cfif>
</cfif>
</html>
```

DirectoryDelete

Description
Deletes on-disk or in-memory directory.
Category
System functions

Function syntax
DirectoryDelete(path [, recurse])

<tr>
<td>path</td>
<td>Absolute path of the directory to be deleted. Alternatively, you can specify IP address, as in the following example: DirectoryDelete(&quot;//12.3.123.123/c_drive/test&quot;).</td>
</tr>
<tr>
<td>recurse</td>
<td>This is an optional parameter and the default value is false. If true, the directory and the sub-directories are deleted. If the directory (being deleted) has sub-directories and you set recurse to false, an exception occurs.</td>
</tr>
</tbody>
</table>

Usage
Ensure that you have the required permissions to run this function.
Example

<h2>DirectoryDelete Example</h2>

Enter a directory to delete.

<form action="directoryDelete.cfm" method="post">
   <label for="delDirectory">Directory Path: </label><input type = "text" id="delDirectory" name = "delDirectory">
   <br>
   <label for="recurse">Recurse: </label><input id="recurse" type="checkbox" value="recurse" name="recurse">
   <br>
   <input type = "submit" value="submit" name = "submit" onclick='return confirm("Are you sure !!!");'>
</form>

<cfif IsDefined("FORM.delDirectory")>
   <cfif FORM.delDirectory is not "">
      <cfset delDirectory = FORM.delDirectory>
      <cfset recurse = false>
      <cfif isDefined("FORM.recurse")>
         <cfset recurse = true>
      </cfif>
      <cftry>
         <cfset DirectoryDelete(delDirectory, recurse)>
         <cfoutput><p>Directory <b>#delDirectory#</b> has been deleted.</cfoutput>
      </cfcatch>
      <cfcatch>
         <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
         <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
      </cfcatch>
   </cfif>
</cfif>

DirectoryExists

Description
Determines whether on-disk or in-memory directory exists.

Returns
Yes, if the specified directory exists; No, otherwise.

Category
System functions

Function syntax
DirectoryExists(absolute_path)

See also
DirectoryCreate, DirectoryDelete, DirectoryList, DirectoryRename
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absolute_path</td>
<td>An absolute on-disk or in-memory path. Alternatively, you can specify IP address as in the following example: DirectoryExists(&quot;/12.3.123.123/c_drive/test&quot;);</td>
</tr>
</tbody>
</table>

Example

```
<h3>DirectoryExists Example</h3>
<h3>Enter a directory to check for existence.</h2>
<form action = "directoryexists.cfm" method="post">
    <input type = "text" name = "yourDirectory">
    <br>
    <input type = "submit" name = "submit">
</form>

<cfif IsDefined("FORM.yourDirectory")>
    <cfif FORM.yourDirectory is not ">
        <cfset yourDirectory = FORM.yourDirectory>
        <cfif DirectoryExists(yourDirectory)>
            <cfoutput>
                <p>Your directory exists. Directory name: #yourDirectory#</p>
            </cfoutput>
            <cfelse>
                <p>Your directory does not exist.</p>
            </cfelse>
        </cfif>
    </cfif>
</cfif>
```

DirectoryList

Description
Lists the contents of on-disk or in-memory directory. Also lists the contents of the sub-directories if `recurse` is set to `true`.

Returns
Contents of the directory based on the parameter `listInfo`:
- If `listInfo="query"`, query object
- If `listInfo="name"`, array of names
- If `listInfo="path"`, array of path

Category
System functions

Function Syntax
DirectoryList(path [,recurse] [,listInfo] [,filter] [,sort])

See Also
DirectoryCreate, DirectoryDelete, DirectoryExists, DirectoryRename
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The absolute path of the directory for which to list the contents. Alternatively, you can specify IP address as in the following example: DirectoryList(&quot;//12.3.123.123/c_drive/test&quot;);</td>
</tr>
<tr>
<td>recurse</td>
<td>Whether ColdFusion performs the action on subdirectories: If true, contents of all subdirectories are also listed.</td>
</tr>
</tbody>
</table>
| listInfo  | • name: returns an array of names of files and directories.  
• path: returns an array of paths of files and directories.  
• query: returns a query. |
| filter    | File extension filter applied to returned names, for example, *.cfm. One filter can be applied. |
| sort      | Query columns by which to sort a directory listing. Delimited list of columns from query output.  
To qualify a column, use one of the following values:  
• asc: ascending (a to z) sort order.  
• dec: descending (z to a) sort order.  
For example:  
sort = "directory ASC, size DESC, datelastmodified"

Usage

Ensure that you have the required permissions to run this function.

Example

The following code dumps the contents of a directory:

```cfml
<h2>DirectoryList Example</h2>
<h3>Enter a directory for Listing.</h3>
<cfform action = "directoryList.cfm" method="post" preservedata="true" >
  <label for="listDirectory">Directory Path: </label><cfinput type = "text" id="listDirectory" name = "listDirectory">
  <br />
  <label for="recurse">Recurse: </label><cfinput id="recurse" type="checkbox" value="recurse" name="recurse">
  <br />
  <label for="listInfo">List Info: </label>
  <cfselect name="listInfo" id="listInfo">
    <option value="name">name</option>
    <option value="path">path</option>
    <option value="query">query</option>
  </cfselect>
  <br />
  <label for="filter">Filter: </label><cfinput id="filter" type="text" value="" name="filter">
  <br/>
  <input type = "submit" value="submit" name = "submit">
</cfform>
```
<cfif IsDefined("FORM.listDirectory")>
  <cfif FORM.listDirectory is not ">
    <cfset listDirectory = FORM.listDirectory>
    <cfset recurse = false>
    <cfif isDefined("FORM.recurse")>
      <cfset recurse = true>
    </cfif>
  </cfif>
  <cfset listInfo = FORM.listInfo>
  <cfset filter = FORM.filter>
  <cftry>
    <cfset res = DirectoryList(listDirectory, recurse, listInfo, filter)>
    <cfoutput><b>Content of Directory #listDirectory#: </b></cfoutput>
    <cfdump var="#res#"/>
  </cfcatch>
  </cftry>
</cfif>

DirectoryRename

Description
Renames on-disk or in-memory directory.

Category
System functions

Function Syntax
DirectoryRename(currentName, newName)

See Also
DirectoryCreate, DirectoryDelete, DirectoryExists, DirectoryList

Usage
Ensure that you have the required permissions to run this function.

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentName</td>
<td>Absolute path of the directory to be renamed. Alternatively, you can specify IP address, for example, DirectoryRename(&quot;/12.3.123.123/c_drive/test&quot;);</td>
</tr>
<tr>
<td>newName</td>
<td>Name with which the directory has to be renamed.</td>
</tr>
</tbody>
</table>
Example
<h2>DirectoryRename Example</h2>
<h3>Enter a directory to rename.</h3>
<cfform action = "directoryRename.cfm" method="post" preservedata="true">
  <label for="renameDirectory">Directory to rename: </label><cfinput required="true" type = "text" id="renameDirectory" name = "renameDirectory">
  <br/>
  <label for="newName">New Name: </label><cfinput required="true" type="text" id="newName" name = "newName"> 
  <br/>  <input type = "submit" value="submit" name="submit">
</cfform>

<cfif IsDefined("FORM.renameDirectory") and IsDefined("FORM.newName") >
  <cfif FORM.renameDirectory is not "" and FORM.newName is not "">
    <cfset renameDirectory = FORM.renameDirectory>
    <cfset newName = FORM.newName>
    <cftry>
      <cfset DirectoryRename(renameDirectory,newName)> 
      <cfoutput><b>Directory #renameDirectory# renamed to newName</b></cfoutput>
      <cfcatch>
        <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
        <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
      </cfcatch>
    </cftry>
  </cfif>
</cfif>

DollarFormat

Description
Formats a string in U.S. format. (For other currencies, use LSCurrencyFormat or LSEuroCurrencyFormat.

Returns
A number as a string, formatted with two decimal places, thousands separator, and dollar sign. If number is negative, the return value is enclosed in parentheses. If number is an empty string, returns zero.

Category
Display and formatting functions

Function syntax
DollarFormat(number)

See also
DecimalFormat, NumberFormat

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to format</td>
</tr>
</tbody>
</table>
Example
<!--- This example shows the use of DollarFormat -->
...  
<h3>DollarFormat Example</h3>
<cfloop from = 8 to = 50 index = counter>
  <cfset full = counter>
  <cfset quarter = counter + (1/4)>
  <cfset half = counter + (1/2)>
  <cfset threefourth = counter + (3/4)>
  <cfoutput>
  <pre>
  bill#DollarFormat(full)##DollarFormat(quarter)#
  #DollarFormat(half)# #DollarFormat(threefourth)#
  18% tip#DollarFormat(full * (18/100))#
  #DollarFormat(quarter * (18/100))#
  #DollarFormat(half * (18/100))#
  #DollarFormat(threefourth * (18/100))#
  </pre>
  </cfoutput>
</cfloop>
...  

DotNetToCFType  

Description  
Explicitly converts a value returned by a .NET method to the corresponding ColdFusion data type.  

Returns  
A ColdFusion data value.  

Category  
Structure functions, System functions  

Function syntax  
DotNetToCFType(variable_name)  

See also  
CreateObject: .NET object, cfobject: .NET object, Converting between .NET and ColdFusion data types in the Developing ColdFusion Applications  

History  
ColdFusion 8: Added this function  

Parameters  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of the .NET variable to convert</td>
</tr>
</tbody>
</table>
Usage
For detailed information on when and why you use this function, see Working with complex .NET data types in the Developing ColdFusion Applications.

Example
The following example creates a .NET System.Data.DataTable object and converts it to a ColdFusion query.

```coldfusion
<!---Create a SQL Command Object--->
<cfobject action="create" name="sqlCommandObject"
    class="System.Data.SqlClient.SqlCommand" type=".Net"
    assembly="#assemblyList#">
<cfset sqlCommandObject.init("SELECT [ID], [FriendlyName] FROM [Batch]",
    sqlConnectionObject)> 
<cfset sqlDataReaderObject = sqlCommandObject.ExecuteReader()>
<cfset dataTable = createObject(".net", "System.Data.DataTable",
    assemblyList)> 
<!--- populate the datatable --->
<cfset dataTable.load(sqlDataReaderObject)>
<!--- convert to cfquery --->
<cfset myquery=DotNetToCFType(dataTable)> 
```

**Duplicate**

**Description**
Returns a clone, also known as a deep copy, of a variable. There is no reference to the original variable.

**Returns**
A clone of a variable.

**Category**
Structure functions, System functions

**Function syntax**
Duplicate(variable_name)

**See also**
StructCopy, other Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

**History**
ColdFusion 8: Changed behavior: this function can duplicate CFCs.
ColdFusion MX: Changed behavior: this function can be used on XML objects.
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of a variable to duplicate</td>
</tr>
</tbody>
</table>

Usage

Use this function to duplicate complex structures, such as nested structures and queries.

When you duplicate a CFC instance, the entire CFC contents is copied, including the values of the variables in the this scope at the time you call the `Duplicate` function. Thereafter, the two CFC instances are independent, and changes to one copy, for example by calling one of its functions, have no effect on the other copy.

**Note:** With this function, you cannot duplicate a COM, CORBA, or JAVA object returned from the `cfobject` tag or the `CreateObject` function. If an array element or structure field is a COM, CORBA, or JAVA object, you cannot duplicate the array or structure.

Example

```cfc
<h3>Duplicate Example</h3>
<cfset s1 = StructNew()>
<cfset s1.nested = StructNew()>
<cfset s1.nested.item = "original">
<cfset copy = StructCopy(s1)>  
<cfset clone = Duplicate(s1)>  
<!--- modify the original --->
<cfset s1.nested.item = "modified">
<cfoutput>
<p>The copy contains the modified value: #copy.nested.item#</p>
<p>The duplicate contains the original value: #clone.nested.item#</p>
</cfoutput>
```

Functions e-g

**EncodeForCSS**

Description

Encodes the input string for use in CSS.

Returns

Encoded string

Category

Display and formatting functions

Syntax

`encodeForCSS(inputString [,strict])`

See also

`EncodeForHTML, EncodeForHTMLAttribute, EncodeForURL, Canonicalize`
History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to encode.</td>
</tr>
<tr>
<td>strict</td>
<td>Optional. If set to true, restricts multiple and mixed encoding.</td>
</tr>
</tbody>
</table>

Example

```cfm
<cfif not isDefined("form.bgcolor")>
  <cfset form.bgcolor = 'red'>
</cfif>
<cfoutput>
  <style>
    .myDiv
    {
      background-color: #encodeForCSS(form.bgcolor);
      /* Encode the input to avoid any malicious code execution.*/
    }
  </style>
</cfoutput>
<hr/>
<cfoutput>
  <div class="myDiv">
    This div element is styled!!!!
  </div>
</cfoutput>
<hr/>
<cfform action="#cgi.SCRIPT_NAME#" method="post">
  Background Color : <cfinput name="bgcolor" type="text" value="#form.bgcolor#"> <br/>
  <cfinput name="submit" type="submit" value="Style the div!!!"/>
</cfform>
```

EncodeForHTML

Description
Encodes the input string for use in HTML.

Returns
Encoded string

Category
Display and formatting functions

Syntax
`encodeForHTML(inputString [,strict])`

See also
`Canonicalize, EncodeForHTMLAttribute, EncodeForJavaScript, EncodeForCSS, EncodeForURL`

Last updated 7/9/2012
EncodeForHTMLAttribute

Description
Encodes the input string for use in HTML attribute, such as table width or image height.

Returns
Encoded string

Category
Display and formatting functions

Syntax
encodeForHTMLAttribute(inputString [,strict])

See also
Canonicalize, EncodeForJavaScript, EncodeForCSS, EncodeForURL, EncodeForHTML

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to encode.</td>
</tr>
<tr>
<td>strict</td>
<td>Optional. If set to true, it restricts multiple and mixed encoding.</td>
</tr>
</tbody>
</table>
Example
<cfif not isDefined ("form.submit")>
   <cfset form.width = 200 />
</cfif>
<cfoutput >
  <table width="#encodeForHTMLAttribute(form.width)#" border="1" bgcolor="RED">
      <tr>
          <td> Enter the value in the below text field. 
      </td>
  </tr>
  </table>
</cfoutput>
<cfform>
  <cfinput name="width" type="text" value="#form.width#">
  <cfinput name="submit" type="submit" value="Submit">
</cfform>

EncodeForJavaScript

Description
Encodes the input string for use in JavaScript.

Returns
Encoded string

Category
Display and formatting functions

Syntax
encodeForJavaScript(inputString [,strict])

See also
Canonicalize, EncodeForHTMLAttribute, EncodeForHTML, EncodeForCSS, EncodeForURL

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to encode.</td>
</tr>
<tr>
<td>strict</td>
<td>Optional. If set to true, restricts multiple and mixed encoding.</td>
</tr>
</tbody>
</table>
Example

```coldfusion
<cfif isDefined("form.submit")>
  <!--- If the user submits the form, show him/her a JavaScript alert. --->
  <cfoutput>
    <script type="text/javascript">
      alert('Hello #encodeForJavascript(form.userName)# !!!');
      // For security purpose, encode the user-generated input, so that it does not
      // execute malicious codes.
    </script>
  </cfoutput>
</cfelse>
  <cfset form.username = "" />
</cfif>
<cfform action="#cgi.SCRIPT_NAME#" method="post" >
  <cfinput name="userName" type="text" value="#form.userName#">
  <cfinput name="submit" type="submit" value="SayHello!!!">
</cfform>

**EncodeForURL**

**Description**

Encodes the input string for use in URLs.

**Returns**

Encoded string

**Category**

Display and formatting functions

**Syntax**

`encodeForURL(inputString [, strict])`

**See also**

[`Canonicalize`, `EncodeForHTMLAttribute`, `EncodeForHTML`, `EncodeForCSS`, `EncodeForJavaScript`]

**History**

ColdFusion 10: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to encode.</td>
</tr>
<tr>
<td>strict</td>
<td>Optional. If set to true, it restricts multiple and mixed encoding.</td>
</tr>
</tbody>
</table>
Example
<cfif not isDefined("form.url")>
   <cfset form.url = "www.adobe.com">
</cfif>
<cfform action="#cgi.SCRIPT_NAME#" method="post">
   <cfinput name="url" type="text" value="#form.url#">
   <cfinput name="submit" type="submit" value="Show link to this URL!!!">
</cfform>
<hr />
<cfoutput>
   <b>LINK to URL:</b> <a target="_blank" href="http://#encodeForURL(form.url)#">#encodeForURL(form.url)#</a>
</cfoutput>

EncodeForXML

Description
Encodes a string for XML.

Returns
Encoded XML string.

Category
Display and formatting functions.

Function syntax
encodeforXML(Inputstring , [strict])

See also
Canonicalize, EncodeForHTMLAttribute, EncodeForJavaScript, EncodeForCSS, EncodeForURL

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputString</td>
<td>Required. The string to encode.</td>
</tr>
<tr>
<td>strict</td>
<td>Optional. If set to true, it restricts multiple and mixed encoding.</td>
</tr>
</tbody>
</table>
Example
<cfif isDefined("form.submit")>
  MyDoc = XmlNew();
  MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");
  MyDoc.MyRoot.XmlText = #encodeForXML(form.userName)#;
  <b>
  Output:<cfoutput>#encodeForXML(form.userName)#</cfoutput>
  </b>
</cfif>
<cfelse>
  <cfset form.username=""/>
</cfif>
</cfform>

Encrypt

Description
Encrypts a string using a specific algorithm and encoding method.

Returns
String; can be much longer than the original string.

Category
Security functions, String functions

Function syntax
Encrypt(string, key [, algorithm, encoding, IVorSalt, iterations])

See also
Decrypt, EncryptBinary, DecryptBinary

History
ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.
ColdFusion MX 7.01: Added the IVorSalt and iterations parameters.
ColdFusion MX 7: Added the algorithm and encoding parameters.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String to encrypt.</td>
</tr>
<tr>
<td>key</td>
<td>String. Key or seed used to encrypt the string.</td>
</tr>
<tr>
<td></td>
<td>• For the CFMX_COMPAT algorithm, any combination of any number of characters; used as a seed used to generate a 32-bit encryption key.</td>
</tr>
<tr>
<td></td>
<td>• For all other algorithms, a key in the format used by the algorithm. For these algorithms, use the <code>GenerateSecretKey</code> function to generate the key.</td>
</tr>
<tr>
<td>algorithm</td>
<td>(Optional) The algorithm to use to encrypt the string.</td>
</tr>
<tr>
<td></td>
<td>The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. It includes the following algorithms:</td>
</tr>
<tr>
<td></td>
<td>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</td>
</tr>
<tr>
<td></td>
<td>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</td>
</tr>
<tr>
<td></td>
<td>• DES-EDE: the &quot;Triple DES&quot; algorithm defined by NIST FIPS-46-3.</td>
</tr>
<tr>
<td></td>
<td>• DESX: The extended Data Encryption Standard symmetric encryption algorithm.</td>
</tr>
<tr>
<td></td>
<td>• RC2: The RC2 block symmetric encryption algorithm defined by RFC 2268.</td>
</tr>
<tr>
<td></td>
<td>• RC4: The RC4 symmetric encryption algorithm.</td>
</tr>
<tr>
<td></td>
<td>• RC5: The RC5 encryption algorithm.</td>
</tr>
<tr>
<td></td>
<td>• PBE: Password-based encryption algorithm defined in PKCS #5.</td>
</tr>
</tbody>
</table>

In addition to these algorithms, you can use the algorithms provided in the Standard Edition of ColdFusion.

The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:

- CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).
- AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.
- BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.
- DESX: the "Triple DES" algorithm defined by NIST FIPS-46-3.

If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms.
ColdFusion Functions

Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The security of the encrypted string depends on maintaining the secrecy of the key.

The following are the FIPS-140 approved algorithms included in the RSA BSafe Crypto-J library that are used by ColdFusion. Some of these are not used with the encrypt function, but are used with other functions:

- AES – ECB, CBC, CFB (128), OFB (128) – [128, 192, 256-bit key sizes]
- AES – CTR
- Diffie-Hellman Key Agreement
- DSA
- FIPS 186-2 General Purpose [(x-Change Notice); (SHA-1)]
- FIPS 186-2 [(x-Change Notice); (SHA-1)]
- HMAC-SHAx (where x is 1, 224, 256, 384, or 512)
- RSA PKCS#1 v1.5 (sign, verify) (SHA-1,SHA-224,SHA-256,SHA-384,SHA-512)
- Secure Hash Standard (SHA-1, SHA-224, SHA-256, SHA-384, SHA-512)
- Triple DES - ECB, CBC, CFB (64 bit), and OFB (64 bit)

All algorithms included in the RSA BSafe Crypto-J library are available for use in the Enterprise Edition. In certain cases, you may want to disable some algorithms. To disable the DESX, RC5, and MD5PRNG algorithms, specify the following in the JVM arguments on the Java and JVM page of the ColdFusion Administrator:

-Dcoldfusion.enablefipscrypto=true

FIPS-140 approved cryptography is not available if you are running ColdFusion on WebSphere of JBoss.

To use the IBM/Lotus Sametime Instant Messaging Gateway in the Enterprise edition, disable the FIPS-140-only cryptography setting by specifying the following in the JVM arguments on the Java and JVM page of the ColdFusion Administrator:
ColdFusion Functions

-Dcoldfusion.disablejsafe=true

In Standard Edition, for all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The default algorithm, which is the same one used in ColdFusion 5 and ColdFusion MX, uses an XOR-based algorithm that uses a pseudo-random 32-bit key, based on a seed passed by the user as a function parameter. This algorithm is less secure than the other available algorithms.

Example

The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX_COMPAT algorithm. For all other algorithms, it generates a secret key.

```cfml
<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myString")>
<cfscript>
/* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm, so use the key from the form. */
if (Form.myAlgorithm EQ "CFMX_COMPAT")
theKey=Form.MyKey;
// For all other encryption techniques, generate a secret key.
else
theKey=generateSecretKey(Form.myAlgorithm);
//Encrypt the string
encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm, Form.myEncoding);
//Decrypt it
decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
</cfscript>

<!--- Display the values used for encryption and decryption, and the results. --->
<cfoutput>
<b>The algorithm:</b> #Form.myAlgorithm#
<b>The key:</b> #theKey#
<b>The string:</b> #Form.myString#
<b>Encrypted:</b> #encrypted#
<b>Decrypted:</b> #decrypted#
</cfoutput>
</cfif>

<!--- The input form.--->
<form action="#CGI.SCRIPT_NAME#" method="post">
<b>Select the encoding</b><br>
<select size="1" name="myEncoding">
<option selected>UU</option>
<option>Base64</option>
</select>
</form>
```

Last updated 7/9/2012
EncryptBinary

Description
Encrypts binary data using a specific algorithm and encoding method.

Returns
Binary data.

Category
Security functions, String functions

Function syntax
EncryptBinary(bytes, key [, algorithm, IVorSalt, iterations])

See also
Decrypt, DecryptBinary, Encrypt

History
ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.
ColdFusion MX 7.01: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bytes</td>
<td>Binary data to encrypt.</td>
</tr>
<tr>
<td>key</td>
<td>String. Key or seed used to encrypt the string.</td>
</tr>
<tr>
<td></td>
<td>• For the CFMX_COMPAT algorithm, any combination of any number of characters; used as a seed to generate a 32-bit encryption key.</td>
</tr>
<tr>
<td></td>
<td>• For all other algorithms, a key in the format used by the algorithm. For these algorithms, use the <code>GenerateSecretKey</code> function to generate the key.</td>
</tr>
<tr>
<td>algorithm</td>
<td>(Optional) The algorithm to use to decrypt the string.</td>
</tr>
<tr>
<td></td>
<td>The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. For a list of algorithms, see the <code>Encrypt</code> function.</td>
</tr>
<tr>
<td></td>
<td>The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:</td>
</tr>
<tr>
<td></td>
<td>• CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</td>
</tr>
<tr>
<td></td>
<td>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</td>
</tr>
<tr>
<td></td>
<td>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</td>
</tr>
<tr>
<td></td>
<td>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</td>
</tr>
<tr>
<td></td>
<td>• DESEDE: the &quot;Triple DES&quot; algorithm defined by NIST FIPS-46-3.</td>

<tr>
<td>IVorSalt</td>
<td>(Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>• For Block Encryption algorithms: This is the binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size. Use the same value in the <code>Decrypt</code> function to successfully decrypt the data.</td>
</tr>
<tr>
<td></td>
<td>• For Password Based Encryption algorithms: This is the binary Salt value to transform the password into a key. The same value must be used to decrypt the data.</td>
</tr>
<tr>
<td>iterations</td>
<td>(Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption algorithms. Use the same value to encrypt and decrypt the data.</td>
</tr>
</tbody>
</table>

Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt binary data. The security of the encrypted data depends on maintaining the secrecy of the key.

For all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The default algorithm, which is the same as was used in ColdFusion 5 and ColdFusion MX, uses an XOR-based algorithm that uses a pseudo-random 32-bit key, based on a seed passed by the user as a function parameter. This algorithm is less secure than the other available algorithms.
Example
The following example encrypts and decrypts binary data. It encrypts the binary data contained in a file and then decrypts the encrypted file. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX_COMPAT algorithm. For all other algorithms, it generates a secret key.

```cfml
<h3>EncryptBinary Example</h3>
<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myfile")>
<cffile file="#Form.myfile#" action="readBinary" variable="myData">
<cfscript>
/* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm, so use the key from the form. */
if (Form.myAlgorithm EQ "CFMX_COMPAT")
  theKey=Form.MyKey;
// For all other encryption techniques, generate a secret key.
else
  theKey=generateSecretKey(Form.myAlgorithm);
//Encrypt the string
encrypted=encryptBinary(myData, theKey, Form.myAlgorithm);
//Decrypt it
decrypted=decryptBinary(encrypted, theKey, Form.myAlgorithm);
</cfscript>
<cfset encfile="#Form.myfile# & ".enc">  
<cfset decfile="#Form.myfile# & ".dec">  
<cffile file="#encfile#" action="write" output="#encrypted#">  
<cffile file="#decfile#" action="write" output="#decrypted#">  

<!--- Display the values used for encryption and decryption, and the results. --->

**EntityDelete**

**Description**
Deletes the record from the database for the specified entity. Depending on the cascade attribute specified in the mapping, it deletes the associated objects also.

**Category**
ORM functions

**Function Syntax**
EntityDelete(entity)

**See Also**
EntityLoad, EntitySave

**History**
ColdFusion 9: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>
<td>Name of the entity being deleted.</td>
</tr>
</tbody>
</table>

**Example**
<cfset employee = EntityLoad('employee', 100, true)>
<cfset EntityDelete(employee)>
<cfset employee = CreateObject('component', 'employee')>
<cfset employee.setEmployeeID(100)>
<cfset EntityDelete(employee)>
EntityLoad

Description
Loads and returns an array of entities for the specified entity name. You can also specify a filter criteria and sort order. All EntityLoad methods take the entity name as input.

Returns
Array (if unique=false)
Single entity (if unique=true)

Category
ORM functions

Function syntax
EntityLoad (entityname)
EntityLoad (entityname, id [, unique])
EntityLoad (entityname, filtercriteria [,unique])
EntityLoad (entityname, filtercriteria, sortorder [, options])

See Also
EntityLoadByExample, EntityReload, EntityDelete

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity name</td>
<td>Name of the entity to be loaded.</td>
</tr>
<tr>
<td>ID</td>
<td>The primary key value of the entity that must be loaded.</td>
</tr>
<tr>
<td></td>
<td>If the entity has a composite key, then the ID has to be specified as key-value pairs (ColdFusion struct).</td>
</tr>
</tbody>
</table>

| unique       | If unique is set to true, then the entity is returned.                      |
|             | If you are sure that only one record exists that matches this filtercriteria, then you can specify unique=true, so that a single entity is returned instead of an array. |
|             | If you set unique=true and multiple records are returned, then an exception occurs. |
ColdFusion Functions

### History
ColdFusion 9: Added this function.

### Usage
For pagination, you can use the options `offset` and `maxResults` as shown in the example:

```
EntityLoad('employee', {department='qa'}, {offset=21, maxResults=10})
```

This example retrieves the (next) 10 objects of employees whose department is `qa` from offset 22.

### Example

**Example with only entity name specified:**

```
<cfset employees = EntityLoad('employee')>
```

**Example with `EntityName`, ID, and `unique` set to true.** Instead of true, if you set `unique` as false, then array is returned with one entity.

```
<cfset employee = EntityLoad('employee', 100, true)>
```

**Entity name, composite key.**

```
<cfset orderDetail = EntityLoad('orderdetails', {OrderID=100, ProductID=1}, true)>
```

**Example which describes how to retrieve objects whose country is `UK`, and sorted by `Department` ascending and `Age` descending:**

```
<cfset employeesInUKSorted = EntityLoad('employee', {country="UK"}, "Department Asc, Age Desc")>
```

**Example that describes how to retrieve details of all the employees who live in 'UK':**

```
<cfset employeesFromUK = EntityLoad('employee', {country="UK"})>
```

**Example that describes how to retrieve a unique object.** If you specify `unique= "true"` and more than one object satisfies the condition, then an exception occurs.

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filtercriteria</code></td>
<td>Key-value pair (ColdFusion Struct) of property names and values. If there are more than one key-value pair, then the AND operator is used. If specified, loads and returns an array of entities of the specified entity name that matches the <code>filtercriteria</code>.</td>
</tr>
<tr>
<td><code>sortorder</code></td>
<td>String used to specify the sort order of the entities that are returned. If specified, loads and returns an array of entities that satisfy the <code>filtercriteria</code> sorted as specified by the <code>sortorder</code>.</td>
</tr>
</tbody>
</table>
| `options` | The following options to customize the output:  
  - `ignorecase`: Ignores the case of sort order when set to true. Use only if you specify the `sortorder` parameter.  
  - `offset`: Specifies the position from which to retrieve the objects.  
  - `maxResults`: Specifies the maximum number of objects to be retrieved.  
  - `cacheable`: Whether the result has to be cached in the secondary cache. Default is false.  
  - `cachename`: Name of the cache in secondary cache.  
  - `timeout`: Specifies the timeout value (in seconds) for the query. |
<cfset employee = EntityLoad('employee', {firstname="Marcia", lastname="Em"}, "true")>

**EntityLoadByExample**

**Description**
Loads and returns an array of objects that match the `sampleentity`. The filter criteria is constructed by ANDing all the non-null properties of the `sampleentity`.

**Returns**
Array of objects

**Category**
ORM functions

**Function Syntax**

```
entityloadbyexample(sampleentity [, unique])
```

**See Also**

EntityLoad, EntityReload

**History**

ColdFusion 9: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sampleentity</td>
<td>Name of the sample entity that is used to match and filter similar entities to load.</td>
</tr>
</tbody>
</table>

**Example**

```
<cfset employee = CreateObject("component", "employee")>
<cfset employee.setDepartment("ColdFusion")>
<cfset employee.setCountry("USA")>
<cfset employee=EntityLoadByExample(employee)>
```

**EntityLoadByPK**

**Description**

Loads and returns an array of objects for the specified primary key. Use this function to avoid specifying the boolean parameter that you must specify with the `EntityLoad()` function.

**Returns**

object

**Category**

ORM functions
Function Syntax
entityLoadByPK( entityName ,id)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity name</td>
<td>Name of the entity to be loaded.</td>
</tr>
<tr>
<td>id</td>
<td>Primary key id</td>
</tr>
</tbody>
</table>

EntityLoad, EntityReload, EntityLoadByExample, EntityDelete, ColdFusion ORM chapter in Developing ColdFusion Applications

History
ColdFusion 9: Added this function.

Example
<cfscript>
    art = EntityLoadByPK("Art", 1);
    writedump(art);
</cfscript>

EntityMerge

Description
Attaches the specified entity to the current ORM session. It copies the state of the given object onto the persistent object with the same identifier and returns the persistent object.

If there is no persistent instance currently associated with the session, it is loaded. The given instance is not associated with the session. User have to use the returned object from this session.

Returns
object

Category
ORM functions

Function Syntax
entityMerge( entity)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>
<td>The entity that must be attached to the ORM session.</td>
</tr>
</tbody>
</table>

See Also
EntityLoad, EntityLoadByExample, EntityDelete, ColdFusion ORM chapter in Developing ColdFusion Applications

Last updated 7/9/2012
ColdFusion Functions

History
ColdFusion 9: Added this function.

EntityNew

Description
Creates an instance of the persistent CFC with the entity name that you provide.

Returns
Object

Category
ORM functions

Function Syntax
entityNew(entityName [ ,properties])

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityName</td>
<td>Entity name of the persistent CFC.</td>
</tr>
<tr>
<td>properties</td>
<td>Key-value pair (ColdFusion struct) of property names and values.</td>
</tr>
</tbody>
</table>

See Also
EntityLoad, EntityLoadByExample, EntityDelete, ColdFusion ORM chapter in Developing ColdFusion Applications

History
ColdFusion 9: Added this function.

Usage
You can now use the application to initialize the object that is being created. properties takes a struct with key being the property name. When the object is created, all the properties are populated with the passed struct.

For example,
cfset artistObj = entityNew("Artists",{FirstName="Tom",LastName="Ron"})
Example

```coldfusion
newArtistObj = EntityNew("Artists");
newArtistObj.setfirstname("John");
newArtistObj.setlastname("Smith");
newArtistObj.setaddress("5 Newport lane");
newArtistObj.setcity("San Francisco");
newArtistObj.setstate("CA");
newArtistObj.setpostalcode("90012");
newArtistObj.setphone("612-832-2343");
newArtistObj.setfax("612-832-2344");
newArtistObj.setemail("jsmith@company.com");
newArtistObj.setthepassword("jsmith");
EntitySave(newartistobj);
ormflush();
```

**EntityReload**

**Description**
Reloads data for an entity that is already loaded. This method refetches data from the database and repopulates the entity with the refreshed data.

**Category**
ORM functions

**Function Syntax**
entityreload()

**See Also**
EntityLoad, EntityLoadByExample, EntityDelete

**History**
ColdFusion 9: Added this function.

**EntitySave**

**Description**
Saves or updates data of the entity and all related entities to the database. ColdFusion automatically tries to find if a new record should be inserted or an existing record be updated for the given entity. If you set forceinsert=true, then ColdFusion tries to insert the entity as a new record.

**Returns**
Void

**Category**
ORM functions

**Function Syntax**
EntitySave(entity, [forceinsert])
See Also
EntityLoad, EntityLoadByExample, EntityDelete

History
ColdFusion 9: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>
<td>Name of the entity that must be saved in the database.</td>
</tr>
<tr>
<td>forceinsert</td>
<td>If true, then ColdFusion always tries to insert the entity as a new record.</td>
</tr>
</tbody>
</table>

Example
To save an entity:

```cfm
<cfset employee = createObject("Employee")>
<cfset employee.setFirstName("Marcia")>
<cfset employee.setlastName("Em")>
<cfset EntitySave(employee)>
```

To update an entity:

```cfm
<cfset employee = EntityLoad('employee', 100, true)>
<cfset employee.setLastName("Em")>
<cfset EntitySave(employee)>
```

EntitytoQuery

Description
Converts the input entity object or the input array of entity objects to a query object.

Returns
Query

Category
ORM functions

Function Syntax

EntitytoQuery (orm_object, [entity_name])
EntitytoQuery (orm_object_array, [entity_name])

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orm_object</td>
<td>Entity object that needs to be converted to a query object.</td>
</tr>
<tr>
<td>orm_object_array</td>
<td>Array that needs to be converted to a query object.</td>
</tr>
<tr>
<td>entity_name</td>
<td>Name of the entity. Use this optional parameter to return the query of the given entity in the case of inheritance mapping.</td>
</tr>
</tbody>
</table>
See Also
EntityLoad, EntityDelete

History
ColdFusion 9: Added this function.

Usage
The following conditions apply for this function:

• In the case of array input, all objects in the array must be of the same type.
• The result query will not contain any relation data.

Example
<cfset artists = EntityLoad("Artist")>
<cfset artistQuery = EntityToQuery(artists)>

Evaluate

Description
Evaluates one or more string expressions, dynamically, from left to right. (The results of an evaluation on the left can have meaning in an expression to the right.) Returns the result of evaluating the rightmost expression.

Returns
An object; the result of the evaluations.

Category
Dynamic evaluation functions

Function syntax
Evaluate(string_expression1 [, string_expression2 , ... ])

See also
DE, IIf, PrecisionEvaluate, Using Expressions and Number Signs in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string_expression1, string_expression2...</td>
<td>Expressions to evaluate</td>
</tr>
</tbody>
</table>

Usage
String expressions can be complex. If a string expression contains a single- or double-quotation mark, the mark must be escaped.

This function is useful for forming one variable from multiple variables. For example, to reference a column of the query qNames with a variable, var, using an index value to traverse rows, you could use the following code:

<cfset var=Evaluate("qNames.#colname#[#index#]")>
Example

```cfml
<!--- This example shows the use of PrecisionEvaluate and DE functions.--->
<h3>Evaluate Example</h3>
<cfif IsDefined("FORM.myExpression")>
  <cftry>
    <!--- Evaluate the expression --->
    <cfset theExpression = Evaluate(Form.myExpression)>
    <cfoutput>
      <!--- The DE function prevents the Evaluate function from evaluating
          the expression. --->
      The value of the expression #Evaluate(DE(FORM.MyExpression))# is #theExpression#.<br>
      <!--- The following line does not use the DE function. --->
      The value of the expression #FORM.MyExpression# is #theExpression#.<br>
    </cfoutput>
  </cftry>
  <cfcatch type="application">
    <cfoutput>Could not evaluate the expression #Form.myExpression#. Make sure you enter a valid ColdFusion Expression.</cfoutput>
  </cfcatch>
</cfif>

<cfform preservedata="yes">
  <h3>Enter a ColdFusion expression for evaluation</h3>
  <cfinput type="text" name="myExpression" size="60"><br />
  <cfinput type="submit" name="submit">
</cfform>
```

Exp

**Description**
Calculates the exponent whose base is $e$ that represents `number`. The constant $e$ equals 2.71828182845904, the base of the natural logarithm. This function is the inverse of `Log`, the natural logarithm of `number`.

**Returns**
The constant $e$, raised to the power of `number`.

**Category**
Mathematical functions

**Function syntax**

```
Exp(number)
```

**See also**

`Log`, `Log10`
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Exponent to apply to the base e</td>
</tr>
</tbody>
</table>

Usage

To calculate powers of other bases, use the exponentiation operator (^).

Example

```xml
<h3>Exp Example</h3>
<cfif IsDefined("FORM.Submit")>
  <cfoutput>
    <p>Your number, #FORM.number#</p>
    <br>#FORM.number# raised to the E power: #exp(FORM.number)#
    <cfif FORM.number LTE 0>
      <br>You must enter a positive real number to see its natural logarithm
    </cfelse>
    The natural logarithm of #FORM.number#: #log(FORM.number)#
  </cfif>
  <cfif FORM.number LTE 0><br>
    You must enter a positive real number to see its logarithm to base 10
  </cfelse>
  The logarithm of #FORM.number# to base 10: #log10(FORM.number)#
</cfoutput>
</cfif>
</cfoutput>
</cfif>
<cfform action = "exp.cfm">
Enter a number to see its value raised to the E power, its natural logarithm, and the logarithm of number to base 10.
<cfinput type = "Text" name = "number" message = "You must enter a number"
  validate = "float" required = "No">
  <input type = "Submit" name = "Submit">
</cfform>

ExpandPath

Description

Creates an absolute, platform-appropriate path that is equivalent to the value of relative_path, appended to the base path. This function (despite its name) can accept an absolute or relative path in the relative_path parameter.

The base path is the currently executing page’s directory path. It is stored in pageContext.getServletContext().

Returns

A string. If the relative path contains a trailing forward slash or backward slash, the return value contains the same trailing character.

Category

System functions

Function syntax

ExpandPath(relative_path)
See also
FileExists, GetCurrentTemplatePath, GetFileFromPath

History
ColdFusion MX: Changed behavior for the relative_path parameter: this function can now accept an absolute or relative path in the relative_path parameter. To resolve a path, this function uses virtual mappings that are defined in the ColdFusion Administrator. This function does not reliably use virtual mappings that are defined in IIS, Apache, or other web servers.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relative_path</td>
<td>Relative or absolute directory reference or filename, within the current directory, (\ and ..) to convert to an absolute path. Can include forward or backward slashes. Files in the custom tag directory are also resolved. For instance, if there is a file test.txt in the custom tag directory (C:\ColdFusion10), the function (with \test.txt) returns C:\ColdFusion10\test.txt.</td>
</tr>
</tbody>
</table>

Usage
If the parameter or the returned path is invalid, the function throws an error. You cannot use this function with in-memory files.

These examples show the valid constructions of relative_path:

- ExpandPath( "*.*")
- ExpandPath( "/")
- ExpandPath( "")
- ExpandPath( "/mycfpage.cfm")
- ExpandPath( "mycfpage.cfm")
- ExpandPath( "myDir/mycfpage.cfm")
- ExpandPath( "/myDir/mycfpage.cfm")
- ExpandPath( "../..//mycfpage.cfm")

Enhancement in ColdFusion 10 lets files in the custom tag directory to also resolve. For instance, if there is a file test.txt in the custom tag directory (C:\ColdFusion10), the function (with \test.txt) returns C:\ColdFusion10\test.txt.
Example
<h3>ExpandPath Example</h3>

<cfset thisPath=ExpandPath("*.\")>
<cfset thisDirectory=GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#

<cfif IsDefined("form.yourFile") AND form.yourFile is not ">
  <cfset yourFile = form.yourFile>
  <cfif FileExists(ExpandPath(yourfile))>
    <p>Your file exists in this directory. You entered the correct filename, #GetFileFromPath("#thisPath#/#yourfile#")#
  <cfelse>
    <p>Your file was not found in this directory:
    <br>Here is a list of the other files in this directory:
    <!--- use cfdirectory to give the contents of the snippets directory, order by name and size --->
    <cfdirectory directory="#thisDirectory#" name="myDirectory" sort="name ASC, size DESC">
      <!--- Output the contents of the cfdirectory as a cftable --->
      <cftable query="myDirectory">
        <cfcol header="NAME:" text="#Name#">
        <cfcol header="SIZE:" text="#Size#">
      </cftable>
    </cfdirectory>
  </cfif>
</cfif>
</cfoutput>
</form>

FileClose

Description
Closes an on-disk or in-memory file that is open. When you use the FileOpen function, ColdFusion returns a handle to a file object. When you close the file, the handle is still available; however, it lists the file as closed.

Category
System functions

Function syntax
FileClose(fileObj)

See also
FileCopy, FileIsEOF, FileOpen, FileRead, FileReadLine, FileWriter
History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileobj</td>
<td>The file to close.</td>
</tr>
</tbody>
</table>

Usage
Always close a file after opening it. When you use the FileOpen function to open a file, the file stream is opened and contents are read from or written to it. The FileClose function closes the stream. If you do not close a file, the stream remains open; in that case, the operating system can lock the file, which results in the file not being usable until the server is restarted.

Example
The following example checks to see if a file is still open and closes it.

```cfscript
<cfscript>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
  x = FileReadLine(myfile);
  WriteOutput("#x# <br>");
}
</cfscript>
<!--- Additional code goes here. --->
<cfif #myfile.status# IS "open">
  <cfoutput>The file #myfile.filepath# is #myfile.status#</cfoutput><br>
  <cfscript>
    FileClose(myfile);
  </cfscript>
</cfif>
```

FileCopy

Description
Copies the specified on-disk or in-memory source file to the specified destination file.

Category
System functions

Function syntax
FileCopy(source, destination)

See also
FileClose, FileIsEOF, FileOpen, FileRead, FileReadLine, FileWrite, cffile

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Pathname of the on-disk or in-memory file to copy. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the GetTempDirectory function.</td>
</tr>
<tr>
<td>destination</td>
<td>Pathname of an on-disk or in-memory directory or file on the web server where the file is copied. If you specify a filename without a directory path, ColdFusion copies it relative to the source directory.</td>
</tr>
</tbody>
</table>

Usage

Use the following syntax to specify an in-memory file or directory, which is not written to disk. In-memory files speed processing of transient data.

ram://filepath

The filepath can include directories, for example ram://petStore/images/poodle.jpg. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

Example

The following example copies the test1.txt file from the c:\testingdir\ directory to the c:\productiondir\ directory in Windows and names the new copy of the file test2.txt:

```cfc
<h3>FileCopy Example</h3>
<cfset sourcefile="c:\testingdir\test1.txt">
<cfset destinationfile="c:\productiondir\test2.txt">

<cfif FileExists(#sourcefile#)>
  <cfif FileExists(#destinationfile#)>
    <cfoutput>A copy of #destinationfile# already exists.</cfoutput>
  <cfelse>
    <cfscript>
      FileCopy(#sourcefile#, #destinationfile#);
    </cfscript>
    <cfoutput>Copied: #sourcefile#<br>To: #destinationfile#</cfoutput>
  </cfif>
</cfif>
<cfelse>
  <cfoutput>The source file does not exist.</cfoutput>
</cfif>
```

FileDelete

Description

Deletes the specified on-disk or in-memory file on the server.

Category

System functions

Function syntax

FileDelete(filepath)
See also
FileClose, FileIsEOF, FileOpen, FileRead, FileReadLine, FileWrite, cffile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>Pathname of the on-disk or in-memory file to delete. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the GetTempDirectory function.</td>
</tr>
</tbody>
</table>

Usage
Use this function to free the memory used by an in-memory file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

Example
The following example deletes the file c:\productiondir\test1.txt before moving c:\testdir\test1.txt:

```cfml
<h3>FileDelete Example</h3>
<cfset sourcefile="c:\testdir\test1.txt">
<cfset destinationfile="c:\productiondir\test1.txt">
<cfif FileExists(#sourcefile#)>
   <cfif FileExists(#destinationfile#)>
      <cfoutput>The destination file already exists.<br>
      Deleting previous copy of #destinationfile#. <br>
      Moving: #sourcefile# <br>
      To: <br> #destinationfile#. </cfoutput><br>
   </cfif>
   <cfscript>
      FileDelete(#destinationfile#);
      FileMove(#sourcefile#, #destinationfile#);
   </cfscript>
</cfif>
<cfelse>
   <cfscript>
      FileMove(#sourcefile#, #destinationfile#);
   </cfscript>
   <cfoutput>Moved: #sourcefile# <br>
   To: <br> #destinationfile#. </cfoutput><br>
</cfif>
<cfelse>
   <cfoutput>The source file does not exist.</cfoutput><br>
</cfif>
```

FileExists

Description
Determines whether an on-disk or in-memory file exists.
Returns
Yes, if the file specified in the parameter exists; No, otherwise.

Category
System functions, Decision functions

Function syntax
FileExists(absolute_path)

See also
DirectoryExists, ExpandPath, GetTemplatePath

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>absolute_path</td>
<td>The absolute path of the on-disk or in-memory file.</td>
</tr>
</tbody>
</table>

Usage
To access a file on a remote system, the account (for Windows) or user (for UNIX and Linux) that is running ColdFusion must have permission to access the file, directory, and remote system. For example, if you run ColdFusion in the Server Configuration as a Windows service, by default it runs under the local system account, which does not have sufficient privileges to access remote systems. You can change this, however, on the Log On page of the Services Properties dialog box.

Example
<h3>FileExists Example</h3>
<cfset thisPath = ExpandPath(".*")>
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not ">"
<cfset yourFile = FORM.yourFile>
  <cfif FileExists(ExpandPath(yourfile))>
    Your file exists in this directory. You entered the correct filename, #GetFileFromPath("#thisPath#/yourfile")#</p>
  <cfelse>

FileGetMimeType

Description
Gets the MIME type for the file path/file object you have specified.

Returns
Returns MIME type.
Syntax

```
fileGetMimeType(path[, strict])
fileGetMimeType(fileObject[, strict])
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Full path on disk to the file if <code>strict</code> is set to true. If you do not specify the full path, the file is assumed to be present in the temp directory, as returned by the function <code>getTempDirectory</code>.</td>
</tr>
<tr>
<td>fileObject</td>
<td>Name of the file object.</td>
</tr>
<tr>
<td>strict</td>
<td>If <code>false</code>, determines the file type by extension. The default value is <code>true</code>.</td>
</tr>
</tbody>
</table>

Example

Assume that you have a file named `test.pdf` in `/folder1` and `test.txt` in the same folder, and you want to check the MIME type. Here `test.txt` is a copy of `test.pdf` with extension renamed to `txt`.

```
<cfscript>
    // Case 1.
    mime.mimeType1 = FilegetMimeType(expandPath('/folder1/test.pdf'));
    // Case 2.
    mime.mimeType2 = FilegetMimeType(expandPath('/folder1/test.pdf'),false);
    // Case 3.
    mime.mimeType3 = FilegetMimeType(expandPath('/folder1/test.txt'));
    // Case 4.
    mime.mimeType4 = FilegetMimeType(expandPath('/folder1/test.txt'),false);
    writeDump(mime);
</cfscript>
```

- **Case 1 and Case 2**: Returns `application/pdf` no matter if `strict = true` or `false` because the file is originally a PDF file.
- **Case 3**: Returns `application/pdf` since by default `strict = true` and the file is originally a PDF which is renamed as TXT.
- **Case 4**: Returns `text/plain` since `strict = false`.

**FileIsEOF**

**Description**

Determines whether ColdFusion has reached the end of an on-disk or in-memory file while reading it.

**Returns**

Yes, if the end of the file has been reached; No, otherwise.

**Category**

`System functions, Decision functions`

**Function syntax**

```
FileIsEOF(fileObj)
```
See also
FileClose, FileOpen, FileRead, FileReadLine

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileObj</td>
<td>The file object.</td>
</tr>
</tbody>
</table>

Example
The following example reads a file until it reaches the end of the file:

```c堡垒script>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
 x = FileReadLine(myfile);
 WriteOutput("#x# <br>");
}
FileClose(myfile);
</c堡垒script>

FileMove

Description
Moves an on-disk or in-memory file from one location to another on the server.

Category
System functions

History
ColdFusion 8: Added this function.

Function syntax
FileMove(source, destination)

See also
FileClose, FileCopy, FileOpen, FileRead, FileReadLine, FileWrite, cffile

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Pathname of the on-disk or in-memory file to move. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the GetTempDirectory function.</td>
</tr>
<tr>
<td>destination</td>
<td>Pathname of the destination on-disk or in-memory directory or file. If not an absolute path, it is relative to the source directory.</td>
</tr>
</tbody>
</table>

Usage

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

`ram://filepath`

The filepath can include directories, for example `ram://petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

Example

The following example moves the test1.txt file from the `c:\testingdir\` directory to the `c:\productiondir\` directory in Windows and renames the file test2.txt:

```cfs
<h3>FileMove Example</h3>
<cfset sourcefile="c:\testingdir\test1.txt">
<cfset destinationfile="c:\productiondir\test2.txt">

<cfif FileExists(#sourcefile#)>
    <cfif FileExists(#destinationfile#)>
        <cfoutput>The destination file already exists.</cfoutput>
    <cfelse>
        <cfscript>
            FileMove(#sourcefile#, #destinationfile#);
        </cfscript>
        <cfoutput>Moved: #sourcefile# <br>
        To: <br> #destinationfile#.</cfoutput><br>
    </cfif>
<cfelse>
    <cfoutput>The source file does not exist.</cfoutput><br>
</cfif>
```

FileOpen

Description

Opens an on-disk or in-memory file to read, write, or append. Use this function with the FileRead function to read large files.

Returns

A file object that represents the open file.

Category

System functions
**Function syntax**

FileOpen(filepath, [mode, charset])

**See also**

FileClose, FileCopy, FileReadBinary, FileRead, FileReadLine, FileWrite, cffile

**History**

ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path of an on-disk or in-memory file on the server.</td>
</tr>
<tr>
<td>mode</td>
<td>Action to perform on the file, including the following:</td>
</tr>
<tr>
<td></td>
<td>• read</td>
</tr>
<tr>
<td></td>
<td>• readBinary</td>
</tr>
<tr>
<td></td>
<td>• write</td>
</tr>
<tr>
<td></td>
<td>• append</td>
</tr>
<tr>
<td></td>
<td>If you do not specify the mode, ColdFusion opens the file in read mode.</td>
</tr>
<tr>
<td>charset</td>
<td>The character set of the file.</td>
</tr>
</tbody>
</table>

**Usage**

The file does not have to exist before you open it. To write a new file, open it for writing, and then write it.

The file object is a handle to a file. You can use the object as a structure to access the following information:

- filename  Name of the file you opened
- filepath  Absolute path and filename
- lastmodified  The time when the file was most recently modified
- mode  The action for which the file was opened
- size  The file size in bytes
- status  Whether the file object is open or closed

The following opens a file, and then displays the absolute path and filename of that file:

```cfscript
myfile = FileOpen("c:temp\test1.txt", "read");
</cfscript>

myfile refers to:
<cfdump var="#myfile.filepath#">

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

ram://filepath

The filepath can include directories, for example ram://petStore/images/poodle.jpg. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.
Always close a file after opening it. When you use the FileOpen function to open a file, the file stream from the disk is opened and contents are read from or written to it. The FileClose function closes the stream. If you do not close a file, the stream remains open; in that case, the operating system can lock the file, which results in the file not being usable until the server is restarted.

Example
The following example opens a file, reads and outputs each line of the file, then closes the file.

```cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{  
x = FileReadLine(myfile);
WriteOutput("#x# <br>"; }
FileClose(myfile);
</cfscript>

FileRead

Description
Reads an on-disk or in-memory text file or a file object created with the FileOpen function. You use this function either as an alternative to the cfandle tag with the action="read" attribute. You can also use this function to improve performance when reading a large file, because FileRead does not read the entire file into memory.

Returns
If you specify a filepath, the full text content of the file.
If you specify a file object, the character or byte buffer of the specified size.
If the file was opened in read mode, FileRead returns the character data (a string), otherwise it returns binary data.

Category
System functions

Function syntax
FileRead(filepath [, charset])
OR
FileRead(fileobj [, buffersize])

See also
FileClose, FileIsEOF, FileReadBinary, FileReadLine, FileWrite

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path to an on-disk or in-memory text file on the server.</td>
</tr>
<tr>
<td>charset</td>
<td>The character encoding in which the file contents is encoded. The following list includes commonly used values:</td>
</tr>
<tr>
<td></td>
<td>- utf-8</td>
</tr>
<tr>
<td></td>
<td>- iso-8859-1</td>
</tr>
<tr>
<td></td>
<td>- windows-1252</td>
</tr>
<tr>
<td></td>
<td>- us-ascii</td>
</tr>
<tr>
<td></td>
<td>- shift_jis</td>
</tr>
<tr>
<td></td>
<td>- iso-2022-jp</td>
</tr>
<tr>
<td></td>
<td>- euc-jp</td>
</tr>
<tr>
<td></td>
<td>- euc-kr</td>
</tr>
<tr>
<td></td>
<td>- big5</td>
</tr>
<tr>
<td></td>
<td>- euc-cn</td>
</tr>
<tr>
<td></td>
<td>- utf-16</td>
</tr>
<tr>
<td></td>
<td>If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.</td>
</tr>
<tr>
<td>fileobj</td>
<td>The file object from which to read.</td>
</tr>
<tr>
<td>buffersize</td>
<td>The number of characters to read.</td>
</tr>
</tbody>
</table>

Usage

You can read a text file or a file object with the FileRead function. When you specify an absolute path of a text file, ColdFusion reads the entire contents of the file. When you specify a file object, which you created using the FileOpen function, ColdFusion reads the number of characters specified in buffersize.

Example

```coldfusion
<h3>FileRead Example - Reading a file</h3>

<!--- This reads and outputs the entire file contents. --->
<cfscript>
myfile = FileRead("c:\temp\myfile.txt");
   WriteOutput("#myfile#");
</cfscript>

<!--- This reads and outputs the first 100 characters --->
<!--- from the same file. --->
<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
x = FileRead(myfile, 100);
WriteOutput("#x#");
FileClose(myfile);
</cfscript>
```
FileReadBinary

Description
Reads an on-disk or in-memory binary file (such as an executable or image file) on the server, into a binary object parameter that you can use in the page. To send it through a web protocol (such as HTTP or SMTP) or store it in a database, first convert it to Base64 by using the ToBase64 function.

Note: This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because they can bring down the server.

Returns
The entire contents of a binary file.

Category
System functions

Function syntax
FileReadBinary(filepath)

See also
FileClose, FileIsEOF, FileRead, FileReadLine, FileWrite

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path to an on-disk or in-memory binary file on the server</td>
</tr>
</tbody>
</table>

Usage
You convert the binary file to Base64 to transfer it to another site. ColdFusion 8 supports reading an image file as a binary and passing the result to a cfimage.

Example
The following example reads a binary file.

```cfscript
myfile = FileReadBinary("c:\testingdir\test3.jpg");
```

FileReadLine

Description
Reads a line from an on-disk or in-memory file.
**FileReadLine**

**Returns**
The line of the file.

**Category**
System functions

**Function syntax**

```coldfusion
FileReadLine(fileObj)
```

**See also**

FileClose, FileIsEOF, FileRead, FileWrite

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileObj</td>
<td>The file object</td>
</tr>
</tbody>
</table>

**Example**
The following example opens a file, reads each line, outputs each line, and then closes the file.

```coldfusion
<h3>FileReadLine Example</h3>
<cfscript>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
    x = FileReadLine(myfile); // read line
    WriteOutput("#x#");
}
FileClose(myfile);
</cfscript>
```

**FileSeek**

**Description**
Seeks the position for read or write operation of an on-disk or in-memory file on the server.

**Returns**
Returns the file position within a stream where the next file operation occurs.

**Category**
System functions

**Function syntax**

```coldfusion
FileSeek(fileObj, pos)
```
See also
FileCopy, FileDelete, FileExists, FileMove, FileSetAccessMode, FileSetAttribute, FileSkipBytes

History
ColdFusion 9: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileObj</td>
<td>The file object.</td>
</tr>
<tr>
<td>pos</td>
<td>The position in a file within a stream where the following read and write operation must occur.</td>
</tr>
</tbody>
</table>

Example
<cfscript>
NewFile = FileOpen(ExpandPath("." & "/test.txt","write","",true));
FileSeek(#NewFile#,0);
FileWrite(#NewFile#,"Hello World.. This is for FileOpen, FileSeek, FileSkipBytes.");
FileClose(#NewFile#);
WriteOutput("<br>Opening in Read Mode.<br> ");
NewFile = FileOpen(ExpandPath("." & "/test.txt","read","",true));
ReadFile = FileRead(#NewFile#,100);
WriteOutput("#ReadFile#<br>");
FileClose(#NewFile#);
WriteOutput("<br>Opening in Read-Write Mode.<br> ");
NewFile = FileOpen(ExpandPath("." & "/test.txt","readwrite","",true));
FileSeek(#NewFile#,2);
FileSkipBytes(#NewFile#,4);
FileWrite(#NewFile#,"Earth");
ReadFile = FileRead(#NewFile#,100);
WriteOutput("#ToString(ReadFile)#<br>");
FileClose(#NewFile#);
</cfscript>

FileSetAccessMode

Description
Sets the attributes of an on-disk file on UNIX or Linux. This function does not work with in-memory files.

Category
System functions

Function syntax
FileSetAccessMode(filepath, mode)

See also
FileCopy, FileDelete, FileExists, FileMove

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path to the file on the server.</td>
</tr>
</tbody>
</table>
| mode      | A three-digit value, in which each digit specifies the file access for individuals and groups:  
  - The first digit represents the owner.  
  - The second digit represents a group.  
  - The third digit represents anyone.  
  Each digit of this code sets permissions for the appropriate individual or group:  
  - 4 specifies read permission.  
  - 2 specifies write permission.  
  - 1 specifies execute permission.  
  You use the sums of these numbers to indicate combinations of the permissions:  
  - 3 specifies write and execute permission.  
  - 5 specifies read and execute permission.  
  - 6 indicates read and write permission.  
  - 7 indicates read, write, and execute permission.  
  For example, 400 specifies that only the owner can read the file; 004 specifies that anyone can read the file. |

Example
The following example sets the access mode of a file so that only the owner can read the file.

```html
<h3>FileSetAccessMode Example</h3>

<cfscript>
  FileSetAccessMode("test1.txt", "004");
</cfscript>
```

**FileSetAttribute**

Description
Sets the attributes of an on-disk file in Windows. This function does not work with in-memory files.

Category
System functions

Function syntax
FileSetAttribute(filepath, attribute)

See also
FileCopy, FileDelete, FileExists, FileMove
ColdFusion Functions

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path to a file on the server.</td>
</tr>
</tbody>
</table>
| attribute | One of the following:  
  * readOnly  
  * hidden  
  * normal  
  Set the attribute to normal to make a file not read-only and not hidden. |

Example
The following example sets the access mode of a file to be read-only.

```html
<h3>FileSetAttribute Example</h3>

<cfscript>
  FileSetAttribute("c:\temp\test1.txt", "readOnly");
</cfscript>
```

**FileSetLastModified**

Description
Sets the date when an on-disk or in-memory file was most recently modified.

Category
System functions

Function syntax
`FileSetLastModified(filepath, date)`

See also
`FileCopy`, `FileDelete`, `FileExists`, `FileMove`, `FileSetAccessMode`, `FileSetAttribute`

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filepath</td>
<td>An absolute path to an on-disk or in-memory file on the server.</td>
</tr>
<tr>
<td>date</td>
<td>A valid ColdFusion date or datetime.</td>
</tr>
</tbody>
</table>
Example
<cfscript>
    FileSetLastModified("c:\temp\test1.txt", "#Now()#");
    WriteOutput(#GetFileInfo("c:\temp\test1.txt").lastmodified#);
</cfscript>

FileSkipBytes

Description
Skips over the data before a read or write operation of an on-disk or in-memory file on the server.

Category
System functions

Function syntax
FileSkipBytes(fileObj, noOfBytesToSkip)

See Also
FileCopy, FileDelete, FileExists, FileMove, FileSetAccessMode, FileSetAttribute, FileSeek

History
ColdFusion 9: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileObj</td>
<td>The file object.</td>
</tr>
<tr>
<td>noOfBytesToSkip</td>
<td>The number of bytes that must be skipped before the next file operation.</td>
</tr>
</tbody>
</table>

Usage
For noOfBytesToSkip, if you specify a value greater than the actual number of bytes, all bytes are skipped.

Example
See the Example section for the function FileSeek.

FileUpload

Description
Uploads file to a directory on the server.

Returns
Struct that contains the result (or status) of file upload.

For details of what the struct contains, see the usage section of cffile action = "upload".
**Function syntax**

FileUpload(destination) FileUpload(destination, filefield) FileUpload(destination, filefield, accept) FileUpload(destination, filefield, accept, nameconflict)

**History**

ColdFusion 9.0.1: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Path of directory in which to upload the file. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory returned by the function GetTempDirectory. If the destination you specify does not exist, ColdFusion creates a file with the specified destination name. For example, if you specify the destination C:\XYZ, ColdFusion creates a file XYZ in the C: drive.</td>
</tr>
<tr>
<td>accept</td>
<td>Limits the MIME types to accept. Comma-delimited list. For example, the following code permits JPEG and Microsoft Word file uploads: &quot;image/jpg,application/msword&quot;. The browser uses the filename extension to determine file type.</td>
</tr>
<tr>
<td>nameConflict</td>
<td>Action to take if file has the same name of a file in the directory. - Error: File is not saved. ColdFusion stops processing the page and returns an error. - Skip: File is not saved. This option permits custom behavior based on file properties. - Overwrite: Replaces file. - MakeUnique: Forms a unique filename for the upload; name is stored in the file object variable serverFile.</td>
</tr>
<tr>
<td>fileField</td>
<td>Name of form field used to select the file. Do not use number signs (#) to specify the field name.</td>
</tr>
</tbody>
</table>

**See also**

*FileUploadAll*

**Usage**

cffile action = "upload"

**Example**

```xml
<cfif isdefined("form.fileData")>
    <cfscript>
        hello = FileUpload("<path>","<mime type>","unique");
    </cfscript>
    <cfdump var="#hello#">
</cfifelse>
    <cfform name="myUpload" enctype="multipart/form-data">
        <cfinput type="file" name="fileData"><br>
        <cfinput type="submit" name="submit">
    </cfform>
</cfif>
```

Last updated 7/9/2012
FileUploadAll

Description
Uploads all files sent to the page in an HTTP request to a directory on the server.

Returns
An array of struct that provides the file upload status.
For details of what the struct contains, see the Usage Section of `cffile action = "uploadAll"`.

Function Syntax
FileUploadAll(destination)
FileUploadAll(destination, accept)
FileUploadAll(destination, accept, nameConflict)

History
ColdFusion 9.0.1: Added this function.

Parameter

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Path of directory in which to upload the file.</td>
</tr>
<tr>
<td></td>
<td>If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, returned by the function <code>GetTempDirectory</code>.</td>
</tr>
<tr>
<td></td>
<td>If the destination you specify does not exist, ColdFusion creates a file with the specified destination name. For example, if you specify the destination C:\XYZ, ColdFusion creates a file XYZ in the C: drive.</td>
</tr>
<tr>
<td>accept</td>
<td>Limits the MIME types to accept. Comma-delimited list.</td>
</tr>
<tr>
<td></td>
<td>For example, the following code permits JPEG and Microsoft Word file uploads:</td>
</tr>
<tr>
<td></td>
<td>&quot;image/jpg, application/msword&quot;</td>
</tr>
<tr>
<td></td>
<td>The browser uses the filename extension to determine file type.</td>
</tr>
<tr>
<td>nameConflict</td>
<td>Action to take if file has the same name of a file in the directory.</td>
</tr>
<tr>
<td></td>
<td>• Error: File is not saved. ColdFusion stops processing the page and returns an error.</td>
</tr>
<tr>
<td></td>
<td>• Skip: File is not saved. Permits custom behavior based on file properties.</td>
</tr>
<tr>
<td></td>
<td>• Overwrite: Replaces file.</td>
</tr>
<tr>
<td></td>
<td>• MakeUnique: Forms a unique filename for the upload; name is stored in the file object variable <code>serverFile</code>.</td>
</tr>
</tbody>
</table>

See also
FileUpload

Usage
`cffile action = "uploadAll"`
**FileWrite**

**Description**
If you specify a file path, writes the entire content to the specified on-disk or in-memory file. If you specify a file object, writes text or binary data to the file object.

**Category**
System functions

**Function syntax**
```
FileWrite(filepath, data [, charset])
```

OR
```
FileWrite(fileobj, data)
```

**See also**
FileCopy, FileDelete, FileExists, FileMove, cffile

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>The character encoding in which the file contents is encoded. The following list includes commonly used values:</td>
</tr>
<tr>
<td></td>
<td>* utf-8</td>
</tr>
<tr>
<td></td>
<td>* iso-8859-1</td>
</tr>
<tr>
<td></td>
<td>* windows-1252</td>
</tr>
<tr>
<td></td>
<td>* us-ascii</td>
</tr>
<tr>
<td></td>
<td>* shift_jis</td>
</tr>
<tr>
<td></td>
<td>* iso-2022-jp</td>
</tr>
<tr>
<td></td>
<td>* euc-jp</td>
</tr>
<tr>
<td></td>
<td>* euc-kr</td>
</tr>
<tr>
<td></td>
<td>* big5</td>
</tr>
<tr>
<td></td>
<td>* euc-cn</td>
</tr>
<tr>
<td></td>
<td>* utf-16</td>
</tr>
</tbody>
</table>

If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.
Usage
Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram://filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

Example
```
<h3>FileWrite Example</h3>
<!--- This example gets the email addresses of employees, --->
<!--- creates a file object that contains the e-mail addresses, --->
<!--- read the file object, and then creates a text file with a --->
<!--- list of e-mail addresses. --->

<cfquery name="getemployees" datasource="cfdocexamples">
SELECT EMAIL
FROM Employees
</cfquery>

<cfset companymail = ">

<cfloop query = "getemployees">
    <cfset companymail = companymail & #EMAIL# & ";" & ">
</cfloop>

<cfscript>
FileWrite("mail_list", 
#companymail#");
mlist = FileRead("mail_list");
FileWrite("c:\temp\mail_list.txt", 
#mlist#");
</cfscript>
```

FileWriteLine

Description
Appends the specified text to the file object.

Category
System functions
### FileWriteLine

**Function syntax**

`FileWriteLine(fileobj, text)`

**See also**

`FileCopy`, `FileDelete`, `FileExists`, `FileMove`, `FileWrite`, `cffile`

### History

ColdFusion 8: Added this function.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Content to add to the file object.</td>
</tr>
<tr>
<td>fileobj</td>
<td>The file object to which to write the line.</td>
</tr>
</tbody>
</table>

### Example

```<h3>FileWriteLine Example</h3>```

```<cfscript>
    myfile = FileOpen("c:\temp\test1.txt", "write");
    FileWriteLine(myfile,"This line is new.");
    FileClose(myfile);
</cfscript>```

### Find

**Description**

Finds the first occurrence of a `substring` in a `string`, from a specified start position. The search is case sensitive.

**Returns**

A number; the position of `substring` in `string`; or 0, if `substring` is not in `string`.

**Category**

String functions

**Function syntax**

`Find(substring, string [, start ])`

**See also**

`FindNoCase`, `Compare`, `FindOneOf`, `REFind`, `Replace`

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>A string or a variable that contains one. String for which to search.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>start</td>
<td>Start position of search.</td>
</tr>
</tbody>
</table>
Example
<cfoutput>
  <cfset stringToSearch = "The quick brown fox jumped over the lazy dog."/>
  #find("the",stringToSearch)#<br>
  #find("the",stringToSearch,35)#<br>
  #find("no such substring",stringToSearch)#<br>
  <br>
  #findnocase("the",stringToSearch)#<br>
  #findnocase("the",stringToSearch,5)#<br>
  #findnocase("no such substring",stringToSearch)#<br>
  <br>
  #findoneof("aeiou",stringToSearch)#<br>
  #findoneof("aeiou",stringToSearch,4)#<br>
  #findoneof("@%^*()",stringToSearch)#<br>
</cfoutput>

FindNoCase

Description
Finds the first occurrence of a substring in a string, from a specified start position. If substring is not in string, returns zero. The search is case-insensitive.

Returns
The position of substring in string; or 0, if substring is not in string.

Category
String functions

Function syntax
FindNoCase(substring, string [, start ])

See also
Find, CompareNoCase, FindOneOf, REFind, Replace

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>A string or a variable that contains one. String for which to search.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>start</td>
<td>Start position of search.</td>
</tr>
</tbody>
</table>

Example
In the following example, the Find function returns 33 as the first position found because "the" is lowercase. The FindNoCase function returns 1 as the first position because the case is ignored.
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">

stringToSearch = <cfoutput>#{stringToSearch}#</cfoutput><br>
<p>Find Function:<br>Find("the",stringToSearch) returns <cfoutput>#{find("the",stringToSearch)}#</cfoutput><br>
<p>FindNoCase Function:<br>FindNoCase("the",stringToSearch) returns <cfoutput>#{FindNoCase("the",stringToSearch)}#</cfoutput>

FindOneOf

Description
Finds the first occurrence of *any one of a set of characters* in a *string*, from a specified start position. The search is case sensitive.

Returns
The position of the first member of *set* found in *string*, or 0, if no member of *set* is found in *string*.

Category
String functions

Function syntax
FindOneOf(*set*, *string*, [, *start]*)

See also
Find, Compare, REFind

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>set</td>
<td>A string or a variable that contains one. String that contains one or more characters to search for.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>start</td>
<td>Start position of search.</td>
</tr>
</tbody>
</table>
Example
<cfoutput>
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">
#find("the",stringToSearch)#<br>
#find("the",stringToSearch,35)#<br>
#find("no such substring",stringToSearch)#<br>
<br>
#findnocase("the",stringToSearch)#<br>
#findnocase("the",stringToSearch,5)#<br>
#findnocase("no such substring",stringToSearch)#<br>
<br>
#findoneof("aeiou",stringToSearch)#<br>
#findoneof("aeiou",stringToSearch,4)#<br>
#findoneof("@%^*()",stringToSearch)#<br>
</cfoutput>

FirstDayOfMonth

Description
Determines the ordinal (day number, in the year) of the first day of the month in which a given date falls.

Returns
A number that corresponds to a day-number in a year.

Category
Date and time functions

Function syntax
FirstDayOfMonth(date)

See also
Day, DayOfWeek, DayOfWeekAsString, DayOfYear, DaysInMonth, DaysInYear

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

Example
<h3>FirstDayOfMonth Example</h3>

<cfoutput>
The first day of #MonthAsString(Month(Now()))#, #Year(Now())# was day #FirstDayOfMonth(Now())# of the year.
</cfoutput>
**Fix**

**Description**
Converts a real number to an integer.

**Returns**
If `number` is greater than or equal to 0, the closest integer less than or equal to `number`.
If `number` is less than 0, the closest integer greater than or equal to `number`.

**Category**
Mathematical functions

**Function syntax**
Fix(`number`)  

**See also**
Ceiling, Int, Round

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A number</td>
</tr>
</tbody>
</table>

**Example**

```cfoutput```
<p>Fix returns the closest integer less than the number if the number is greater than or equal to 0. Fix returns the closest integer greater than the number if number is less than 0.</p>
```cfoutput```

```cfoutput```
<p>The fix of 3.4 is #Fix(3.4)#</p>
<p>The fix of 3 is #Fix(3)#</p>
<p>The fix of 3.8 is #Fix(3.8)#</p>
<p>The fix of -4.2 is #Fix(-4.2)#</p>
```cfoutput```

**FormatBaseN**

**Description**
Converts `number` to a string, in the base specified by `radix`.

**Returns**
String that represents `number`, in the base `radix`.

**Category**
Display and formatting functions, Mathematical functions, String functions
Function syntax
FormatBaseN(number, radix)

See also
InputBaseN

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to convert</td>
</tr>
<tr>
<td>radix</td>
<td>Base of the result</td>
</tr>
</tbody>
</table>

Example

<h3>FormatBaseN Example</h3>
<p>Converts a number to a string in the base specified by Radix.</p>
<pre>
<cfoutput>
FormatBaseN(10,2): #FormatBaseN(10,2)#
FormatBaseN(1024,16): #FormatBaseN(1024,16)#
FormatBaseN(125,10): #FormatBaseN(125,10)#
FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#
</cfoutput>
</pre>

<h3>InputBaseN Example</h3>
<p>InputBaseN returns the number obtained by converting a string, using base specified by Radix (an integer from 2 to 36).</p>
<pre>
<cfoutput>
InputBaseN("1010",2): #InputBaseN("1010",2)#
InputBaseN("3ff",16): #InputBaseN("3ff",16)#
InputBaseN("125",10): #InputBaseN("125",10)#
InputBaseN(1010,2): #InputBaseN(1010,2)#
</cfoutput>
</pre>

GenerateSecretKey

Description
Gets a secure key value for use in the Encrypt function.

Returns
A string that contains the encryption key.

Category
Security functions, String functions

Function syntax
GenerateSecretKey(algorithm [,keysize])

See also
Decrypt, Encrypt
History
ColdFusion 8: Added the `keysize` attribute.
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| algorithm | The encryption algorithm for which to generate the key. ColdFusion installs a cryptography library with the following algorithms:  
  - AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.  
  - BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.  
  - DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3. |
| keysize   | Number of bits requested in the key for the specified algorithm.  
  You can use this to request longer keys when allowed by the JDK. For example, the AES algorithm keys are limited to 128 bits unless the Java Unlimited Strength Jurisdiction Policy Files are installed. For more information, see http://java.sun.com/products/jce/index-14.html. |

Usage
You cannot use the `GenerateSecretKey` function to generate a key for the ColdFusion default encryption algorithm (CFMX_COMPAT) of the `Encrypt` and `Decrypt` functions.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

Example
The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX_COMPAT algorithm. For all other algorithms, it uses the `GenerateSecretKey` function to generate a secret key.
<h3>Decrypt Example</h3>

<!---- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myString")>
  <cfscript>
    /* GenerateSecretKey does not generate keys for the CFMX_COMPAT algorithm, so we use a key from the form. */
    if (Form.myAlgorithm EQ "CFMX_COMPAT")
    theKey=Form.MyKey;
    // For all other encryption techniques, generate a secret key.
    else
      theKey=generateSecretKey(Form.myAlgorithm);
    //Encrypt the string.
    encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm, Form.myEncoding);
    //Decrypt it.
    decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
  </cfscript>

<!---- Display the values used for encryption and decryption, and the results. --->
<cfoutput>
  <b>The algorithm:</b> #Form.myAlgorithm#<br>
  <b>The key:</b> #theKey#<br>
  <br>
  <b>The string:</b> #Form.myString# <br>
  <br>
  <b>Encrypted:</b> #encrypted#<br>
  <br>
  <b>Decrypted:</b> #decrypted#<br>
</cfoutput>
</cfif>

<!---- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <b>Select the encoding</b><br>
  <select size="1" name="myEncoding">
    <option selected>UU</option>
    <option>Base64</option>
  </select>
</form>
GetApplicationMetadata

Description
Returns the application settings that you have specified in the application, either in the Application.cfc or Application.cfm. For details, see Application Variables section in CFML Reference.

Note: If you have turned on Enable Global Script Protection in ColdFusion Administrator (Server Settings > Settings), the value returned is the default scopes protected (form, URL, CGI, or Cookie). If you specify an invalid value, none, or if Enable Global Script Protection is turned off in ColdFusion Administrator, none is returned.

Note: If you have specified memory limit for VFS in ColdFusion Administrator and if Memory Limit per Application for In-Memory Virtual File System (Server Settings > Settings) has a value lesser than what you have specified in the Application.cfc (this.inmemoryfilesystem.size), then the returned value is the one specified in the ColdFusion Administrator and not the Application.cfc.

Note: If ColdFusion does not find the Application.cfc/Application.cfm ColdFusion searches for the application in the order in which you have set Application.cfm/Application.cfc look up order (ColdFusion Administrator > Settings > Server Settings). If no application is found, an empty struct is returned.

Returns
A struct that contains application settings such as name, sessionManagement, or invokeImplicitAccessor.

Category
Other functions

Syntax
getApplicationMetadata()
Application.cfc

component
{
    this.name = "myapp";
    this.applicationtimeout = createtimespan(0, 0, 0, 10);
    this.sessiontimeout = createtimespan(0, 0, 0, 10);
    this.sessionmanagement = true;
    this.clientmanagement = true;
    this.datasource = "cfartgallery";
    this.ormenabled = true;
    this.secureJSON = true;
    this.secureJSONPrefix = "///";
    this.setClientCookies = true;
    this.setDomainCookies = true;
    this.setClientStorage = "Registry";
    this.setLoginStorage = "Cookies";
    this.scriptProtect = "all";
    this.mappings["mymapping"] = getdirectoryfrompath(cgi.cf_template_path);
    this.customTagPaths = "path1,path2,path3";
    this.invokeImplicitAccessor = true;
    this.inmemoryfilesystem.enabled = true;
    this.inmemoryfilesystem.size = 10;
}

AppMetaData.cfm

<cfscript>
    writedump(getApplicationMetadata());
</cfscript>

GetAuthUser

Description
Gets the name of an authenticated user.

Returns
The name of an authenticated user.

Category
Security functions

Function syntax
GetAuthUser()

See also
cflogin, cfloginuser, cflogout, GetUserRoles, IsUserInAnyRole, IsUserInRole, IsUserLoggedIn, Securing Applications in the Developing ColdFusion Applications

History
ColdFusion MX: Added this function.
Usage
This function works with `cflogin` authentication or web server authentication. It checks for a logged-in user as follows:

1. It checks for a login made with `cfloginuser`.
2. If no user was logged in with `cfloginuser`, it checks for a web server login (`cgi.remote_user`).

Example

```cfoutput
Authenticate User: #GetAuthUser()#</cfoutput>
```

**GetBaseTagData**

Description
Used within a custom tag. Finds calling (ancestor) tag by name and accesses its data.

Returns
An object that contains data (variables, scopes, and so on) from an ancestor tag. If there is no ancestor by the specified name, or if the ancestor does not expose data (for example, `cfif`), an exception is thrown.

Category
Other functions

Function syntax

```
GetBaseTagData(tagname [, instancenumber ])
```

See also

`GetBaseTagList`; High-level data exchange in the *Developing ColdFusion Applications*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tagname</code></td>
<td>(Required) Ancestor tag name for which to return data</td>
</tr>
<tr>
<td><code>instancetype</code></td>
<td>(Optional) Number of ancestor levels to jump before returning data. The default value is 1 (closest ancestor).</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Example

<!--- This example shows the use of GetBaseTagData function. Typically used in custom tags.--->
...
<cfif trim(inCustomTag) neq "">
  <cfoutput>
    Running in the context of a custom tag named #inCustomTag#.<p>
  </cfoutput>
</cfif>

<!--- Get the tag instance data --->
<cfset tagData = GetBaseTagData(inCustomTag)>
<!--- Find the tag's execution mode --->
Located inside the template
<cfelse>
  BODY
</cfif>

GetBaseTagList

Description
Gets ancestor tag names, starting with the parent tag.

Returns
A comma-delimited list of uppercase ancestor tag names, as a string. The first list element is the current tag. If the current tag is nested, the next element is the parent tag. If the function is called for a top-level tag, it returns an empty string. If an ancestor does not expose data (see GetBaseTagData), its name might not be returned.

Category
Other functions

Function syntax
GetBaseTagList()

See also
GetBaseTagData; High-level data exchange in the Developing ColdFusion Applications

Usage
This function does not display the following tags or end tags in the ancestor tag list:
- cfif, cfelseif, cfelse
- cfswitch, cfcase, cfdefaultcase
- cftry, cfcatch
This function displays the following tags only under the following conditions:
- cfloop: if it uses a query attribute
- cfoutput: if at least one of its children is a complex expression
• `cfprocessingdirective`: if it has at least one other attribute besides `pageencoding`

**Example**

`<%!--- This example shows the use of GetBaseTagList function. Typically used in custom tags. ---%>
<cif thisTag.executionMode is "start">
  <!--- Get the tag context stack
  The list will look something like "CFIF,MYTAGNAME..." ---%>
  <cfset ancestorList = GetBaseTagList()>
  <br><br>
  Dump of GetBaseTagList output:<br>
  <cfdump var="#ancestorList#"><br><br>
  <!--- Output current tag name ---%>
  <cfoutput>This is custom tag#ListGetAt(ancestorList,1)#</cfoutput><br>
  <!--- Determine whether this is nested inside a loop ---%>
  <cfset inLoop = ListFindNoCase(ancestorList, "cfloop")>
  <cfif inLoop>
  Running in the context of a cfloop tag.<br>
  </cfif>
</cif>

**GetBaseTemplatePath**

**Description**

Gets the absolute path of an application’s base page.

**Returns**

The absolute path of the application base page, as a string.

**Category**

*Other functions*, *System functions*

**Function syntax**

`GetBaseTemplatePath()`

**See also**

`GetCurrentTemplatePath`, `FileExists`, `ExpandPath`

**Example**

```cfml
<h3>GetBaseTemplatePath Example</h3>

<p>The template path of the current page is:
<cfoutput>#GetBaseTemplatePath()#</cfoutput>
```

**GetClientVariablesList**

**Description**

Finds the client variables to which a page has write access.
Returns
Comma-delimited list of non-read-only client variables, as a string.

Category
List functions, Other functions

Function syntax
GetClientVariablesList()

See also
DeleteClientVariable

Usage
The list of variables returned by this function is compatible with ColdFusion list functions.

Example
<h3>GetClientVariablesList Example</h3>

<!--- The following line enables client variables. You would normally do this in Application.cfc.--->
<cfapplication clientmanagement="yes">
<p>This example creates two client variables and deletes the User_ID client variable, if it exists in the list of client variables returned by GetClientVariablesList().</p>
<cfset client.somevar = "">
<cfset client.User_ID = "">
<p>Client variable list: <cfoutput>#GetClientVariablesList()#</cfoutput></p>
<cfif ListFindNoCase(GetClientVariablesList(), "User_ID") is not 0>
  Delete client.User_ID variable.
  <cfset temp = DeleteClientVariable("User_ID")>
  <p>Was variable "User_ID" Deleted? <cfoutput>#temp#</cfoutput></p>
</cfif>
<p>Amended Client variable list: <cfoutput>#GetClientVariablesList()#</cfoutput></p>
</cfapplication>

GetComponentMetaData

Description
Gets metadata (such as the functions and implemented interfaces of a component) for a CFC or ColdFusion interface.

Returns
A structure containing the metadata for the CFC or interface. For information on the structure contents, see the component entry in the table in the GetMetaData Usage section.

Category
Extensibility functions
Function syntax
GetComponentMetaData(path)

See also
GetMetaData

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The dot-delimited path of the interface or CFC definition. The path can be relative to the current directory or the web root. For example, if a cfm page that calls this function is in web_root/my_apps/interfaces, the interface file is in web_root/my_apps/interfaces/definitions, and you want to get the metadata for the interface defined in I2.cfc, specify either of the following values in this parameter:</td>
</tr>
<tr>
<td></td>
<td>• definitions.I2</td>
</tr>
<tr>
<td></td>
<td>• my_apps.interface.definitions.I2.cfc</td>
</tr>
</tbody>
</table>

Usage
This function and the getMetaData function return the same data. This function, however, takes a path to the CFC or Interface definition file, and does not use or create an object instance. Also, this function can get data about CFCs and interfaces only, and you cannot specify an interface in the getMetaData function.

GetContextRoot

Description
Returns path to the J2EE server context root for the current request.

Returns
The path from the web root to the context root for the current page. The path starts with a forward slash character (/) but does not end with a forward slash character (/). For applications in the default (root) context, returns the empty string.

Category
System functions

History
ColdFusion MX 7: Added this function.

Function syntax
GetContextRoot ()

See also
GetPageContext
Usage
This function is equivalent to calling `GetPageContext().GetRequest().GetContextPath()`. On J2EE configurations, it returns the path from the Web root to the J2EE context root of the ColdFusion J2EE application. On server configurations, it returns the empty string, because the context root is at the web root.

This function is useful in applications that might be installed at varying J2EE context roots.

Example
The ColdFusion Administrator uses the following line to get the location of the administrator directory:

```cfset request.thisURL = "#getContextRoot()#/CFIDE/administrator/"
```

The Administrator uses the returned value in places where it uses a URL to access Administrator resources, such as images, as in the following line:

```html
<a href="index.cfm"><img src="#request.thisURL#images/back.gif" width="16" height="16" border="0" alt=""></a>
```

GetCPUUsage

Description
Gets the CPU usage with default or custom snapshot interval. The default interval is 1000 milli-seconds.

Syntax

```cfml
getCPUUsage()
getCPUUsage(long ms)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>long ms</td>
<td>Time in milli-seconds. This is the time delay between two snapshots.</td>
</tr>
</tbody>
</table>

GetCurrentTemplatePath

Description
Gets the path of the page that calls this function.

Returns
The absolute path of the page that contains the call to this function, as a string.

Category
System functions

Function syntax

```cfml
GetCurrentTemplatePath()
```

See also
`GetBaseTemplatePath, FileExists, ExpandPath`
Usage
If the function call is made from a page included with a cfinclude tag, this function returns the page path of an included page. Contrast this with the GetBaseTemplatePath function, which returns the path of the top-level page, even if it is called from an included page.

Example
<!--- This example uses GetCurrentTemplatePath to show the template path of the current page --->
<h3>GetCurrentTemplatePath Example</h3>
<p>The template path of the current page is: <cfoutput>#GetCurrentTemplatePath()#</cfoutput>

GetDirectoryFromPath

Description
Extracts a directory from an absolute on-disk or in-memory path.

Returns
Absolute path, without the filename. The last character is a forward or backward slash, depending on the operating system.

Category
System functions

Function syntax
GetDirectoryFromPath(path)

See also
ExpandPath, GetFileFromPath

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Absolute on-disk or in-memory path.</td>
</tr>
</tbody>
</table>
GetDirectoryFromPath Example

```coldfusion
<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
  <cfif FORM.yourFile is not ">
    <cfset yourFile = FORM.yourFile>
    <cfif FileExists(ExpandPath(yourfile))>
      <p>Your file exists in this directory. You entered the correct filename,<br>#GetFileFromPath("#thisPath#/yourfile")#</p>
    <cfelse>
      <p>Your file was not found in this directory:<br>Here is a list of the other files in this directory:<br>"" &gt;&gt; use cfdirectory show directory, order by name & size &gt;&gt;
<cfset cfdirectory directory = "#thisDirectory#"
    name = "myDirectory" SORT = "name ASC, size DESC">
      <p>&gt;&gt; Output the contents of the cfdirectory as a CFTABLE &gt;&gt;
<cfset cftable query = "myDirectory">
    <cfcol header = "NAME:" text = "#Name#">
    <cfcol header = "SIZE:" text = "#Size#">
  </cftable>
</cfif>
</cfif>
<cfelse>
  <H3>Please enter a filename</H3>
</cfif>
</cfoutput>
<form action="getdirectoryfrompath.cfm" METHOD="post">
  <H3>Enter the name of a file in this directory <I><FONT SIZE="-1">(try expandpath.cfm)</FONT></I></H3>
  <input type="Text" NAME="yourFile">
  <input type="Submit" NAME="">
</form> --->

GetEncoding

Description

Returns the encoding (character set) of the Form or URL scope.

Returns

String; the character encoding of the specified scope.

Category

International functions, System functions

Function syntax

GetEncoding(scope_name)
See also
cfcontent, cfprocessingdirective, URLEncode, URLEncodedFormat

History
ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scope_name</td>
<td>• Form</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
</tbody>
</table>

Usage
Use this function to determine the character encoding of the URL query string or the fields of a form that was submitted to the current page. The default encoding, if none has been explicitly set, is UTF-8.

For more information, see www.iana.org/assignments/character-sets.

Example
<!--- This example sends the contents of two fields and interprets them as big5 encoded text. Note that the form fields are received as URL variables because the form uses the GET method.--->
<form action='#cgi.script_name#' method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type="Submit" value="Submit"></form>

<cfif IsDefined("URL.xxx")>
<cfscript>
    SetEncoding("url", "big5");
    WriteOutput("URL.XXX is " & URL.xxx & "<br>");
    WriteOutput("URL.YYY is " & URL.yyy & "<br>");
    theEncoding = GetEncoding("URL");
    WriteOutput("The URL variables were decoded using '" & theEncoding & "' encoding.");

    WriteOutput("The encoding is " & theEncoding);
</cfscript>
</cfif>

GetException

Description
Used with the cfttry and cfcatch tags. Retrieves a Java exception object from a Java object.

Returns
Any Java exception object raised by a previous method call on the Java object.
Category
System functions

Syntax
GetException(object)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A Java object.</td>
</tr>
</tbody>
</table>

Usage
ColdFusion stores a Java exception object for each method call on a Java object. Subsequent method calls reset the exception object. To get the current exception object, call GetException on the Java object before other methods are invoked on it.

Example

```coldfusion
<!--- Create the Java object reference --->
<cfobject action = create type = java class = primativetype name = myObj>
<!--- Calls the object's constructor --->
<cfset void = myObj.init()>
<cftry>
<cfset void = myObj.DoException() >
<cfcatch type = "Any">
  <cfset exception = GetException(myObj)>
  <!--- User can call any valid method on the exception object.--->
  <cfset message = exception.toString()>
  <cfoutput>
    I got exception 
    <br> The exception message is: #message# 
  </cfoutput>
</cfcatch>
</cftry>
```

GetFileFromPath

Description
Extracts a filename from an absolute on-disk or in-memory path.

Returns
Filename, as a string.

Category
System functions

Function syntax
GetFileFromPath(path)
See also
ExpandPath, GetCurrentTemplatePath

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Absolute on-disk or in-memory path.</td>
</tr>
</tbody>
</table>

Example

```cf
<h3>GetFileFromPath Example</h3>
<cfset thisPath = ExpandPath("*.txt")>
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not ">
<cfset yourFile = FORM.yourFile>
<cfif FileExists(ExpandPath(yourfile))>
<p>Your file exists in this directory. You entered the correct file name, #GetFileFromPath("#thisPath#/yourfile")#</p>
<cfelse>
<p>Your file was not found in this directory:
<br>Here is a list of the other files in this directory:
<br>--- use CFDIRECTORY to give the contents of the snippets directory, order by name and size ---
<CFDIRECTORY
    DIRECTORY = "#thisDirectory#"
    name = "myDirectory"
    SORT = "name ASC, size DESC">
<---- Output the contents of the CFDIRECTORY as a CFTABLE ----
    <CFTABLE QUERY = "myDirectory">
        <CFCOL HEADER = "NAME:" TEXT = "#Name#"/>
        <CFCOL HEADER = "SIZE:" TEXT = "#Size#"/>
        ...
</CFDIRECTORY>
```

GetFileInfo

Description
Retrieves information about on-disk or in-memory file.

Returns
The filename, path, parent directory, type, size, when the file was most recently modified, whether the file has read permission, write permission, and is hidden.

Category
System functions

Function syntax
GetFileInfo(path)
See also

FileOpen

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Absolute on-disk or in-memory path.</td>
</tr>
</tbody>
</table>

Usage
The function returns a structure that includes the following keys:

- Name: name of the file
- Path: absolute path of the file
- Parent: path to the file's parent directory
- Type: either "directory" or "file"
- Size: file size in bytes
- Lastmodified: datetime when it was the file was most recently modified
- canRead: whether the file can be read
- canWrite: whether the file has write permission
- isHidden: whether the file is a hidden

Example

```cfscript
<cfscript>
    FileSetLastModified("c:\temp\test1.txt", "#Now()#");
    WriteOutput(GetFileInfo("c:\temp\test1.txt").lastmodified);
</cfscript>
```

GetFreeSpace

Description
Gets information about free hard disk space or free in-memory VFS space.

Returns
Returns the free space in bytes.

Syntax

getFreeSpace(path)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to the</td>
</tr>
<tr>
<td></td>
<td>• Hard disk drive, for example C:\ for Windows or / for UNIX. Note that for Windows, you have to explicitly use colon (:) and not just C. Only the space of the entire hard disk drive is returned. If you mention a directory in the path, for example, /opt/, it is ignored and only / is considered.</td>
</tr>
<tr>
<td></td>
<td>• For in-memory file system, the path is ram:</td>
</tr>
</tbody>
</table>

Usage

See the usage section for `GetTotalSpace`.

Example

In the following example, in-memory file system memory for the application is set to 20 MB in ColdFusion Administrator. The function returns 20, which means the total space considered is 20 MB. This is because the value specified in the ColdFusion Administrator (Memory Limit per Application for In-Memory Virtual File System) is lesser than the value specified in the Application.cfc (20 MB).

Application.cfc

```cfc
<cfcomponent>
    <cfset this.name = "vfs_total_space">
    <cfset this.inmemoryfilesystem.size = 30>
</cfcomponent>
```

space.cfm

```cft
<cftry>
    <cfset totalRAMSpace = getTotalSpace("ram:" ) >
    <cfset freeRAMSpace = getFreeSpace("ram:" ) >
    <cfset totalDiskSpace = getTotalSpace("c:" ) >
    <cfset freeDiskSpace = getFreeSpace("c:" ) >
    <cfoutput>
        Total Hard Disk Space = #DecimalFormat(totalDiskSpace / (1024 * 1024 * 1024))# GB
        Free Hard Disk Space = #DecimalFormat(freeDiskSpace / (1024 * 1024 * 1024))# GB
        Total Application RAM Memory = #DecimalFormat(totalRAMSpace / (1024 * 1024))# MB
        Free Application RAM Memory = #DecimalFormat(freeRAMSpace / (1024 * 1024))# MB
    </cfoutput>
<cfcatch type="any">    #cfcatch.message#    #cfcatch.detail#    </cfcatch>
</cftry>
```

GetFunctionCalledName

Description

Returns the name of the variable used to call a defined function.
Returns
Name of the variable.

Category
System functions

Function syntax
GetFunctionCalledName()

History
ColdFusion 9: Added this function

Usage
This function can be used to return data from CFCs by simulating getters and setters. This applies only if the CFC does not use implicit getters and setters provided by ColdFusion.

Example
The following example shows how you can use this function to return data without defining explicit setters and getters:

```coldfusion
//callednamedemo.cfc
component
{
    variables.x1 = 1;
    variables.y1 = 2;
    function init()
    {
        return this;
    }
    function get()
    {
        var name = getFunctionCalledName();
        return variables[mid(name,4,len(name)-3)];
    }
    function set(value)
    {
        var name = getFunctionCalledName();
        variables[mid(name,4,len(name)-3)] = value;
    }
    this.getX1 = get;
}
```
this.getY1 = get;
this.setX1 = set;
this.setY1 = set;
}
<!---- calledname.cfm --->
<cfscript>
function test()
{
    return getFunctionCalledName();
}
WriteOutput(test() & "<br>"); // test
a = test;
WriteOutput(variables.a() & "<br>"); // a
o = new callednamedemo();
// shows *real* methods get(), SetX1() and getY1(), etc.
writeDump(o);
o.setX1(10);
o.setY1(20);
WriteOutput(o.getX1() & "<br>"); // 10
WriteOutput(o.getY1() & "<br>"); // 20 </cfscript>

GetFunctionList

Description
Displays a list of the functions that are available in ColdFusion.

Returns
A structure of functions.

Category
System functions

Function syntax
GetFunctionList()

Example
<!----- This example shows the use of GetFunctionList. ---->
<cfset fList = GetFunctionList()>
<cfoutput>#StructCount(fList)# functions<br><br>
</cfoutput>
<cfloop COLLECTION = "#fList#" ITEM = "key">
    <cfoutput>#key#<br>
</cfoutput>
</cfloop>

GetGatewayHelper

Description
Gets a Java GatewayHelper object that provides methods and properties for use with a ColdFusion event gateway.
Returns
A Java GatewayHelper object.

Category
Extensibility functions

Function syntax
GetGatewayHelper(gatewayID)

See also
SendGatewayMessage

History
ColdFusion MX 7: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayID</td>
<td>Identifier of the gateway that provides the GatewayHelper object. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion Administrator Event Gateways section’s Gateways page.</td>
</tr>
</tbody>
</table>

Usage
The ColdFusion GetGatewayHelper function returns a Java GatewayHelper object that provides event gateway-specific helper methods and properties. To use this function, the event gateway must provide access to a class that implements the GatewayHelper class. For example, an instant messaging event gateway might make buddy-list management functions available in a GatewayHelper object.

An event gateway listener CFC can get the gatewayID value from the CFEvent structure of the incoming message.

You access the GatewayHelper object’s methods and properties using standard ColdFusion Java object access techniques. For more information, see The role of the GatewayHelper object in the Developing ColdFusion Applications.

Example
If an event gateway’s helper class includes an addBuddy method that takes a single String parameter, you could use the following code to get the GatewayHelper object and add a buddy to the buddies list:

```cfc
<cfscript>
myHelper = getGatewayHelper(myGatewayID);
status = myHelper.addBuddy("jsmith");
</cfscript>
```

GetHttpRequestData

Description
Makes HTTP request headers and body available to CFML pages. Useful for capturing SOAP request data, which can be delivered in an HTTP header.
Returns
A ColdFusion structure.

Category
System functions

Function syntax
GetHttpRequestData()

Returns
The function returns a structure that contains the following entries:

<table>
<thead>
<tr>
<th>Structure element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>Raw content from form submitted by client, in string or binary format. For content to be considered string data, the FORM request header &quot;CONTENT_TYPE&quot; must start with &quot;text/&quot; or be special case &quot;application/x-www-form-urlencoded&quot;. Other types are stored as a binary object.</td>
</tr>
<tr>
<td>headers</td>
<td>Structure that contains HTTP request headers as value pairs. Includes custom headers, such as SOAP requests.</td>
</tr>
<tr>
<td>method</td>
<td>String that contains the CGI variable Request_Method.</td>
</tr>
<tr>
<td>protocol</td>
<td>String that contains the Server_Protocol CGI variable.</td>
</tr>
</tbody>
</table>

Usage
To determine whether data is binary, use IsBinary(x.content). To convert data to a string value, if it can be displayed as a string, use ToString(x.content).

Example
The following example shows how this function can return HTTP header information.

```cfdm
<cfset x = GetHttpRequestData()>
<cfoutput>
<table cellpadding = "2" cellspacing = "2">
<tr>
  <td><b>HTTP Request item</b></td>    <td><b>Value</b></td> </tr>
<cfloop collection = #x.headers# item = "http_item">
  <tr>
    <td>#http_item#</td>     <td>#StructFind(x.headers, http_item)#</td></tr>
<cfloop>
<tr>
  <td>request_method</td>
  <td>#x.method#</td></tr>
<tr>
  <td>server_protocol</td>
  <td>#x.protocol#</td></tr>
</table>
<b>http_content --- #x.content#</b>
</cfoutput>
```
**GetHttpTimeString**

**Description**
Gets the current time, in the Universal Time code (UTC).

**Returns**
The time, as a string, according to the HTTP standard described in RFC 1123 and its underlying RFC, 822. This format is commonly used in Internet protocols, including HTTP.

**Category**
Date and time functions, International functions

**Function syntax**
GetHttpTimeString(date_time_object)

**See also**
GetLocale, GetTimeZoneInfo, SetLocale

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date_time_object</td>
<td>A ColdFusion date-time object string or Java Date object</td>
</tr>
</tbody>
</table>

**Usage**
The time in the returned string is UTC, consistent with the HTTP standard.

**Example**
```cfoutput>
   #GetHttpTimeString(now())#
</cfoutput>```

**GetK2ServerDocCountLimit**

**Description**
This function is deprecated.

**Returns**
Number of collection metadata items that the K2 server permits, as an integer

**Category**
Full-text search functions, Query functions

**Function syntax**
GetK2ServerDocCountLimit()

**History**
ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.
ColdFusion MX: Added this function.

**Usage**
If a search generates a larger number of documents than the limit, ColdFusion puts a warning message in the Administrator and in the log file.

**Example**
```cfoutput>
```

**GetLocale**

**Description**
Gets the current ColdFusion geographic/language locale value.

To set the default display format of date, time, number, and currency values in a ColdFusion application session, you use the `SetLocale` function.

**Returns**
The current locale value, as an English string. If a locale has a Java name and a name that ColdFusion used prior to the ColdFusion MX 7 release (for example, en_US and English (US)), ColdFusion returns the ColdFusion name (for example, English (US)).

**Category**
Display and formatting functions, International functions, System functions

**Function syntax**
`GetLocale()`

**See also**
`GetLocaleDisplayName`, `SetLocale`

**History**
ColdFusion MX 7: Added support for all Java locales and locale names.
ColdFusion MX: Changed behavior to that described in usage.

**Usage**
This function returns the locale name as it is represented in ColdFusion; for example, Portuguese (Brazilian), or ca_ES. To get a locale name in the language of the locale, use the `GetLocaleDisplayName` function, which returns português (Brasil) and (Espanya).

This function determines whether a locale value is set for ColdFusion. (The value is set with the `SetLocale` function.)

- If the ColdFusion locale value is present, the function returns it.
- If the ColdFusion locale has not been explicitly set, ColdFusion now determines whether the default locale of the ColdFusion server computer operating system is among the locale values it supports. (The default locale is stored in the user environment variables user.language and user.region.)
If the default locale value is not supported, the function returns English (US). ColdFusion sets the locale in the JVM to this value; it persists until the server is restarted or it is reset with the `SetLocale` function.

This function does not access a web browser’s Accept-Language HTTP header setting.

**Note:** When ColdFusion is started, it stores the supported locale values in the variable `Server.ColdFusion.SupportedLocales`. ColdFusion supports the locales supported by its Java runtime environment. The `SupportedLocales` value lists the Java names for the supported locales and the corresponding names that ColdFusion used prior to the ColdFusion MX 7 release.

For more information, see Locales in the *Developing ColdFusion Applications*.

**Example**

```coldfusion
<h3>Example: Using SetLocale and GetLocale</h3>
<cfoutput>
<!--- For each new request, the locale gets reset to the JVM locale --->
Initial locale's ColdFusion name: #GetLocale()#<br>
<br>
<!--- Do this only if the form was submitted. --->
<cfif IsDefined("form.mylocale")>
<b>Changing locale to #form.mylocale#</b><br>
<br>
<!--- Set the locale to the submitted value and save the old ColdFusion locale name.--->
<cfset oldlocale=SetLocale("#form.mylocale#")>
<!--- Get the current locale. It should have changed. --->
New locale: #GetLocale()#<br>
</cfif>
<br>
<!--- Self-submitting form to select the new locale. --->
<cfform>
<h3>Please select the new locale:</h3>
<cfselect name="mylocale">
<!--- The server.coldfusion.supportedlocales variable is a list of all supported locale names. Use a list cfloop tag to create an HTML option tag for each name in the list. --->
<cfloop index="i" list="#server.coldfusion.supportedlocales#">
<option value="#i#">#i#</option>
</cfloop>
</cfselect>
<br>
<br>
<cfinput type="submit" name="submitit" value="Change Locale">
</cfform>
</cfoutput>
```

**GetLocaleDisplayName**

**Description**

Gets a locale value and displays the name in a manner that is appropriate to a specific locale. By default, gets the current locale in the current locale’s language.

**Returns**

The localized display name of the locale, in the language of the specified locale.
Category
Display and formatting functions, International functions, System functions

Function syntax
GetLocaleDisplayName([locale, inLocale])

See also
GetLocale, SetLocale

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>locale</td>
<td>The locale whose name you want. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale.</td>
</tr>
<tr>
<td>inlocale</td>
<td>The locale in which to return the name. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale.</td>
</tr>
</tbody>
</table>

Example
The following example expands on the GetLocale example to show the use of the GetLocaleDisplayName function to display locale names in the current locale and in other locales. It lets you select a locale from all supported locales, changes the ColdFusion locale to the selected locales, and displays the old and new locale names.

```html
<html>
<head>
<title>Displaying locales</title>
</head>

<body>
<h3>Example: Changing and Displaying Locales</h3>
<cfoutput>
<!--- For each new request, the locale gets reset to the JVM locale --->
Initial locale's ColdFusion name: #GetLocale()#<br>
Initial locale's display name: #GetLocaleDisplayName()#<br>
<br>
<!--- Do this only if the form was submitted. --->
<cfif IsDefined("form.mylocale")>
<b>Changing locale to #form.mylocale#</b><br>
<br>
<!--- Set the locale to the submitted value. --->
SetLocale returns the old ColdFusion locale name.--->
<cfset oldlocale=SetLocale("#form.mylocale#")>
<!--- Get the current locale's ColdFusion name. It should have changed. --->
<cfset newlocale=GetLocale()>
New locale's ColdFusion name: #newlocale#<br>
New locale's display name in current locale: #GetLocaleDisplayName()#<br>
New locale's display name in old locale:
#GetLocaleDisplayName(newlocale, oldlocale)#<br>
New locale's display name in en_US:
#GetLocaleDisplayName(newlocale, "en_US")#
</cfif>
</cfoutput>
</body>
</html>
```
Old locale's display name in current locale:
#GetLocaleDisplayName(oldlocale)#
Old locale's display name in en_US:
#GetLocaleDisplayName(oldlocale, "en_US")#

GetLocalHostIP

Description
Returns the localhost IP address, which is 127.0.0.1 for IPv4 and ::1 for IPv6 addresses.

Returns
The localhost IP address.

Category
Decision functions

Function syntax
GetLocalHostIP()

See also
IsLocalHost

History
ColdFusion MX 7.01: Added this function.
Example

<h3>GetLocalHostIP Example</h3>

<cfoutput>The localhost IP address is #GetLocalHostIP()#.</cfoutput>

GetMetaData

Description

Gets metadata (such as the methods, properties, and parameters of a component) associated with an object that is deployed on the ColdFusion server.

Returns

Structured metadata information: for ColdFusion components (CFCs) and user-defined functions (UDFs), a structure; for query objects, an array of structures.

Category

System functions

Function syntax

GetMetaData(object)

See also

CreateObject, GetComponentMetaData, QueryAddColumn, QueryNew

History

ColdFusion MX 7: Added support for getting query object metadata.

ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A ColdFusion component, user-defined function, or query object. Within a CFC, the parameter can also specify the This scope.</td>
</tr>
</tbody>
</table>

Usage

This function provides information about application data, and lets applications dynamically determine the structure of an object and how to use it. This function is useful for CFCs and query objects. The metadata for a CFC includes information on the component and its functions, arguments, and properties. The getMetaData function also returns metadata for user-defined functions that are not part of CFCs. Use the GetComponentMetaData function to get information about ColdFusion interfaces, or about CFC definitions that you have not instantiated.

The following table lists the data returned by the function for supported object types:
<table>
<thead>
<tr>
<th>Object</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>displayname</td>
<td>Value of the cfcomponent tag displayName attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>extends</td>
<td>Metadata for the component’s ancestor component. Components that do not explicitly extend another component extend the WEB-INF.cftags.component.</td>
</tr>
<tr>
<td></td>
<td>fullname</td>
<td>The dot delimited path from the cf_webroot of the component.</td>
</tr>
<tr>
<td></td>
<td>functions</td>
<td>Array of metadata structures for the component’s functions.</td>
</tr>
<tr>
<td></td>
<td>hint</td>
<td>Value of the cfcomponent tag displayName attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>implements</td>
<td>A structure containing the metadata of the interfaces that the component implements. The key of the structure is the interface name, and the value is a structure containing the interface metadata.</td>
</tr>
<tr>
<td></td>
<td>name</td>
<td>Component name, including the period-delimited path from a component search root such as the web root or a directory specified in the administrator Custom Tag Paths page.</td>
</tr>
<tr>
<td></td>
<td>output</td>
<td>Value of the cfcomponent tag output attribute, if any</td>
</tr>
<tr>
<td></td>
<td>path</td>
<td>Absolute path to the component.</td>
</tr>
<tr>
<td></td>
<td>properties</td>
<td>Array of structures containing metadata specified by the component’s cfproperty tags, if any.</td>
</tr>
<tr>
<td></td>
<td>type</td>
<td>Always, component.</td>
</tr>
<tr>
<td></td>
<td>userMetadata</td>
<td>User-specified attributes in the cfcomponent tag.</td>
</tr>
<tr>
<td>Function</td>
<td>access</td>
<td>Value of thecffunction tag access attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>displayname</td>
<td>Value of thecffunction tag displayName attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>hint</td>
<td>Value of thecffunction tag hint attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>name</td>
<td>Function name.</td>
</tr>
<tr>
<td></td>
<td>output</td>
<td>Value of thecffunction tag output attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>parameters</td>
<td>Array of structures containing metadata for the function parameters.</td>
</tr>
<tr>
<td></td>
<td>returnformat</td>
<td>The format in which to return values to a remote caller. This attribute has no effect on values returned to a local caller.</td>
</tr>
<tr>
<td></td>
<td>returnType</td>
<td>Value of thecffunction tag returnType attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>roles</td>
<td>Value of thecffunction tag output attribute, if any.</td>
</tr>
<tr>
<td></td>
<td>userMetadata</td>
<td>User-specified attributes in thecffunction tag.</td>
</tr>
<tr>
<td>Parameter</td>
<td></td>
<td>A structure containing the following fields.</td>
</tr>
<tr>
<td>or Property</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Note: Use the This scope to access component metadata inside the CFC. The This scope is available at runtime in the component body and in the CFC methods. It is used to read and write variables that are present during the life of the component.

For more information, see Using introspection to get information about components in the Developing ColdFusion Applications.

Example

The following example uses the cfdump tag to display metadata for the utilities CFC that is used by the ColdFusion component browser. It also displays the names and data types of the fields in the cfdocexamples database Employees table.

<table>
<thead>
<tr>
<th>Object</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Value of the cfargument or cfproperty tag default attribute, if any.</td>
<td></td>
</tr>
<tr>
<td>displayname</td>
<td>Value of the cfargument or cfproperty tag displayname attribute, if any.</td>
<td></td>
</tr>
<tr>
<td>hint</td>
<td>Value of the cfargument or cfproperty tag hint attribute, if any.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>Function parameter or CFC property name.</td>
<td></td>
</tr>
<tr>
<td>required</td>
<td>Value of the cfargument or cfproperty tag required attribute, if any.</td>
<td></td>
</tr>
<tr>
<td>type</td>
<td>Value of the cfargument or cfproperty tag type attribute, if any.</td>
<td></td>
</tr>
<tr>
<td>userMetadata</td>
<td>User-specified attributes in the argument tag.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Query</th>
<th>An array of structures containing the following elements:</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsCaseSensitive</td>
<td>Boolean value indicating whether character data must be case correct.</td>
</tr>
<tr>
<td>Name</td>
<td>The column name.</td>
</tr>
<tr>
<td>TypeName</td>
<td>The SQL data type (Omitted if the query object is created with QueryNew without specifying types.)</td>
</tr>
</tbody>
</table>
<!--- Create an instance of the Component Explorer utilities CFC. and get its metadata -->
<cfscript>
    componentutils = createObject("component", "cfide.componentutils.utils");
    utilmetadata = getMetaData(componentutils);
</cfscript>

<h4>Metadata for the CFC component utilities</h4>
<cfdump var="#utilmetadata#">

<!--- use GetMetaData to get the names and data types of the fields in the cfdocexamples Employees table -->
<cfquery name="getemployees" datasource="cfdocexamples">
    SELECT *
    FROM Employees
</cfquery>
<cfset employeemeta=getMetaData(getemployees)>

<h4>The Employees table has the following columns</h4>
<cfloop index="i" from="1" to="#arrayLen(employeemeta)#">
    <cfoutput>
        #employeemeta[i].name# #employeemeta[i].TypeName# #employeemeta[i].isCaseSensitive#
    </cfoutput>
</cfloop>

**GetMetricData**

**Description**

Gets server performance metrics.

**Returns**

ColdFusion structure that contains metric data, depending on the `mode` value.

**Category**

System functions

**Function syntax**

GetMetricData(`mode`)
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>perf_monitor</td>
<td>Returns internal data, in a structure. To receive data, enable PerfMonitor in ColdFusion Administrator before executing the function. On Windows, this data is otherwise displayed in the Windows PerfMonitor.</td>
</tr>
<tr>
<td>simple_load</td>
<td></td>
<td>Returns an integer value that is computed from the state of the server's internal queues. Indicates the overall server load.</td>
</tr>
<tr>
<td>prev_req_time</td>
<td></td>
<td>Returns the time, in milliseconds, that it took the server to process the previous request.</td>
</tr>
<tr>
<td>avg_req_time</td>
<td></td>
<td>Returns the average time, in milliseconds, that it takes the server to process a request. Changing the setting to 0 prevents the server from calculating the average and removes overhead associated with gathering data. The default value is 120 seconds.</td>
</tr>
</tbody>
</table>

Usage

If `mode = "perf_monitor"`, the function returns a structure with these data fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceName</td>
<td>The name of the ColdFusion server. The default value is cfserver.</td>
</tr>
<tr>
<td>PageHits</td>
<td>Number of HTTP requests received since ColdFusion was started.</td>
</tr>
<tr>
<td>ReqQueued</td>
<td>Number of HTTP requests in the staging queue, waiting for processing.</td>
</tr>
<tr>
<td>DBHits</td>
<td>Number of database requests since the server was started.</td>
</tr>
<tr>
<td>ReqRunning</td>
<td>Number of HTTP requests currently running.</td>
</tr>
<tr>
<td>ReqTimedOut</td>
<td>Number of HTTP requests that timed out while in the staging queue or during processing.</td>
</tr>
<tr>
<td>BytesIn</td>
<td>Number of bytes in HTTP requests to ColdFusion.</td>
</tr>
<tr>
<td>BytesOut</td>
<td>Number of bytes in HTTP responses from ColdFusion.</td>
</tr>
<tr>
<td>AvgQueueTime</td>
<td>For the last two HTTP requests (current and previous), the average length of time the request waited in the staging queue.</td>
</tr>
<tr>
<td>AvgReqTime</td>
<td>For the last two HTTP requests (current and previous), the average length of time the server required to process the request</td>
</tr>
<tr>
<td>AvgDBTime</td>
<td>For the last two HTTP requests (current and previous), the average length of time the server took to process CFQueries in the request.</td>
</tr>
<tr>
<td>cachepops</td>
<td>This parameter is deprecated. ColdFusion automatically sets its value to -1.</td>
</tr>
</tbody>
</table>
Example
<cfset pmData = GetMetricData( "PERF_MONITOR" ) >
<cfoutput>
Current PerfMonitor data is: <p>
InstanceName: #pmData.InstanceName# <p>
PageHits: #pmData.PageHits# <p>
ReqQueued: #pmData.ReqQueued# <p>
DBHits: #pmData.DBHits# <p>
ReqRunning: #pmData.ReqRunning# <p>
ReqTimedOut: #pmData.ReqTimedOut# <p>
BytesIn: #pmData.BytesIn# <p>
BytesOut: #pmData.BytesOut# <p>
AvgQueueTime: #pmData.AvgQueueTime# <p>
AvgReqTime: #pmData.AvgReqTime# <p>
AvgDBTime: #pmData.AvgDBTime# <p>
</cfoutput>

GetPageContext

Description
Gets the current ColdFusion PageContext object that provides access to page attributes and configuration, request, and response objects.

Returns
The current ColdFusion Java PageContext Java object.

Category
System functions

Function syntax
GetPageContext()

History
ColdFusion MX: Added this function.

Usage
The ColdFusion PageContext class is a wrapper class for the Java PageContext object that can resolve scopes and perform case-insensitive variable lookups.

The PageContext object exposes fields and methods that can be useful in J2EE integration. It includes the include and forward methods that provide the equivalent of the corresponding standard JSP tags. You use these methods to call JSP pages and servlets. For example, you use the following code in CFScript to include the JSP page hello.jsp and pass it a name parameter:

```
GetPageContext().include("hello.jsp?name=Bobby");
```

When you use `GetPageContext` to include a JSP page in a CFML page on WebLogic, you may need to flush the output of the CFML page with `cfflush` before calling the JSP page. Otherwise, the ColdFusion output appears after the JSP output.
The methods supported on the returned PageContext are only the ones mandated by the JSP specification. To look up scopes by name, use the StructGet function, for example:

```cfml
<cfset myscope = "server">
<cfset myserver = StructGet(myscope)>
```

For more information, see your Java Server Pages (JSP) documentation.

On WebLogic, you may need to flush the output of the CFML page (using cfflush) before calling a JSP page. If you do not, the ColdFusion output appears after the JSP output.

On JBOSS, if you use this function and you include any JSP file, the content of the JSP file is processed prior to the processing of any CFML tags before the function.

**Example**

```cfml
<!--- This example shows using the page context to set a page variable and access the language of the current locale. --->
<cfset pc = GetPageContext()>
<cfset pc.setAttribute("name","John Doe")>
<cfoutput>name: #variables.name#<br></cfoutput>
<cfoutput>Language of the current locale is #pc.getRequest().getLocale().getDisplayLanguage()#</cfoutput>.
```

### GetPrinterInfo

**Description**
Determines which print attributes are supported by a selected printer.

**Returns**
A structure that contains the attributes supported by the printer. If the printer is not specified, the structure contains attributes supported by the default printer, if one exists.

**Category**
System functions

**Function syntax**

```
GetPrinterInfo("printer")
```

**See also**

cfpdf, cfprint

**History**

ColdFusion 8: Added this function.
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>printer</td>
<td>The name of a printer. An example in Windows is &quot;\s1001prn02\NTN-2W-HP_BW02&quot;. The default is the default printer for the account where the ColdFusion server is running. Printer names are case sensitive and must be entered exactly as they appear in the System Information page of the ColdFusion Administrator. If you specify an empty string, for example GetPrinterInfo(&quot;&quot;), ColdFusion generates an error. Use the following code to retrieve information on the default printer: GetPrinterInfo().</td>
</tr>
</tbody>
</table>

**Usage**

Use this function in conjunction with the **cfprint** tag when processing large print jobs. Not all printers support the complete list of print attributes allowed by the **cfprint** tag. If the selected printer does not support a print attribute, the printer ignores the attribute.

In Windows systems, the account running the ColdFusion server must have **PRINTER_ACCESS_USE** access rights for each printer it uses. Even if the printer is configured locally on the system, the printer is not available if the account in which ColdFusion is running does not have the proper permissions.

For more information on attributeStruct, see “**cfprint**” on page 550.

**Example**

```cfml
<!--- The following code returns information on the default printer. --->
<cfdump var="#GetPrinterInfo()#">

<!--- The following code returns information on the specified printer. --->
<cfdump var="#GetPrinterInfo('\s1001prn02\NTN-2W-SHARP01')#">
```

**GetPrinterList**

**Description**

Gets the list of printers that are accessible by ColdFusion server.

**Returns**

A list of accessible printers.

**Category**

System functions

**Function Syntax**

`getPrinterList()`

**See Also**

`cfpdf`, `cfprint`

**History**

ColdFusion 8: Added this function.

**Usage**

Ensure that you run ColdFusion server using an account that has appropriate permissions to access all desired printers.
**GetProfileSections**

**Description**
Gets all the sections of an initialization file.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, boot.ini, Win32.ini.

**Returns**
An initialization file, as a structure whose format is as follows:
- Each initialization file section name is a key in the structure
- Each list of entries in a section of an initialization file is a value in the structure

If there is no value, returns an empty string.

**Category**
*System functions*

**Function syntax**
```
GetProfileSections(iniFile)
```

**See also**
*GetProfileString, SetProfileString*

**History**
ColdFusion MX: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iniFile</td>
<td>Absolute path (drive, directory, filename, extension) of initialization file; for example, C:\boot.ini</td>
</tr>
</tbody>
</table>

---

**GetProfileString**

**Description**
Gets an initialization file entry.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, boot.ini, Win32.ini.

**Returns**
An entry in an initialization file, as a string. If there is no value, returns an empty string.

**Category**
*System functions*
Function syntax
GetProfileString(iniPath, section, entry)

See also
GetProfileSections, SetProfileString

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iniPath</td>
<td>Absolute path (drive, directory, filename, extension) of initialization file; for example, C:\boot.ini</td>
</tr>
<tr>
<td>section</td>
<td>Section of initialization file from which to extract information</td>
</tr>
<tr>
<td>entry</td>
<td>Name of value to get</td>
</tr>
</tbody>
</table>

Example

```
<h3>GetProfileString Example</h3>
Uses GetProfileString to get the value of timeout in an initialization file. Enter
the full path of your initialization file, and submit the form.
<cfif Isdefined("Form.Submit")>
  <cfset IniPath = FORM.iniPath>
  <cfset Section = "boot loader">
  <cfset timeout = GetProfileString(IniPath, Section, "timeout")>
  <h4>Boot Loader</h4>
  <!--- If no entry in an initialization file, nothing displays --->
  <p>Timeout is set to: #timeout#</p>
</cfif>
<form action = "getprofilestring.cfm">
<table cellspacing = "2" cellpadding = "2" border = "0">
  <tr>
    <td>Full Path of Init File</td>
    <td><input type = "Text" name = "IniPath" value = "C:\myboot.ini"></td>
  </tr>
  <tr>
    <td><input type = "Submit" name = "Submit" value = "Submit"></td>
  </tr>
</table>
</form>
```

GetReadableImageFormats

Description
Returns a list of image formats that ColdFusion can read on the operating system where ColdFusion is deployed.

Returns
A list of image file formats.

Category
System functions
ColdFusion Functions

ColdFusion 8: Added this function.

Function syntax
GetReadableImageFormats()

See also
GetWriteableImageFormats, cfimage (for supported image file formats)

Usage
Use this function to determine image file compatibility on the ColdFusion server.

Example
<cfoutput>#GetReadableImageFormats()#</cfoutput>

GetSOAPRequest

Description
Returns an XML object that contains the entire SOAP request. Usually called from within a web service CFC.

Returns
An XML object that contains the entire SOAP request.

Category
XML functions

History
ColdFusion MX 7: Added this function.

Function syntax
GetSOAPRequest()

See also
AddSOAPRequestHeader, AddSOAPResponseHeader, GetSOAPRequestHeader, GetSOAPResponse, GetSOAPResponseHeader, IsSOAPRequest; Basic web service concepts in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webservice</td>
<td>Optional. A webservice object as returned from the cfobject tag or the CreateObject function. Required if the function is called from the client.</td>
</tr>
</tbody>
</table>

Usage
Call this function to obtain a web service request object after the web service has been invoked. If you call this function from outside a web service CFC without the webservice parameter, it throws the following expression error:

Unable to use getSOAPRequest: not processing a web service request.
If you call this function from within a web service CFC, you can omit the `webservice` argument. The function executes against the request that it is currently processing.

You can use CFML XML functions to examine the returned XML object.

**Example**
This example makes a request to execute the `echo_me` function of the `headerservice.cfc` web service. For information on implementing the `headerservice.cfc` web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the `AddSOAPResponseHeader` function or the `GetSOAPRequestHeader` function.

```cfscript
<cfscript>
  ws = CreateObject("webservice",
  "http://localhost/soapheaders/headerservice.cfc?WSDL");
  ws.echo_me("hello world");
  req = getSOAPRequest(ws);
</cfscript>
<cfdump var="#req#">

**GetSOAPRequestHeader**

**Description**
Obtains a SOAP request header. Call only from within a CFC web service function that is processing a request as a SOAP web service.

**Returns**
A SOAP request header.

**Category**
XML functions

**History**
ColdFusion MX 7: Added this function.

**Function syntax**
```
GetSOAPRequestHeader(namespace, name [, asXML])
```

**See also**
`AddSOAPRequestHeader, AddSOAPResponseHeader, GetSOAPRequest, GetSOAPResponse, GetSOAPResponseHeader, IsSOAPRequest`; Basic web service concepts in the *Developing ColdFusion Applications*
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>A String that is the namespace for the header.</td>
</tr>
<tr>
<td>name</td>
<td>A String that is the name of the header.</td>
</tr>
<tr>
<td>asXML</td>
<td>If true, the header is returned as a CFML XML object; if false (default), the header is returned as a Java object.</td>
</tr>
</tbody>
</table>

Usage

If you specify false for the asXML parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header’s xsi:type attribute. If the xsi:type attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify true for the asXML parameter, ColdFusion retrieves the header as raw XML.

This function throws an error if it is invoked in a context that is not a web service request. Use the IsSOAPRequest function to determine whether the CFC is running as a web service.

Example

This example creates a CFC web service that illustrates the operation of the GetSOAPRequestHeader function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as headerservice.cfc in a folder called soapheaders under your web root. Test its operation, and specifically the operation of the GetSOAPRequestHeader function, by executing the examples that invoke this web service. For example, see the example for AddSOAPRequestHeader.

```cfml
<h3>GetSOAPRequestHeader Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">
  <cffunction name="echo_me" access="remote" output="false" returntype="string" displayname="Echo Test" hint="Header test">
    <cfargument name="in_here" required="true" type="string">
    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>
      <!--- Get the first header as a string and as XML --->
      <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
      <cfset return = "The service saw username: " & username>
      <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username", "TRUE")>
      <cfset return = return & "<br> as XML: " & xmlusername>
      <!--- Get the second header as a string and as XML --->
      <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
      <cfset return = return & "The service saw password: " & password>
      <cfset xmplpassword = getSOAPRequestHeader("http://mynamespace/", "password", "TRUE")>
      <cfset return = return & "<br> as XML: " & xmplpassword>
      <!--- Add a header as a string --->
      <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE", false)>
    </cfif>
  </cffunction>
</cfcomponent>
```

Last updated 7/9/2012
<!--- Add a second header using a CFML XML value --->
<cfset doc = XmlNew()>
<cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
<cfset x.XmlText = "hey man, here I am in XML">
<cfset x.XmlAttributes["xsi:type"] = "xsd:string">
<cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>
<cfelse>
  <!--- Add a header as a string - Must generate error! --->
  <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE", false)>
  --->
  <cfset return = "Not invoked as a web service">
  </cfif>
  <cfreturn return>
  </cffunction>
  </cfcomponent>

GetSOAPResponse

Description
Returns an XML object that contains the entire SOAP response after invoking a web service.

Returns
An XML object that contains the entire SOAP response.

Category
XML functions

History
ColdFusion MX 7: Added this function.

Function syntax
GetSOAPResponse(webservice)

See also
AddSOAPRequestHeader, AddSOAPResponseHeader, GetSOAPRequest, GetSOAPRequestHeader,
GetSOAPResponseHeader, IsSOAPRequest; Basic web service concepts in the Developing ColdFusion Applications

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webservice</td>
<td>A webservice object as returned from the cfoject tag or the CreateObject function.</td>
</tr>
</tbody>
</table>

Usage
Invoke the web service before attempting to get the response. You can use CFML XML functions to examine the XML response.
Example
This example makes a request to execute the `echo_me` function of the headerservice.cfc web service. Following the request, the example calls the `GetSOAPResponse` function to get the SOAP response, and then calls `cfdump` to display its content.

for information on implementing the headerservice.cfc web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the `AddSOAPResponseHeader` function or the `GetSOAPRequestHeader` function.

<!--- Note that you might need to modify the URL in the CreateObject function to match your server and the location of the headerservice.cfc file if it is different than shown here. -->

```cfscript>
    ws = CreateObject("webservice", "http://localhost/soapheaders.headerservice.cfc?WSDL");
    ws.echo_me("hello world");
    resp = getSOAPResponse(ws);
</cfscript>
```

`GetSOAPResponseHeader`

Description
Returns a SOAP response header. Call this function from within code that is invoking a web service after making a web service request.

Returns
A SOAP response header.

Category
XML functions

History
ColdFusion MX 7: Added this function.

Function syntax
`GetSOAPResponseHeader(webservice, namespace, name [, asXML])`

See also
`AddSOAPRequestHeader, AddSOAPResponseHeader, GetSOAPRequest, GetSOAPRequestHeader, GetSOAPResponse, IsSOAPRequest`; Basic web service concepts in the *Developing ColdFusion Applications*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>webservice</td>
<td>A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function.</td>
</tr>
</tbody>
</table>
Usage
If you specify false for the asXML parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header’s xsi:type attribute. If the xsi:type attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify true for the asXML parameter, ColdFusion retrieves the header as raw XML.

Usage within CFML code by a consumer of a web service after it calls the web service with cfinvoke.

Example
There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for either the AddSOAPResponseHeader function or the GetSOAPRequestHeader function.

Execute the following example to see how the GetSOAPResponseHeader function operates:

```cfs
t <!--- Note that you might need to modify the URL in the CreateObject function to match your server and the location of the headerservice.cfc file if it is different than shown here. Likewise for the cfinvoke tag at the end --->

<h3>GetSOAPResponseHeader Example</h3>
<cfscript>
   // Create the web service object
   ws = CreateObject("webservice", "http://localhost/soapheaders/headerservice.cfc?WSDL");

   // Set the username header as a string
   addSOAPRequestHeader(ws, "http://mynamespace/", "username", "tom", false);

   // Set the password header as a CFML XML object
   doc = XmlNew();
   doc.password = XmlElemNew(doc, "http://mynamespace/", "password");
   doc.password.XmlText = "My Voice is my Password";
   doc.password.XmlAttributes["xsi:type"] = "xsd:string";
   addSOAPRequestHeader(ws, "ignoredNameSpace", "ignoredName", doc);

   // Invoke the web service operation
   ret = ws.echo_me("argument");

   // Get the first header as an object (string) and as XML
   header = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader");
   XMLheader = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader", true);
</cfscript>
```
// Get the second header as an object (string) and as XML
header2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2");
XMLheader2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2", true);
</cfscript>
<hr>
<cfoutput>
Soap Header value: #HTMLCodeFormat(header)#<br>
Soap Header XML value: #HTMLCodeFormat(XMLheader)#<br>
Soap Header 2 value: #HTMLCodeFormat(header2)#<br>
Soap Header 2 XML value: #HTMLCodeFormat(XMLheader2)#<br>
Return value: #HTMLCodeFormat(ret)#<br>
</cfoutput>
<hr>
<cfinvoke component="soapheaders.headerservice" method="echo_me" returnvariable="ret" in_here="hi">
</cfinvoke>
<cfoutput>Cfinvoke returned: #ret#/</cfoutput>

**GetSystemFreeMemory**

**Description**
Gets details of free memory.

**Returns**
Memory, in bytes, that is currently free.

**Syntax**
getSystemFreeMemory()

**GetSystemTotalMemory**

**Description**
Gets details of the memory that is available for the operating system, in bytes.

**Returns**
Memory that is available in bytes.

**Syntax**
getSystemTotalMemory()

**GetTempDirectory**

**Description**
Gets the path of the directory that ColdFusion uses for temporary files. The directory depends on the account under which ColdFusion is running and other factors. Before using this function in an application, test to determine the directory it returns under your account.
**Returns**
The absolute pathname of a directory, including a trailing slash, as a string.

**Category**
*System functions*

**Function syntax**
```cfscript
GetTempDirectory()
```

**See also**
*GetTempFile*

**History**
ColdFusion MX: Changed behavior: on Windows, this function now returns the temporary directory of the embedded Java application server. On other platforms, it returns the temporary directory of the operating system.

**Example**
```html
<h3>GetTempDirectory Example</h3>
<p>The temporary directory for this ColdFusion server is
    <cfoutput>#GetTempDirectory()#</cfoutput>.</p>
<p>We have created a temporary file called:
    <cfoutput>#GetTempFile(GetTempDirectory(), "testFile")#</cfoutput></p>
```

---

**GetTempFile**

**Description**
Creates a temporary file in a directory whose name starts with (at most) the first three characters of `prefix`.

**Returns**
Name of a temporary file, as a string.

**Category**
*System functions*

**Function syntax**
```cfscript
GetTempFile(dir, prefix)
```

**See also**
*GetTempDirectory*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir</code></td>
<td>Directory name</td>
</tr>
<tr>
<td><code>prefix</code></td>
<td>Prefix of a temporary file to create in the <code>dir</code> directory</td>
</tr>
</tbody>
</table>
Example
<h3>GetTempFile Example</h3>
<p>The temporary directory for this ColdFusion Server is
<cfoutput>#GetTempDirectory()#</cfoutput>.</p>
<p>We have created a temporary file called:
<cfoutput>#GetTempFile(GetTempDirectory(),"testFile")#</cfoutput></p>

GetTemplatePath

Description
This function is deprecated. Use the GetBaseTemplatePath function instead.

Gets the absolute path of an application’s base page.

History
ColdFusion MX: Deprecated this function. It might not work, and it might cause an error, in later releases.

GetTickCount

Description
Returns the current value of an internal millisecond timer.

Returns
A string representation of the system time, in milliseconds.

Category
Date and time functions, System functions

Function syntax
GetTickCount()

Usage
This function is useful for timing CFML code segments or other page processing elements. The value of the counter has no meaning. To generate useful timing values, take the difference between the results of two GetTickCount calls.

Example
<!--- Setup timing test --->
<cfset iterationCount = 1000>
<!--- Time an empty loop with this many iterations --->
<cfset tickBegin = GetTickCount()>
<cfloop Index = i From = 1 To = #iterationCount#></cfloop>
<cfset tickEnd = GetTickCount()>
<cfset loopTime = tickEnd - tickBegin>

<!--- Report --->
<cfoutput>Loop time (#iterationCount# iterations) was: #loopTime# milliseconds</cfoutput>
GetTimeZoneInfo

Description
Gets local time zone information for the computer on which it is called, relative to Universal Time Coordinated (UTC). UTC is the mean solar time of the meridian of Greenwich, England, used as the basis for calculating standard time throughout the world.

ColdFusion stores date and time values as date-time objects: real numbers on a universal time line. It converts an object to a time zone when it formats an object; it converts a date/time value from a time zone to a real number when it parses a value.

Returns
Structure that contains these elements and keys:

- utcTotalOffset: offset of local time, in seconds, from UTC
  - A plus sign indicates a time zone west of UTC (such as a zone in North America)
  - A minus sign indicates a time zone east of UTC (such as a zone in Germany)
- utcHourOffset: offset, in hours of local time, from UTC
- utcMinuteOffset: offset, in minutes, beyond the hours offset. For North America, this is 0. For countries that are not exactly on the hour offset, the number is from 0 through 60. For example, standard time in Adelaide, Australia is offset 9 hours and 30 minutes from UTC.
- isDSTOn: True, if Daylight Savings Time (DST) is on in the host; False, otherwise

Category
Date and time functions, International functions

Function syntax
GetTimeZoneInfo()

See also
DateConvert, CreateDateTime, DatePart

Example
<h3>GetTimeZoneInfo Example</h3>
<!--- This example shows the use of GetTimeZoneInfo --->
<cfoutput>
The local date and time are #now()#.
</cfoutput>
<cfset info = GetTimeZoneInfo()>  
<cfoutput>
Total offset in seconds is #info.utcTotalOffset#.
Offset in hours is #info.utcHourOffset#.
Offset in minutes minus the offset in hours is #info.utcMinuteOffset#.
Is Daylight Savings Time in effect? #info.isDSTOn#.
</cfoutput>
**GetToken**

**Description**
Determines whether a token of the list in the `delimiters` parameter is present in a string.

**Returns**
The token found at position `index` of the string, as a string. If `index` is greater than the number of tokens in the string, returns an empty string.

**Category**
String functions

**Function syntax**
```
GetToken(string, index [, delimiters ])
```

**See also**
`Left`, `Right`, `Mid`, `SpanExcluding`, `SpanIncluding`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>index</td>
<td>Positive integer or a variable that contains one. The position of a token.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. A delimited list of delimiters. Elements may consist of multiple characters. Default list of delimiters: space character, tab character, newline character; or their codes: &quot;chr(32)&quot;, &quot;chr(9)&quot;, chr(10). Default list delimiter: comma character.</td>
</tr>
</tbody>
</table>

**Usage**
The following examples show how this function works.

**Example 1**
In the following example, the function call requests element number 2 from the string, using the delimiter ":;".
```
GetToken("red,blue;;red,black,tan;;red,pink,brown;;red,three", 2, ":;")
```
The output is as follows:
```
red,black,tan
```
Example 2

```
cfset mystring = "four," & #chr(32)# & #chr(9)# & #chr(10)# & ",five, nine,zero;;" & #chr(10)# & "nine,ten:, eleven:,twelve:,thirteen," & #chr(32)# & #chr(9)# & #chr(10)# & ",four">
<cfoutput>
  #HTMLCodeFormat(mystring)#<br><br>
</cfoutput>
```

The output is as follows:

four,<br>
, five, nine,zero;;
nine,ten:, eleven:,twelve:,thirteen,<br>
, four

The `GetToken` function recognizes explicit spaces, tabs, or newline characters as the parameter delimiters. (To specify a space character, the code is `chr(32)`; a tab character, `chr(9)`; and a newline character, `chr(10)`.)

In the example string `mystring`, there is:

- A forced space between the substrings "four," and ",five"
- A literal space between "five," and "nine"
- A literal space between "ten:," and "eleven,"
- A forced space between "thirteen," and ",four"

In the following call against `mystring`, no spaces are specified in `delimiters` (it is omitted), so the function uses the space character as the string delimiter:

```
<cfoutput>
  GetToken(mystring, 3) is : #GetToken(mystring, 3)#
</cfoutput><br>
```

The output of this code is as follows:

GetToken(mystring, 3) is : nine,zero;;

The function finds the third delimiter, and returns the substring just before it that is between the second and third delimiter. This substring is "nine,zero;;".

Example 3

```
cfset mystring2 = "four," & #chr(9)# & #chr(10)# & ",five,nine,zero;;" & #chr(10)# & "nine,ten:,eleven:,twelve:,thirteen," & #chr(9)# & #chr(10)# & ",four">
<cfoutput>
  #HTMLCodeFormat(mystring2)#<br>
</cfoutput>
```

The output is as follows:
The following is a call against mystring2:

```cfoutput```
GetToken(mystring2, 2) is : #GetToken(mystring2, 2)#
```

The output is as follows:

GetToken(mystring2, 2) is : ,five,nine,zero;:

The function finds the second delimiter, and returns the substring just before it that is between the first and second delimiter. This substring is",five,nine,zero;:"

Example

```cftag```
GetToken Example```
```
```cfif```
IsDefined("FORM.yourString")
```
```cftif```
FORM.yourDelimiter is not ""
```
```cfset```
yourDelimiter = FORM.yourDelimiter
```
```cfelse```
```cfset```
yourDelimiter = " "
```
```cfelse```
```
```cftif```
ListLen(FORM.yourString, yourDelimiter) GTE FORM.returnElement
```
```cfoutput```
```
<br>is:#GetToken(FORM.yourString, FORM.returnElement, yourDelimiter)#
```

...
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to the</td>
</tr>
<tr>
<td></td>
<td>- Hard disk drive, for example C: for Windows or / for UNIX. Note that for Windows, you have to explicitly use colon (:) and not just C. Only the space of the entire hard disk drive is returned. If you mention a directory in the path, for example, /opt/, it is ignored and only / is considered.</td>
</tr>
<tr>
<td></td>
<td>- For in-memory file system, the path is ram:</td>
</tr>
</tbody>
</table>

Usage

Application memory is determined by the following settings for RAM:

- In the ColdFusion Administrator, the value specified for Memory Limit per Application for In-Memory Virtual File System (Server Settings > Settings).
  The default value is 20 MB.
- The value specified in the Application.cfc for this.inmemoryfilesystem.size

If you have set values in both the places, the lesser value is considered.

**Note:** Even if the value specified in Application.cfc is lesser, ensure that Server Settings > Settings > Enable In-Memory File System is checked in the ColdFusion Administrator.

Example

See the example for GetFreeSpace.

**GetUserRoles**

Description

Retrieves the list of roles for the current user. This function returns only ColdFusion roles, not roles set for the servlet API.

Returns

The list of roles for the current user.

Category

Security functions

Function syntax

getUserRoles()
Example
<cfloginuser name = "#cflogin.name#" password = "#cflogin.password#"
  roles = "#GetUserRoles()#" />

GetVFSMetaData

Description
Gets in-memory virtual file system metadata.

Returns
A structure that contains information about in-memory virtual file system.

Category
System functions

Function syntax
getVFSMetaData (fileSystemType)

See also
Working with in-memory files in the Developing ColdFusion Applications.

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileSystemTy</td>
<td>The in-memory file system type. ColdFusion supports only RAM.</td>
</tr>
<tr>
<td>pe</td>
<td></td>
</tr>
</tbody>
</table>

Usage
The function returns a structure with the following keys:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>If support for in-memory virtual file system is enabled. This is the only key that is returned within the structure if in-memory virtual file system is disabled.</td>
</tr>
<tr>
<td>Limit</td>
<td>The memory limit in bytes for in-memory virtual file system.</td>
</tr>
<tr>
<td>Used</td>
<td>The memory out of the specified memory limit that is in use (in bytes).</td>
</tr>
<tr>
<td>Free</td>
<td>The free memory in bytes.</td>
</tr>
</tbody>
</table>

Example
<cfset myroot = hash(getDirectoryFromPath(getCurrentTemplatePath())) >
<cfset name = "ram:///&myroot/&"/>
<cffile action="append" file="&name#" output="created at #now()#">
<cfset contents = fileRead(name)>
<cffdump var="#contents#">
<cfdfump var="#getVFSMetaData("ram")#"
The example works only if in-memory virtual file system is enabled.

**GetWriteableImageFormats**

**Description**
Returns a list of image formats that ColdFusion can write on the operating system where ColdFusion is deployed.

**Returns**
A list of image file formats.

**Category**
System functions

**History**
ColdFusion 8: Added this function.

**Function syntax**
GetWriteableImageFormats()

**See also**
GetReadableImageFormats, cfimage (for supported image file formats)

**Usage**
Use this function to determine image file compatibility on the ColdFusion server.

**Example**
<cfoutput>#GetWriteableImageFormats()#</cfoutput>

**Functions h-im**

**Hash**

**Description**
Converts a variable-length string to a fixed-length string that can act as a “fingerprint” or unique identifier for the original string. It is not possible to convert the hash result back to the source string.

**Returns**
A string.

**Category**
Conversion functions, Security functions, String functions

**Function syntax**
Hash(string [, algorithm [, encoding ]])
History
ColdFusion MX 7: Added the algorithm and encoding parameters.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String to hash.</td>
</tr>
</tbody>
</table>
| algorithm | (Optional) The algorithm to use to hash the string. ColdFusion installs a cryptography library with the following algorithms:
  - CFMX_COMPAT: Generates a hash string identical to that generated by ColdFusion MX and ColdFusion MX 6.1 (default). It is only a place holder algorithm that informs ColdFusion to use an algorithm compatible with CFMX if the user does not have any option to provide algorithm.
  - MD5: (default) Generates a 32-character, hexadecimal string, using the MD5 algorithm (The algorithm used in ColdFusion MX and prior releases).
  - SHA: Generates a 40-character string using the Secure Hash Standard SHA-1 algorithm specified by Nation Institute of Standards and Technology (NIST) FIPS-180-2.
  - SHA-256: Generates a 44-character string using the SHA-256 algorithm specified by FIPS-180-2.
| encoding  | (Optional; to use this attribute, also specify the algorithm parameter) A string specifying the encoding to use when converting the string to byte data used by the hash algorithm. Must be a character encoding name recognized by the Java runtime. The default value is the value specified by the defaultCharset entry in the neo-runtime.xml file, which is normally UTF-8. Ignored when using the CFMX_COMPAT algorithm. |

Usage
The result of this function is useful for comparison and validation. For example, you can store the hash of a password in a database without exposing the password. You can check the validity of the password by hashing the entered password and comparing the result with the hashed password in the database.
ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The `encoding` attribute is normally not required. It provides a mechanism for generating identical hash values on systems with different default encodings. ColdFusion uses a default encoding of UTF-8 unless you modify the `defaultCharset` entry in the `neo-runtime.xml` file.

**Example**
The following example lets you enter a password and compares the hashed password with a hash value saved in the `SecureData` table of the `cfdocexamples` database. This table has the following entries:

<table>
<thead>
<tr>
<th>User ID</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>blaw</td>
<td>blaw</td>
</tr>
<tr>
<td>dknob</td>
<td>dknob</td>
</tr>
</tbody>
</table>

```html
<!---- Do the following if the form is submitted. ---->
<cfif IsDefined("Form.UserID")>

<!---- Query the database. ---->
<cfquery name = "CheckPerson" datasource = "cfdocexamples">
    SELECT PasswordHash
    FROM SecureData
    WHERE UserID = <cfqueryparam value = "#Form.userID#" cfsqltype = 'CF_SQL_VARCHAR'>
</cfquery>

<!---- Compare query PasswordHash field and the hashed form password and display the results. ---->
<cfoutput>
    <cfif Hash(Form.password, "SHA") is not CheckPerson.PasswordHash>
        User ID #Form.userID# or password is not valid. Try again.
    <cfelse>
        Password is valid for User ID #Form.userID#.
    </cfif>
</cfoutput>
</cfif>

<!---- Form for entering ID and password. ---->
<form action="#CGI.SCRIPT_NAME#" method="post">
    User ID: <input type = "text" name="UserID" />
    Password: <input type = "text" name="password" />
    <input type = "Submit" value = "Encrypt my String" />
</form>
```
**HMac**

**Description**
Creates Hash-based Message Authentication Code for the given string based on the algorithm and encoding. Hash-based Message Authentication Code (HMAC) is used to verify the data integrity and authenticity of a message transmitted. It involves a cryptographic hash function in combination with a secret key. The cryptographic hash function can be Message Digest 5 (MD5), Secure Hash Algorithm (SHA), and so on.

**Returns**
a Boolean value. true if successful.

**Category**
Display and formatting functions

**Syntax**
HMac(message, key [,algorithm] [,encoding])

**See also**
SessionInvalidate, SessionRotate

**History**
ColdFusion 10: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required/Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Required</td>
<td>The message to transmit. The message can be a String or a byte array.</td>
</tr>
<tr>
<td>key</td>
<td>Required</td>
<td>The secret key to create HMAC. The key can be a String or a byte array.</td>
</tr>
<tr>
<td>algorithm</td>
<td>Optional</td>
<td>Algorithm used.</td>
</tr>
<tr>
<td>encoding</td>
<td>Optional</td>
<td>Encoding to be used.</td>
</tr>
</tbody>
</table>

**Usage**
Use this function to create Hash-based Message Authentication Code for the given string based on the algorithm and encoding.

**Example**
```cfmthtml
<h2>HMAC Test</h2>
<cfset x=hmac("Hi There","key1","HMACRIPEMD160")>
<cfoutput>#x#</cfoutput>
```

**HQL Methods**
The Hibernate Query Language (HQL) methods return a single or multi-dimensional array of values or entities, based on what the HQL query returns. If you are sure that only one record exists that matches this filter criteria, specify `unique=true` so that a single entity is returned instead of an array.

If `unique=true` and multiple records are returned, then an exception is thrown.
**Note:** entityName and properties used in HQL are case sensitive.

The following HQL methods are available:

- ORMExecuteQuery(hql, [,unique] [, queryoptions])
- ORMExecuteQuery(hql, params [,unique] [,queryOptions])
- ORMExecuteQuery(hql, namedparams [, unique] [, queryOptions])

**ORMExecuteQuery(hql, [,unique] [, queryoptions])**

**Description**
Runs HQL on the default data source specified for the application. You can specify several options to control the behavior of retrieval using `queryOptions`:

- `ignorecase`: Ignores the case of sort order when you set it to true. Use this option only when you specify the `sortorder` parameter.
- `maxResults`: Specifies the maximum number of objects to be retrieved.
- `offset`: Specifies the start index of the resultset from where it has to start the retrieval.
- `cacheable`: Whether the result of this query is to be cached in the secondary cache. Default is false.
- `cachename`: Name of the cache in secondary cache.
- `timeout`: Specifies the timeout value (in seconds) for the query

**Note:** Maxresults and timeout are used for pagination.

**Category**
ORM functions

**Example**
```cfdno
<cfset employees = ORMExecuteQuery("from Employees")>
<cfset employees = ORMExecuteQuery("from Employees where age > 40")>
<cfset employeeObj = ORMExecuteQuery("from Employees where EmployeeID =1", true)>
<cfset firstNameArray = ORMExecuteQuery("select FirstName from Employees")>
<cfset numberOfEmps = ORMExecuteQuery("select count(*) from Employees")>
<cfset firstName = ORMExecuteQuery("select FirstName from Employees where EmployeeID = 1", true)>
<cfset employees = ORMExecuteQuery("from Employees", false, {offset=5, maxresults=10, timeout=5})>
```

**ORMExecuteQuery(hql, params [,unique] [,queryOptions])**

**Description**
This type of ORMExecuteQuery lets you pass parameters to the query. Use '?' (question mark) as the placeholder for the parameters. The values to the parameters must be passed as an array to params.

In addition, you can specify several options to control the behavior of retrieval using `queryOptions`:

- `ignorecase`: Ignores the case of sort order when you set it to true. Use this option only when you specify the sortorder parameter.
- `maxResults`: Specifies the maximum number of objects to be retrieved.
- `offset`: Specifies the start index of the resultset from where it has to start the retrieval.
ColdFusion Functions

- **cacheable**: Whether the result of this query is to be cached in the secondary cache. Default is false.
- **cachename**: Name of the cache in secondary cache.
- **timeout**: Specifies the timeout value (in seconds) for the query

**Note**: Maxresults and timeout are used for pagination.

**Category**
ORM functions

**Example**

```cfset employees = ORMExecuteQuery("from Employee where age > ?", [40])>
<cfset employeeObj = ORMExecuteQuery("from Employee where EmployeeID=?", [1], true)>
<cfset employees = ORMExecuteQuery("from Employee where age > ? and age < ?", [40, 80])>
```

**ORMExecuteQuery(hql, namedparams [, unique] [, queryOptions])**

**Description**
This type of ORMExecuteQuery lets you pass named parameters to the query. The placeholder for the parameter must be a name and must start with ":" as in ":age" or ":id". The values to the names must be passed as key-value pairs. In addition, you can specify several options to control the behavior of retrieval using queryOptions:

- **ignorecase**: Ignores the case of sort order when you set it to true. Use this option only when you specify the sortorder parameter.
- **maxResults**: Specifies the maximum number of objects to be retrieved.
- **offset**: Specifies the start index of the resultset from where it has to start the retrieval.
- **cacheable**: Whether the result of this query is to be cached in the secondary cache. Default is false.
- **cachename**: Name of the cache in secondary cache.
- **timeout**: Specifies the timeout value (in seconds) for the query

**Note**: Maxresults and timeout are used for pagination.

**Category**
ORM functions

**Example**

To retrieve employee details of all employees whose reside in USA and are also citizens of USA:

```cfset USEmployees = ORMExecuteQuery("from Employee where country=:country and citizenship=:country", {country='USA'})>
<cfset orderDetail = ORMExecuteQuery("from Orders where OrderID=:orderid and ProductID=:productid", {orderid=1, productid=901}, true)>
```

**Hour**

**Description**
Gets the current hour of the day.
ColdFusion Functions

Hour

Returns
Ordinal value of the hour, in the range 0–23.

Category
Date and time functions

Function syntax
Hour(date)

See also
DatePart, Minute, Second

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

Example

```html
<!--- This example shows the use of Hour, Minute, and Second --->
<h3>Hour Example</h3>
<cfoutput>
The time is currently #TimeFormat(Now())#. We are in hour #Hour(Now())#, Minute #Minute(Now())# and Second #Second(Now())# of the day.
</cfoutput>
```

HTMLCodeFormat

Description
Replaces special characters in a string with their HTML-escaped equivalents and inserts <pre> and </pre> tags at the beginning and end of the string.

Returns
HTML-escaped string string, enclosed in <pre> and </pre> tags. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as &gt;.

Category
Display and formatting functions

Function syntax

```html
HTMLCodeFormat(string [, version ])
```

See also

HTMLEditFormat
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
<tr>
<td>version</td>
<td>HTML version to use; currently ignored.</td>
</tr>
<tr>
<td></td>
<td>• -1: The latest implementation of HTML</td>
</tr>
<tr>
<td></td>
<td>• 2.0: HTML 2.0 (default)</td>
</tr>
<tr>
<td></td>
<td>• 3.2: HTML 3.2</td>
</tr>
</tbody>
</table>

Usage

This function converts the following characters to HTML character entities:

<table>
<thead>
<tr>
<th>Text character</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>&lt;</td>
</tr>
<tr>
<td>&gt;</td>
<td>&gt;</td>
</tr>
<tr>
<td>&amp;</td>
<td>&amp;</td>
</tr>
<tr>
<td>&quot;</td>
<td>&quot;</td>
</tr>
</tbody>
</table>

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (Left, Right, and Mid, for example) against the expanded string.

The only difference between this function and HTMLEditFormat is that HTMLEditFormat does not surround the text in an HTML pre tag.

Example

```cfml
<!--- This example shows the effects of HTMLCodeFormat and HTMLEditFormat. View it in your browser; then View it using your browser's the View Source command. --->
<cfset testString="This is a test & this is another
This text is in angle brackets">

Previous line was blank!!!"

<cfoutput>
<h3>The text without processing</h3>
#testString#<br>
<h3>Using HTMLCodeFormat</h3>
#HTMLCodeFormat(testString)#
<h3>Using HTMLEditFormat</h3>
#HTMLEditFormat(testString)#
</cfoutput>
```

HTMLEditFormat

Description

Replaces special characters in a string with their HTML-escaped equivalents.
ColdFusion Functions

Returns
HTML-escaped string string. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as &gt;.

Category
Display and formatting functions

Function syntax
HTMLEditFormat(string [, version ])

See also
HTMLCodeFormat, cfapplication

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
<tr>
<td>version</td>
<td>HTML version to use; currently ignored.</td>
</tr>
<tr>
<td></td>
<td>• -1: The latest implementation of HTML</td>
</tr>
<tr>
<td></td>
<td>• 2.0: HTML 2.0 (default)</td>
</tr>
<tr>
<td></td>
<td>• 3.2: HTML 3.2</td>
</tr>
</tbody>
</table>

Usage
This function converts the following characters to HTML character entities:

<table>
<thead>
<tr>
<th>Text character</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>&lt;</td>
</tr>
<tr>
<td>&gt;</td>
<td>&gt;</td>
</tr>
<tr>
<td>&amp;</td>
<td>&amp;</td>
</tr>
<tr>
<td>&quot;</td>
<td>&quot;</td>
</tr>
</tbody>
</table>

This function can be used to help protect ColdFusion pages that return user-provided data to the client browser from cross-site scripting attacks. However, the scriptprotect attribute of the cfapplication tag or the equivalent This.scriptProtect variable setting in Application.cfc can be preferable in most instances, because you only need to specify it once for an application.

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (Left, Right, and Mid, for example) against the expanded string.

The only difference between this function and HTMLCodeFormat is that HTMLCodeFormat surrounds the text in an HTML pre tag.
Example
<!--- This example shows the effects of HTMLCodeFormat and HTMLEditFormat. View it in your browser, then View it using your browser's the View Source command. --->
<cfset testString="This is a test & this is another
This text is in angle brackets">

Previous line was blank!!!

IIf

Description
Evaluates a Boolean conditional dynamic expression. Depending on whether the expression is yes or no, dynamically evaluates one of two string expressions and returns the result. This function is convenient for incorporating a cfif tag in-line in HTML.

For general conditional processing, see cfif. For error handling, see cftry. For more information, see the Developing ColdFusion Applications.

Returns
If result is yes, returns the value of Evaluate(string_expression1); otherwise, returns the value of Evaluate(string_expression2).

Category
Decision functions, Dynamic evaluation functions

Function syntax
IIf(condition, string_expression1, string_expression2)

See also
DE, Evaluate

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td>An expression that can be evaluated as a Boolean.</td>
</tr>
<tr>
<td>string_expression1</td>
<td>A string or a variable that contains one. Expression to evaluate and return if condition is yes.</td>
</tr>
<tr>
<td>string_expression2</td>
<td>A string or a variable that contains one. Expression to evaluate and return if condition is no.</td>
</tr>
</tbody>
</table>
Usage
The IIf function is a shortcut for the following construct:

```coldfusion
<cfif condition>
  <cfset result = Evaluate(string_expression1)>
  <cfelse>
  <cfset result = Evaluate(string_expression2)>
</cfif>
```

The expressions `string_expression1` and `string_expression2` must be string expressions, so that they are not evaluated immediately as the parameters of IIf. For example:

```coldfusion
IIf(y is 0, DE("Error"), x/y)
```

If $y = 0$, this generates an error, because the third expression is the value of $x/0$ (invalid expression).

ColdFusion evaluates `string_expression1` and `string_expression2`. To return the string itself, use the `DE` function.

**Note:** If you use number signs (#) in `string_expression1` or `string_expression2`, ColdFusion evaluates the part of the expression in number signs first. If you misuse the number signs, you can cause unexpected results from the IIf function. For example, if you use number signs around the whole expression in `string_expression1`, and if there is an undefined variable in `string_expression1`, the function might fail, with the error "Error Resolving Parameter."

If a variable is undefined, ColdFusion throws an error when it processes this function. The following example shows this problem:

```coldfusion
#IIf(IsDefined("Form.Deliver"), DE(Form.Deliver), DE("no"))#
```

This returns 'Error resolving parameter FORM.DELIVER'.

To avoid this problem, use the `DE` and `Evaluate` functions in code such as the following:

```coldfusion
#IIf(IsDefined("Form.Deliver"), Evaluate(DE("Form.Deliver")), DE("no"))#
```

This returns 'no'; ColdFusion does not throw an error.

In the following example, `LocalVar` is undefined; however, if you omit number signs around `LocalVar`, the code works properly:

```coldfusion
<cfoutput>
  #IIf(IsDefined("LocalVar"), "LocalVar", DE("The variable is not defined.")))#
</cfoutput>
```

The output is:

```
The variable is not defined.
```

The number signs around `LocalVar` in the following code cause it to fail with the error message 'Error Resolving Parameter', because ColdFusion never evaluates the original condition `IsDefined("LocalVar")`.

Here is another example:

```coldfusion
<cfoutput>
  #IIf(IsDefined("LocalVar"), DE("LocalVar"), DE("The variable is not defined.")))#
</cfoutput>
```

The error message would be as follows:

```
Error resolving parameter LOCALVAR
```

The `DE` function has no effect on the evaluation of `LocalVar`, because the number signs cause it to be evaluated immediately.

ColdFusion Functions

Usage

The thickness of the border is specified in pixels by the thickness parameter. The thickness cannot be less than 0.

For the color value, specify a hexadecimal value or supported named color; see the list of valid HTML named colors in "cfimage" on page 336. For a hexadecimal value, use the form "#xxxxxxx" or "xxxxxxx", where x = 0–9 or A–F; use two number signs or none.

Example

Example 1

```coldfusion
<!--- This example shows how to create a 10-pixel-wide red border around an image with a 5-pixel-wide green border around the red border. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Draw a red border around the outside edge of the image. --->
<cfset ImageAddBorder(myImage,10,"red")>
<!--- Draw a green border around the outside edge of the red border. --->
<cfset ImageAddBorder(myImage,5,"green")>
<!--- Save the modified ColdFusion image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->
<img src="../cfdocs/images/artgallery/jeff05.jpg"/>
<img src="test_myImage.jpeg"/>
```

Example 2

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>thickness</td>
<td>Required. Thickness of the border in pixels. The default value is 1. The border is added to the outside edge of the image; the image area is increased accordingly.</td>
</tr>
<tr>
<td>color</td>
<td>Optional. Border color. The default border color is black. See Usage. Only valid if the borderType is not specified or if borderType = &quot;constant&quot;.</td>
</tr>
</tbody>
</table>
| borderType | Optional. The type of border:  
- zero: Sets the border color to black.  
- constant: Sets the border to the specified color (default).  
- copy: Sets sample values to copies of the nearest valid pixel. For example, pixels to the left of the valid rectangle assume the value of the valid edge pixel in the same row. Pixels both above and to the left of the valid rectangle assume the value of the upper-left pixel.  
- reflect: Mirrors the edges of the source image. For example, if the left edge of the valid rectangle is located at x = 10, pixel (9, y) is a copy of pixel (10, y) and pixel (6, y) is a copy of pixel (13, y).  
- wrap: Tiles the source image in the plane. |
<cffunction name="ImageBlur" access="public" returntype="void">
  <p>Smooths (blurs) the ColdFusion image.</p>
  <p>Description</p>
  <p>Smooths (blurs) the ColdFusion image.</p>
  <p>Returns</p>
  <p>Nothing.</p>
  <p>Category</p>
  <p>Image functions</p>
  <p>Function syntax</p>
  <p><code>ImageBlur(name [, BlurRadius])</code></p>
</cffunction>
See also
ImageSharpen, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>blurRadius</td>
<td>Optional. The size of the blur radius. Value must be greater than or equal to 3 and less than or equal to 10. The default value is 3.</td>
</tr>
</tbody>
</table>

Usage
The blurRadius operation affects performance: as the blurRadius value increases, performance decreases.

Example
<!--- This example shows how to blur an image by a radius of 10. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Use the maximum blur radius to blur the image. --->
<cfset ImageBlur(myImage, 10)>
<!--- Save the modified ColdFusion image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->
<img src="../cfdocs/images/artgallery/jeff05.jpg"/>
<img src="test_myImage.jpeg"/>

ImageClearRect

Description
Clears the specified rectangle by filling it with the background color of the current drawing surface.

Returns
Nothing.

Category
Image functions

Function syntax
ImageClearRect(name, x, y, width, height)

See also
ImageSetBackgroundColor, IsImageFile

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the rectangle to clear.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the rectangle to clear.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the rectangle to clear.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the rectangle to clear.</td>
</tr>
</tbody>
</table>

Usage

Use this function in conjunction with the `ImageSetBackgroundColor` function.

Example

```coldfusion
<!--- This example shows how to set the background color to green and draws four rectangles
in that color on the image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Set the background color to green. --->
cfset ImageSetBackgroundColor(myImage,"green")>
<!--- Draw four rectangles in the background color. --->
cfset ImageClearRect(myImage,10,25,50,50)>
cfset ImageClearRect(myImage,100,25,50,50)>
cfset ImageClearRect(myImage,10,100,50,50)>
cfset ImageClearRect(myImage,100,100,50,50)>
<!--- Save the modified ColdFusion image to a file. --->
cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg"/>
<cfimage source="test_myImage.jpeg"/>
```

ImageCopy

Description

Copies a rectangular area of an image.

Returns

A ColdFusion image for the copied area.

Category

Image functions

Function syntax

`ImageCopy(name, x, y, width, height [, dx, dy])`

See also

`ImageNew, ImagePaste, IsImageFile`
History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the source rectangle.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the source rectangle.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the source rectangle.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the source rectangle.</td>
</tr>
<tr>
<td>dx</td>
<td>Optional. The x coordinate of the destination rectangle.</td>
</tr>
<tr>
<td>dy</td>
<td>Optional. The y coordinate of the destination rectangle.</td>
</tr>
</tbody>
</table>

Usage
The rectangle is specified by \((x,y,\text{width},\text{height})\). The area is copied to the rectangle with the upper-left corner specified by \((dx,dy)\).

Example

Example 1

<!---- This example shows how to copy a rectangular area of an image to a new image. ---->
<!---- Create a ColdFusion image from an existing JPEG file. ---->
<cfimage source="../cfdocs/images/artgallery/lori05.jpg" name="myImage"/>
<!---- Copy the rectangular area specified by the coordinates (25,25,50,50) in the image to the rectangle beginning at (75,75), and return this copied rectangle as a new ColdFusion image. ---->
<cfset dupArea = ImageCopy(myImage, 25, 25, 50, 50, 75, 75)>
<!---- Write the result to a PNG file. ---->
<cfimage source="#myImage#" action="write" destination="test_myImage.png" overwrite="yes"/>
<!---- Display the source image and the new image. ---->
<img src="../cfdocs/images/artgallery/lori05.jpg"/>
<img src="test_myImage.png"/>

Example 2

<!---- This example shows how to copy a rectangular area from one image and paste it over another image. ---->
<!---- Create a ColdFusion image named "myImage1" from an existing JPEG file.---->
<cfimage source="../cfdocs/images/artgallery/lori05.jpg" name="myImage1"/>
<!---- Create the ColdFusion image "myImage2" from a different JPEG file. ---->
<cfimage source="../cfdocs/images/artgallery/maxwell01.jpg" name="myImage2"/>
<!---- Copy a rectangular region of "myImage1" as a new image. ---->
<cfset resImage = ImageCopy(myImage1, 1, 1, 55, 55)>
<!---- Paste the rectangular area on the second image. ---->
<cfset ImagePaste(myImage2, resImage, 50, 75)>
<!---- Write the second ColdFusion image to a file. ---->
<cfimage action="write" source="#myImage2#" destination="test_myImage.jpg" overwrite="yes"/>
<!---- Display the two source files and the new file. ---->
<img src="../cfdocs/images/artgallery/lori05.jpg"/>
<img src="../cfdocs/images/artgallery/maxwell01.jpg"/>
<img src="test_myImage.jpg"/>
ImageCreateCaptcha

Description
Create a Completely Automated Public Turing test to tell Computers and Humans Apart (CAPTCHA) image, a distorted text image that is human-readable, but not machine-readable, used in a challenge-response test for preventing spam.

Returns
Image object

Syntax
imageCreateCaptcha (height, width, text)
imageCreateCaptcha (height, width, text [, difficulty])
imageCreateCaptcha (height, width, text [, difficulty, fonts, fontsize])

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>Required. Height in pixels of the image.</td>
</tr>
<tr>
<td>width</td>
<td>Required. Width in pixels of the image.</td>
</tr>
<tr>
<td>text</td>
<td>Required. Text string displayed in the CAPTCHA image.</td>
</tr>
<tr>
<td>difficulty</td>
<td>Optional. Level of complexity of the CAPTCHA text. Specify one of the</td>
</tr>
<tr>
<td></td>
<td>following levels of text distortion:</td>
</tr>
<tr>
<td></td>
<td>- low</td>
</tr>
<tr>
<td></td>
<td>- medium</td>
</tr>
<tr>
<td></td>
<td>- high</td>
</tr>
<tr>
<td>font</td>
<td>Optional. One or more valid fonts to use for the CAPTCHA text. Separate</td>
</tr>
<tr>
<td></td>
<td>multiple fonts with commas. ColdFusion supports only the system fonts that</td>
</tr>
<tr>
<td></td>
<td>the JDK can recognize. For example, TTF fonts in the Windows directory are</td>
</tr>
<tr>
<td></td>
<td>supported on Windows.</td>
</tr>
<tr>
<td>fontsize</td>
<td>Optional. Font size of the text in the CAPTCHA image. The value must be</td>
</tr>
<tr>
<td></td>
<td>an integer.</td>
</tr>
</tbody>
</table>

Example

<h1>ImageCreateCaptcha Method</h1>
<cfset funcimg1 = ImageCreateCaptcha(35,400,"loner")>
    <cfimage action="writetoBrowser" source="#funcimg1#">
<cfset funcimg2 = ImageCreateCaptcha(35,400,"loner","high")>
    <cfimage action="writetoBrowser" source="#funcimg2#">
<cfset funcimg3 = ImageCreateCaptcha(35,400,"loner","high","serif,sansserif", "24")>
    <cfimage action="writetoBrowser" source="#funcimg3#">

ImageCrop

Description
Crops a ColdFusion image to a specified rectangular area.
Returns
Nothing.

Category
Image functions

Function syntax
ImageCrop(name, x, y, width, height)

See also
ImageFlip, ImageResize, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x origin of the crop area.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y origin of the crop area.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the crop area.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the crop area.</td>
</tr>
</tbody>
</table>

Usage
The rectangular area cannot be empty, and must be fully contained within the source image bounds.

Example
<!--- This example shows how to crop an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/lori05.jpg" name="myImage">
<!--- Crop myImage to 100x100 pixels starting at the coordinates (10,10). --->
<cfset ImageCrop(myImage,10,10,100,100)>  
<!--- Write the result to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">  
<!--- Display the source image and the new image. --->
<img src="../cfdocs/images/artgallery/lori05.jpg"/>
<img src="test_myImage.jpg"/>

ImageDrawArc

Description
Draws a circular or elliptical arc.

Returns
Nothing.
Category
Image functions

Function syntax
ImageDrawArc(name, x, y, width, height, startAngle, arcAngle [, filled])

See also
ImageDrawCubicCurve, ImageDrawOval, ImageDrawQuadraticCurve, ImageSetAntialiasing,
ImageSetDrawingColor, ImageSetDrawingStroke, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the upper-left corner of the arc.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the upper-left corner of the arc.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the arc.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the arc.</td>
</tr>
<tr>
<td>startAngle</td>
<td>Required. The beginning angle in degrees.</td>
</tr>
<tr>
<td>arcAngle</td>
<td>Required. The angular extent of the arc, relative to the start angle.</td>
</tr>
<tr>
<td>filled</td>
<td>Optional. Specify whether the arc is filled:</td>
</tr>
<tr>
<td></td>
<td>• yes: The arc is filled with the specified drawing color.</td>
</tr>
<tr>
<td></td>
<td>• no: Only the outline of the arc is drawn (default).</td>
</tr>
</tbody>
</table>

Usage
The resulting arc begins at startAngle and extends for arcAngle degrees. Degrees start at 0 in the three o’clock position. A positive value indicates a counter-clockwise rotation; a negative value indicates a clockwise rotation.

The center of the arc is the center of the rectangle whose origin is (x,y) and whose size is specified by the width and height parameters.

The angles are specified relative to the non-square extents of the bounding rectangle so that 45 degrees always falls on the line from the center of the ellipse to the upper-right corner of the bounding rectangle. As a result, if the bounding rectangle is noticeably longer on one axis than the other, the angles to the start and end of the arc segment are skewed farther along the longer axis of the bounds.

If the filled parameter is set to yes, the area inside the oval is filled with the current drawing color.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to specify the color and line attributes of the arc. Use the ImageSetAntialiasing function to improve the quality of the rendered image.
Example

<!--- This example shows how to use the ImageNew function to create a blank ColdFusion image that is 250 pixels wide and 180 pixels high. --->
<cfset myImage=ImageNew("",250,320)>

<!--- Set the drawing color for the arc to orange. --->
<cfset ImageSetDrawingColor(myImage,"orange")>

<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>

<!--- Draw an enclosed orange arc starting at the coordinate (5,5). --->
<cfset ImageDrawArc(myImage,5,5,200,300,100,100,"yes")>

<!--- Display the image in a browser. --->
<cfimage action="writeToBrowser" source="#myImage#">

**ImageDrawBeveledRect**

**Description**

Draws a rectangle with beveled edges.

**Returns**

Nothing.

**Category**

Image functions

**Function syntax**

ImageDrawBeveledRect(name, x, y, width, height, raised [, filled])

**See also**

**History**

ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the rectangle.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the rectangle.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the rectangle.</td>
</tr>
</tbody>
</table>
Usage
The edges of the rectangle are highlighted so that they appear beveled and lit from the upper-left corner. The colors used for the highlighting effect are determined by the current drawing color.

If the `filled` parameter is set to `yes`, the cuboid area is filled with the current drawing color.

Use the `ImageSetDrawingColor` and `ImageSetDrawingStroke` functions to specify the color and line attributes of the rectangle. Use the `ImageSetAntialiasing` function to improve the quality of the rendered image.

Example
```cfdm
<!--- This example shows how to create a bevel-edged rectangle. --->
<!--- Use the ImageNew function to create a 200x200-pixel image. --->
<cfset myImage=ImageNew('',200,200)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing color for the image to light gray. --->
<cfset ImageSetDrawingColor(myImage,"lightgray")>
<!--- Draw a 3D gray, filled, raised rectangle. --->
<cfset ImageDrawBeveledRect(myImage,50,50,100,75,"yes","yes")>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

**ImageDrawCubicCurve**

**Description**
Draws a cubic curve.

**Returns**
Nothing.

**Category**
Image functions

**Function syntax**
```
ImageDrawCubicCurve(name, ctrlx1, ctrly1, ctrlx2, ctrly2, x1, y1, x2, y2)
```
ColdFusion Functions

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>ctrlx1</td>
<td>Required. The x coordinate of the first control point of the cubic curve segment.</td>
</tr>
<tr>
<td>ctrly1</td>
<td>Required. The y coordinate of the first control point of the cubic curve segment.</td>
</tr>
<tr>
<td>ctrlx2</td>
<td>Required. The x coordinate of the second control point of the cubic curve segment.</td>
</tr>
<tr>
<td>ctrly2</td>
<td>Required. The y coordinate of the second control point of the cubic curve segment.</td>
</tr>
<tr>
<td>x1</td>
<td>Required. The x coordinate of the start point of the cubic curve segment.</td>
</tr>
<tr>
<td>y1</td>
<td>Required. The y coordinate of the start point of the cubic curve segment.</td>
</tr>
<tr>
<td>x2</td>
<td>Required. The x coordinate of the end point of the cubic curve segment.</td>
</tr>
<tr>
<td>y2</td>
<td>Required. The y coordinate of the end point of the cubic curve segment.</td>
</tr>
</tbody>
</table>

Usage
Coordinates can be integers or real numbers.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to specify the color and line attributes of the cubic curve. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
```cfml
<!--- This example shows how to draw a curved line that looks like a stylized 7. --->
<!--- Use the ImageNew function to create a blank ColdFusion image that is 200 pixels wide and 380 pixels high. --->
<cfset myImage=ImageNew("",200,380)>
<!--- Set the drawing color to magenta. --->
<cfset ImageSetDrawingColor(myImage,"magenta")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a curved line that starts at (380,28) and ends at (32,56) with its first control point at (120,380) and its second control point at (5,15). --->
<cfset ImageDrawCubicCurve(myImage,120,380,5,15,380,28,32,56)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

ImageDrawLine

Description
Draws a single line defined by two sets of x and y coordinates on a ColdFusion image.
Returns
Nothing.

Category
Image functions

Function syntax
ImageDrawLine(name, x1, y1, x2, y2)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x1</td>
<td>Required. The x coordinate for the start point of the line.</td>
</tr>
<tr>
<td>y1</td>
<td>Required. The y coordinate for the start point of a line.</td>
</tr>
<tr>
<td>x2</td>
<td>Required. The x coordinate for the end point of the line.</td>
</tr>
<tr>
<td>y2</td>
<td>Required. The y coordinate for the end point of the line.</td>
</tr>
</tbody>
</table>

Usage
Each pair of coordinates, (x1,y1) and (x2,y2), defines a point. The start and end points cannot be the same.

This function is affected by the attributes defined in the ImageSetDrawingStroke and ImageSetDrawingColor functions. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to draw a square bisected by a diagonal line. -->
<!--- Use the ImageNew function to create a 100x100-pixel image. -->
<cfset myImage=ImageNew("",100,100)>
<!--- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a diagonal line that bisects the square. -->
<cfset ImageDrawLine(myImage,0,0,100,100)>
<!--- Display the image in a browser. -->
<cfimage source="#myImage#" action="writeToBrowser">

ImageDrawLines

Description
Draws a sequence of connected lines defined by arrays of x and y coordinates.
Returns
Nothing.

Category
Image functions

Function syntax
ImageDrawLines(name, xcoords, ycoords [, isPolygon, filled])

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>xcoords</td>
<td>Required. A CFML array of x coordinates.</td>
</tr>
<tr>
<td>ycoords</td>
<td>Required. A CFML array of y coordinates.</td>
</tr>
<tr>
<td>isPolygon</td>
<td>Optional. Specify whether the lines form a polygon:</td>
</tr>
<tr>
<td></td>
<td>- yes: The lines are connected to form a polygon.</td>
</tr>
<tr>
<td></td>
<td>- no: The lines do not form a polygon (default).</td>
</tr>
<tr>
<td>filled</td>
<td>Optional. Specify whether the polygon is filled:</td>
</tr>
<tr>
<td></td>
<td>- yes: The polygon is filled with the specified drawing color.</td>
</tr>
<tr>
<td></td>
<td>- no: Only the outline of the polygon is drawn (default).</td>
</tr>
</tbody>
</table>

Usage
Each pair of (x,y) coordinates defines a point.

To draw a polygon, set isPolygon to yes. The start point cannot be the same value as the end point. If isPolygon is yes, a line joining start point and the end point is drawn to complete a polygon. If isPolygon is no, line completing the polygon is not drawn.

Set the isPolygon and filled parameters to yes to draw a polygon filled with the current drawing color.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to control the color and line attributes. Use the ImageSetAntialiasing function to improve the quality of the rendered image.
Example
<!--- This example shows how to draw a zigzag line. --->
<!--- Use the ImageNew function to create a 250x250-pixel image. --->
<cfset myImage=ImageNew("",250,250)>
<!--- Set the drawing color to cyan. --->
<cfset ImageSetDrawingColor(myImage,"cyan")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Create arrays for the x and y coordinates. --->
<cfset x = ArrayNew(1)>
<cfset y = ArrayNew(1)>
<!--- Set the values for the x and y coordinates for three connected line segments: the first
segment begins at (100,50) and ends at (50,100). The second segment begins at (50, 100) and
ends at (200,100). The third segment begins at (200,100) and ends at (100,200). --->
<cfset x[1] = "100">  
<cfset x[2] = "50">  
<cfset x[3] = "200">  
<cfset x[4] = "100">  
<cfset y[1] = "50">  
<cfset y[2] = "100">  
<cfset y[3] = "100">  
<cfset y[4] = "200">  
<!--- Draw the lines on the image. --->
<cfset ImageDrawLines(myImage,x,y)>
<!--- Display the image in a browser. --->
<cfimage source=#myImage# action="writeToBrowser">

ImageDrawOval

Description
Draws an oval.

Returns
Nothing.

Category
Image functions

Function syntax
ImageDrawOval(name, x, y, width, height [, filled])

See also

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the upper left corner of the oval to draw.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the upper left corner of the oval to draw.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the oval to draw.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the oval to draw.</td>
</tr>
<tr>
<td>filled</td>
<td>Optional. Specify whether the oval is filled:</td>
</tr>
<tr>
<td></td>
<td>• yes: The oval is filled with the specified drawing color.</td>
</tr>
<tr>
<td></td>
<td>• no: Only the outline of the oval is drawn (default).</td>
</tr>
</tbody>
</table>

Usage

The result is a circle or ellipse that fits within the rectangle specified by the x, y, width, and height arguments.

If the filled parameter is set to yes, the area inside the oval is filled with the current drawing color.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to specify the color and line attributes of the oval. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example

Example 1

<!--- This example shows how to draw a green filled oval. --->
<!--- Use the ImageNew function to create a 200x110-pixel image. --->
<cfset myImage=ImageNew("",200,110)>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a filled green oval on the image. --->
<cfset ImageDrawOval(myImage,5,5,190,100,"yes")>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

Example 2
<cfset myImage=ImageNew("",201,201)>  
<cfset ImageSetDrawingColor(myImage,"red")>  
<cfset ImageSetAntialiasing(myImage,"on")>  
<cfset attr=StructNew()>  
<cfset attr.width = 10>  
<cfset ImageSetDrawingStroke(myImage,attr)>  
<cfset ImageDrawLine(myImage,40,40,165,165)>  
<cfset ImageDrawOval(myImage,5,5,190,190)>  
<cfimage source="#myImage#" action="writeToBrowser"> 

### ImageDrawPoint

**Description**

Draws a point at the specified (x,y) coordinate.

**Returns**

Nothing.

**Category**

Image functions

**Function syntax**

ImageDrawPoint(name, x, y)

**See also**

**History**

ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the point.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the point.</td>
</tr>
</tbody>
</table>
Usage
Use the ImageSetDrawingStroke and ImageSetDrawingColor functions to control the appearance of the drawing point. For example, set the width attribute of the ImageSetDrawingStroke function to 10 pixels to draw a 20-pixel-square centered at (x,y). Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to draw a large square in the middle of an image. --->
<!--- Use the ImageNew function to create a 200x200-pixel image. --->
<cfset myImage=ImageNew('',200,200)>
<!---Set the drawing color to orange. --->
<cfset ImageSetDrawingColor(myImage,"orange")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing area to 10 pixels. --->
<cfset attr = StructNew()>
<cfset attr.width = 10>
<cfset ImageSetDrawingStroke(myImage,attr)>
<!--- Draw the point at (100,100). --->
<cfset ImageDrawPoint(myImage,100,100)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

ImageDrawQuadraticCurve

Description
Draws a curved line. The curve is controlled by a single point.

Returns
Nothing.

Category
Image functions

Function syntax
ImageDrawQuadraticCurve(name, ctrlx1, ctrly1, ctrlx2, ctrly2, x1, y1, x2, y2)

See also

History
ColdFusion 8: Added this function.
A quadratic curve is a curve controlled by a single control point. The curve is drawn from the last point in the shape to the target x and y coordinates. Coordinates can be integers or real numbers.

Use the `ImageSetDrawingColor` and `ImageSetDrawingStroke` functions to specify the color and lines of the quadratic curve. Use the `ImageSetAntialiasing` function to improve the quality of the rendered image.

Example

```cfscript
<!--- This example shows how to draw a curved line. --->
<!--- Use the ImageNew function to create a 400x400-pixel image. --->
<cfset myImage=ImageNew("",400,400)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Draw a curved line on the image. --->
<cfset ImageDrawQuadraticCurve(myImage,120,320,5,15,380,280)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### ImageDrawRect

**Description**

Draws a rectangle.

**Returns**

Nothing.

**Category**

Image functions

**Function syntax**

```
ImageDrawRect(name, x, y, width, height [, filled])
```
See also
ImageDrawQuadraticCurve, ImageDrawRoundRect, ImageSetAntialiasing, ImageSetDrawingColor,
ImageSetDrawingStroke, ImageDrawText, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the rectangle.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the rectangle.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the rectangle.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the rectangle.</td>
</tr>
<tr>
<td>filled</td>
<td>Optional. Specify whether the rectangle is filled:</td>
</tr>
<tr>
<td></td>
<td>• yes: The rectangle is filled with the specified drawing color.</td>
</tr>
<tr>
<td></td>
<td>• no: Only the outline of the rectangle is drawn (default).</td>
</tr>
</tbody>
</table>

Usage
The left and right edges of the rectangle are at x and x plus width, respectively. The upper and lower edges are at y and y plus height, respectively.

Set the filled parameter to yes to fill the rectangle with the current drawing color.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to format the color and lines of the rectangle. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to draw a rectangle. --->
<!--- Use the ImageNew function to create a ColdFusion image that is 150 pixels wide and 200 pixels high. --->
<cfset myImage=ImageNew("",150,200)>
<!--- Set the drawing color for the image to yellow. --->
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a filled yellow rectangle on the image. --->
<cfset ImageDrawRect(myImage,25,45,100,20,"yes")>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

ImageDrawRoundRect

Description
Draws a rectangle with rounded corners.
Returns
Nothing.

Category
Image functions

Function syntax
ImageDrawRoundRect(name, x, y, width, height, arcWidth, arcHeight [, filled])

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate of the rectangle.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate of the rectangle.</td>
</tr>
<tr>
<td>width</td>
<td>Required. The width of the rectangle.</td>
</tr>
<tr>
<td>height</td>
<td>Required. The height of the rectangle.</td>
</tr>
<tr>
<td>arcWidth</td>
<td>Required. The horizontal diameter of the arc at the four corners.</td>
</tr>
<tr>
<td>arcHeight</td>
<td>Required. The vertical diameter of the arc at the four corners.</td>
</tr>
</tbody>
</table>
| filled    | Optional. Specify whether the rectangle is filled:  
|           | • yes: The rectangle is filled with the specified drawing color.  
|           | • no: Only the outline of the rectangle is drawn (default). |

Usage
The left and right edges of the rectangle are at x and x plus width, respectively. The upper and lower edges are at y and y plus height, respectively.

Set the filled parameter to yes to fill the rectangle with the current drawing color.

Use the ImageSetDrawingColor and ImageSetDrawingStroke functions to control the color and line attributes of the rectangle. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
Example 1
<!--- This example shows how to draw a square with rounded corners. --->
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Set the drawing color for the image to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a blue filled square with round corners of arcWidth=10 and arcHeight=2. --->
<cfset ImageDrawRoundRect(myImage,5,5,190,190,"yes",10,2)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

Example 2

<!--- Create an image. --->
<cfset myImage = imageNew("",100,100,"argb")>
<!--- Create a text attribute collection. --->
<cfset textStruct = structNew()>
<cfset textStruct.size=16>
<cfset textStruct.style="bold">
<cfset textStruct.font="Trebuchet MS">

<cfoutput>
<!--- Turn on antialiasing to improve the quality of the rendered image. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the background color. --->
<cfset ImageSetBackgroundColor(myImage,"cyan") />
<cfset ImageClearRect(myImage,0,0,myImage.getwidth(),myImage.getheight())>
<!--- Set the drawing color. --->
<cfset ImageSetDrawingColor(myImage,"black") />
<!--- Draw a rectangle with rounded corners. --->
<cfset ImageDrawRoundRect(myImage,10,10,myImage.width-20, myImage.height-20,i,i,"yes")>
<!--- Set the text arc value. --->
<cfset ImageSetDrawingColor(myImage,"##cccccc")>
<cfset ImageDrawText(myImage, "##i#",30,30,textStruct)>
<!--- Write the image to a file. --->
<cfset imageWrite(myImage,##expandPath("##i#.png")##)>
<!--- Display the image. --->
<img src="##i#.png">
</cfoutput>
</cfoutput>

ImageDrawText

**Description**

Draws a text string on a ColdFusion image with the baseline of the first character positioned at (x,y) in the image.

**Returns**

A struct that contains width and height of the text drawn.

**Category**

Image functions
Function syntax

ImageDrawText(name, str, x, y [, attributeCollection])

See also

History

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>str</td>
<td>Required. The text string to draw.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate for the start point of the string.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate for the start point of the string.</td>
</tr>
<tr>
<td>attributeCollection</td>
<td>Optional. The structure used to specify the text characteristics. See the Usage section.</td>
</tr>
</tbody>
</table>

Usage

Specify all the optional key-value pairs in an attributeCollection structure. To specify the text color, use the ImageSetDrawingColor function.

attributeCollection

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>The name of the font used to draw the text string. If you do not specify the font attribute, the text is drawn in the default system font.</td>
</tr>
<tr>
<td>size</td>
<td>The font size for the text string. The default value is 10 points.</td>
</tr>
<tr>
<td>style</td>
<td>The style to apply to the font:</td>
</tr>
<tr>
<td></td>
<td>• bold</td>
</tr>
<tr>
<td></td>
<td>• italic</td>
</tr>
<tr>
<td></td>
<td>• boldItalic</td>
</tr>
<tr>
<td></td>
<td>• plain (default)</td>
</tr>
<tr>
<td>strikethrough</td>
<td>Specify whether strikethrough is applied to the text image:</td>
</tr>
<tr>
<td></td>
<td>• yes: For vertical text, strikethrough is applied to each character individually.</td>
</tr>
<tr>
<td></td>
<td>• no (default)</td>
</tr>
<tr>
<td>underline</td>
<td>Specify whether underline is applied to the text image:</td>
</tr>
<tr>
<td></td>
<td>• yes: For vertical text, underline is applied to each character individually.</td>
</tr>
<tr>
<td></td>
<td>• no (default)</td>
</tr>
</tbody>
</table>
Example
Example 1

<!---- This example shows how to create a text string image. ---->
<!---- Use the ImageNew function to create a 200x100-pixel image. ---->
<cfset myImage=ImageNew("",200,100)>
<!---- Set the drawing color to green. ---->
<cfset ImageSetDrawingColor(myImage,"green")>
<!---- Specify the text string and the start point for the text. ---->
<cfset ImageDrawText(myImage,"It's not easy being green.",10,50)>
<!---- Display the image in a browser. ---->
<cfimage source="#myImage#" action="writeToBrowser">

Example 2

<!---- This example shows how to draw three text strings with different text attributes. ---->
<!---- Use the ImageNew function to create a 400x400-pixel image. ---->
<cfset myImage=ImageNew("",400,400)>
<!---- Set the text attributes. ---->
<cfset attr = StructNew()>
<cfset attr.underline = "yes">
<cfset attr.size = 25>
<cfset attr.style = "bold">
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!---- Draw the text string "ColdFusion Rocks!" starting at (100,150). ---->
<cfset ImageDrawText(myImage,"ColdFusion Rocks!",100,150,attr)>
<!---- Set new text attributes. ---->
<cfset attr=StructNew()>
<cfset attr.size = 18>
<cfset attr.strikethrough = "yes">

<!---- Draw the text string "Powered by ColdFusion" starting at (100,200). ---->
<cfset ImageDrawText(myImage,"Powered by ColdFusion",110,200,attr)>
<!---- Set new text attributes. ---->
<cfset attr = StructNew()>
<cfset attr.font="Arial">
<cfset attr.style="italic">
<cfset attr.size=15>
<cfset ImageSetDrawingColor(myImage,"white")>
<!---- Draw the text string "Coming in 2007" starting at (150,250). ---->
<cfset ImageDrawText(myImage,"We've arrived",150,250,attr)>
<!---- Display the text image in a browser. ---->
<cfimage source="#myImage#" action="writeToBrowser">

ImageFlip

Description
Flips an image across an axis.

Returns
Nothing.
Category
Image functions

Function syntax
ImageFlip(name [, transpose])

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>transpose</td>
<td>Optional. Transpose the image:</td>
</tr>
<tr>
<td></td>
<td>• vertical: Flip an image across an imaginary horizontal line that runs through the center of the image (default).</td>
</tr>
<tr>
<td></td>
<td>• horizontal: Flip an image across an imaginary vertical line that runs through the center of the image.</td>
</tr>
<tr>
<td></td>
<td>• diagonal: Flip an image across its main diagonal that runs from the upper-left to the lower-right corner.</td>
</tr>
<tr>
<td></td>
<td>• antidiagonal: Flip an image across its main diagonal that runs from the upper-right to the lower-left corner.</td>
</tr>
<tr>
<td></td>
<td>• (90</td>
</tr>
</tbody>
</table>

Usage
If you do not specify the `transpose` parameter for the `ImageFlip` function, the image is transposed on a vertical axis, creating an image that is an upside-down version of the source. Use the `ImageSetAntialiasing` function to improve the quality of the rendered image.

Example
Example 1

```cfml
<!--- This example shows how to rotate an image by 270 degrees. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="./cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Rotate the image by 270 degrees. --->
<cfset ImageFlip(myImage,"270")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

Example 2
<!--- This example shows how to flip an image on a vertical axis. --->
<cfimage source='../cfdocs/images/artgallery/paul03.jpg' name='myImage'>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image so that it is upside down. --->
<cfset ImageFlip(myImage,"vertical")>
<!--- Display the modified image in a browser. --->
<cfimage source='#myImage#' action="writeToBrowser">

Example 3

<!--- This example shows how to flip an image on a horizontal axis. --->
<cfimage source='../cfdocs/images/artgallery/paul03.jpg' name='myImage'>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image so that it is a mirror image of the source. --->
<cfset ImageFlip(myImage,"horizontal")>
<!--- Display the modified image in a browser. --->
<cfimage source='#myImage#' action="writeToBrowser">

Example 4

<!--- This example shows how to flip an image on a diagonal axis. --->
<cfimage source='../cfdocs/images/artgallery/paul03.jpg' name='myImage'>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image on a diagonal axis. --->
<cfset ImageFlip(myImage,"diagonal")>
<!--- Display the modified image in a browser. --->
<cfimage source='#myImage#' action="writeToBrowser">

Example 5

<!--- This example shows how to flip an image on an antidiagonal axis. --->
<cfimage source='../cfdocs/images/artgallery/paul03.jpg' name='myImage'>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image on an antidiagonal axis. --->
<cfset ImageFlip(myImage,"antidiagonal")>
<!--- Display the modified image in a browser. --->
<cfimage source='#myImage#' action="writeToBrowser">

**ImageGetBlob**

**Description**

Retrieves the bytes of the underlying image. The bytes are in the same image format as the source image.

**Returns**

The bytes of the underlying image of a BLOB.

**Category**

Image functions
Function syntax
ImageGetBlob(source)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage
Use this function to insert ColdFusion images into BLOB columns of databases.

Note: If you do not specify a source image, you get a parameter validation error.

Example
Example 1

<!--- This example shows how to add a ColdFusion image to a database. --->
<!--- Create ColdFusion image from a an existing JPEG file. --->
<cfimage source="aiden01.jpg" name="myImage">
<!--- Use the cfquery tag to insert the ColdFusion image as a BLOB in the database. --->
<cfquery name="InsertBlobImage" datasource="myBlobData">
INSERT into EMPLOYEES (FirstName,LastName,Photo)
VALUES ('Aiden','Quinn',<cfqueryparam value="#ImageGetBlob(myImage)#" cfsqltype='cf_sql_blob'>)
</cfquery>

Example 2

The following example shows how to use the ImageNew function to generate thumbnail images in JPEG format from BLOB data retrieved from a database:

<!--- Use the cfquery tag to retrieve all employee photos and employee IDs from a database. --->
<cfquery name="GetBLOBs" datasource="myBlobData">
SELECT EMPLOYEEID, PHOTO FROM Employees
</cfquery>
<!--- Use the ImageNew function to create a ColdFusion image from the BLOB data that was retrieved from the database. --->
<cfset myImage = ImageNew(#GetBLOBs.PHOTO#)>
<!--- Create thumbnail versions of the images by resizing them to a 100x100-pixel image, while maintaining the aspect ratio of the source image. --->
<cfset ImageScaleToFit(myImage,100,"")>
<!--- Convert the images to JPEG format and save them to files in the thumbnails subdirectory, using the employee ID as the filename. --->
<cfimage source="#myImage#" action="write" destination="images/thumbnails/#GetBLOBs.EMPLOYEEID#.jpg">
ImageGetBufferedImage

Description
Returns the java.awt.BufferedImage object underlying the current ColdFusion image.

Returns
The java.awt.BufferedImage object.

Category
Image functions

Function syntax
ImageGetBufferedImage(name)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage
Use this function to return an image object that can be used with other Java Abstract Windowing Toolkit (AWT) objects embedded in the page.

Example
<!--- This example shows how to create a ColdFusion image, modify it, and retrieve the width of the buffered image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul05.jpg" name="myImage">
<!--- Blur the image by an order of 10. --->
<cfset ImageBlur(myImage,10)>
<!--- Get the blurred image from the buffer and set it to variable x. --->
<cfset x = ImageGetBufferedImage(myImage)>
<!--- Return the width of the buffered image. --->
<cfoutput>#x.getWidth()#
</cfoutput>

ImageGetEXIFMetadata

Description
Retrieves the Exchangeable Image File Format (EXIF) headers in an image as a CFML structure.
Returns
A structure with the EXIF header values.

Category
Image functions

Function syntax
ImageGetEXIFMetadata(name)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage
The EXIF is a standard for storing interchange information in image files, especially those using JPEG compression. Most digital cameras use the EXIF format.

EXIF metadata includes information pertaining to the creation of the image, such as the creation date, the software used to create the image, the aperture, the make and model, and the resolution of the image.

The result of the ImageGetEXIFMetadata function is cached in the ColdFusion image to optimize performance.

The ImageGetEXIFMetadata function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

Example
<!--- This example shows how to retrieve the EXIF header information from a JPEG file. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="images\paul05.jpg" name="myImage"/>
<!--- Retrieve the metadata associated with the image. --->
<cfset data = ImageGetEXIFMetadata(myImage)>
<!--- Display the EXIF header information associated with the image (creation date, software, and so on). --->
<cfdump var="#data#">

ImageGetEXIFTag

Description
Retrieves the specified EXIF tag in an image.
Returns
The value of the specified EXIF tag.

Category
Image functions

Function syntax
ImageGetEXIFTag(name, tagName)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>tagName</td>
<td>Required. The EXIF tag name to be returned.</td>
</tr>
</tbody>
</table>

Usage
The ImageGetEXIFTag function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

Example
<!--- This example shows how to retrieve one element from the EXIF information associated with an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul05.jpg" name="myImage">
<!--- Retrieve the name of the software application used to create the original image. --->
<cfset data = ImageGetEXIFTag(myImage, "software")>
<!--- Display the name of the software. --->
<cfdump var="#data#">

ImageGetHeight

Description
Retrieves the height of the ColdFusion image in pixels.

Returns
The height of the specified ColdFusion image in pixels.

Category
Image functions
Function syntax

ImageGetHeight(name)

See also

History

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage

Use this function to retrieve the height of a ColdFusion image.

Example

```html
<!--- This example shows how to retrieve the height of an image. --->
<!---- Create a ColdFusion image from a JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Retrieve the height of the image. --->
<cfset height=#ImageGetHeight(myImage)#>
<!--- Display the height of the image. --->
<cfdump var="#height#">
```

ImageGetIPTCMetadata

Description

Retrieves the International Press Telecommunications Council (IPTC) headers in a ColdFusion image as a structure. The IPTC metadata contains text that describes the image that is stored with it. IPTC metadata includes, but is not limited to, caption, keywords, credit, copyright, object name, created date, byline, headline, and source.

Returns

A structure containing IPTC header values.

Category

Image functions

Function syntax

ImageGetIPTCMetadata(name)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage

The IPTC metadata contains text that describes the image that is stored with it. IPTC metadata includes, but is not limited to, caption, keywords, credit, copyright, object name, created date, byline, headline, and source.

The result of the `ImageGetIPTCMetadata` function is cached in the ColdFusion image to optimize performance.

The `ImageGetIPTCMetadata` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

Example

```coldfusion
<!--- This example shows how to retrieve the IPTC header information for a JPEG file. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="images\aiden01.jpg" name="myImage">  
<!--- Retrieve the IPTC header information saved with the image, such as copyright, caption, and headline. --->
<cfset data = ImageGetIPTCMetadata(myImage)>  
<!--- Display the parameter values for the ColdFusion image. --->
<cfdump var="#myImage#">  
<!--- Display the IPTC header information. --->
<cfdump var="#data#>  
```

**ImageGetIPTCTag**

Description

Retrieves the value of the IPTC tag for a ColdFusion image.

Returns

The value of the IPTC tag.

Category

Image functions

Function syntax

`ImageGetIPTCTag(name, tagName)`

See also

History

ColdFusion 8: Added this function.
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>tagName</td>
<td>Required. The IPTC tag name whose value is returned.</td>
</tr>
</tbody>
</table>

Usage

The `ImageGetIPTCTag` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other image types, ColdFusion generates errors.

Example

```coldfusion
<!--- This example shows how to retrieve the caption for a JPEG file. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul05.jpg" name="myImage" action="read">
<!--- Retrieve the camera make used to take the original picture. --->
<cfset cameraMake=ImageGetIPTCTag(myImage, "make")>
<cfdump var="#cameraMake#"/>
```

ImageGetWidth

Description

Retrieves the width of the specified ColdFusion image.

Returns

An integer that represents the width of the ColdFusion image in pixels.

Category

Image functions

Function syntax

`ImageGetWidth(name)`

See also

History

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
Example
<!--- This example shows how to retrieve the width of an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage"/>
<!--- Get the width of the image. --->
<cfset width=#ImageGetWidth(myImage)#>
<!--- Display the width of the image in pixels. --->
<cfdump var=#width#>

ImageGrayscale

Description
Converts a ColdFusion image to grayscale.

Returns
Nothing.

Category
Image functions

Function syntax
ImageGrayscale(name)

See also
ImageBlur, ImageNegative, ImageSetAntialiasing, ImageSharpen, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage
Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to change a color image to grayscale. --->
<!--- Create a ColdFusion image from an existing color image. --->
<cfimage source="../cfdocs/images/artgallery/jeff04.jpg" name="myImage"/>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Change the image to grayscale. --->
<cfset ImageGrayscale(myImage)>
<!--- Save the grayscale image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the source image and the grayscale image. --->
<img src="../cfdocs/images/artgallery/jeff04.jpg"/>
<img src="test_myImage.jpg"/>
**ImageInfo**

**Description**
Returns a structure that contains information about the image, such as height, width, color model, size, and filename.

**Returns**
A structure that contains information for image parameters.

**Category**
Image functions

**Function syntax**
ImageInfo(name)

**See also**
cfimage, ImageGetHeight, ImageGetWidth, IsImage, IsImageFile

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

**Usage**
Use this function to determine whether images are compatible. For example, to use the ImageOverlay function to overlay two images, both images must have the same color model.

**Example**
```cfml
<cfset info=ImageInfo(myImage)>
<cfdump var="#info#"></cfdump>
<p>height = <cfoutput>#info.height#</cfoutput>
<p>width = <cfoutput>#info.width#</cfoutput>
<p>source = <cfoutput>#info.source#</cfoutput>
<p>pixel size = <cfoutput>#info.colormodel.pixel_size#</cfoutput>
<p>transparency = <cfoutput>#info.colormodel.transparency#</cfoutput>
```

**ImageMakeColorTransparent**

**Description**
Creates an image and sets a transparent color.
ColdFusion Functions

Returns
Image object

Syntax
imageMakeColorTransparent(img, color)

History
ColdFusion 10: Added this function

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>img</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>color</td>
<td>Required. The transparent color:</td>
</tr>
</tbody>
</table>

- Hexadecimal value of RGB color. For example, specify the color white as "#FFFFFF" or "FFFFF".
- String value of color (for example, "black", "red", "green").
- The default value of the transparent color is "black".
  List of three numbers for (R,G,B) values. Each value must be in the range 0–255.

Example
<cfset myImage=ImageNew("",200,110)>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a filled green oval on the image. --->
<cfset ImageDrawOval(myImage,5,5,190,100,"yes")>
<!--- Display the image in a browser. --->
<cfoutput><PNG image=""></cfoutput>
<cfset ImageWrite(myImage,"#expandpath('.')#/png.png")>
<cfset myImage = ImageRead("#expandpath('.')#/png.png")>
<cfimage source="#myImage#" action="writeToBrowser" >
<cfset x =ImageMakeColorTransparent(myImage,"green")>
<cfimage source="#x#" action="writeToBrowser" >

ImageMakeTranslucent

Description
Create a new translucent image with given percentage of translucence.

Returns
Image object

Syntax
imageMakeTranslucent(img, percent)
The following example illustrates three images with the second one translucent than first and the third one translucent than the second.

```html
<cfset myImage=ImageNew('',200,110)>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a filled green oval on the image. --->
<cfset ImageDrawOval(myImage,5,5,190,100,"yes")>
<!--- Display the image in a browser. --->
<cfoutput>PNG image
<br></cfoutput>
<cfset ImageWrite(myImage,"#expandpath('.')#/png.png")>
<cfset myImage = ImageRead("#expandpath('.')#/png.png")>
<cfimage source="#myImage#" action="writeToBrowser" >
<cfset x = ImageMakeTranslucent(myImage,50)>
<cfimage source="#x#" action="writeToBrowser" >
<cfset x = ImageMakeTranslucent(myImage,75)>
<cfimage source="#x#" action="writeToBrowser" >
<cfset x = ImageMakeTranslucent(myImage,100)>
<cfimage source="#x#" action="writeToBrowser" >
</body></html>
```

### ImageNegative

**Description**

Inverts the pixel values of a ColdFusion image.

**Returns**

Nothing.

**Category**

Image functions

**Function syntax**

`ImageNegative(name)`

**See also**

`ImageBlur, ImageGrayscale, ImageSetAntialiasing, ImageSharpen, IsImageFile`
History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>

Usage
The resulting image has the same dimensions of the source image, but not necessarily the same number bytes. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to create a negative version of an image. --->
<!--- Create a ColdFusion image from and existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">  
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>  
<!--- Create a negative version of the image. --->
<cfset ImageNegative(myImage)>  
<!--- Save the modified image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">  
<!--- Display the source image and the negative image. --->
<img src="../cfdocs/images/artgallery/jeff05.jpg"/>  
<img src="test_myImage.jpg"/>

ImageNew

Description
Creates a ColdFusion image.

Returns
A ColdFusion image.

Category
Image functions

Function syntax
ImageNew([source, width, height, imageType, canvasColor])

See also
cfimage, ImageCopy, ImageRead, ImageReadBase64, ImageSetDrawingColor, IsImageFile

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Optional. The source image on-disk or in-memory pathname, URL, a ColdFusion variable that is read into the new ColdFusion image, or a Java buffered image.</td>
</tr>
<tr>
<td>width</td>
<td>Optional. The width of the new ColdFusion image. Valid when the height is specified and the source is not.</td>
</tr>
<tr>
<td>height</td>
<td>Optional. The height of the new ColdFusion image. Valid when the width is specified and the source is not.</td>
</tr>
<tr>
<td>imageType</td>
<td>Optional. The type of the ColdFusion image to create:</td>
</tr>
<tr>
<td></td>
<td>- rgb</td>
</tr>
<tr>
<td></td>
<td>- argb</td>
</tr>
<tr>
<td></td>
<td>- grayscale</td>
</tr>
<tr>
<td></td>
<td>Valid only when width and height are specified.</td>
</tr>
<tr>
<td>canvasColor</td>
<td>Optional. Color of the image canvas:</td>
</tr>
<tr>
<td></td>
<td>- Hexadecimal value of RGB color. For example, specify the color white as #ffffff or ffffff.</td>
</tr>
<tr>
<td></td>
<td>- String value of color (for example, &quot;black&quot;, &quot;red&quot;, &quot;green&quot;). The default value of the drawing color is &quot;black&quot;.</td>
</tr>
<tr>
<td></td>
<td>- List of three numbers for (R,G,B) values. Each value must be in the range 0–255.</td>
</tr>
</tbody>
</table>

Usage

You can pass the `ImageNew` function any of the following parameters:

- Absolute or relative pathname: The image file located at the specified pathname on a disk is read and returned as a ColdFusion image.
- URL: The image from the specified URL is read and returned as a ColdFusion image.
- Width and height (imageType is optional): A blank ColdFusion image with the specified attributes is returned.
- ColdFusion image variable: An image variable in memory; for example, `#myImage#`.
- A BLOB from a database that contains image data.
- A byte array that contains Base64 image data.
- A Java buffered image.

ColdFusion generates an error when the passed attributes cannot create a valid ColdFusion image.

The `ImageNew` function and the `cfimage` read action support the SQL Server Image Column data type.

To read Base64 images, use the `ImageReadBase64` function.

If the color value is a string, specify a supported named color; see the valid HTML named colors in “`cfimage`” on page 336. For a hexadecimal value, use the form “#xxxxxx” or “xxxxxx”, where x = 0–9 or A–F; use two number signs or none.

**Note:** If you specify the ARGB image type, the image is white; however, if you specify RGB or grayscale, the image is black. To create blank images consistently, use the `canvasColor` parameter.
Example 1
<br> <!--- Use the ImageNew function to create a 200x200-pixel image in ARGB format. --->
<br><cfset myImage = ImageNew("",200,200,"argb")>
<br><cfimage action="writeToBrowser" source="#myImage#">

Example 2
<br> <!--- This example shows how to create a ColdFusion image from a BLOB in a database. --->
<br><cfquery name="GetBLOBs" datasource="myblobdata">
<br> SELECT LastName,Photo
<br> FROM Employees
<br></cfquery>
<br><cfset i = 0>
<br><table border=1>
<br> <cfoutput query="GetBLOBS">
<br> <tr>
<br> <td>
<br> #LastName#
<br> </td>
<br> <td>
<br> <cfset i = i+1>
<br> <cfset myImage=ImageNew("#GetBLOBS.Photo#")>
<br> <cfset ImageWrite(myImage,"photo#i#.png")>
<br> </td>
<br> </tr>
<br></cfoutput>
<br></table>

Example 3
<br> <!--- This example shows how to create a ColdFusion image from a URL. --->
<br><cfset myImage = ImageNew("http://www.google.com/images/logo_sm.gif")>
<br><cfset ImageWrite(myImage,"google_via_imagenew.png")>
<br><img src="google_via_imagenew.png">

Example 4
<br> <!--- This example shows how to use the cffile tag to convert an image file to binary format and pass it as a variable to the ImageNew function. --->
<br><!---Use the cffile tag to read an image file, convert it to binary format, and write the result to a variable. --->
<br><cffile action = "readBinary" file = apple.jpg>
<br> variable = "aBinaryObj">
<br> <!--- Use the ImageNew function to create a ColdFusion image from the variable. --->
<br><cfset myImage = ImageNew(aBinaryObj)>

Example 5
Example 6

<!--- This example uses cfscript to pass a Java buffered image to the ImageNew function. --->
<cfscript>
    bufferedImage = createObject("java", "java.awt.image.BufferedImage");
    bufferedImage.init(JavaCast("int", 100), JavaCast("int", 100),
    BufferedImage.TYPE_4BYTE_ABGR);
    myImage = imageNew(bufferedImage);
</cfscript>

ImageOverlay

Description
Reads two source ColdFusion images and overlays the second source image on the first source image.

Returns
Nothing.

Category
Image functions

Function syntax
ImageOverlay(source1, source2 [, rule, alpha])

See also
ImageCopy, ImagePaste, ImageSetAntialiasing, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source1</td>
<td>Required. The ColdFusion image that is the bottom layer in the ColdFusion image.</td>
</tr>
</tbody>
</table>
Usage
The destination image always has the same bounding rectangle as the first source image and the same image type as
the two sources. If the two source images do not intersect, the destination image is the same as the first source image.

The two source images must have the same color models. For example, you can overlay an RGB image over another
RGB image, but you cannot overlay an RGB image on a grayscale image. To verify the color model of an image, use
the `ImageInfo` function.

Use the `ImageSetAntialiasing` function to improve the quality of the rendered image.

Example
<!--- This example shows how to overlay a smaller image on a larger image. --->
<!--- Create a ColdFusion image from an existing JPEG file and enlarge it by 150%. This image
is displayed in the background. --->
<cimage source="../cfdocs/images/artgallery/maxwell01.jpg" name="myImage" action="resize"
width="150%" height="150%">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Create a ColdFusion image from an existing JPEG file. This image is overlaid on the
background image. --->
<cimage source="../cfdocs/images/artgallery/viata05.jpg" name="topImage">
<!--- Overlay the top image on the background image. --->
<cfset ImageOverlay(myImage,topImage)>
<!--- Display the combined image in a browser. --->
<cimage source="#myImage#" action="writeToBrowser">

ImagePaste

Description
Takes two images and an (x,y) coordinate and draws the second image over the first image with the upper-left corner
at coordinate (x,y).

Returns
A ColdFusion image.

Category
Image functions

Function syntax
ImagePaste(image1, image2, x, y)
See also
ImageCopy, ImageOverlay, ImageSetAntialiasing, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>image1</td>
<td>Required. The bottom ColdFusion image.</td>
</tr>
<tr>
<td>Image2</td>
<td>Required. The ColdFusion image that is pasted on top of image1.</td>
</tr>
<tr>
<td>x</td>
<td>Required. The x coordinate where the upper-left corner of image2 is pasted.</td>
</tr>
<tr>
<td>y</td>
<td>Required. The y coordinate where the upper-left corner of image2 is pasted.</td>
</tr>
</tbody>
</table>

Usage
Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to copy a small rectangular area of one image and paste it over a larger image. --->
<!--- Create a ColdFusion image from an existing JPEG file and name it "myImage1". --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage1">
<!--- Create a ColdFusion image from an existing JPEG file and name it "myImage2". --->
<cfimage source="../cfdocs/images/artgallery/maxwell01.jpg" name="myImage2">
<!--- Copy a rectangular region of myImage1. --->
<cfset resImage = ImageCopy(myImage1,1,1,50,50)>
<!--- Paste the rectangular area over myImage2. --->
<cfset ImagePaste(myImage2,resImage,100,100)>
<!--- Write the second ColdFusion image to result.jpg. --->
<cfimage source="#myImage2#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the two source images and the new image. --->
<img src="../cfdocs/images/artgallery/jeff05.jpg"/>
<img src="../cfdocs/images/artgallery/maxwell01.jpg"/>
<img src="test_myImage.jpg"/>

ImageRead

Description
Reads the on-disk or in-memory source pathname or URL and creates a ColdFusion image.

Returns
A ColdFusion image.

Category
Image functions

Function syntax
ImageRead(path)
ColdFusion Functions

History
ColdFusion 8: Added this function.

See also
cfimage, ImageNew, ImageReadBase64, ImageWrite, IsImageFile

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Required. On-disk or in-memory pathname or URL of the source image.</td>
</tr>
</tbody>
</table>

Usage
The ImageRead function performs the same operation as the cfimageread action. However, you cannot use the cfimage tag to read and create a ColdFusion image variable in the cfscript tag. Use the ImageRead function within the cfscript tag to read ColdFusion images.

The following example reads the image file aiden01.jpg into a variable called myImage and displays the image in the browser:

```cfscript
<cfset myImage=ImageRead("../cfdocs/images/artgallery/aiden01.jpg")>
<cfimage action="writeToBrowser" source="#myImage#">
```

For a list of valid image formats, see the supported image file formats listed in "cfimage" on page 336. To retrieve a list of readable formats on the server where the ColdFusion application is deployed, use the GetReadableImageFormats function.

Example
---
This example shows how to create a script that reads an image from a URL. ---

```cfscript
myImage=ImageRead("http://www.google.com/images/logo.gif");
ImageWrite(myImage,"google-logo.gif");
</cfscript>
```

This image has been downloaded by ColdFusion:

![Google Logo](http://www.google.com/images/logo.gif)

This is the original image:

![Google Logo](http://www.google.com/images/logo.gif)

ImageReadBase64

Description
Creates a ColdFusion image from a Base64 string.

Returns
A ColdFusion image.

Category
Image functions

Function syntax
ImageReadBase64(string)
See also
ImageNew, ImageRead, ImageWrite, ImageWriteBase64, BinaryDecode, BinaryEncode, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Required. The ColdFusion variable or Base64 string.</td>
</tr>
</tbody>
</table>

Usage
Base64 is a way to describe binary data as a printable string of characters. The ImageReadBase64 function takes Base64 strings as input and creates images from the strings.

The strings can be with or without the headers used to pass Base64 images to an HTML `<img src>` tag.

Use this function to convert any Base64 string to a ColdFusion image. Some databases store images as Base64 strings instead of BLOB data. You can query the database and use the ImageReadBase64 function to convert the string into a ColdFusion image. This eliminates the intermediary step of converting images with the BinaryEncode and BinaryDecode functions.

Really Simple Syndication (RSS) feeds transfer images in the form of embedded Base64 strings in the XML file. Use the ImageReadBase64 function to read these images in ColdFusion.

Example
Example 1

```cfml
<!--- This example shows how to read a Base64 string with headers. --->
<cfset myImage = ImageReadBase64("data:image/jpg;base64,/9j/4AAQSkZJRgABAQA..............")>
<cfimage source="#myImage#" destination="test_my64.jpeg" action="write">
```

Example 2

```cfml
<!--- This example shows how to read a Base64 string without headers. --->
<cfset myImage = ImageReadBase64("/9j/4AAQSkZJRgABAQA..............")>
<cfimage source="#myImage#" destination="test_my64.jpeg" action="write">
```

ImageResize

Description
Resizes a ColdFusion image.

Returns
Nothing.

Category
Image functions
Function syntax
ImageResize(name, width, height [, interpolation, blurFactor])

See also
cfimage, ImageSetAntialiasing, ImageScaleToFit, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>width</td>
<td>Required. New width of the ColdFusion image.</td>
</tr>
<tr>
<td>height</td>
<td>Required. New height of the ColdFusion image.</td>
</tr>
</tbody>
</table>
| interpolation | Optional. The interpolation method for resampling. You can specify a specific interpolation algorithm by name (for example, hamming), by image quality (for example, mediumQuality), or by performance (for example, highestPerformance). Valid values are:  
  * highestQuality (default)  
  * highQuality  
  * mediumQuality  
  * highestPerformance  
  * highPerformance  
  * mediumPerformance  
  * nearest  
  * bilinear  
  * bicubic  
  * bessel  
  * blackman  
  * hamming  
  * hanning  
  * hermite  
  * lanczos  
  * mitchell  
  * quadratic  
See Interpolation algorithms in the Usage section for more information. |
| blurFactor    | Optional. The blur factor used for resampling. The higher the blur factor, the more blurred the image (also, the longer it takes to resize the image). This value must be from 1 through 10. |
Usage
You can use this function to enlarge an image or create a thumbnail image.

To specify the height or width in pixels, enter the integer, for example, 100. To specify the height or width as a percentage, enter the percentage followed by the percent symbol, for example, 50%.

To resize an image by one dimension (for example, height), specify the height and leave width value blank ("").
ColdFusion calculates the width proportionally to the height.

Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Interpolation algorithms
Interpolation algorithms let you fine-tune how images are resampled. Each algorithm balances image quality against performance: in general, the higher the image quality, the slower the performance. Quality and performance differ based on image type and the size of the source file. The following table describes the algorithms and their named equivalents based on average test results:

<table>
<thead>
<tr>
<th>Value</th>
<th>Named equivalents</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>highestQuality (default)</td>
<td>lanczos</td>
<td>Highest image quality with low performance</td>
</tr>
<tr>
<td>highQuality, mediumPerformance</td>
<td>mitchell, quadratic</td>
<td>Good image quality with slightly higher performance</td>
</tr>
<tr>
<td>mediumQuality, highPerformance</td>
<td>hamming, hanning, hermite</td>
<td>Medium quality image with medium performance</td>
</tr>
<tr>
<td>blackman, bessel</td>
<td></td>
<td>Slightly distorted image quality with high performance</td>
</tr>
<tr>
<td>highestPerformance</td>
<td>nearest, bicubic, bilinear</td>
<td>Poor image quality with highest performance</td>
</tr>
</tbody>
</table>

Example
<!--- This example shows how to resize an image to 50% of original size and resize it proportionately to the new width. Notice that the height is blank. --->
<cfset myImage=ImageNew("http://www.google.com/images/logo_sm.gif")>
<cfset ImageResize(myImage,"50%","",blackman",2")>
<!--- Save the modified image to a file called "test_myImage.jpeg" and display the image in a browser. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the thumbnail image. --->
<img src="http://www.google.com/images/logo_sm.gif"/>
<img src="test_myImage.jpeg"/>

ImageRotate

Description
Rotates a ColdFusion image at a specified point by a specified angle.

Returns
Nothing.

Category
Image functions

Function syntax
ImageRotate(name, angle [, x, y, interpolation])
See also
cfimage, ImageFlip, ImageSetAntialiasing, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>angle</td>
<td>Required. The rotation angle in degrees.</td>
</tr>
<tr>
<td>x</td>
<td>Optional. The x coordinate for the point of rotation. The default value is 2.</td>
</tr>
<tr>
<td>y</td>
<td>Optional. The y coordinate for the point of rotation. The default value is 2.</td>
</tr>
<tr>
<td>interpolation</td>
<td>Optional. Type of interpolation:</td>
</tr>
<tr>
<td></td>
<td>nearest: Applies the nearest neighbor method of interpolation. Image quality is lower than the other</td>
</tr>
<tr>
<td></td>
<td>interpolation methods, but processing is fastest (default).</td>
</tr>
<tr>
<td></td>
<td>bilinear: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the</td>
</tr>
<tr>
<td></td>
<td>default, but processing is slower.</td>
</tr>
<tr>
<td></td>
<td>bicubic: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this</td>
</tr>
<tr>
<td></td>
<td>method and processing is slowest.</td>
</tr>
</tbody>
</table>

Usage
Specify both the x and the y coordinates or neither. If you do not specify the x and y coordinates, the point of rotation is the center of the image, which is the default position. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
Example 1

<!--- This example shows how to rotate an image by 10 degrees. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff05.jpg")>
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Rotate the image by 10 degrees. --->
<cfset ImageRotate(myImage,10)>
<cfimage source="#myImage#" action="writeToBrowser">

Example 2

<!--- This example shows how to rotate an image by 10 degrees and change the interpolation to bicubic for higher resolution. The image is rotated at the (10,90) coordinates. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<cfset ImageRotate(myImage,10,10,90,"bicubic")>

<img src="testMyImage.jpeg">
ImageRotateDrawingAxis

Description
Rotates all subsequent drawing on a ColdFusion image at a specified point by a specified angle.

Returns
A ColdFusion image.

Category
Image functions

Function syntax
ImageRotateDrawingAxis(name, angle [, x, y])

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>angle</td>
<td>Required. The rotation angle in degrees.</td>
</tr>
<tr>
<td>x</td>
<td>Optional. The x coordinate for the point of rotation. The default value is 0.</td>
</tr>
<tr>
<td>y</td>
<td>Optional. The y coordinate for the point of rotation. The default value is 0.</td>
</tr>
</tbody>
</table>

Usage
The default position of the origin is 0,0. To revert to the original drawing axis, call the same (x,y) parameters with the negative of the original angle. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- This example shows how to create an image with three shapes drawn on the same axis. --->
<!--- Use ImageNew to create a 300x300-pixel image. --->
<cfset myImage=ImageNew("",300,300)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing axis to 30 degrees and the point of rotation at (10,10). --->
<cfset ImageRotateDrawingAxis(myImage,30,10,10)>
<!--- Set the drawing color to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Draw three shapes with the same color and drawing axis. --->
<cfset ImageDrawRect(myImage,150,10,10,150,"yes")>
<cfset ImageDrawOval(myImage,200,40,45,65,"yes")>
<cfset ImageDrawRect(myImage,275,10,10,150,"yes")>
<cfimage source="#myImage#" action="writeToBrowser"
ImageScaleToFit

Description
Creates a resized image with the aspect ratio maintained.

Returns
Nothing.

Category
Image functions

Function syntax
ImageScaleToFit(name, fitWidth, fitHeight [, interpolation , blurFactor])

See also
cfimage, ImageResize, ImageSetAntialiasing, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>fitWidth</td>
<td>Required. The width of the bounding box in pixels. You can specify an integer, or an empty string (“”) if the fitHeight is specified. See the Usage section for more information.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>fitHeight</td>
<td>Required. The height of the bounding box in pixels. You can specify an integer, or an empty string (&quot;&quot;) if the fitWidth is specified. See the Usage section for more information.</td>
</tr>
</tbody>
</table>
| interpolation | Optional. The interpolation method for resampling. You can specify a specific interpolation algorithm by name (for example, hamming), by image quality (for example, mediumQuality), or by performance (for example, highestPerformance). Valid values are:  
  - highestQuality (default)  
  - highQuality  
  - mediumQuality  
  - highestPerformance  
  - highPerformance  
  - mediumPerformance  
  - nearest  
  - bilinear  
  - bicubic  
  - bessel  
  - blackman  
  - hamming  
  - hanning  
  - hermite  
  - lanczos  
  - mitchell  
  - quadratic  
  See Interpolation algorithms in the Usage section for more information. |
| blurFactor  | Optional. The blur factor used for resampling. The higher the blur factor, the more blurred the image (also, the longer it takes to resize the image). Valid values are 1–10. |

**Usage**

Use this operation to resize images or create thumbnail images while maintaining the aspect ratio. Specify the fitWidth and fitHeight parameters; either the fitWidth or the fitHeight can be an empty string:

```cfset ImageScaleToFit(myImage,100,"")>
```

In this example, the ImageScaleToFit function resizes the image so that it fits in a 100x100-pixel square; the width of the resulting image is 100 pixels and the height is less than or equal to 100 pixels. For example, if the source image is 400x200 pixels, the resulting image is 100x50 pixels.

Likewise, if you specify the fitHeight parameter and an empty string for the fitWidth parameter, the ImageScaleToFit function resizes the image so that the height equals the fitHeight parameter and the width of the image is scaled proportionately:

```cfset ImageScaleToFit(myImage,"",100)>
```
In this example, a 400x200-pixel source image is resized to 200x100 pixels, and a 200x400-pixel image is resized to 50x100 pixels.

If you set both the fitWidth and the fitHeight parameters, the ImageScaleToFit function resizes the image proportionately so that both conditions are true: the width of the resulting image is less than or equal to the fitWidth, and the height is less than or equal to the fitHeight:

```cfc
<cfset ImageScaleToFit(myImage,100,200)>
```

In this example, a 400x200-pixel source image is resized to 100x50 pixels, and a 200x400-pixel source image is resized to 100x200 pixels.

Use the ImageSetAntialiasing function to improve the quality of the rendered image.

### Example

```cfc
<!--- This example shows how to resize an image to fit a 100x100-pixel square while maintaining the aspect ratio. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Resize the image to fit a 100x100-pixel square. --->
<cfset ImageScaleToFit(myImage,100,"","lanczos")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### ImageSetAntialiasing

**Description**

Switches antialiasing on or off in rendered graphics.

**Returns**

Nothing.

**Category**

Image functions

**Function syntax**

```cfc
ImageSetAntialiasing(name [, antialias])
```

**See also**

**History**

ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>antialias</td>
<td>Optional. Antialiasing switch:</td>
</tr>
<tr>
<td></td>
<td>• on (default)</td>
</tr>
<tr>
<td></td>
<td>• off</td>
</tr>
</tbody>
</table>

Usage

The `ImageSetAntialiasing` function is used to turn antialiasing on and off when drawing shapes and text in an image. Antialiasing is a technique used to soften jagged edges. Turn on antialiasing when using other image functions, such as `ImageDrawRoundRect` and `ImageRotate`, to improve the quality of the rendered image. Notice that antialiasing decreases performance.

Example

Example 1

```cfml
<!--- This example shows how to turn off antialiasing for a ColdFusion image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/elecia02.jpg")>
<!--- Turn off antialiasing.--->
<cfset ImageSetAntialiasing(myImage,"off")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

Example 2

```cfml
<!--- This example shows how to turn on antialiasing to improve the output of the ImageDrawRoundRect function. --->
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Set the drawing color for the image to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Turn on antialiasing. --->
<cfset ImageSetAntialiasing(myImage)> | |
<!--- Draw a blue filled square with round corners of arcWidth=10 and arcHeight=2. --->
<cfset ImageDrawRoundRect(myImage,5,5,190,190,"yes",10,2)>
<!--- Rotate the image 30 degrees. --->
<cfset ImageRotate(myImage,30)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

ImageSetBackgroundColor

Description

Sets the background color for the ColdFusion image. The background color is used for clearing a region. Setting the background color only affects the subsequent `ImageClearRect` calls.

Returns

Nothing.
**ColdFusion Functions**

**Category**
Image functions

**Function syntax**

ImageSetBackgroundColor(name, color)

**See also**
ImageClearRect, ImageSetAntialiasing, IsImageFile

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
| color     | Required. Background color:  
  - Hexadecimal value of RGB color. For example, specify the color white as ##FFFFFF or FFFFFF.  
  - String value of color (for example, "black", "red", "green"). The default value of the drawing color is "black".  
  - List of three numbers for (R,G,B) values. Each value must be in the range 0–255. |

**Usage**

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in "cfimage" on page 336. For a hexadecimal value, use the form "##xxxxxx" or "xxxxxx", where x = 0–9 or A–F; use two number signs or none.

Use this function in conjunction with the ImageClearRect function to clear a rectangular area of an image and set it to a specified color.

**Example**

<!--- This example shows how to set the background color, and then draw a rectangle on an image filled with that color. --->
  <!--- Create a ColdFusion image from an existing JPEG file. --->
  <cfimage name="myImage" source="/cfdocs/images/artgallery/maxwell01.jpg">
  <!--- Turn on antialiasing to improve image quality. --->
  <cfset ImageSetAntialiasing(myImage)>
  <!--- Set the background color to magenta. --->
  <cfset ImageSetBackgroundColor(myImage,"magenta")>
  <!--- Clear the rectangle specified on myImage with the background color specified for the image. --->
  <cfset ImageClearRect(myImage,36,45,100,100)>
  <!--- Display the modified image in a browser. --->
  <cfimage source="#myImage#" action="writeToBrowser">
ImageSetDrawingColor

Description
Sets the current drawing color for ColdFusion images. All subsequent graphics operations use the specified color.

Returns
Nothing.

Category
Image functions

Function syntax
ImageSetDrawingColor(name, color)

See also
ImageSetAntialiasing, ImageSetBackgroundColor, ImageSetDrawingStroke, ImageSetDrawingTransparency, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
| color     | Required. Drawing color:  
  - Hexadecimal value of RGB color. For example, specify the color white as "#FFFFFF" or "FFFFFF".  
  - String value of color (for example, "black", "red", "green"). The default value of the drawing color is "black".  
  - List of three numbers for (R,G,B) values. Each value must be in the range 0-255. |

Usage
Use the ImageSetDrawingColor function to control the color of all subsequent drawing objects in ColdFusion images. For example, you can use this function to set the drawing color to red once, and then draw a circle, a square, and 10 lines in that color.

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in “cfimage” on page 336. For a hexadecimal value, use the form "#xxxxxx" or "xxxxxx", where x = 0-9 or A-F; use two number signs or none.
Example
<!--- This example shows how to set the drawing color and draw several objects in that color. --->
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage=ImageNew("",200,300)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the drawing color to pink. --->
<cfset ImageSetDrawingColor(myImage,"pink")>
<!--- Draw a pink line. --->
<cfset ImageDrawLine(myImage,1,1,200,300)>
<!--- Draw a pink oval. --->
<cfset ImageDrawOval(myImage,40,50,80,40)>
<!--- Draw another pink oval. --->
<cfset ImageDrawOval(myImage,15,180,80,40)>
<!--- Draw a pink rectangle. --->
<cfset ImageDrawRect(myImage,100,100,45,65)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

**ImageSetDrawingStroke**

**Description**
Sets the drawing stroke for points and lines in subsequent ColdFusion images.

**Returns**
Nothing.

**Category**
Image functions

**Function syntax**
```
ImageSetDrawingStroke(name [, attributeCollection])
```

**See also**

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>attributeCollection</td>
<td>Optional. The structure used to specify the line attributes. See the Usage section.</td>
</tr>
</tbody>
</table>
Usage
Use the `ImageSetDrawingStroke` function to control the line attributes of all subsequent drawing objects in a ColdFusion image. For example, you can use this function to set the drawing stroke to a dash pattern once, and then create a rectangle, two ovals, and five lines with that pattern.

If a blank or no attribute structure is passed, the drawing stroke is reset to the default values.

**attributeCollection**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Pen width, which is measured perpendicularly to the pen trajectory.</td>
</tr>
<tr>
<td>endcaps</td>
<td>Decoration applied to the ends of unclosed subpaths and dash segments. Subpaths that start and end on the same point are considered unclosed if they do not have a close segment:</td>
</tr>
<tr>
<td></td>
<td>- butt</td>
</tr>
<tr>
<td></td>
<td>- round</td>
</tr>
<tr>
<td></td>
<td>- square</td>
</tr>
<tr>
<td>lineJoins</td>
<td>Type of line joins:</td>
</tr>
<tr>
<td></td>
<td>- bevel</td>
</tr>
<tr>
<td></td>
<td>- miter</td>
</tr>
<tr>
<td></td>
<td>- join</td>
</tr>
<tr>
<td>miterLimit</td>
<td>The limit to trim a line join that has a mitered join decoration. (Use only when <code>lineJoins = “miter”). A line join is trimmed when the ratio of miter length to stroke width is greater than the </code>miterLimit` value. The miter length is the diagonal length of the miter, which is the distance between the inside corner and the outside corner of the intersection. The smaller the angle formed by two line segments, the longer the miter length and the sharper the angle of intersection. The default value is 10.0, which trims all angles less than 11 degrees. Trimming miters converts the decoration of the line join to bevel.</td>
</tr>
<tr>
<td>dashArray</td>
<td>An array of numbers that indicates the dash pattern. For example, if <code>dashArray</code> is (8,4), the dash pattern is 8 pixels solid, 4 pixels blank, 8 pixels solid, 4 pixels blank, and so on.</td>
</tr>
<tr>
<td>dash_phases</td>
<td>An offset into the dash pattern. For example, a dash phase of 2, and a dashArray of (8,4) produces the dash pattern of 6 pixels solid, 4 pixels blank, 8 pixels solid, 4 pixels blank, and so on.</td>
</tr>
</tbody>
</table>

Example
Example 1
<!--- This example shows how to create an attribute collection for the ImageSetDrawingStroke function and draws a line with those attributes. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Create an attribute collection to pass to the ImageSetDrawingStroke function. Create a stroke that is 10-pixels wide, has round endcaps, and has a dash pattern of (8,4). --->
<cfset attr = StructNew()>
<cfset attr.width = 2>
<cfset attr.endcaps = "round">
<cfset dashPattern = ArrayNew(1)>
<cfset dashPattern[1] = 8>
<cfset dashPattern[2] = 4>
<cfset attr.dashArray = dashPattern>
<!--- Apply the attribute collection to the ImageSetDrawingStroke function for the image. --->
<cfset ImageSetDrawingStroke(myImage,attr)>
<!--- Draw a line on the ColdFusion image with the drawing stroke attributes. --->
<cfset ImageDrawLine(myImage,20,20,40,150)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

Example 2

<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage=ImageNew("",500,500)>
<!-- Set the drawing color of the image to cyan. --->
<cfset ImageSetDrawingColor(myImage,"cyan")>
<!--- Draw a line from (30,40) to (200,190). --->
<cfset ImageDrawLine(myImage,30,30,200,200)>
<!--- Create the attribute collection for the drawing stroke. --->
<cfset attr = StructNew()>
<cfset attr.width = 1>
<cfset attr.endcaps = "round">
<cfset dashPattern = ArrayNew(1)>
<cfset dashPattern[1] = 3>
<cfset dashPattern[2] = 4>
<cfset dashPattern[3] = 8>
<cfset attr.dashArray = dashPattern>
<!--- Pass the attribute collection as an argument to the set drawing stroke function. --->
<cfset ImageSetDrawingStroke(myImage,attr)>
<!-- Set the drawing color of the image to yellow. --->
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!--- Draw a rectangle with the drawing stroke specified. --->
<cfset ImageDrawRect(myImage,200,50,210,200)>
<!--- Reset the drawing stroke. --->
<cfset ImageSetDrawingStroke(myImage)>
<!--- Draw a green quadratic curve. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<cfset ImageDrawQuadraticCurve(myImage,120,320,5,15,380,280)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser"
**ImageSetDrawingTransparency**

**Description**
Specifies the degree of transparency of drawing functions.

**Returns**
Nothing.

**Category**
Image functions

**Function syntax**
```
ImageSetDrawingTransparency(name, percent)
```

**See also**
ImageSetAntialiasing, ImageSetBackgroundColor, ImageSetDrawingColor, ImageSetDrawingStroke, IsImageFile

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
| percent   | Required. Percent of transparency:  
  * 0 = opaque  
  * 100 = transparent  
  Decimal values are valid. |

**Usage**
By default drawing images are opaque. Use this function to create watermarks or other translucent images. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

**Example**
Example 1
<!--- This example shows how to draw semitransparent text over an image. --->
<cfimage source='..//cfdocs/images/artgallery/austin01.jpg' name='myImage'>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>  
<!--- Set the drawing transparency to 40%. --->
<cfset ImageSetDrawingTransparency(myImage, 40)>  
<!--- Set the text drawing attributes. --->
<cfset attr = StructNew()>
<cfset attr.size = 40>
<cfset attr.style = "bold">  
<!--- Specify the text string and the location of the text on the image. --->
<cfset ImageDrawText(myImage, "SOLD!", 40, 100, attr)>  
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

Example 2  
<!--- This example shows how to create a watermark from the a JPEG file. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source='..//cfdocs/getting_started/photos/somewhere.jpg' name='myImage' action="read">  
<!--- Set the drawing transparency to 75%. --->
<cfset ImageSetDrawingTransparency(myImage, 75)>  
<!--- Create a ColdFusion image from a picture in the cfartgallery. --->
<cfimage source='..//cfdocs/images/artgallery/raquel05.jpg' name='myImage2' action="read">  
<!--- Set the drawing transparency to 30%. --->
<cfset ImagesetDrawingTransparency(myImage, 30)>  
<!--- Paste the ColdFusion log over the picture at coordinates (0,0). --->
<cfset ImagePaste(myImage, myImage2, 0, 0)>  
<!--- Display the two source images and the result. --->
<cfimage source="#myImage#" destination="watermark.jpg" action="write" overwrite="yes">  
<img src='..//cfdocs/getting_started/photos/somewhere.jpg'>  
<img src='..//cfdocs/images/artgallery/raquel05.jpg'>  
<img src='watermark.jpg'>

Example 3  
<!--- This code creates a ColdFusion image to be used as a watermark. --->
<cfimage action="read" name="logo" source='..//cfdocs/getting_started/photos/somewhere.jpg'>  
<cfset imageGrayscale(logo)>  
<cfset imageRotate(logo, 45)>  
<!--- This code creates the ColdFusion image to be used as the base image. --->
<cfimage action="read" source='..//cfdocs/images/artgallery/raquel05.jpg' name="baseImage">  
<!--- This code sets the drawing transparency for the base image to 80%. --->
<cfset ImageSetDrawingTransparency(baseImage, 80)>  
<!--- This code pastes the watermark image onto the base image at the coordinates (0,0). --->
<cfset ImagePaste(baseImage, logo, 0, 0)>  
<!--- This code writes the result to a file. --->
<cfimage action="write" source="#baseImage#" destination="abc_watermark.jpg" overwrite="yes">  
<!--- This code displays the image used as a watermark and the result. --->
<img src='..//cfdocs/getting_started/photos/somewhere.jpg'/>  
<img src='abc_watermark.jpg'/>
ImageSharpen

Description
Sharpens a ColdFusion image by using the unsharp mask filter.

Returns
Nothing.

Category
Image functions

Function syntax
ImageSharpen(name [, gain])

See also
ImageBlur, ImageSetAntialiasing, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>gain</td>
<td>Optional. -1 &lt;= gain &lt;= 2.</td>
</tr>
<tr>
<td></td>
<td>Gain values can be integers or real numbers. The default value is 1.0.</td>
</tr>
<tr>
<td></td>
<td>The value determines whether the image is blurred or sharpened:</td>
</tr>
<tr>
<td></td>
<td>• If &gt; 0, the image is sharpened.</td>
</tr>
<tr>
<td></td>
<td>• If = 0, no effect</td>
</tr>
<tr>
<td></td>
<td>• If &lt; 0, the image is blurred.</td>
</tr>
</tbody>
</table>

Usage
Use this function to sharpen outlines in photographs. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!-- Create a ColdFusion image from an existing JPEG file. -->
<cfimage source="../cfdocs/images/artgallery/paul01.jpg" name="myImage" />
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on") />
<!-- Sharpen myImage by 2. -->
<cfset ImageSharpen(myImage,2) />
<!-- Write the sharpened image to a file. -->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes" />
<!-- Display the original and the sharpened images. -->
<img src="../cfdocs/images/artgallery/paul01.jpg" />
<img src="test_myImage.jpg" />
ImageShear

Description
Shears an image either horizontally or vertically. For each pixel \((x, y)\) of the destination, the source value at the fractional subpixel position \((x', y')\) is constructed with an Interpolation object and written to the destination.

Returns
Nothing.

Category
Image functions

Function syntax

ImageShear(name, shear [, direction, interpolation])

See also

ImageSetAntialiasing, ImageShearDrawingAxis, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>shear</td>
<td>Required. Shear value. Coordinates can be integers or real numbers.</td>
</tr>
<tr>
<td>direction</td>
<td>Optional. Shear direction:</td>
</tr>
<tr>
<td></td>
<td>• horizontal (default)</td>
</tr>
<tr>
<td></td>
<td>• vertical</td>
</tr>
<tr>
<td>interpolation</td>
<td>Optional. Type of interpolation:</td>
</tr>
<tr>
<td></td>
<td>• nearest: Applies the nearest neighbor method of interpolation. Image quality is lower than the other interpolation methods, but processing is fastest (default).</td>
</tr>
<tr>
<td></td>
<td>• bilinear: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the default, but processing is slower.</td>
</tr>
<tr>
<td></td>
<td>• bicubic: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this method and processing is slowest.</td>
</tr>
</tbody>
</table>

Usage
Use this function to distort an image.

If the direction parameter is set to horizontal, \(x' = (x - y*shear)\) and \(y' = y\).

If the direction parameter is set to vertical, \(x' = x\) and \(y' = (y - x*shear)\).

Use the ImageSetAntialiasing function to improve the quality of the rendered image.
Example
<cfimage source="../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Create a ColdFusion image from an existing JPEG file. --->
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage, "on")>
<!--- Shear the image by a factor of 1 on a horizontal axis. --->
<cfset ImageShear(myImage, 1, "horizontal")>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

ImageShearDrawingAxis

Description
Shears the drawing canvas.

Returns
Nothing.

Category
Image functions

Function syntax
ImageShearDrawingAxis(name, shx, shy)

See also
ImageRotateDrawingAxis, ImageSetAntialiasing, ImageShear, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>shx</td>
<td>Required. The multiplier by which coordinates are shifted in the positive x axis direction as a function of the y coordinate.</td>
</tr>
<tr>
<td>shy</td>
<td>Required. The multiplier by which coordinates are shifted in the positive y axis direction as a function of the x coordinate.</td>
</tr>
</tbody>
</table>

Usage
For each pixel (x,y) of the destination, the source value at the fractional subpixel position (x',y') is constructed with an interpolation object and written to the destination.

If the direction parameter is equal to horizontal, \( x' = (x - y \times \text{shear} \) and \( y' = y \).

If the direction parameter is equal to vertical, \( x' = x \) and \( y' = (y - x \times \text{shear} \).

Use the ImageSetAntialiasing function to improve the quality of the rendered image.
Example
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage, "on")>
<!--- Set the shear drawing axis. --->
<cfset ImageShearDrawingAxis(myImage, 0.5, 0.5)>
<!--- Draw a rectangle on the image with the shear settings. --->
<cfset ImageDrawRect(myImage, 50, 50, 50, 50)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

ImageTranslate

Description
Copies an image to a new location on the plane.

Returns
Nothing.

Category
Image functions

Function syntax
ImageTranslate(name, xTrans, yTrans [, interpolation])

See also
ImageSetAntialiasing, ImageShear, ImageTranslateDrawingAxis, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>xTrans</td>
<td>Required. Displacement in the x direction.</td>
</tr>
<tr>
<td>yTrans</td>
<td>Required. Displacement in the y direction.</td>
</tr>
<tr>
<td>interpolation</td>
<td>Optional. Type of interpolation used for resampling:</td>
</tr>
<tr>
<td></td>
<td>• nearest: Applies the nearest neighbor method of interpolation. Image quality is lower than the other interpolation methods, but processing is fastest (default).</td>
</tr>
<tr>
<td></td>
<td>• bilinear: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the default, but processing is slower.</td>
</tr>
<tr>
<td></td>
<td>• bicubic: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this method and processing is slowest.</td>
</tr>
</tbody>
</table>
Usage
For each pixel \((x, y)\) of the destination, the source value at the fractional subpixel position \((x - xTrans, y - yTrans)\) is constructed with an interpolation object and written to the destination. If both \(xTrans\) and \(yTrans\) are integral, the operation wraps the source image to change the image's position in the coordinate plane.

Use the `ImageSetAntialiasing` function to improve the quality of the rendered image.

Example

```coldfusion
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/aiden01.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage, "on")>
<!--- Offset the image's position to \((20,10)\). --->
<cfset ImageTranslate(myImage, 20, 10)>
<!--- Display the offset image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

**ImageTranslateDrawingAxis**

**Description**
Translates the origin of the image context to the point \((x,y)\) in the current coordinate system. Modifies the image context so that its new origin corresponds to the point \((x,y)\) in the image's original coordinate system.

**Returns**
Nothing.

**Category**
Image functions

**Function syntax**

```
ImageTranslateDrawingAxis(name, x, y)
```

**See also**

**History**
ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>x</td>
<td>(x) coordinate</td>
</tr>
<tr>
<td>y</td>
<td>(y) coordinate</td>
</tr>
</tbody>
</table>
Usage
All coordinates used in subsequent rendering operations on this image context are relative to the new origin. Use the ImageSetAntialiasing function to improve the quality of the rendered image.

Example
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Translate the origin to (100,20). --->
<cfset ImageTranslateDrawingAxis(myImage,100,20)>
<!--- Draw a rectangle at the offset location. --->
<cfset ImageDrawRect(myImage,50,60,40,50)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">

ImageWrite

Description
Writes a ColdFusion image to the specified on-disk or in-memory destination.

Returns
Nothing.

Category
Image functions

Function syntax
ImageWrite(name [, destination, quality, optional])

See also
cfimage, GetWriteableImageFormats, ImageNew, ImageRead, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
Usage
Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

ram://filepath

The filepath can include directories, for example ram:///petStore/images/poodle.jpg. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

The file format is derived from the file extension, therefore, use this function to convert images.

For a list of valid formats to write, see the supported image file formats listed in “cfimage” on page 336. To retrieve a list of writable formats on the server where the ColdFusion application is deployed, use the GetWriteableImageFormats function.

**Note:** Converting images between one file format to another is time-consuming. Also, image quality can degrade; for example, PNG images support 24-bit color, but GIF images support only 256 colors. Converting transparent images (images with alpha) can degrade image quality.

Example

<!--- This example shows how to convert a GIF image to a PNG image. --->
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage = ImageNew("http://www.google.com/images/logo_sm.gif")>
<!--- Convert the image to a PNG format. --->
<cfset ImageWrite(myImage,"google.png")>
<!--- Display the PNG image. --->
<img src="google.png">

**ImageWriteBase64**

**Description**
Writes Base64 images to the specified on-disk or in-memory destination.

**Returns**
Base64 string.

**Category**
Image functions
Function syntax

ImageWriteBase64(name, destination, format [, inHTMLFormat, optional])

See also

cfimage, ImageReadBase64, IsImageFile

History

ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
<tr>
<td>destination</td>
<td>Required. The absolute or relative on-disk or in-memory pathname where you write the file.</td>
</tr>
<tr>
<td>format</td>
<td>Required. The format</td>
</tr>
</tbody>
</table>
| inHTMLFormat  | Optional. Specify whether Base64 output includes the headers used by the Base64 images in the HTML <img> tag (“data:image/<format>;base64,...“):

  - yes
  - no (default) |
| overwrite      | Optional. If set to true, overwrites the destination file. |

Usage

You use the ImageWriteBase64 function to encode image data as a string of printable characters. This is useful for several applications, including sending images by e-mail and storing images in database text fields.

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

ram://filepath

The filepath can include directories, for example ram:///petStore/images/poodle.jpg. Create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the Developing ColdFusion Applications.

If you do not specify a file format, ColdFusion cannot recognize the format required to encode the image before converting to Base64, and generates errors.

You can verify whether ColdFusion reads a Base64 string properly in the following ways:

- Use the cfdump tag. For example: `<cfdump var="#myImage#">`
- Use the ImageInfo function. For example: `<cfset ImageInfo(myImage)>`
- Use the ImageWrite function and save the image as a JPEG file. Then open the JPEG file in a browser or imaging application.
Example
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff01.jpg")>
<!--- Create a new ColdFusion image. --->
<!--- Convert the image to Base64 format and save it to a file.--->
<cfset ImageWriteBase64(myImage,"jeffBase64.txt","jpg","yes")>

ImageXORDrawingMode

Description
Sets the paint mode of the image to alternate between the image’s current color and the new specified color.

Returns
Nothing.

Category
Image functions

Function syntax
ImageXORDrawingMode(name, c1)

See also
ImageSetDrawingColor, IsImageFile

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion image on which this operation is performed.</td>
</tr>
</tbody>
</table>
| c1        | Required. XOR alternation color:  
  - Hexadecimal value of the RGB color. For example, specify the color white as "##FFFFFF" or "FFFFFF".  
  - String value of color (for example, "black", "red", "green"). |

Usage
This function alternates pixels between the current color and a new specified XOR (exclusive Or) color.

When drawing operations are performed, pixels that are the current color are changed to the specified color, and vice versa.

Pixels that are of colors other than current color or the new specified color are changed in an unpredictable but reversible manner. If the same figure is drawn twice, all pixels are restored to their original values.

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in “cfimage” on page 336. For a hexadecimal value, use the form "##xxxxxx" or "xxxxxx", where x = 0–9 or A–F; use two number signs or none.

Last updated 7/9/2012
Example
<!--- This example shows how to draw rectangles with alternating colors where they overlap. --->
<!--- Use the ImageNew function to create a 300x200-pixel image in RGB format. --->
<cfset myImage = ImageNew("",300,200,"rgb")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the drawing color to white. --->
<cfset ImageSetDrawingColor(myImage,"white")>
<!--- Draw a white filled rectangle that is the size of the original image. --->
<cfset ImageDrawRect(myImage,0,0,300,200,"yes")>
<!--- Set the XOR drawing mode to white. --->
<cfset ImageXORDrawingMode(myImage,"white")>
<!--- Set the drawing color to red. --->
<cfset ImageSetDrawingColor(myImage,"red")>
<!--- Draw a filled red rectangle. --->
<cfset ImageDrawRect(myImage,50,50,150,100,"yes")>
<!--- Translate the drawing axis to (25,25). --->
<cfset ImageTranslateDrawingAxis(myImage,25,25)>
<!--- Set the drawing color to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Draw a blue filled rectangle at the offset location. --->
<cfset ImageDrawRect(myImage,50,50,150,100,"yes")>
<!--- Save the ColdFusion image as a PNG file. --->
<cfset ImageWrite(myImage,"xortest.png")>
<!--- Display the PNG file. --->
<img src="xortest.png">

Functions in-k

IncrementValue

Description
Adds one to an integer.

Returns
The integer part of number, incremented by one.

Category
Mathematical functions

Function syntax
IncrementValue(number)

See also
DecrementValue
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to increment</td>
</tr>
</tbody>
</table>

Example

<h3>IncrementValue Example</h3>

<p>Returns the integer part of a number incremented by one.</p>

<p>IncrementValue(0): <cfoutput>#IncrementValue(0)#</cfoutput></p>

<p>IncrementValue("1"): <cfoutput>#IncrementValue("1")#</cfoutput></p>

<p>IncrementValue(123.35): <cfoutput>#IncrementValue(123.35)#</cfoutput></p>

InputBaseN

Description

Converts string, using the base specified by radix, to an integer.

Returns

A number in the range 2-36, as a string.

Category

Mathematical functions

Function syntax

InputBaseN(string, radix)

See also

FormatBaseN

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String that represents a number, in the base specified by radix.</td>
</tr>
<tr>
<td>radix</td>
<td>Base of the number represented by string, in the range 2—36.</td>
</tr>
</tbody>
</table>
Example
<h3>InputBaseN Example</h3>
<pre><p>FormatBaseN converts a number to a string in the base specified by Radix.</p></pre>
<pre><br>FormatBaseN(10,2): #FormatBaseN(10,2)#
FormatBaseN(1024,16): #FormatBaseN(1024,16)#
FormatBaseN(125,10): #FormatBaseN(125,10)#
FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#</pre>
<h3>InputBaseN Example</h3>
<pre><p>InputBaseN returns the number obtained by converting a string, using the base specified by Radix.</p></pre>
<pre><br>InputBaseN("1010",2): #InputBaseN("1010",2)#
InputBaseN("3ff",16): #InputBaseN("3ff",16)#
InputBaseN("125",10): #InputBaseN("125",10)#
InputBaseN(1010,2): #InputBaseN(1010,2)#</pre>

Insert

Description
Inserts a substring in a string after a specified character position. If position=0, prefixes the substring to the string.

Returns
A string.

Category
String functions

Function syntax
Insert(substring, string, position)

See also
RemoveChars, Len

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>substring</td>
<td>A string or a variable that contains one. String to insert.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String into which to insert substring.</td>
</tr>
<tr>
<td>position</td>
<td>Integer or variable; position in string after which to insert substring.</td>
</tr>
</tbody>
</table>
Example

```
<cfif IsDefined("FORM.myString")>
  <!---- if the position is longer than the length of the string, err --->
  <cfif FORM.insertPosition GT Len(MyString)>
    <cfoutput>
      <p>This string only has #Len(MyString)# characters; therefore, you cannot insert the substring #FORM.mySubString# at position #FORM.insertPosition#.
    </cfoutput>
  </cfif>
</cfif>
<cfelse>
  <cfoutput>
    <p>You inserted the substring #FORM.MySubstring# into the string #FORM.MyString#, resulting in the following string:
    <br>#{Insert(FORM.MySubString, FORM.myString, FORM.insertposition)#
  </cfoutput>
</cfif>
```

Int

Description

Calculates the closest integer that is smaller than number. For example, it returns 3 for Int(3.3) and for Int(3.7); it returns -4 for Int(-3.3) and for Int(-3.7)

Returns

An integer, as a string.

Category

Mathematical functions

Function syntax

```
Int(number)
```

See also

Ceiling, Fix, Round

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Real number to round down to an integer.</td>
</tr>
</tbody>
</table>

Example

```
<p>Int Example</p>
<p>Int returns the closest integer smaller than a number.</p>

<p>Int(11.7) : #Int(11.7)#</p>
<p>Int(-11.7) : #Int(-11.7)#</p>
<p>Int(0) : #Int(0)#</p>
```
**Invoke**

**Description**
Does either of the following:
- Invokes a component method from within a ColdFusion page or component
- Invokes a web service

**Returns**
Returns what is returned by the invoked method.

**Syntax**
```
invoke(cfcinstance, methodname [, arguments])
```

**Properties**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cfcinstance</code></td>
<td>Required. String or component object; a reference to a component, or component to instantiate.</td>
</tr>
<tr>
<td><code>methodname</code></td>
<td>Required. Name of a method. For a web service, the name of an operation.</td>
</tr>
<tr>
<td><code>arguments</code></td>
<td>Optional. Arguments to pass to the method.</td>
</tr>
</tbody>
</table>

**Example**
```
<cfscript>
obj = createObject("component","TestComponent");
invoke(obj,"function1",{a1="ColdFusion"});
</cfscript>
```

**isArray**

**Description**
Determines whether a value is an array.

**Returns**
True, if `value` is an array, or a query column object.

**Category**
Array functions, Decision functions

**Function syntax**
```
isArray(value [, number ])
```

**See also**
Array functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications
History
ColdFusion MX:
- Changed behavior: if the value parameter contains a reference to a query result column, this function now returns True. For example: isArray(MyQuery['Column']) returns True. (In earlier releases, it returns False.)
- Changed behavior: this function can be used on XML objects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Variable or array name</td>
</tr>
<tr>
<td>number</td>
<td>Dimension; function tests whether the array has exactly this dimension</td>
</tr>
</tbody>
</table>

Usage
Use this function to determine whether a value is an array or query column. This function evaluates a Java array object, such as a vector object, as having one dimension.

Example

```coldfusion
<h3>IsArray Example</h3>

<!--- Make an array --->
<cfset MyNewArray = ArrayNew(1)>
<!--- set some elements --->
<cfset MyNewArray[1] = "element one">
<cfset MyNewArray[2] = "element two">
<cfset MyNewArray[3] = "element three">
<!--- is it an array? --->
<cfoutput>
  <p>Is this an array? #IsArray(MyNewArray)#
  <p>It has #ArrayLen(MyNewArray)# elements.
  <p>Contents: #ArrayToList(MyNewArray)#
</cfoutput>
```

IsAuthenticated

Description
This function is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications.

History
ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

IsAuthorized

Description
This function is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications
History
ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

IsBinary

Description
Determines whether a value is stored as binary data.

Returns
True, if the value is binary; False, otherwise.

Category
Decision functions

Function syntax
IsBinary(value)

See also
ToBinary, ToBase64, IsNumeric, YesNoFormat

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number or string</td>
</tr>
</tbody>
</table>
Example

<!--- Create a string of all ASCII characters (32-255) and concatenate them together. --->
<cfset charData =""
<cfloop index="data" from="32" to="255">
    <cfset ch=chr(data)>
    <cfset charData=charData & ch>
</cfloop>
<br>The following string is the concatenation of all characters (32 to 255) from the ASCII table.<br><br>
<cfoutput>#htmleditformat(charData)#</cfoutput><br>
<!--- Create a Base 64 representation of this string. --->
<cfset data64=toBase64(charData)>
<!--- Convert string to binary. --->
<cfset binaryData=toBinary(data64)>
<!--- Check to see if it really is a binary value. --->
<cfif IsBinary(binaryData)>
The binaryData variable is binary!<br>
</cfif>
<!--- Convert binary data back to Base 64. --->
<cfset another64=toBase64(binaryData)>
<!--- Check if it really is binary. --->
<cfif Not IsBinary(another64)>
The another64 variable is NOT binary!<br>
</cfif>
<!--- Compare another64 with data64 to ensure that they are equal. --->
<cfif another64 eq data64>
    Base 64 representation of binary data is identical to the Base 64 representation of string data.<br>
<cfelse>
    <h3>Conversion error.</h3>
</cfif>

IsBoolean

Description
Determines whether a value can be converted to Boolean

Returns
True, if the parameter can be converted to Boolean; False, otherwise.

Category
Decision functions

Function syntax
IsBoolean(value)

See also
IsNumeric, IsValid, YesNoFormat
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number or string</td>
</tr>
</tbody>
</table>

Example

```html
<h3>IsBoolean Example</h3>

<cfif IsDefined("FORM.theTestValue")>
  <cfif IsBoolean(FORM.theTestValue)>
    <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is Boolean</h3>
  </cfif>
  <cfelse>
    <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not Boolean</h3>
  </cfif>
</cfif>

<form action = "isBoolean.cfm">
<p>Enter an expression, and discover whether it can be evaluated to a Boolean value.

<input type = "Text" name = "TheTestValue" value = "1">
<input type = "Submit" value = "Is it Boolean?" name = "">
</form>

IsClosure

Description
Determines whether a name represents a closure.

Returns
True, if name can be called as a closure; False, otherwise.

Category
Decision functions

Syntax
isClosure(closureName)

See also
Other decision functions.

History
ColdFusion 10: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>closureName</td>
<td>Name of a closure. Must not be in quotation marks. Results in an error if not a defined variable or function name.</td>
</tr>
</tbody>
</table>

Usage

Use this function to determine whether the name represents a closure.

Example

```cfscript>
isClosure(closureName)
{
    // do something
}
else
{
    // do something
}
</cfscript>
```

IsCustomFunction

Description

Determines whether a name represents a custom function.

Returns

True, if `name` can be called as a custom function; False, otherwise.

Category

Decision functions

Function syntax

`IsCustomFunction(name)`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a custom function. Must not be in quotation marks. If not a defined variable or function name, ColdFusion generates an error.</td>
</tr>
</tbody>
</table>

Usage

The `IsCustomFunction` function returns True for any function that can be called as a custom function, including functions defined using CFScript function declarations and `cffunction` tags, and functions that are ColdFusion component methods. For CFC methods, first instantiate the component.

Note: To prevent undefined variable exceptions, always precede `IsCustomFunction` with an `IsDefined` test, as shown in the example.
Example

```cfscript
function realUDF() {
    return 1;
}
</cfscript>
<cfset X = 1>

<!--- Example that fails existence test --->
<cfif IsDefined("Foo") AND IsCustomFunction(Foo)>
    Foo is a UDF.<br>
</cfif>

<!--- Example that passes existence test but fails IsCustomFunction --->
<cfif IsDefined("X") AND IsCustomFunction(X)>
    X is a UDF.<br>
</cfif>

<!--- Example that passes both tests--->
<cfif IsDefined("realUDF") AND IsCustomFunction(realUDF)>
    realUDF is a function.<br>
</cfif>

<!--- Example using a CFC, defined in TestCFC.cfc--->
<cfobject component="TestCFC" name="myTestCFCObject">
    <CFIF IsDefined("myTestCFCObject.testFunc") AND IsCustomFunction(myTestCFCObject.testFunc)>
        myTestCFCObject.testFunc is a function.
    </CFIF>
</cfobject>

IsDate

Description
Determines whether a string or Java object can be converted to a date/time value.

Returns
True, if `string` can be converted to a date/time value; False, otherwise. ColdFusion converts the Boolean return value to its string equivalent, “Yes” or “No.”

Category
Date and time functions, Decision functions

Function syntax
IsDate(string)

See also
CreateDateDateTime, IsNumericDate, IsValid, LSDateFormat, LSIsDate, ParseDateTime
IsDate

Usage
This function checks against U.S. date formats only. For other date support, see IsDateFormat.

A date/time object falls in the range 100 AD–9999 AD.

Example
<h3>IsDate Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif IsDate(FORM.theTestValue)>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput>
is a valid date</h3>
  </cfifelse>
  <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput>
is not a valid date</h3>
</cfif>
</cfif>
<form action = "isDate.cfm" method="post">
<p>Enter a string, find whether it can be evaluated to a date value.
<p><input type = "Text" name = "TheTestValue" value = "<cfoutput>#Now()#" />
<input type = "Submit" value = "Is it a Date?" name = "" />
</form>

IsDDX

Description
Determines whether a DDX file exists and is valid, or if a string contains valid DDX instructions.

Returns
True, if the value represents a valid DDX file or string. False, otherwise.

Category
Decision functions

Function syntax
IsDDX("path or string")

See also
IsPDFObject, IsPDFFile, cfpdf

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path or string</td>
<td>Pathname to the DDX file or a string of DDX instructions. The pathname can be absolute or relative to the CFM page that calls it and must be enclosed in quotation marks.</td>
</tr>
</tbody>
</table>

Usage

This function returns False if the pathname to the DDX file is invalid, the pathname to the DDX file is null, the DDX file does not conform to the schema supported by ColdFusion, or the DDX instructions are invalid.

Example

```cfml
<cfif IsDDX("TOCformat.ddx")>
  <cfset inputStruct=StructNew()>
  <cfset inputStruct.Doc0="title.pdf">
  <cfset inputStruct.Doc1="Chap1.pdf">
  <cfset inputStruct.Doc2="Chap2.pdf">
  <cfset inputStruct.Doc3="Chap3.pdf">
  <cfset inputStruct.Doc4="Chap4.pdf">

  <cfset outputStruct=StructNew()>
  <cfset outputStruct.Out1="myBook.pdf">

  <cfpdf action="processddx" ddxfile="TOCformat.ddx" inputfiles="#inputStruct#" outputfiles="#outputStruct#" name="ddxVar">
    <cfoutput>#ddxVar.Out1#</cfoutput>
  </cfpdf>
</cfif>

<cfelse>
  <p>This is not a valid DDX file.</p>
</cfelse>
```

IsDebugMode

Description

Determines whether debugging output is enabled.

Returns

True, if debugging mode is set in the ColdFusion Administrator; False if debugging mode is disabled.

Category

Decision functions

Function syntax

IsDebugMode()
Description
If debugging output is enabled in ColdFusion Administrator and has not been overridden by setting the `cfsetting` tag `showDebugOutput` attribute to No, the `IsDebugMode` function returns Yes; No, otherwise.

Example
```coldfusion
<h3>IsDebugMode Example</h3>
<cfif IsDebugMode()>
  <h3>Debugging is set in the ColdFusion Administrator</h3>
<cfelse>
  <h3>Debugging is disabled</h3>
</cfif>
```

IsDefined

Description
Evaluates a string value to determine whether the variable named in it exists.

This function is an alternative to the `ParameterExists` function, which is deprecated.

Returns
True, if the variable is found; False, otherwise.

Category
Decision functions

Function syntax
```coldfusion
IsDefined("variable_name")
```

See also
`Evaluate`

History
ColdFusion MX: Changed behavior: this function can process only the following constructs:
- A simple variable
- A named variable with dot notation
- A named structure with dot notation (for example: `mystruct.key`)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>variable_name</code></td>
<td>String, enclosed in quotation marks. Name of variable to test for.</td>
</tr>
</tbody>
</table>

Usage
Passing an array entry, such as `myArray[3]` to this function causes an error. To check whether a specific entry exists in an array, use the `ArrayIsDefined` function.
You can test whether a specific key exists in a structure by using this function or the StructKeyExists function. For example, when working with scopes that ColdFusion exposes as structures, the StructKeyExists function can sometimes replace this function. The following lines are equivalent:

```coldfusion
if(isDefined("form.myVariable"))
if(StructKeyExists(form,"myVariable"))
```

**Example**

```coldfusion
<cfif IsDefined("form.myString")>
  <p>The variable form.myString has been defined, so show its contents. This construction allows us to place a form and its resulting action code on the same page and use IsDefined to control the flow of execution.</p>
  <p>The value of "form.myString" is <i><b>form.myString</b></i></p>
<cfelse>
  <p>During the first time through this template, the variable "form.myString" has not yet been defined, so we do not try to evaluate it.</p>
</cfif>
```

IsImage

**Description**

Determines whether a variable returns a ColdFusion image.

**Returns**

True, if the value is a ColdFusion image; False, otherwise.

**Category**

Image functions

**Function syntax**

```coldfusion
IsImage(name)
```

**See also**

cfimage, ImageGetBlob, ImageInfo, ImageNew

**History**

ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The ColdFusion variable that is checked.</td>
</tr>
</tbody>
</table>
Usage
Use this function to determine whether a variable returns a ColdFusion image.

Example
<cfif IsImageFile("images/#form.art#")>
<cfset myImage=ImageNew("images/#form.art#")>
...
<cfset IsImage("#myImage#")>
<cfimage action="writeToBrowser" source="#myImage#"/>
</cfif>

IsImageFile

Description
Verifies whether an image file is valid.

Returns
True, if the value is a valid image file; False, otherwise.

Category
Image functions

Function syntax
IsImageFile("path")

See also
cfimage, ImageGetBlob, ImageInfo, ImageNew, IsImage

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Required. The pathname of the on-disk or in-memory file, or URL, to be checked. The pathname can be absolute or relative to the CFM page and must be enclosed in quotation marks.</td>
</tr>
</tbody>
</table>

Usage
Use this function to determine whether an image file is valid. This function returns a False value if the image file format is not supported by the server where ColdFusion is deployed, or if the pathname to the image file is null or invalid.

For a list of standard image file formats supported by ColdFusion, see the supported image file formats provided in “cfimage” on page 336. To determine which image file formats are supported on the server where ColdFusion is deployed, use the “GetReadableImageFormats” on page 971 and “GetWriteableImageFormats” on page 987.
Example

<!--- Use the IsImageFile function to determine whether an image retrieved from the artwork table in the cfartgallery database is a valid image file. --->
<cfif IsImageFile("images/#artwork.largeImage#")>
   <cfset myImage=ImageNew("images/#artwork.largeImage#")>
   <cfset ImageResize(myImage,50,"")>
   <cfimage action="writeToBrowser" source="#myImage#">
<cfelse>
   <p>I'm sorry, there is no image associated with the title you selected. Please click the Back button and try again.</p>
</cfelse>

IsInstanceOf

Description
Determines whether an object is an instance of a ColdFusion interface or component, or of a Java class.

Returns
Returns true if any of the following is true:

- The object specified by the first parameter is an instance of the interface or component specified by the second parameter.
- The Java object specified by the first parameter was created by using the cfobject tag or CreateObject method and is an instance of the Java class specified by the second parameter.
- The object specified by the first parameter is an instance of a component that extends the component specified in the second parameter.
- The object specified by the first parameter is an instance of a component that extends a component that implements the interface specified in the second parameter.
- The Java object specified by the first parameter was created by using the cfobject tag or CreateObject method and is an instance of a Java class that extends the class specified by the second parameter.

Returns false otherwise.

Note: The IsInstanceOf function returns false if the CFC specified by the object parameter does not define any functions.

Category
Decision functions, Extensibility functions

Function syntax
IsInstanceOf(object, typeName)

See also
cfcomponent, cfinterface, cfobject

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>The CFC instance or Java object that you are testing</td>
</tr>
<tr>
<td>typeName</td>
<td>The name of the interface, component, or Java class of which the object might be an instance</td>
</tr>
</tbody>
</table>

Usage

For Java objects, the comparison is valid only if you created the object specified in the first parameter by using a cfobject tag or CreateObject method.

Example

```cftags
<!--- to use this example, create an I1.cfc interface, as follows: --->

<cfinterface>
  <cffunction name = "method1">
  </cffunction>
</cfinterface>

<!--- Create a C1.cfc component that implements the I1.cfc interface, as follows: --->
<cfcomponent implements=I1>
  <cffunction name = "method1">
    <cfoutput>C1.method1 called</cfoutput>
  </cffunction>
</cfcomponent>

<!--- Create a test.cfm file as follows and display the page. --->
<!--- Create an instance of the C1 CFC, which implements the I1 interface. --->
<cfset c1obj = CreateObject("Component", "C1")>
<!--- Create a Java object --->
<cfset javaObj = createobject("java", "java.lang.System")>

<cfoutput>
  IsInstanceOf(c1obj,"C1") = #IsInstanceOf(c1obj,"C1")# (Expected = YES)<br>
  IsInstanceOf(c1obj,"I1") = #IsInstanceOf(c1obj,"I1")# (Expected = YES)<br>
  IsInstanceOf(c1obj,"C2") = #IsInstanceOf(c1obj,"C2")# (Expected = NO)<br>
  IsInstanceOf(javaObj,"java.lang.System") = #IsInstanceOf(javaObj,"java.lang.System")# (Expected = YES)<br>
  IsInstanceOf(javaObj,"java.lang.String") = #IsInstanceOf(javaObj,"java.lang.String")# (Expected = NO)<br>
</cfoutput>

IsIPv6

Description

Determines whether the host supports IPv6.
Returns
True if the host supports IPv6.

Category
Decision functions

Syntax
IsIPv6()
IsIPv6(hostname)

See also
GetLocalHostIP, IsLocalHost

History
ColdFusion 9: Added this function

Usage
When you use this function to verify if the remote host supports IPv6, pass the hostname and not the IP address.
This function applies only if the server that places the request is IPv6-enabled.

Example
The following example checks whether the localhost supports IPv6:

```cfc
<cfset hostname="localhost">
<cfset test=IsIPv6()>
<cfif test>
<cfoutput>localhost supports IPv6</cfoutput>
</cfif>
```

The following example checks whether the remote host supports IPv6:

```cfc
<cfset hostname="remote hostname">
<cfset test=IsIPv6(hostname)>
<cfif test>
<cfoutput>#hostname# supports IPv6</cfoutput>
</cfif>
```

IsJSON

Description
Evaluates whether a string is in valid JSON (JavaScript Object Notation) data interchange format.

Returns
True if the parameter is a valid JSON value.
False if the parameter is not a valid JSON data representation.

Category
Conversion functions
Syntax
IsJSON(var)

See also
DeserializeJSON, SerializeJSON, cfajaxproxy, Using Ajax Data and Development Features in the Developing ColdFusion Applications, http://www.json.org

History
ColdFusion 8: Added function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>var</td>
<td>A string or variable that represents one.</td>
</tr>
</tbody>
</table>

Example
This example checks whether the data feed that is generated by the example for the SerializeJSON function contains valid JSON data.

The feed is in the form of a JavaScript function call where the parameter is a JSON string that contains the feed data. The example does the following operations:

1. Uses a cfhttp tag to get the feed (in the cfhttp.fileContent variable).
2. Strips the function call wrapper from the text.
3. Uses the IsJSON function to check whether the result of the previous step is a valid JSON format string.
4. Displays a message that indicates whether the text is valid JSON data, followed by the feed text string.

To run this example, put this file and the example for the SerializeJSON function in an appropriate location under your ColdFusion web root, replace the URL with the correct URL for the serialization example, and run this page.

```cfml
<!--- Get the JSON Feed --->
<cfhttp url="http://localhost:8500/My_Stuff/Ajax/Books/CreateJSON_NEW.cfm">

<!--- JSON data is often distributed as a JavaScript function. The following REReplace functions strip the function wrapper. --->
<cfset theData=REReplace(cfhttp.FileContent, "\s*\[[[:word:]]*\s*([^\s]*,\s*)\]\s*\(\s*","")>
<cfset theData=REReplace(theData, \"\s*\)\s*\]\\s*\)\"", "")>

<!--- Test to make sure you have JSON data. --->
<cfif isJSON(theData)>
  <h3>The URL you requested provides valid JSON</h3>
</cfif>
<cfelse>
  <h3>The URL you requested does not provide valid JSON</h3>
</cfelse>

<!--- Display the data. --->
<cfoutput>#theData#</cfoutput>

For a more complex example that then converts the JSON data, see DeserializeJSON.
**IsK2ServerABroker**

**Description**
This function is deprecated.

**Returns**
True, if K2Broker is in configured with ColdFusion; False, otherwise.

**Category**
Decision functions, Full-text search functions, Query functions

**Function syntax**
`IsK2ServerABroker()`

**See also**

**History**
ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.
ColdFusion MX: Added this function.

**Example**
```
<cfoutput>IsK2ServerABroker = 
  $$#IsK2ServerABroker()##$$</cfoutput>
```

**IsK2ServerDocCountExceeded**

**Description**
This function is deprecated.

**Returns**
True, if the document count limit is exceeded; False, otherwise.

**Category**
Decision functions, Full-text search functions, Query functions

**Function syntax**
`IsK2ServerDocCountExceeded()`

**See also**
GetK2ServerDocCountLimit, IsK2ServerABroker

**History**
ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.
ColdFusion 5: Added this function.
Example
<cfoutput>IsK2ServerDocCountExceeded =
    (!$*#IsK2ServerDocCountExceeded#*$)</cfoutput>

IsK2ServerOnline

Description
This function is deprecated because the K2Server is always running when ColdFusion is running.

Returns
True, if the K2Server is available to perform a search; False, otherwise.

Category
Decision functions, Full-text search functions, Query functions

Function syntax
IsK2ServerOnline()

See also
IsK2ServerABroker

History
ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.
ColdFusion MX: Added this function.

Example
<cfoutput>IsK2ServerOnline =
    (!$*#IsK2ServerOnline#*$)</cfoutput>

IsLeapYear

Description
Determines whether a year is a leap year.

Returns
True, if year is a leap year; False, otherwise.

Category
Date and time functions, Decision functions

Function syntax
IsLeapYear(year)

See also
DaysInYear
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>year</td>
<td>Number representing a year</td>
</tr>
</tbody>
</table>

Example

```
<h3>IsLeapYear Example</h3>

<cfif IsDefined("FORM.theTestValue")>
    <cfif IsLeapYear(FORM.theTestValue)>
        <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is a Leap Year</h3>
    </cfif>
    <cfelse>
        <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not a Leap Year</h3>
    </cfif>
</cfif>
```

```
<form action = "isLeapYear.cfm" method="POST">
<p>Enter a year value, and find out whether it is a Leap Year.<p>
<input type = "Text" name = "TheTestValue" value = 
    <cfoutput>#Year(Now())#</cfoutput>">
<input type = "Submit" value = "Is it a Leap Year?" name = ">
</form>
```

**IsLocalHost**

**Description**
Determined whether the specified IP address is the localhost. This supports both IPv4 and IPv6 addresses.

**Returns**
True, if the IP address is the localhost; False, otherwise.

**Category**
Decision functions

**Function syntax**

IsLocalHost(ipaddress)

**See also**
GetLocalHostIP

**History**
ColdFusion MX 7.01: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddress</td>
<td>Valid IP address.</td>
</tr>
</tbody>
</table>
Example
<h3>IsLocalHost Example</h3>

<cfif IsDefined("FORM.theTestIPAddress")>
  <cfif IsLocalHost(FORM.theTestIPAddress)>
    <h3>The IP address <cfoutput>#FORM.theTestIPAddress#</cfoutput> is the localhost</h3>
  </cfif>
  <cfelse>
    <h3>The IP address <cfoutput>#DE(FORM.theTestIPAddress)#</cfoutput> is not the localhost.</h3>
  </cfif>
</cfif>

<form action = "isIPAddressLocalHost.cfm"
Enter an IP address to find out if it is the localhost.
<p><input type = "Text" name = "TheTestIPAddress" value = "127.0.0.1"
<input type = "Submit" value = "Is this the localhost?" name = "></form>

IsNull

Description
Used to check if the given object or expression evaluates to null.

Returns
True, if the given object is null or if the given expression evaluates to null; False, otherwise.

Category
Decision functions

Function syntax
IsNull(obj)

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>Object for which you perform the null check.</td>
</tr>
</tbody>
</table>

IsNumeric

Description
Determines whether a string can be converted to a numeric value. Supports numbers in U.S. number format. For other number support, use LSIsNumeric.

Returns
True, if string can be converted to a number; False, otherwise.

Category
Decision functions
Function syntax
IsNumeric(string)

See also
IsBinary, IsValid

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
</tbody>
</table>

Example
<h3>IsNumeric Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif IsNumeric(FORM.theTestValue)>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> can be
    converted to a number</h3>
  </cfif>
</cfif>

<form action = "isNumeric.cfm">
<p>Enter a string, and find out whether it can be evaluated to a numeric value.

<p><input type = "Text" name = "TheTestValue" value = "123">
<input type = "Submit" value = "Is it a Number?" name = "">
</form>

IsNumericDate

Description
Evaluates whether a real number is a valid representation of a date (date/time object).

Returns
True, if the parameter represents a valid date/time object; False, otherwise.

Category
Date and time functions, Decision functions

Function syntax
IsNumericDate(number)

See also
IsDate, ParseDateTime
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A real number</td>
</tr>
</tbody>
</table>

Usage

ColdFusion, by default, evaluates any input parameter and attempts to convert it to a real number before it passes the parameter to the `IsNumericDate` function. As a result, parameter values such as 12/12/03 and `{ts '2003-01-14 10:04:13'}` return True, because ColdFusion converts valid date string formats to date/time objects, which are real numbers.

Example

```html
<h3>IsNumericDate Example</h3>
<cif IsDefined("form.theTestValue")>
  <!--- test if the value represents a number or a pre-formatted Date value --->
  <cif IsNumeric(form.theTestValue) or IsDate(form.theTestValue)>
    <!--- if this value is a numericDate value, then pass --->
    <cfif IsNumericDate(form.theTestValue)>
      <h3>The string <cfoutput>#DE(form.theTestValue)#</cfoutput> can be converted to a valid numeric date</h3>
    </cfif>
    <cfelse>
      <h3>The string <cfoutput>#DE(form.theTestValue)#</cfoutput> can not be converted to a valid numeric date</h3>
    </cfelse>
  </cif>
</cif>

<form action="#cgi.script_name#" method="POST">
  <p>Enter a value, and discover if it can be evaluated to a date value.</p>
  <input type="Text" name="TheTestValue" value="<CFOUTPUT>#Now()#</CFOUTPUT>">
  <input type="Submit" value="Is it a Date?" name="">
</form>

IsObject

Description

Determines whether a value is an object.

Returns

True, if the value represents a ColdFusion object. False if the value is any other type of data, such as an integer, string, date, or struct.

Category

Decision functions
Function syntax
IsObject(value)

See also
IsDate, IsImage, IsNumeric, IsNumericDate, IsQuery, IsSimpleValue, IsStruct, IsWDDX, IsXmlDoc, IsXmlElem, IsXmlRoot

History
ColdFusion MX: Added this function.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>A value, typically the name of a variable.</td>
</tr>
</tbody>
</table>

Usage
This function returns False for query and XML objects.

Example
<!--- to use this example, create a color.cfc component as follows: --->
<!----
<cfcomponent>
<cffunction name="myFunction" access="public" returntype="string">
<!---- Create a structure object --->
<cfset myColor = "Blue">
<cfreturn myColor>
</cffunction>
</cfcomponent>
--->

<!--- Create an instance of the color.cfc component --->
<cfobject name="getColor" component="color">
<cfif IsObject(getColor)>
<!---- Invoke the myFunction method --->
<cfinvoke
 component="#getColor#"
 method="myFunction"
 returnVariable="myColor">
</cfinvoke>

<cfif IsDefined("myColor")>
<!---- Output the returned variable --->
The value of myColor = <cfoutput>#myColor#</cfoutput>
</cfif>
</cfif>

IsPDFFile

Description
Verifies whether a PDF file is valid.
ColdFusion Functions

Returns
True, if the value returns a valid PDF file. False, otherwise.

Category
Decision functions

Function syntax
IsPDFFile("path")

See also

History
ColdFusion 8: Added this function.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Pathname to an on-disk or in-memory PDF file. The pathname can be absolute or relative to the CFM page and must be enclosed in quotation marks.</td>
</tr>
</tbody>
</table>

Usage
This function returns False if the value is not a valid pathname to a PDF file, the pathname is null, the PDF file is not valid, or the PDF file is corrupted.

Example
<!--- The following code shows the action page for a form where a user chooses a PDF document to print. --->

   <cfif IsPDFFile("#form.printMe#")>
   <cfprint type="PDF" source="#myPDF#”>
   <cfelse>
   <p>This is not a valid PDF file or the PDF document you have chosen is not available.</p>
   </cfif>

IsPDFObject

Description
Determines whether a value is a PDF object.

Returns
True, if the value represents a PDF object. False if the value is any other type of data, such as an integer, string, date, or structure.

Category
Decision functions
Function syntax
IsPDFObject(value)

See also

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>A value, typically the PDF object stored as a variable name.</td>
</tr>
</tbody>
</table>

Usage
This function returns False for query and XML objects.

Example
<cfpdf source="c:\forms\uoteform.pdf" action="read" name="myPDFform"/>
<cfif IsPDFObject(myPDFform)>
  <cfpdf source=#myPDFform# action="write" destination = "c:\forms\newPDFForm.pdf">
  <cfelse>
    <p>This is not a PDF.</p>
  </cfif>
</cfif>

IsProtected

Description
This function is obsolete. Use the newer security tools; see “Conversion functions” on page 727 and Securing Applications in the Developing ColdFusion Applications

History
ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

IsQuery

Description
Determines whether value is a query.

Returns
True, if value is a query.

Category
Decision functions, Query functions
Function syntax
IsQuery(value)

See also
QueryAddRow

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Query variable</td>
</tr>
</tbody>
</table>

Example
<!--- Shows an example of IsQuery and IsSimpleValue --->
<h3>IsQuery Example</h3>
<!--- define a variable called "GetEmployees" --->
<CFPARAM name = "GetEmployees" DEFAULT = "#Now()#">

<p>Before the query is run, the value of GetEmployees is
<cfoutput>#GetEmployees#</cfoutput>

<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value</p>
</cfif>
<!--- make a query on the snippets datasource --->
<cfquery name = "GetEmployees" datasource = "cfdocexamples">
  SELECT *
  FROM employees
</cfquery>

<p>After the query is run, GetEmployees contains a number of rows
that look like this (display limited to three rows):
<cfoutput QUERY = "GetEmployees" MaxRows = "3">
  #Emp_ID# #FirstName# #LastName#
</cfoutput>

<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>

IsSimpleValue

Description
Determines the type of a value.

Returns
True, if value is a string, number, Boolean, or date/time value; False, otherwise.

Category
Decision functions

Function syntax
IsSimpleValue(value)
See also
IsValid

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Variable or expression</td>
</tr>
</tbody>
</table>

Example

```coldfusion
<!--- Shows an example of IsQuery and IsSimpleValue --->
<h3>IsSimpleValue Example</h3>
<!--- define a variable called "GetEmployees" --->
<cfparam name = "GetEmployees" default = "#Now()#">

<!--- make a query on the snippets datasource --->
<cfquery name = "GetEmployees" datasource = "cfdocexamples">
  SELECT *
  FROM employees
</cfquery>

<p>Before the query is run, the value of GetEmployees is</p>
<cfoutput>#GetEmployees#</cfoutput>
<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value</p>
</cfif>
<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>
```

IsSOAPRequest

Description
Determine whether a CFC is being called as a web service.

Returns
True if CFC is being called as a web service; False, otherwise.

Category
XML functions

History
ColdFusion MX 7: Added this function.

Function syntax
IsSOAPRequest()
See also
AddSOAPRequestHeader, AddSOAPResponseHeader, GetSOAPRequest, GetSOAPRequestHeader, GetSOAPResponse, GetSOAPResponseHeader; Basic web service concepts in the Developing ColdFusion Applications

Usage
Call this function within a CFC to determine if it is running as a web service.

Example
This example creates a CFC web service that illustrates the operation of the IsSOAPRequest function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as headerservice.cfc in a folder called soapheaders under your web root. Test its operation, and specifically the operation of the IsSOAPRequest function, by executing the examples that invoke this web service. For example, see the example for AddSOAPRequestHeader.

```
<h3>IsSOAPRequest Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">
  <cffunction name="echo_me" access="remote" output="false" returntype="string" displayname="Echo Test" hint="Header test">
    <cfargument name="in_here" required="true" type="string">
    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>
      <!--- Get the first header as a string and as XML --->
      <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
      <cfset return = "The service saw username: " & username>
      <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username", "TRUE")>
      <cfset return = return & " as XML: " & xmlusername>

      <!--- Get the second header as a string and as XML --->
      <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
      <cfset return = return & "The service saw password: " & password>
      <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password", "TRUE")>
      <cfset return = return & " as XML: " & xmlpassword>

      <!--- Add a header as a string --->
      <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE", false)>
    </cfif>
  </cffunction>
</cfcomponent>
```
<!--- Add a second header using a CFML XML value --->
<cfset doc = XmlNew()>
<cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
<cfset x.XmlText = "hey man, here I am in XML">
<cfset x.XmlAttributes["xsi:type"] = "xsd:string">
<cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>
<cfelse>
<!--- Add a header as a string - Must generate error! --->
<cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE", false)>
<cfset return = "Not invoked as a web service">
</cfif>
<cfreturn return>
</cffunction>
</cfcomponent>

IsSpreadsheetFile

Description
Returns a value that determines if the input is a spreadsheet file.

Returns
A Boolean value. True if the input is a spreadsheet file; False if it is a spreadsheet object.

Category
Microsoft Office Integration

Function syntax
IsSpreadsheetFile(spreadsheetfile)

See also

History
ColdFusion 9: Added.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetfile</td>
<td>Specifies the spreadsheet file.</td>
</tr>
</tbody>
</table>

Example
<cfset filepath = "C:/Documents/SingleSheet.xls">
<cfoutput># isSpreadSheetObject(filepath)# NOT an Object<br></cfoutput>
<cfoutput># isSpreadSheetFile(filepath)# a File<br></cfoutput>
**IsSpreadsheetObject**

**Description**
Returns a value that determines if the input is a spreadsheet object.

**Returns**
A Boolean value. True if the input is a spreadsheet object; False if it is a spreadsheet file.

**Category**
Microsoft Office Integration

**Function syntax**
IsSpreadsheetObject(spreadsheetobject)

**See also**
IsSpreadsheetFile

**History**
ColdFusion 9: Added.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobject</td>
<td>Specifies the spreadsheet object.</td>
</tr>
</tbody>
</table>

**Example**
```
<cfspreadsheet action="read" src="C:/documents/SingleSheet.xls" name="SpreadsheetObj" >
<cfoutput># isSpreadsheetObject(SpreadsheetObj)# an Object<br></cfoutput>
<cfoutput># isSpreadSheetFile(SpreadsheetObj)# NOT a File<br></cfoutput>
```

**IsStruct**

**Description**
Determines whether a variable is a structure.

**Returns**
True, if *variable* is a ColdFusion structure or is a Java object that implements the java.lang.Map interface. The return value is False if the object in *variable* is a user-defined function (UDF).

**Category**
Decision functions, Structure functions

**Function syntax**
IsStruct(variable)
See also
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: this function can be used on XML objects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>Variable name</td>
</tr>
</tbody>
</table>

Example

```<cfif IsStruct(attributes.EMPINFO)>
<cfoutput>Error. Invalid data.</cfoutput>
<cfexit method = "ExitTag">
<cfelse>
<cfquery name = "AddEmployee" datasource = "cfdocexamples">
INSERT INTO Employees
(FirstName, LastName, Email, Phone, Department)
VALUES
( ''#StructFind(attributes.EMPINFO, "firstname")#',
'#StructFind(attributes.EMPINFO, "lastname")#',
'#StructFind(attributes.EMPINFO, "email")#',
'#StructFind(attributes.EMPINFO, "phone")#',
'#StructFind(attributes.EMPINFO, "department")#'
)
</cfoutput>
</cfquery>
</cfif>
<cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch> --->
```

IsUserInAnyRole

Description
Determines whether an authenticated user belongs to any role in a list of roles.

Returns
True, if the authenticated user, belongs to any Role in the list; False, otherwise.

Last updated 7/9/2012
Category
Security functions, Decision functions

Function syntax
IsUserInAnyRole(role_list)

See also
cflogin, cfloginuser, cflogout, GetAuthUser, GetUserRoles, IsUserInRole, IsUserLoggedIn, Securing Applications in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_list</td>
<td>A comma-delimited list of one or more roles to be tested.</td>
</tr>
</tbody>
</table>

Example
<cfif IsUserInAnyRole(allRoles) >
   <cfoutput>Authenticated user is in these roles: #GetUserRoles()#</cfoutput>
<cfelseif >
   <cfoutput>Authenticated user is in no roles</cfoutput>
</cfif>

IsUserInRole

Description
Determines whether an authenticated user belongs to the specified Role.

Returns
True, if the authenticated user, belongs to the specified Role; False, otherwise.

Category
Security functions, Decision functions

Function syntax
IsUserInRole("role_name")

See also
cflogin, cfloginuser, GetAuthUser, GetUserRoles, IsUserInRole, IsUserLoggedIn, Securing Applications in the Developing ColdFusion Applications

History
ColdFusion MX: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>Name of a security role</td>
</tr>
</tbody>
</table>

Usage

Role names are not case-sensitive.

To check if a user is in multiple roles, specify them in a comma-delimited list, such as "Admin,HR". Lists with multiple roles cannot contain spaces as separators; for example, do not use "Admin, HR".

Example

```cfml
<cfif IsUserInRole("Admin") >
   <cfoutput>Authenticated user is an administrator</cfoutput>
<cfelse IsUserInRole("User") >
   <cfoutput>Authenticated user is a user</cfoutput>
</cfif>
```

IsUserLoggedIn

**Description**

Determines whether a user is logged in.

**Returns**

True, if the user is logged in; False, otherwise.

**Category**

Security functions, Decision functions

**Function syntax**

`IsUserLoggedIn()`

**See also**

cflogin, cfloginuser, GetAuthUser, GetUserRoles, IsUserInAnyRole, IsUserInRole, Securing Applications in Developing ColdFusion Applications

**History**

ColdFusion 8: Added this function.

**Example**

```cfml
<cfif IsUserLoggedIn() >
   <cfinclude template="welcome.cfm">
<cfelse>
   <cfinclude template="loginform.cfm">
   <cfabort>
</cfif>
```
IsValid

Description
Tests whether a value meets a validation or data type rule.

Returns
True, if the value conforms to the rule; False, otherwise.

Category
Decision functions

Function syntax
IsValid(type, value)
isValid("range", value, min, max)
isValid("regex" or "regular_expression", value, pattern)

See also
cfparam, cfform, IsBoolean, IsDate, IsNumeric, IsSimpleValue; Validating data with the IsValid function and the cfparam tag in the Developing ColdFusion Applications

History
ColdFusion 8: Added the component value for to the type attribute.

ColdFusion MX 7: Added this function.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>The valid format for the data; one of the following. For detailed information on validation algorithms, see Validating form data using hidden fields in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td></td>
<td>• any: any simple value. Returns false for complex values, such as query objects; equivalent to the <code>IsSimpleValue</code> function.</td>
</tr>
<tr>
<td></td>
<td>• array: an ColdFusion array; equivalent to the <code>IsArray</code> function.</td>
</tr>
<tr>
<td></td>
<td>• binary: a binary value; equivalent to the <code>IsBinary</code> function.</td>
</tr>
<tr>
<td></td>
<td>• boolean: a Boolean value: yes, no, true, false, or a number; equivalent to the <code>IsBoolean</code> function.</td>
</tr>
<tr>
<td></td>
<td>• component: a ColdFusion component (CFC).</td>
</tr>
<tr>
<td></td>
<td>• creditcard: a 13-16 digit number conforming to the mod10 algorithm.</td>
</tr>
<tr>
<td></td>
<td>• date or time: any date-time value, including dates or times; equivalent to the <code>IsDate</code> function.</td>
</tr>
<tr>
<td></td>
<td>• email: a valid email address.</td>
</tr>
<tr>
<td></td>
<td>• eurodate: any date-time value, including US date formats and time values,</td>
</tr>
<tr>
<td></td>
<td>• float or numeric: a numeric value; equivalent to the <code>IsNumeric</code> function.</td>
</tr>
<tr>
<td></td>
<td>• guid: a Universally Unique Identifier of the form &quot;XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX&quot; where 'X' is a hexadecimal number.</td>
</tr>
<tr>
<td></td>
<td>• integer: an integer.</td>
</tr>
<tr>
<td></td>
<td>• query: a query object; equivalent to the <code>IsQuery</code> function.</td>
</tr>
<tr>
<td></td>
<td>• range: a numeric range, specified by the min and max attributes.</td>
</tr>
<tr>
<td></td>
<td>• regex or regular_expression: matches input against pattern attribute.</td>
</tr>
<tr>
<td></td>
<td>• ssn or social_security_number: A U.S. social security number.</td>
</tr>
<tr>
<td></td>
<td>• string: a string value, including single characters and numbers</td>
</tr>
<tr>
<td></td>
<td>• struct: a structure; equivalent to the <code>IsStruct</code> function.</td>
</tr>
<tr>
<td></td>
<td>• telephone: a standard US telephone number.</td>
</tr>
<tr>
<td></td>
<td>• URL: an http, https, ftp, file, mailto, or news URL,</td>
</tr>
<tr>
<td></td>
<td>• UUID: a ColdFusion Universally Unique Identifier, formatted ‘XXXXXXXX-XXXX-XXXX-XXXXXXXXXXXXX’, where ‘X’ is a hexadecimal number. See CreateUUID.</td>
</tr>
<tr>
<td></td>
<td>• USdate: a U.S. date of the format mm/dd/yy, with 1-2 digit days and months, 1-4 digit years.</td>
</tr>
<tr>
<td></td>
<td>• variableName: a string formatted according to ColdFusion variable naming conventions.</td>
</tr>
<tr>
<td></td>
<td>• zipcode: U.S., 5- or 9-digit format ZIP codes.</td>
</tr>
<tr>
<td></td>
<td>• maxlength: Specifies a maximum number of characters</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>The value to test</td>
</tr>
<tr>
<td><strong>min</strong></td>
<td>The minimum valid value; used only for range validation</td>
</tr>
<tr>
<td><strong>max</strong></td>
<td>The maximum valid value; used only for range validation</td>
</tr>
<tr>
<td><strong>pattern</strong></td>
<td>A JavaScript regular expression that the parameter must match; used only for regex or regular_expression validation.</td>
</tr>
</tbody>
</table>
Usage
The `IsValid` function lets you assure that validation is performed on the server. You can use the `cfparam` tag to perform equivalent validation.

Example
The following example checks whether a user has submitted a numeric ID and a valid e-mail address and phone number. If any of the submitted values does not meet the validation test, it displays an error message.

```coldfusion
<cfif isDefined("form.saveSubmit")>
  <cfif isValid("integer", form.UserID) and isValid("email", form.emailAddr) and isValid("telephone", form.phoneNo)>
    <cfoutput>
      <!--- Application code to update the database goes here --->
      <h3>The email address and phone number for user #Form.UserID# have been added</h3>
    </cfoutput>
  </cfif>
  <cfelse>
    <H3>You must supply a valid User ID, phone number, and email address.</H2>
  </cfelse>
</cfif>

<cfform action="#CGI.SCRIPT_NAME#">
  User ID: <cfinput type="Text" name="UserID"><br>
  Phone: <cfinput type="Text" name="phoneNo"><br>
  email: <cfinput type="Text" name="emailAddr"><br>
  <cfinput type="submit" name="saveSubmit" value="Save Data"><br>
</cfform>

IsWDDX

Description
Determines whether a value is a well-formed WDDX packet.

Returns
True, if the value is a well-formed WDDX packet; False, otherwise.

Category
Decision functions, XML functions

Syntax
IsWDDX(value)

See also
Using WDDX in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: if the `value` parameter is not a WDDX packet, ColdFusion returns False. (In earlier releases, ColdFusion threw an error.)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>A WDDX packet</td>
</tr>
</tbody>
</table>

Usage
This function processes a WDDX packet with a validating XML parser, which uses the WDDX Document Type Definition (DTD).

To prevent CFWDDX deserialization errors, you can use this function to validate WDDX packets from unknown sources.

Example
```
<cfset packet="
  <wddxPacket version='1.0'>
  <header/>
  <data>
    <struct>
      <var name='ARRAY'>
        <array length='3'>
          <string>one</string>
          <string>two</string>
        </array>
      </var>
      <var name='NUMBER'>
        <string>5</string>
      </var>
      <var name='STRING'>
        <string>hello</string>
      </var>
    </struct>
  </data>
  </wddxPacket>
"
>
<cfoutput>
<cfset packet="#isWDDX(packet)="#br>
</cfoutput>
```

IsXML

Description
Determines whether a string is well-formed XML text.

Returns
True, if the function parameter is a string that contains well-formed XML text; False, otherwise.

Category
Decision functions, XML functions
Function syntax
IsXML(value)

See also
IsXmlAttribute, IsXmlDoc, IsXmlElem, IsXmlNode, IsXmlRoot, XmlParse, XmlValidate; Using XML and WDDX
in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>A string containing the XML document text</td>
</tr>
</tbody>
</table>

Usage
This function determines whether text is well-formed XML, that is, it conforms to all XML syntax and structuring rules. The string does not have to be a complete XML document. The function does not validate against a Document Type Definition (DTD) or XML Schema.

Example
The following example creates two strings, and tests whether they are well-formed XML text:
<!--- A well formed XML string --->
<cfset xmlString1='"<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>"
>

<!--- An invalid XML string, missing the </item> close tag --->
<cfset xmlString2='"<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </items>
</order>"
>

<!--- Test the strings to see if they are well formed XML --->
<cfoutput>
xmString1 contains the following text:<br>
#HTMLCodeFormat(xmlstring1)#
Is it well formed XML text? #IsXML(xmlString1)#<br>
<hr>
xmString2 contains the following text:<br>
#HTMLCodeFormat(xmlstring2)#
Is it well formed XML text? #IsXML(xmlString2)#</cfoutput>

**IsXmlAttribute**

**Description**
Determines whether the function parameter is an XML Document Object Model (DOM) attribute node.

**Returns**
True, if the function argument is an XML attribute node; False, otherwise.

**Category**
Decision functions, XML functions

**Function syntax**
```
IsXmlAttribute(value)
```

**See also**
IsXML, IsXmlDoc, IsXmlElem, IsXmlNode, IsXmlRoot, XmlGetNodeType, XmlValidate, Using XML and WDDX in the Developing ColdFusion Applications
History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Name of an XML attribute</td>
</tr>
</tbody>
</table>

Usage
This function determines whether the parameter is an XML DOM attribute node, a node with an XMLType value of ATTRIBUTE. It is useful for determining whether a value returned by the XmlSearch function is an XML attribute.

The DOM, and therefore ColdFusion, treats XML attributes as properties of an element and does not directly expose them as DOM nodes. For this reason, the XmlAttributes entries in ColdFusion XML document objects do not represent DOM attribute nodes, and tests such as the following always return False:

```coldfusion
IsXmlAttribute(myxmlelement.XMLAttributes)
IsXmlAttribute(myxmlelement.XMLAttributes.myattribute)
```

The XmlSearch function does return attributes as XML DOM attribute nodes. For example, the following line returns an array of attribute nodes containing the quantity attributes in the xmlobject document object:

```coldfusion
quantities = XmlSearch(xmlobject, '//@quantity');
```

Example
The following example creates an XML document object and gets parts of it. It then tests whether these parts are attribute nodes.
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
  <order id="4323251">
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
      <item id="43">
        <quantity>1</quantity>
        <unitprice>15.95</unitprice>
      </item>
    </items>
  </order>
</cfxml>

<!--- Get an array with all lastname quantity DOM attribute nodes
  (In this example there is only one entry) --->
<cfset lastnames = XmlSearch(xmlobject, '//@lastname')>

<!--- Test objects to see if they are attributes --->
<cfoutput>
<h3>Are the following XML Attribute nodes?</h3>
<!---- The order element id attribute.
    This a simple variable, not a DOM attribute node.---->
node.xmlobject.order.XmlAttributes.id:
  #IsXmlAttribute(xmlobject.order.XmlAttributes.id)#<br>
<!---- The items element --->
xmlobject.order.items: #IsXmlAttribute(xmlobject.order.items)#<br>
lastnames[1] returned by XmlSearch:
  #isXmlAttribute(lastnames[1])#<br>
</cfoutput>

IsXmlDoc

Description
Determines whether the function parameter is a ColdFusion XML document object.

Returns
True, if the function argument is an XML document object; False, otherwise.

Category
Decision functions, XML functions

Function syntax
IsXmlDoc(value)

See also
IsXML, IsXmlAttribute, IsXmlElem, IsXmlNode, IsXmlRoot, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

History
ColdFusion MX: Added this function.

Last updated 7/9/2012
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Name of an XML document object</td>
</tr>
</tbody>
</table>

**Example**

The following example creates an XML Document object and a Java object and tests whether they are XML document objects:

```cfc
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!--- Create a Java object --->
<cfobject type="JAVA" action="create" class="java.lang.Error" name="javaobject" >

<!--- Test the objects --->
<cfoutput>
Is xmlobject an XML document object? #IsXmlDoc(xmlobject)#<br>
Is javaobject an XML document object? #IsXmlDoc(javaobject)#<br>
</cfoutput>
```

**IsXmlElem**

**Description**

Determines whether the function parameter is an XML document object element.

**Returns**

True, if the function argument is an XML document object element; False, otherwise.

**Category**

Decision functions, XML functions

**Function syntax**

`IsXmlElem(value)`

**See also**

`IsXML, IsXmlAttribute, IsXmlDoc, IsXmlNode, IsXmlRoot, XmlNodeType, XmlValidate`; Using XML and WDDX in the *Developing ColdFusion Applications*

**History**

ColdFusion MX: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Name of an XML document object element</td>
</tr>
</tbody>
</table>

Example

The following example tests whether an XML document object, the document root, and an element are elements:

```xml
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!--- Test parts of the document object to see if they are elements --->
<cfoutput>
  <h3>Are the following XML document object elements?</h3>
  xmlobject: #IsXmlElem(xmlobject)#
  xmlobject.XMLRoot: #IsXmlElem(xmlobject.XMLRoot)#
  xmlobject.order.items: #IsXmlElem(xmlobject.order.items)#
</cfoutput>
```

**IsXmlNode**

Description

Determines whether the function parameter is an XML document object node.

Returns

True, if the function argument is an XML document object node, including an element; False, otherwise.

Category

Decision functions, XML functions

Function syntax

IsXmlNode(value)

See also

IsXML, IsXmlAttribute, IsXmlDoc, IsXmlElem, IsXmlRoot, XmlNodeType, XmlSearch, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

History

ColdFusion MX 7: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Name of an XML document object node.</td>
</tr>
</tbody>
</table>

Usage

This function returns True for the following components of an XML document object:

- The document object
- Elements in the object
- XmlNode objects in an element's XmlNodes array
  
  It also returns True for XML node objects returned by the `XmlSearch` function. It does not return True for most entries in an element, including XmlText, XmlComment, XmlCdata, or the XmlAttributes array (or individual XML attributes).

Example

The following example tests whether an XML document object, an element, an attribute in the object, and an attribute returned by an `XmlSearch` function are nodes:

```xml
cfxml variable="xmlobject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="43212345">  
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>  
  <items>  
    <item id="43">  
      <quantity>1</quantity>  
      <unitprice>15.95</unitprice>  
    </item>  
  </items>  
</order>
```

```
cfset lastnames = XmlSearch(xmlobject, '//@lastname')
```

```
cfoutput
<h3>Are the following XML nodes?</h3>
xmlobject: #IsXmlNode(xmlobject)#
<!---- The items element -->
xmlobject.order.items: #IsXmlNode(xmlobject.order.items)#
<!---- The order element id attribute; a simple variable, not a DOM node. -->
xmlobject.order.XmlAttributes.id:  
lastnames[1] returned by XmlSearch:  
#isXmlNode(lastnames[1])#
```

Last updated 7/9/2012
**IsXmlRoot**

**Description**
Determines whether the function parameter is the root element of an XML document object.

**Returns**
True, if the function argument is the root object of an XML document object; False, otherwise.

**Category**
Decision functions, XML functions

**Function syntax**

```
IsXmlRoot(value)
```

**See also**
IsXML, IsXmlAttribute, IsXmlDoc, IsXmlElem, IsXmlNode, XmlGetNodeType, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

**History**
ColdFusion MX: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Name of an XML document object</td>
</tr>
</tbody>
</table>

**Example**
The following example tests whether an XML document object, its root element, and a child element are XML root elements:
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
   <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
   <items>
      <item id="43">
         <quantity>1</quantity>
         <unitprice>15.95</unitprice>
      </item>
   </items>
</order>
</cfxml>

<!--- Test objects to see if they are XML root elements --->
<cfoutput>
<h3>Are the following the XML Root?</h3>
xmlobject: #IsXmlRoot(xmlobject)#<br>
xmlobject.order: #IsXmlRoot(xmlobject.order)#<br>
</cfoutput>

---

**JavaCast**

**Description**
Converts the data type of a ColdFusion variable to a specified Java type to pass as an argument to Java or .NET object. Use only for scalar, string, and array arguments.

**Returns**
The variable, as type `type`.

**Category**
String functions

**Function syntax**
`JavaCast(type, variable)`

**History**
ColdFusion MX 8: Added support for bigdecimal, byte, char, and short data types and for casting Arrays.
ColdFusion MX 7: Added support for nulls.

**See also**
`CreateObject, cfobject`, Converting between .NET and ColdFusion data types in and Java and ColdFusion data type conversions in the *Developing ColdFusion Applications*
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Data type to which to convert variable:</td>
</tr>
<tr>
<td></td>
<td>• bigdecimal (converts to java.math.BigDecimal)</td>
</tr>
<tr>
<td></td>
<td>• boolean</td>
</tr>
<tr>
<td></td>
<td>• byte</td>
</tr>
<tr>
<td></td>
<td>• char</td>
</tr>
<tr>
<td></td>
<td>• int</td>
</tr>
<tr>
<td></td>
<td>• long</td>
</tr>
<tr>
<td></td>
<td>• float</td>
</tr>
<tr>
<td></td>
<td>• double</td>
</tr>
<tr>
<td></td>
<td>• short</td>
</tr>
<tr>
<td></td>
<td>• string</td>
</tr>
<tr>
<td></td>
<td>• null</td>
</tr>
<tr>
<td></td>
<td>• xxx[] where xxx is one of the following:</td>
</tr>
<tr>
<td></td>
<td>• any of the preceding types, except for null</td>
</tr>
<tr>
<td></td>
<td>• a Java class name</td>
</tr>
<tr>
<td>variable</td>
<td>A ColdFusion variable that holds a scalar or string type. Must be &quot;&quot; if type is null.</td>
</tr>
</tbody>
</table>

Usage

Use this method to specify the Java type to use for a variable that you use when calling a Java or .NET method when the conversion between types is ambiguous; for example, if a method is overloaded and differs only in parameter type or a .NET method is declared as taking a System.Object class parameter.

Use after creating a Java object with the cfobject tag, before calling one of its methods. If the method takes more than one overloaded argument, call JavaCast for each one. Use JavaCast only when a method is overloaded (because its arguments can take more than one data type, not because the method can take a variable number of arguments).

JavaCast cannot be used to cast between complex objects, nor to cast to a super-class.

Because there is not a one-to-one correspondence between internally stored ColdFusion types and Java scalar types, some conversions cannot be performed.

Use the result of this function only on calls to Java or .NET objects. The following example shows the use when calling a Java method.

```cfs
<cfscript>
  x = CreateObject("java", "test.Hello");
  x.init();
  ret = x.sayHello(JavaCast("null", ""));
</cfscript>

Note: Do not assign the results of JavaCast("null", "") to a ColdFusion variable. Unexpected results will occur.
The format `JavaCast(type[], variable)` casts a ColdFusion Array variable to a single dimensional Array of the specified type. It cannot convert multi-dimensional arrays. You can specify a primitive type or the name of a Class as the type to cast to. For example, you can use the following format to cast a ColdFusion Array to an Array of `vom.x.y.MyClass` objects.

```
javacast("vom.x.y.MyClass[]", myCFArr)
```

Use an array in the first `JavaCast` parameter in any of the following circumstances:

- You have two functions with signatures with the same number of parameters, and a parameter takes different types of Arrays in different signatures; for example, if you have both of the following functions:
  ```
  foo(int[] x)
  and
  foo(String[] strs).
  ```
- The method parameter requires a class array in its signature; for example, `foo(com.x.y.MyClass[])`.
- The method parameter requires an Object in its signature and you must pass an array of any particular type.

The following example shows the use of the `JavaCast` function to cast arrays:

You might have a `fooClass` class that defines the following two methods, each with two arguments where the first argument differs in the type of the array:

```java
public class fooClass {
    public fooClass () {
    }
    public String foo(long[] arg) {
        return "Argument was a long array";
    }
    public String foo(int[] arg) {
        return "Argument was an Integer array";
    }
}
```

To be able to use these functions in your CFML, use the `JavaCast` function to convert the ColdFusion Array to the array type required by one of the functions, as shown in the following code snippet:

```
<cfset arr = [1,2,4,20,10]>
<cfset fooObj = createObject("java", "fooClass")>
<cfset fooObj.foo(javacast("int[]", arr))>
<cfset fooObj.foo(javacast("long[]", arr))>
```

**Example**

The method `fooMethod` in the class `fooClass` takes one overloaded argument. The `fooClass` class is defined as follows:

```java
public class fooClass {
    public fooClass () {
    }
    public String fooMethod(String arg) {
        return "Argument was a String";
    }
    public String fooMethod(int arg) {
        return "Argument was an Integer";
    }
}
```

Within ColdFusion, you use the following code:
<cfobject
action="create"
type = "java"
class = "fooClass"
name = obj>

<!---- ColdFusion can treat this as a string or a real number --->
<cfset x = 33>

Perform an explicit cast to an int and call fooMethod:<br>
<cfset myInt = JavaCast("int", x)>
<cfoutput>#obj.fooMethod(myInt)#</cfoutput>
<br><br>
Perform an explicit cast to a string and call fooMethod:<br>
<cfset myString = javaCast("String", x)>
<cfoutput>#obj.fooMethod(myString)#</cfoutput>

---

**JSStringFormat**

**Description**
Escapes special JavaScript characters, such as single-quoation mark, double-quotiation mark, and newline.

**Returns**
A string that is safe to use with JavaScript.

**Category**
String functions

**Function syntax**

JSStringFormat(string)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
</tbody>
</table>

**Usage**

Escapes special JavaScript characters, so you can put arbitrary strings safely into JavaScript.
Example
<!--- This example shows the use of the JSStringFormat function. ---->
<h3>JSStringFormat</h3>
<cfset stringValue = "An example string value with a tab chr(8),
  a newline (chr10) and some ""quoted"" 'text'">
</cfset>
<p>This is the string we have created:<br>
<cfoutput>#stringValue#</cfoutput></p>
<cfset jsStringValue = JSStringFormat(#stringValue#)>
<!----- Generate an alert from the JavaScript string jsStringValue. ---->
<SCRIPT>
s = 
"<cfoutput>#jsStringValue#</cfoutput>"
alert(s);</SCRIPT>

Functions I

LCase

Description
Converts the alphabetic characters in a string to lowercase.

Returns
A string, converted to lowercase.

Category
String functions

Function syntax
LCase(string)

See also
UCase

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>
Example
<h3>LCase Example</h3>

```html
<cfif IsDefined("FORM.sampleText")>
  <cfif FORM.sampleText is not ">
    <cfoutput>
      <p>Your text, <b>#FORM.sampleText#</b>, returned in lowercase is <b>#LCase(FORM.sampleText)#</b>.</p>
    </cfoutput>
  </cfif>
<cfelse>
  <p><b><i>Please enter some text.</i></b></p>
</cfif>
</cfif>

<p>Enter your text. Press "submit" to see it returned in lowercase: </p>
<form method="post" action = "<cfoutput>#cgi.script_name#</cfoutput>" name="lcaseForm">
  <input type = "Text" name = "SampleText" value = "SAMPLE">
  <input type = "Submit" name = "" value = "submit">
</form>

Left

Description
Returns up to the leftmost count characters in a string.

Returns
String; up to the first count characters in the string parameter.

Category
String functions

Function syntax
Left(string, count)

See also
Right, Mid, Len

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
<tr>
<td>count</td>
<td>A positive integer or a variable that contains one. Maximum number of characters to return.</td>
</tr>
</tbody>
</table>
Example

```html
<h3>Left Example</h3>

<cfif IsDefined("Form.myText")>
  <!--- If len returns 0 (zero), then show error message. --->
  <cfif Len(Form.myText)>
    <cfif Len(Form.myText) LTE Form.RemoveChars>
      <cfoutput>
        <p style="color: red; font-weight: bold">Your string #Form.myText# only has #Len(Form.myText)# characters. You cannot output the #Form.removeChars# leftmost characters of this string because it is not long enough.</p>
      </cfoutput>
    </cfif>
  </cfif>
  <cfelse>
    <cfoutput>
      <p>Your original string: <strong>#Form.myText#</strong></p>
      <p>Your changed string, showing only the <strong>#Form.removeChars#</strong> leftmost characters:<br/>
      <strong>#Left(Form.myText, Form.removeChars)#</strong></p>
    </cfoutput>
  </cfif>
</cfif>

<cfelse>
  <p style="color: red; font-weight: bold">Please enter a string of more than 0 (zero) characters.</p>
</cfif>

<form action="<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
  <p>Type in some text<br/>
  <input type="Text" name="myText"></p>
  <p>How many characters from the left do you want to show?<br/>
  <select name="RemoveChars">
    <option value="1">1</option>
    <option value="3" selected>3</option>
    <option value="5">5</option>
    <option value="7">7</option>
    <option value="9">9</option>
  </select>
  <input type="Submit" name="Submit" value="Remove characters"></p>
</form>

Len

Description
Determines the length of a string or binary object.

Returns
Number; length of a string or a binary object.

Category
String functions

Function syntax
Len(string or binary object)
See also
ToBinary, Left, Right, Mid

History
ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255. When calculating a length, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string, the name of a string, or a binary object</td>
</tr>
</tbody>
</table>

Example

```html
<h3>Len Example</h3>
<cfif IsDefined("Form.MyText")>
    <!--- If len returns 0 (zero), then show error message. --->
    <cfif Len(FORM.myText)>
        <cfoutput>
            Your string, <strong>"#FORM.myText#"</strong>,
            has <strong>#Len(FORM.myText)#</strong> characters.
        </cfoutput>
    <cfelse>
        <p style="color: red; font-weight: bold">Please enter a string of more than 0 characters.</p>
    </cfif>
<cfif>
</cfif>

<form action="#CGI.SCRIPT_NAME#" method="POST">
    Type in some text to see the length of your string.
</form>
```

ListAppend

Description
Concatenates a list or element to a list.

Returns
A copy of the list, with `value` appended. If `value = ""`, returns a copy of the list, unchanged.

Category
List functions

Function syntax

```
ListAppend(list, value [, delimiters ])
```
See also ListPrepend, ListInsertAt, ListGetAt, ListLast, ListSetAt; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>value</td>
<td>An element or a list of elements.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion uses only the first character.</td>
</tr>
</tbody>
</table>

Usage

ColdFusion inserts a delimiter character before value.

The following table shows examples of ListAppend processing:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Output</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListAppend('elem1,elem2', '')</td>
<td>elem1,elem2</td>
<td>Appended element is empty; delimiter is last character in list; list length is 2.</td>
</tr>
<tr>
<td>ListAppend('', 'elem1,elem2')</td>
<td>elem1,elem2</td>
<td>List length is 2.</td>
</tr>
<tr>
<td>ListAppend('one___two', &quot;three&quot;, &quot;___&quot;)</td>
<td>&quot;one___two_three&quot;</td>
<td>Inserted the first character of delimiters before &quot;three.&quot;</td>
</tr>
</tbody>
</table>

Example

```
<!--- First, query to get some values for our list elements --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM PARKS WHERE PARKNAME LIKE 'AL%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfoutput>
The original list: #temp#
</cfoutput>
<!--- now, append a park name to the list --->
<cfset temp2 = ListAppend(Temp, "ANOTHER PARK")>
```

ListChangeDelims

Description

Changes a list delimiter.

Returns

A copy of the list, with each delimiter character replaced by new_delimiter.

Category

List functions
Function syntax
ListChangeDelims(list, new_delimiter [, delimiters, includeEmptyValues ])

See also
ListFirst, ListQualify; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>new_delimiter</td>
<td>Delimiter string or a variable that contains one. Can be an empty string. ColdFusion processes the string as one delimiter.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Example
<h3>ListChangeDelims Example</h3>
<p>ListChangeDelims lets you change the delimiters of a list.  
<!---- First, query to get some values for our list elements---->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdocexamples">
  SELECT PARKNAME,CITY,STATE
  FROM Parks
  WHERE PARKNAME LIKE 'BA%'
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<cfoutput>
The original list: <p>#temp#</cfoutput>
<!---- Change the delimiters in the list ---->
<CFSET temp2 = ListChangeDelims(Temp, "|:P|", ",")>
<cfoutput>
After executing the statement
  <strong>ListChangeDelims(Temp, "|:P|", ",")</strong>,
  the updated list: <p>#temp2#</cfoutput>

ListContains

Description
Determines the index of the first list element that contains a specified substring.

Returns
Index of the first list element that contains substring. If not found, returns zero.

Category
List functions
**Function syntax**

```coldfusion
ListContains(list, substring [, delimiters, includeEmptyValues ])
```

**See also**

`ListContainsNoCase, ListFind`; Lists in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to <code>yes</code> to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>substring</td>
<td>A string or a variable that contains one. The search is case sensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

**Usage**

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

**Example**

```coldfusion
<!--- This example shows differences between ListContains and ListFind --->
<!--- Create a list composed of the elements one, two, three. ---->
<cfset aList = "one">
<cfset aList = ListAppend(aList, "two")>
<cfset aList = ListAppend(aList, "three")>
<p>Here is a list: <cfoutput>#aList#</cfoutput></p>
<p><strong>ListContains</strong> checks for substring "wo" in the list elements: </p><cfoutput>
  &nbsp;&nbsp;&nbsp;Substring "wo" is in element #ListContains(aList, "wo")# of list.
</cfoutput>
<p>ListFind cannot check for a substring within an element; therefore, in the code, it does not find substring "wo" (it returns 0): </p><cfoutput>
  &nbsp;&nbsp;&nbsp;Substring "wo" is in <b>element #ListFind(aList, "wo")#</b> of the list.
</cfoutput>
<p>If you specify a string that exactly equals an entire list element, such as "two", both ListContains and ListFind find it, in the second element: </p><cfoutput>
  &nbsp;&nbsp;&nbsp;The string "two" is in <b>element #ListContains(aList, "two")#</b> of the list.
</cfoutput>
<p>&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&n...
ListContainsNoCase

Description
Determines the index of the first list element that contains a specified substring.

Returns
Index of the first list element that contains substring, regardless of case. If not found, returns zero.

Category
List functions

Function syntax
ListContainsNoCase(list, substring [, delimiters, includeEmptyValues ])

See also
ListContains, ListFindNoCase; Lists in the Developing ColdFusion Applications

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>substring</td>
<td>A string or a variable that contains one. The search is case-insensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Usage
ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

Example
```
<h3>ListContainsNoCase Example</h3>
<cfif IsDefined("form.letter")>
   <!--- First, query to get some values for our list --->
   <cfquery name="GetParkInfo" datasource="cfdocexamples">
      SELECT PARKNAME,CITY,STATE
      FROM Parks
      WHERE PARKNAME LIKE '#form.letter#'
   </cfquery>
   <cfset tempList = #ValueList(GetParkInfo.City)#>
   <cfif ListContainsNoCase(tempList, form.yourCity) is not 0>
      There are parks in your city!
   <cfelse>
      <p>Sorry, there were no parks found for your city.</p>
      <p>Try searching under a different letter.</p>
   </cfif>
</cfif>
```
ListDeleteAt

Description
Deletes an element from a list.

Returns
A copy of the list, without the specified element.

Category
List functions

Function syntax
ListDeleteAt(list, position [, delimiters ])
ListDeleteAt(list, position [, delimiters, includeEmptyValues ])

See also
ListGetAt, ListSetAt, ListLen; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>position</td>
<td>A positive integer or a variable that contains one. Position at which to delete element. The first list position is 1.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
<tr>
<td>includeEmptyValues</td>
<td>If includeEmptyValues is set to false, the list will contain only nonempty elements and the element would be deleted at the specified position.</td>
</tr>
</tbody>
</table>

Usage
To use this and other functions with the default delimiter (comma), you can code as follows:

```coldfusion
<cfset temp2 = ListDeleteAt(temp, "3")>
```

To specify another delimiter, you code as follows:

```coldfusion
<cfset temp2 = ListDeleteAt(temp, "3", ";")>
```

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.
Example

<!--- First, query to get some values for our list elements. --->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdocexamples">
  SELECT PARKNAME,CITY,STATE
  FROM Parks
  WHERE PARKNAME LIKE 'CHI'"
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<CFSET deleted_element = ListGetAt(temp, 3, ",")>
<!--- Delete the third element from the list. --->
<CFSET temp2 = ListDeleteAt(temp, 3)>
<cfoutput>
<p>The original list: #temp#</p>
<p>Deleted the third element from the list. --->
<p>The changed list: #temp2#</p>
This list element: <br>#deleted_element# is no longer present at position three of the list.</coutput>

ListFilter

Description
Used to filter the elements in list.

Returns
A new list

Category
Closure functions

Syntax

```
listFilter(list, function(listElement) {return true|false;});
```

See also
Other closure functions.

History
ColdFusion 10: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Name of the list object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the list. Returns true if the list element has to be included in the resultant list.</td>
</tr>
<tr>
<td>listElement</td>
<td>List element being accessed.</td>
</tr>
</tbody>
</table>
ListFind

Description
Determines the index of the first list element in which a specified value occurs. Case sensitive.

Returns
Index of the first list element that contains value, with matching case. If not found, returns zero. The search is case sensitive.

Category
List functions

Function syntax
ListFind(list, value [, delimiters, includeEmptyValues ])

See also
ListContains, ListFindNoCase; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one</td>
</tr>
<tr>
<td>value</td>
<td>A string, a number, or a variable that contains one. Item for which to search. The search is case sensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Usage
ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.
Example

<!--- Uses ListFind and ListFindNoCase to see if a substring exists in a list --->
<form action="/listfind.cfm" method="POST">
<br><p>Try changing the case in Leary's last name:
<br><input type="Text" size="25" name="myString" value="Leary">
<br>Pick a search type:
<br>   <select name="type">
   <option value="ListFind" selected>Case-Sensitive
   <option value="ListFindNoCase">Case-Insensitive
   </select>
<br><input type="Submit" name="" value="Search Employee List">

</form>

<!--- wait to have a string for searching defined --->
<cfif IsDefined("form.myString") and IsDefined("form.type")>
<cfquery name="SearchEmpLastName" datasource="cfdocexamples">
   SELECT FirstName, RTrim(LastName) AS LName, Phone, Department
   FROM Employees
</cfquery>

<cfset myList = ValueList(SearchEmpLastName.LName)>
<!--- Is this case-sensitive or case-insensitive searching --->
<cfif form.type is "ListFind">
   <cfset temp = ListFind(myList, form.myString)>
   <cfif temp is 0>
      <h3>An employee with that exact last name was not found</h3>
   <cfelse>
      <cfoutput>
      Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
      #ListGetAt(ValueList(SearchEmpLastName.FName), temp)#, of the
      #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
      can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
      temp)#.
      <p>This was the first employee found under this case-sensitive last name search.
      </cfoutput>
   </cfif>
</cfif>
<cfelse>
   <cfset temp = ListFindNoCase(myList, form.myString)>
   <cfif temp is 0>
      <h3>An employee with that exact last name was not found</h3>
   <cfelse>
      <cfoutput>
      Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
      #ListGetAt(ValueList(SearchEmpLastName.FName), temp)#, of the
      #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
      can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
      temp)#.
      <p>This was the first employee found under this case-insensitive last name search.
      </cfoutput>
   </cfif>
</cfelse>
</cfif>
</cfif>
ListFindNoCase

Description
Determines the index of the first list element in which a specified value occurs.

Returns
Index of the first list element that contains value. If not found, returns zero. The search is case-insensitive.

Category
List functions

Function syntax
ListFindNoCase(list, value [, delimiters, includeEmptyValues ])

See also
ListContains, ListFind; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>value</td>
<td>Number or string for which to search. The search is case-insensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Usage
ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.
Example

<!--- Uses ListFind and ListFindNoCase to see if a substring exists in a list --->
<form action="./listfind.cfm" method="POST">
    <p>Try changing the case in Leary's last name:</p>
    <input type="Text" size="25" name="myString" value="Leary">
    <p>Pick a search type:
        <select name="type">
            <option value="ListFind" selected>Case-Sensitive
            <option value="ListFindNoCase">Case-Insensitive
        </select>
        <input type="Submit" name="" value="Search Employee List">
</form>

<!--- wait to have a string for searching defined --->
<cfif IsDefined("form.myString") and IsDefined("form.type")>
    <cfquery name="SearchEmpLastName" datasource="cfdocexamples">
        SELECT FirstName, RTrim(LastName) AS LName, Phone, Department FROM Employees
    </cfquery>
    <cfset myList = ValueList(SearchEmpLastName.LName)>
    <!--- Is this case-sensitive or case-insensitive searching --->
    <cfif form.type is "ListFind">
        <cfset temp = ListFind(myList, form.myString)>
        <cfif temp is 0>
            <h3>An employee with that exact last name was not found</h3>
        </cfif>
        <cfelse>
            <cfoutput>
                Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)##ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department, can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
            </cfoutput>
            <p>This was the first employee found under this case-sensitive last name search.</p>
        </cfelse>
    </cfif>
    <cfif form.type is "ListFindNoCase">
        <cfset temp = ListFindNoCase(myList, form.myString)>
        <cfif temp is 0>
            <h3>An employee with that exact last name was not found</h3>
        </cfif>
        <cfelse>
            <cfoutput>
                Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)##ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department, can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
            </cfoutput>
            <p>This was the first employee found under this case-insensitive last name search.</p>
        </cfelse>
    </cfif>
</cfif>
**ListFirst**

**Description**
Gets the first element of a list.

**Returns**
The first element of a list. If the list is empty, returns an empty string.

**Category**
List functions

**Function syntax**
```
ListFirst(list [, delimiters, includeEmptyValues ])
```

**See also**
ListGetAt, ListLast, ListQualify; Lists in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains a list.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

**Usage**
ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

**Example**
```
<h3>ListFirst Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;</p>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.<p>(Users who posted more than once are listed more than once.)</p>
<!--- Show the first user in the list --->
<p>The first user in the list is: #ListFirst(temp)#</p>
<p>The rest of the list is:&nbsp;</p><cfoutput>#ListRest(temp)#</cfoutput>. <p>(Users who posted more than once are listed more than once.)</p>
<p>The last user in the list is: #ListLast(temp)#</p>
```
**ListGetAt**

**Description**
Gets a list element at a specified position.

**Returns**
Value of the list element at position `position`.

**Category**
List functions

**Function syntax**

```
ListGetAt(list, position [, delimiters, includeEmptyValues ])
```

**See also**
ListFirst, ListLast, ListQualify, ListSetAt; Lists in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>position</td>
<td>A positive integer or a variable that contains one. Position at which to get element. The first list position is 1.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
</tbody>
</table>

**Usage**

If you use list functions on strings that are delimited by a delimiter character and a space, a returned list element might contain a leading space; you use the `trim` function to remove such spaces from a returned element. For example, consider this list:

```
<cfset myList = "one hundred, two hundred, three hundred">  
```

To get a value from this list, use the `trim` function to remove the space before the returned value:

```
<cfset MyValue = #trim(listGetAt(myList, 2))#>  
```

With this usage, `MyValue = "two hundred", not "two hundred", and spaces within a list element are preserved. ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.
Example

```html
<h3>ListGetAt Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!--- loop through the list and show it with ListGetAt --->
<h3>This list of usernames who have posted messages numbers #ListLen(temp)# users.</h3>
<ul>
    <cfloop From = "1" To = "#ListLen(temp)#" index = "Counter">
        <cfoutput><li>Username #Counter#: #ListGetAt(temp, Counter)#</li></cfoutput>
    </cfloop>
</ul>

ListInsertAt

Description
Inserts an element in a list.

Returns
A copy of the list, with value inserted at the specified position.

Category
List functions

Function syntax
ListInsertAt(list, position, value [, delimiters, includeEmptyValues ])

See also
ListDeleteAt, ListAppend, ListPrepend, ListSetAt; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>position</td>
<td>A positive integer or a variable that contains one. Position at which to insert element. The first list position is 1.</td>
</tr>
<tr>
<td>value</td>
<td>An element or a list of elements.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>
Usage
When inserting an element, ColdFusion inserts a delimiter. If `delimiters` contains more than one delimiter, ColdFusion uses the first delimiter in the string; if `delimiters` is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

Example
```coldfusion
<!--- This example shows ListInsertAt --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
SELECT PARKNAME,CITY,STATE
FROM PARKS
WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset insert_at_this_element = ListGetAt(temp, "3", ",")>
<cfoutput>
<p>The original list: #temp#
</cfoutput>
<cfset temp2 = ListInsertAt(Temp, "3", "my Inserted Value")>
```

ListLast

Description
Gets the last element of a list.

Returns
The last element of the list.

Category
List functions

Function syntax
`ListLast(list [, delimiters, includeEmptyValues ])`

See also
`ListGetAt, ListFirst`; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>includeEmptyValues</code></td>
<td>Optional. Set to <code>yes</code> to include empty values.</td>
</tr>
<tr>
<td><code>list</code></td>
<td>A list or a variable that contains a list.</td>
</tr>
<tr>
<td><code>delimiters</code></td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter; you cannot specify a multicharacter delimiter.</td>
</tr>
</tbody>
</table>
Usage
If you use list functions on strings that separated by a delimiter character and a space, a returned list element might contain a leading space; use the trim function to remove leading and trailing spaces from a returned element. For example, consider this list:

```<cfset myList = "one hundred, two hundred, three hundred">```

To get a value from this list, use the trim function to remove the space before the returned value:

```<cfset MyValue = #trim(ListLast(myList)#>```

With this usage, the MyValue variable gets the value "three hundred", not " three hundred", and spaces within a list element are preserved.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

Example

```<h3>ListFirst, ListLast, and ListRest Example</h3>```  
```<!--- Find a list of users who wrote messages ---><cfform name = "GetMessageUser" datasource = "cfdocexamples"  >  
   SELECT Username, Subject, Posted  
   FROM Messages  
</cfform>```  
```<cfset temp = ValueList(GetMessageUser.Username)>```  
```<p>Before editing the list, it is:&nbsp;</p>```  
```<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.```  
```<p>(Users who posted more than once are listed more than once.)</p>```  
```<!--- Show the first user in the list ---><p>The first user in the list is: #ListFirst(temp)#</p>```  
```<p>(Users who posted more than once are listed more than once.)</p>```  
```<p>The rest of the list is:&nbsp;</p>```  
```<cfoutput>#ListRest(temp)#</cfoutput>.```  
```<p>The last user in the list is: #ListLast(temp)#</cfoutput>```  

**ListLen**

**Description**
Determines the number of elements in a list.

**Category**
List functions

**Function syntax**

```ListLen(list [, delimiters ])
ListLen(list [, delimiters, includeEmptyValues ])
```  

**See also**
ListAppend, ListDeleteAt, ListInsertAt, ListPrepend; Lists in the Developing ColdFusion Applications

Last updated 7/9/2012
## ColdFusion Functions

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
<tr>
<td>includeEmptyValues</td>
<td>If includeEmptyValues is set to true, all empty values in the list will be considered when computing length. If set to false, the empty list elements are ignored.</td>
</tr>
</tbody>
</table>

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

Here are some examples of ListLen processing:

<table>
<thead>
<tr>
<th>Statement</th>
<th>Output</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ListLen('a,b,c,,,d')</td>
<td>4</td>
<td>Third element is &quot;c&quot;</td>
</tr>
<tr>
<td>ListLen('a,b,c,,,d','')</td>
<td>4</td>
<td>Fourth element is &quot;d&quot;</td>
</tr>
<tr>
<td>ListLen('elem_1___elem_2___elem_3')</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>ListLen('elem<em>1</em><strong>elem<em>2</em></strong>elem*3')</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>ListLen('elem_1___elem_2___elem_3','_')</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>

### Example

```
<h3>ListLen Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!--- loop through the list and show it with ListGetAt --->
<h3>This is a list of usernames who have posted messages</h3>
<cfoutput>&#ListLen(temp) users.</cfoutput>
<ul>
    <cfloop From = "1" TO = "#ListLen(temp)#" INDEX = "Counter">
        <cfoutput><li>Username #Counter#: #ListGetAt(temp, Counter)#</cfoutput>
    </cfloop>
</ul>
```

### ListPrepend

**Description**

Inserts an element at the beginning of a list.

**Returns**

A copy of the list, with value inserted at the first position.
Category
List functions

Function syntax
ListPrepend(list, value [, delimiters ])

See also
ListAppend, ListInsertAt, ListSetAt; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>value</td>
<td>An element or a list of elements.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion only uses the first character and ignores the others.</td>
</tr>
</tbody>
</table>

Usage
When prepending an element to a list, ColdFusion inserts a delimiter. If delimiters contains more than one delimiter character, ColdFusion uses the first delimiter in the string; if delimiters is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

If the delimiters parameter is the empty string (""), ColdFusion returns the contents of the value parameter.

Example
<!--- This example shows ListPrepend --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM PARKS
    WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset first_element = ListFirst(temp)>
<cfoutput><p>The original list: #temp#</cfoutput>
<!--- now, insert an element at position 1-->
<cfset temp2 = ListPrepend(Temp, "my Inserted Value")>

ListQualify

Description
Inserts a string at the beginning and end of list elements.

Returns
A copy of the list, with qualifier before and after the specified elements.
Function syntax

```coldfusion
ListQualify(list, qualifier [, delimiters, elements, includeEmptyValues ])
```

See also

Lists in Using ColdFusion Variables in the Developing ColdFusion Applications

History

ColdFusion MX: Changed behavior: as the `elements` parameter value, you must specify "all" or "char"; otherwise, ColdFusion throws an exception. (In earlier releases, the function ignored an invalid value, and used "all"; this was inconsistent with other functions.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to <code>yes</code> to include empty values.</td>
</tr>
<tr>
<td><code>list</code></td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td><code>qualifier</code></td>
<td>A string or a variable that contains one. Character or string to insert before and after the list elements specified in the <code>elements</code> parameter.</td>
</tr>
<tr>
<td><code>delimiters</code></td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion uses the first character as the delimiter and ignores the remaining characters.</td>
</tr>
<tr>
<td><code>elements</code></td>
<td>• <code>all</code>: all elements</td>
</tr>
<tr>
<td></td>
<td>• <code>char</code>: elements that are composed of alphabetic characters</td>
</tr>
</tbody>
</table>

Usage

The new list might not preserve all of the delimiters in the list.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.
Example
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName
FROM Employees
</cfquery>

<h3>ListQualify Example</h3>
<p>This example uses ListQualify to put the full names of the employees in the query within quotation marks.</p>
<cfset myArray = ArrayNew(1)>
<!--- loop through query; append these names successively to the last element --->
<cfloop query = "GetEmployeeNames">
  <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>
<!--- sort that array descending alphabetically --->
<cfset myAlphaArray = ArraySort(myArray, "textnocase")>
<!--- show the resulting array as a list ---->
<cfset myList = ArrayToList(myArray, ",")>

<cfoutput>
<p>The contents of the unqualified list are as follows:</p>
#myList#
</cfoutput>

<!--- show the resulting alphabetized array as a qualified list with single quotation marks around each full name. --->
<cfset qualifiedList1 = ListQualify(myList,"'","","CHAR")>

<!--- output the array as a list --->
<cfoutput>
<p>The contents of the qualified list are as follows:</p>
<p>#qualifiedList1#</p>
</cfoutput>

<!--- show the resulting alphabetized array as a qualified list with quotation marks around each full name. We use &quot; to denote quotation marks because the quotation mark character is a control character. --->
<cfset qualifiedList2 = ListQualify(myList,"&quot;","","CHAR")>

<!--- output the array as a list --->
<cfoutput>
<p>The contents of the second qualified list are:</p>
<p>#qualifiedList2#</p>
</cfoutput>

**ListRemoveDuplicates**

**Description**
Removes duplicate values (if they exist) in a list.
Returns
List sans duplicate values

Syntax
ListRemoveDuplicates(list[, delimiter] [, ignoreCase])

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Required. List of objects.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Optional. Character(s) that separate list elements. The default value is comma.</td>
</tr>
<tr>
<td>ignoreCase</td>
<td>Optional. If true, ignores the case of strings in the list. By default the value is set to false.</td>
</tr>
</tbody>
</table>

Example

```
<cfscript>
myList = "one,two,three,four,five,one,five,three"
newList = listremoveduplicates(myList);
//default delimiter is ","
//newList contains "one,two,three,four,five"
</cfscript>

<cfscript>
myList = "one,two,three,four,five,ONE,TWO,THREE"
newList = listremoveduplicates(myList, ",", true);
//newList contains "one,two,three,four,five"
</cfscript>
```

ListRest

Description
Gets a list, without its first element.

Returns
A copy of list, without the first element. If list has one element, returns an empty list.

Category
List functions

Function syntax
ListRest(list [, delimiters, includeEmptyValues ])

See also
ListFirst, ListGetAt, ListLast; Lists in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Usage

If the list begins with one or more empty entries, this function drops them, as well as the first element.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

Example

```coldfusion
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:<br>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.<br>
(Users who posted more than once are listed more than once.)
<p>The first user in the list is:<br>
<cfoutput>#ListFirst(temp)#</cfoutput><br>
The rest of the list is:<br>
<cfoutput>#ListRest(temp)#</cfoutput>.<br>
(Users who posted more than once are listed more than once.)
<p>The last user in the list is:<br>
<cfoutput>#ListLast(temp)#</cfoutput>
```

### ListSetAt

**Description**

Replaces the contents of a list element.

**Returns**

A copy of a list, with a new value assigned to the element at a specified position.

**Category**

List functions

**Function syntax**

`ListSetAt(list, position, value [, delimiters, includeEmptyValues ])`

**See also**

`ListDeleteAt, ListGetAt, ListInsertAt`; Lists in the *Developing ColdFusion Applications*
History
ColdFusion MX: Changed delimiter modification: ColdFusion MX does not modify delimiters in the list. (In earlier releases, in some cases, replaced delimiters with the first character in the delimiters parameter.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>position</td>
<td>A positive integer or a variable that contains one. Position at which to set a value. The first list position is 1.</td>
</tr>
<tr>
<td>value</td>
<td>An element or a list of elements.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Usage
When assigning an element to a list, ColdFusion inserts a delimiter. If delimiters contains more than one delimiter, ColdFusion uses the first delimiter in the string, or, if delimiters was omitted, a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

Example

```cfc
<h3>ListSetAt Example</h3>

<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT Username, Subject, Posted
FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Subject)>

<!--- loop through the list and show it with ListGetAt --->
<h3>This is a list of <cfoutput>#ListLen(temp)#</cfoutput> subjects posted in messages.</h3>
<cfset ChangedElement = ListGetAt(temp, 2)>
<cfset TempToo = ListSetAt(temp, 2, "I changed this subject", ",")>
<ul>
    <cfloop From = "1" To = "#ListLen(TempToo)#" INDEX = "Counter">
        <cfoutput><li>(#Counter#) SUBJECT: #ListGetAt(TempToo, Counter)#</cfoutput>
    </cfloop>
</ul>
<p>Note that element 2, "<cfoutput>#ChangedElement#</cfoutput>", has been altered to "I changed this subject" using ListSetAt.
```

Last updated 7/9/2012
ListSort

Description
Sorts list elements according to a sort type and sort order.

Returns
A copy of a list, sorted.

Category
List functions

Function syntax
ListSort(list, sort_type [, sort_order, delimiters, includeEmptyValues ])

See also
Lists in Using ColdFusion Variables in the Developing ColdFusion Applications

History
ColdFusion 10: Added support for all Java supported locale-specific characters (including support for umlaut characters). A flag for this support has been added for sorttype = "text" or sorttype = "textnocase".

ColdFusion MX: Changed the order in which sorted elements are returned: in a textnocase, descending sort, this function might return elements in a different sort order than in earlier releases. If sort_type="textnocase" and sort_order="desc", ColdFusion MX processes elements that differ only in case differently from earlier releases. ColdFusion MX outputs the elements in the reverse of the ascending order. Earlier releases do not change order of elements that differ only in case. Both operations are correct. The new operation ensures that an ascending and descending sort output elements in exactly reverse order.

For example, in a textnocase, desc sort of d,a,a,b,A, the following occurs:
• ColdFusion MX returns d,b,A,a,a
• Earlier ColdFusion releases return d,b,a,a,A
  (In a textnocase, asc sort, all ColdFusion releases return a,a,A,b,d.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeEmptyValues</td>
<td>Optional. Set to yes to include empty values.</td>
</tr>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>localeSensitive</td>
<td>Specify if you wish to do a locale sensitive sorting. The default value is false.</td>
</tr>
</tbody>
</table>
ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

---

**Parameter** | **Description**
---|---
**sort_type** | - numeric: sorts numbers
- text: sorts text alphabetically, taking case into account (also known as case sensitive). All letters of one case precede the first letter of the other case:
- aabzABZ, if `sort_order = "asc"` (ascending sort)
- ZBAzbaa, if `sort_order = "desc"` (descending sort)
- textnocase: sorts text alphabetically, without regard to case (also known as case-insensitive). A letter in varying cases precedes the next letter:
- aAaBbBzzZ, in an ascending sort; preserves original intra-letter order
- ZzzBbBaAa, in a descending sort; reverses original intra-letter order

**sort_order** | - asc - ascending sort order. Default.
- aabzABZ or aAaBbBzzZ, depending on value of `sort_type`, for letters
- from smaller to larger, for numbers
- desc - descending sort order.
- ZBAzbaa or ZzzBbBaAa, depending on value of `sort_type`, for letters
- from larger to smaller, for numbers

**delimiters** | A string or a variable that contains one. Characters that separate list elements. The default value is comma.
If this parameter contains more than one character, ColdFusion uses the first character in the string as the delimiter, and ignores the rest.
Example

<h3>ListSort Example</h3>

<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT   Username, Subject, Posted
FROM     Messages
</cfquery>

<cfset myList = ValueList(GetMessageUser.UserName)>
<p>Here is the unsorted list. </p>
<cfoutput>#{myList}#</cfoutput>
<p>Here is the list sorted alphabetically:</p>
<cfset sortedList = ListSort(myList, "Text")>
<cfoutput>#{sortedList}#</cfoutput>
<p>Here is a numeric list that is to be sorted in descending order.</p>
<cfset sortedNums = ListSort("12,23,107,19,1,65","Numeric", "Desc")>
<cfoutput>#{sortedNums}#</cfoutput>
<p>Here is a list that must be sorted numerically, since it contains negative and positive numbers, and decimal numbers.</p>
<cfset sortedNums2 = ListSort("23.75;-34,471:100,-9745","Numeric", "ASC", ";,:")>
<cfoutput>#{sortedNums2}#</cfoutput>
<p>Here is a list to be sorted alphabetically without consideration of case.</p>
<cfset sortedMix = ListSort("hello;123,HELLO:jeans,-345,887;ColdFusion:coldfusion","TextNoCase", "ASC", ";,:")>
<cfoutput>#{sortedMix}#</cfoutput>

ListToArray

Description
Copies the elements of a list to an array.

Returns
An array

Category
Array functions, Conversion functions, List functions

Function syntax
ListToArray(list [, delimiters[, includeEmptyFields[, multicharacterDelimiter]]])

See also
ArrayToList; Using Arrays and Structures in the Developing ColdFusion Applications

History
ColdFusion 9: Added the multicharacterDelimiter parameter.
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one. You define a list variable with a cfset statement.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. ColdFusion treats each character in the string as a delimiter. The default value is comma.</td>
</tr>
<tr>
<td>includeEmptyFields</td>
<td>A Boolean value specifying whether to create empty array entries if there are two delimiters in a row.</td>
</tr>
<tr>
<td></td>
<td>- false (Default) ignore empty elements in a list; for example, convert a,,c into an array with only two elements.</td>
</tr>
<tr>
<td></td>
<td>- true Convert empty elements in a list to empty array entries; for example, convert a,,c into an array with three elements, the second of which is empty.</td>
</tr>
<tr>
<td>multiCharacterDelimiter</td>
<td>A Boolean value specifying whether the delimiters parameter specifies a multi-character delimiter. The default is false. If this parameter is true, the delimiters parameter must specify a single delimiter consisting of multiple characters. This parameter enables the ListToArray function to convert a list such as the following to an array of color names: red</td>
</tr>
</tbody>
</table>

Usage

ColdFusion, by default, ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

ColdFusion treats each character in the delimiters parameter as a separate delimiter. Therefore, if the parameter is ",,+" ColdFusion will break the list at either a comma or a plus sign.

If you specify a multiCharacterDelimiter parameter, all list elements must be separated by exactly the specified characters. For example, the following code creates an array with three entries, "red, orange", "yellow, green" and "blue, violet".

```xml
<cfset list = "red, orange, &yellow, green, &blue, violet">
<cfset arr = listToArray (list, ",", false, true)>
```

Example

```xml
<h3>ListToArray Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples"
SELECT Username, Subject, Posted FROM Messages
</cfquery>
<cfset myList = ValueList(GetMessageUser.UserName)>
<p>My list is a list with <cfoutput>#ListLen(myList)#</cfoutput> elements.</p>
<cfset myArrayList = ListToArray(myList)>
<p>My array list is an array with <cfoutput>#ArrayLen(myArrayList)#</cfoutput> elements.</p>
```

ListValueCount

Description

Counts instances of a specified value in a list. The search is case sensitive.
Returns
The number of instances of value in the list.

Category
List functions, String functions

Function syntax
ListValueCount(list, value [, delimiters ])

See also
ListValueCountNoCase; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>value</td>
<td>String or number, or a variable that contains one. Item for which to search. The search is case sensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>

Example

```
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>
<h3>ListValueCount Example</h3>
<p>This example uses ListValueCount to count employees in a department.

<form action = "listvaluecount.cfm">
<p>Select a department: </p>
<select name = "departmentName">
<option value = "Accounting"> Accounting
</OPTION>
<option value = "Administration"> Administration
</OPTION>
<option value = "Engineering"> Engineering
</OPTION>
<option value = "Sales"> Sales
```

Last updated 7/9/2012
ListValueCountNoCase

Description
Counts instances of a specified value in a list. The search is case-insensitive.

Returns
The number of instances of value in the list.

Category
List functions

Function syntax
ListValueCountNoCase(list, value [, delimiters ])

See also
ListValueCount; Lists in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list or a variable that contains one.</td>
</tr>
<tr>
<td>value</td>
<td>String or number, or a variable that contains one. Item for which to search. The search is case-insensitive.</td>
</tr>
<tr>
<td>delimiters</td>
<td>A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</td>
</tr>
</tbody>
</table>
Example

```cfml
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>

<h3>ListValueCountNoCase Example</h3>
<p>This example uses ListValueCountNoCase to count employees in a department.</p>

<form action = "listvaluecountnocase.cfm">
 Select a department:
  <select name = "departmentName">
    <option value = "Accounting">Accounting</option>
    <option value = "Administration">Administration</option>
    <option value = "Engineering">Engineering</option>
    <option value = "Sales">Sales</option>
  </select>
  <input type = "Submit" name = "Submit" value = "Search Employee List">
</form>

<cfif IsDefined("FORM.Submit") and IsDefined("FORM.departmentName")>
  <cfset myList = ValueList(SearchByDepartment.Department)>
  <cfset numberInDepartment = ListValueCountNoCase(myList, FORM.departmentName)>
  <cfif numberInDepartment is 0>
    <h3>There are no employees in #FORM.departmentName#</h3>
  </cfelseif numberInDepartment is 1>
    <p>There is only one person in #FORM.departmentName#.</p>
  </cfif>
  <cfelse>
    <p>There are #numberInDepartment# people in #FORM.departmentName#.</p>
  </cfelse>
</cfif>
```

**LJustify**

**Description**
Left justifies characters in a string of a specified length.

**Returns**
A copy of a string, left-justified.
Category
Display and formatting functions, String functions

Function syntax
LJustify(string, length)

See also
CJustify, RJustify

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>length</td>
<td>Length of field in which to justify string</td>
</tr>
</tbody>
</table>

Example

```html
<!--- This example shows how to use LJustify --->
<cfparam name = "jstring" default = ">

<cfif IsDefined("FORM.justifyString")>
   <cfset jstring = LJustify(FORM.justifyString, 35)>
</cfif>
<html>
<head>
   <title>LJustify Example</title>
</head>
<body>
   <h3>LJustify Function</h3>
   <p>Enter a string, and it will be left justified within the sample field</p>
   <form action = "ljustify.cfm">
   <p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>" size = 35 name = "justifyString">
   <p><input type = "Submit" name = "" /> <input type = "RESET">
   </form>
</body>
</html>
```

Location

Description
A function equivalent of the cflocation tag and is used in the <cfscript> mode.

Parameters
Same as the <cflocation> tag.

Category
Data output functions
Function syntax
location("url", addtoken, statusCode);

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

See also
cfscript, cflocation

Usage
You can call this function as name=value pair or as positional argument.

Example
<cfscript
   location(url="http://localhost:8500/administrator")
</cfscript>

Log

Description
Calculates the natural logarithm of a number. Natural logarithms are based on the constant e (2.71828182845904).

Returns
The natural logarithm of a number.

Category
Mathematical functions

Function syntax
Log(number)

See also
Exp, Log10

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Positive real number for which to calculate the natural logarithm</td>
</tr>
</tbody>
</table>
Example
<h3>Log Example</h3>

```cfscript
<cfif IsDefined("FORM.number")>
  <cfoutput>
    <p>Your number, #FORM.number#</p>
    <br/>#FORM.number# raised to the E power: #exp(FORM.number)#
    <cfif FORM.number LTE 0><br>Enter a positive real number to get its natural logarithm<br/>#FORM.number# raised to the E power: #exp(FORM.number)#</cfif>
    <cfelse><br>Enter a positive real number to get its logarithm to base 10
    <cfif FORM.number LTE 0><br>Enter a positive real number to get its logarithm to base 10
    <cfelse><br>The logarithm of #FORM.number#: #log(FORM.number)#</cfif>
  </cfoutput>
</cfif>
<cfform action = "log.cfm">
  Enter a number to see its value raised to the E power, its natural logarithm, and the logarithm of number to base 10.
  <cfinput type = "Text" name = "number" message = "You must enter a number" validate = "float" required = "No">
  <input type = "Submit" name = "">
</cfform>
```

Log10

Description
Calculates the logarithm of `number`, to base 10.

Returns
Number; the logarithm of `number`, to base 10.

Category
Mathematical functions

Function syntax
```
Log10(number)
```

See also
`Exp`, `Log`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Positive real number for which to calculate the logarithm</td>
</tr>
</tbody>
</table>
**Example**

```cfml
<h3>Log10 Example</h3>
<cfif IsDefined("FORM.number")>
  <cfoutput>
    <p>Your number, #FORM.number#</p>
    <br>#FORM.number# raised to the E power: #exp(FORM.number)#
    <cfif FORM.number LTE 0><br>You must enter a positive real number to see the natural logarithm of that number</cfif>
    <cfelse><br>The natural logarithm of #FORM.number#: #log(FORM.number)#</cfif>
    <cfif #FORM.number# LTE 0><br>You must enter a positive real number to see the logarithm of that number to base 10</cfif>
    <cfelse><br>The logarithm of #FORM.number# to base 10: #log10(FORM.number)#</cfif>
  </cfoutput>
</cfif>
<cfform action = "log10.cfm">
  Enter a number to find its value raised to the E power, its natural logarithm, and the logarithm of number to base 10.
  <cfinput type = "Text" name = "number" message = "You must enter a number" validate = "float" required = "No">
  <input type = "Submit" name = ">
</cfform>
```

**LSCurrencyFormat**

**Description**

Formats a number in a locale-specific currency format. For countries that use the euro, the result depends on the JVM.

**Returns**

A formatted currency value.

**Category**

Display and formatting functions, International functions

**Function syntax**

```
LSCurrencyFormat(number [, type, locale])
```

**See also**

LSEuroCurrencyFormat, LSIsCurrency, LSParseCurrency, LSParseEuroCurrency, SetLocale; Handling data in ColdFusion in the Developing ColdFusion Applications

**History**

ColdFusion 8: Added the locale parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. If a negative number is passed to it, it returns a negative number. If `type = "local"`, it returns the value in the current locale’s standard format. If `type = "international"`, it returns the value in the current locale’s international standard format. This function uses Java standard locale formatting rules on all platforms.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Currency value</td>
</tr>
</tbody>
</table>
| type      | - local: the currency format and currency symbol used in the locale.  
            - With JDK 1.3, the default for Euro Zone countries is their local currency.  
            - With JDK 1.4, the default for Euro Zone countries is the euro.  
            - international: the international standard currency format and currency symbol of the locale.  
            - none: the currency format used in the locale; no currency symbol |
| locale    | Locale to use instead of the locale of the page when processing the function |

Usage

This function uses Java standard locale formatting rules on all platforms.

Note: With a Sun 1.3.1-compliant JVM, use the LSEuroCurrencyFormat function to format euro currency values.

Currency output

The following table shows sample currency output. For locales that use Euro, the Local and International columns contain two entries. The first entry is the result with a Sun the 1.4.1 or later compliant JVM, the second entry is the result with a 1.3.1-compliant JVM.

Note: ColdFusion maps Spanish (Modern) to the Spanish (Standard) format.

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

Example

```coldfusion
<h3>LSCurrencyFormat Example</h3>
<p>LSCurrencyFormat returns a currency value using the locale convention. Default value is "local."
</p>
<!---- loop through list of locales; show currency values for 100,000 units --->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput><p><b><I>#locale#</I></b><br>
Local: #LSCurrencyFormat(100000, "local")#<br>
International: #LSCurrencyFormat(100000, "international")#<br>
None: #LSCurrencyFormat(100000, "none")#<br>
</cfoutput>
</cfloop>
```
**LSDateFormat**

**Description**
Formats the date part of a date/time value in a locale-specific format.

**Returns**
A formatted date/time value. If no mask is specified, the value is formatted according to the locale setting of the client computer.

**Category**
Date and time functions, Display and formatting functions, International functions

**Function syntax**
```plaintext
LSDateFormat(date [, mask, locale])
```

**See also**
LSParseDateTime, LSTimeFormat, DateFormat, SetLocale; Handling data in ColdFusion in the Developing ColdFusion Applications

**History**
ColdFusion 8: Added the `locale` parameter.

ColdFusion MX:
- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following `mask` parameter options: short, medium, long, and full.
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>mask</td>
<td>Characters that show how ColdFusion displays the date:</td>
</tr>
<tr>
<td></td>
<td>• d: Day of month. Digits; no leading zero for single-digit days</td>
</tr>
<tr>
<td></td>
<td>• dd: Day of month. Digits; leading zero for single-digit days</td>
</tr>
<tr>
<td></td>
<td>• ddd: Day of week, abbreviation</td>
</tr>
<tr>
<td></td>
<td>• dddd: Day of week. Full name</td>
</tr>
<tr>
<td></td>
<td>• m: Month. Digits; no leading zero for single-digit months</td>
</tr>
<tr>
<td></td>
<td>• mm: Month. Digits; leading zero for single-digit months</td>
</tr>
<tr>
<td></td>
<td>• mmm: Month. abbreviation (if appropriate)</td>
</tr>
<tr>
<td></td>
<td>• mmmm: Month. Full name</td>
</tr>
<tr>
<td></td>
<td>• y: Year. Last two digits; no leading zero for years less than 10</td>
</tr>
<tr>
<td></td>
<td>• yy: Year. Last two digits; leading zero for years less than 10</td>
</tr>
<tr>
<td></td>
<td>• yyyy: Year. Four digits</td>
</tr>
<tr>
<td></td>
<td>• gg: Period/era string. Not processed. Reserved for future use</td>
</tr>
<tr>
<td></td>
<td>The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:</td>
</tr>
<tr>
<td></td>
<td>• short: dd, mm, and yy separated by / marks</td>
</tr>
<tr>
<td></td>
<td>• medium: text format using mmm, d, and yyyy</td>
</tr>
<tr>
<td></td>
<td>• long: text format using mmmm, d, and yyyy</td>
</tr>
<tr>
<td></td>
<td>• full: text format using dddd, mmmm, d, and yyyy</td>
</tr>
<tr>
<td></td>
<td>The default value is medium</td>
</tr>
<tr>
<td></td>
<td>For more information on formats, see LSParseDateTime.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Usage

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the GetTimeZoneInfo function.
Example

The `LSDateFormat` function formats the date part of a date/time value using the locale convention.

```cfml
<!---- loop through a list of locales; show date values for Now()---->
<cfloop list = "#Server.Coldfusion.SupportedLocales#" index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput>
        <p><b><i>#locale#</i></b>
        <br>
        #LSDateFormat(Now(), "mmm-dd-yyyy")#<br>
        #LSDateFormat(Now(), "mm/dd/yyyy")#<br>
        #LSDateFormat(Now(), "d-mm-yyyy")#<br>
        #LSDateFormat(Now(), "d mmmm d, yyyy")#<br>
        #LSDateFormat(Now(), "d-m-yyyy")#<br>
        #LSDateFormat(Now(), "d/m/yy")#<br>
        #LSDateFormat(Now())#<br>
    </cfoutput>
</cfoutput>
</cfloop>
```

**LSDATEFORMAT**

**Description**

Formats date and time values using locale-specific date and time formatting conventions.

**Returns**

A formatted date and time value.

**Category**

Date and time functions, Display and formatting functions, International functions

**Syntax**

```
LSDATEFORMAT (date , mask)
LSDATEFORMAT (date [, mask, locale])
LSDATEFORMAT (date [, mask, locale, timeZone])
```

**See also**

`LSParseDateTime`, `LSTimeFormat`, `DateFormat`, `SetLocale`; Handling data in ColdFusion in the *Developing ColdFusion Applications*

**History**

ColdFusion 10: Added the function.
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Required. A date/time object, in the range 100 AD–9999 AD.</td>
</tr>
<tr>
<td>mask</td>
<td>Optional. Mask that has to be used for formatting.</td>
</tr>
<tr>
<td>timeZone</td>
<td>The time-zone information. You can specify in either of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• Abbreviation such as GMT or PST</td>
</tr>
<tr>
<td></td>
<td>• Full name such as Europe/Dublin</td>
</tr>
<tr>
<td></td>
<td>By default, this is the time-zone followed by the system.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function.</td>
</tr>
</tbody>
</table>

Example

```cfset todayDateTime = Now()>
<body>
<h3>DateTimeFormat Example</h3>
<p>Today's date and time are #todayDateTime#.</p>
<p>Using DateTimeFormat, we can display that date and time in different ways: 
<cfoutput>
<ul>
<li>#DateTimeFormat(todayDateTime, "yyyy.MM.dd G 'at' HH:nn:ss z")#</li>
<li>#DateTimeFormat(todayDateTime, "EEE, MMM d, 'yy")#</li>
<li>#DateTimeFormat(todayDateTime, "h:nn a")#</li>
<li>#DateTimeFormat(todayDateTime, "hh 'o'clock' a, zzzz")#</li>
<li>#DateTimeFormat(todayDateTime, "K:nn a, z")#</li>
<li>#DateTimeFormat(todayDateTime, "yyyyMMddHHnnssZ", "English (UK)", "GMT")#</li>
</ul>
</cfoutput>
</body>
```

LSEuroCurrencyFormat

Description

Formats a number in a locale-specific currency format.

Returns

A formatted currency value. For countries in the Euro currency zone, the function uses the locale's rule's for formatting currency in euros.

Category

Display and formatting functions, International functions

Function syntax

LSEuroCurrencyFormat(currency-number [, type, locale])

See also

LSParseEuroCurrency, LSCurrencyFormat, SetLocale; Locale-specific content in the Developing ColdFusion Applications
History
ColdFusion 8: Added the locale parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone. As a result, it format currencies for non-Euro zone locales using the country’s currency, not euros.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>currency-number</td>
<td>Currency value.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
<tr>
<td>type</td>
<td>• local: the currency format used in the locale. (Default.)</td>
</tr>
<tr>
<td></td>
<td>• international: the international standard currency format of the locale. For example, EUR10.00</td>
</tr>
<tr>
<td></td>
<td>• none: the currency format used in the locale; no currency symbol</td>
</tr>
</tbody>
</table>

Usage
This function uses euro currency formatting rules for all JVM versions, as follows:

• If the country of the current locale belongs to the Euro Zone (whose members have converted to the euro) the formatted output for the local type includes the Euro currency sign (£); for the international type, the output includes the euro currency symbol (EUR). If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.

• If the country of the current locale is not in the Euro Zone, the currency sign or symbol of the current locale displays. If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see “SetLocale” on page 1259.

Currency output
The following table shows examples of currency output:

<table>
<thead>
<tr>
<th>Locale</th>
<th>Type = Local</th>
<th>Type = International</th>
<th>Type = None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinese (China)</td>
<td>¥100,000.00</td>

<tr>
<td>Spanish (Modern)</td>
<td>100,000,00 €</td>
<td>EUR10.000,000</td>
<td>10,000,000</td>
</tr>
<tr>
<td>Spanish (Standard)</td>
<td>100,000,00 €</td>
<td>ESP10.000,000</td>
<td>10,000,000</td>
</tr>
<tr>
<td>Swedish</td>
<td>100,000,00 kr</td>
<td>SEK100,000,00</td>
<td>100,000,00</td>
</tr>
</tbody>
</table>

**Note:** ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

The following example shows how the function formats negative values. The format includes a negative sign before the value, or parentheses around the value, according to the formatting rules of the current locale.

<table>
<thead>
<tr>
<th>Input value</th>
<th>Output if locale = French (Standard)</th>
<th>Output if locale = English (US)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1234.56</td>
<td>-1 234.56 €</td>
<td>($1,234.56)</td>
</tr>
</tbody>
</table>
Example

Example

LSIsCurrency

Description

Determines whether a string is a valid representation of a currency amount in the current locale.

Returns

True, if the parameter is formatted as a valid currency amount, including the appropriate currency indicator. The return value is True for amounts in the local, international, or none currency formats.

Category

Display and formatting functions, Decision functions, International functions

Function syntax

LSIsCurrency(string [, locale])

See also

GetLocale, SetLocale, LSCurrencyFormat

History

ColdFusion 8: Added the locale parameter.

ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms; the results might vary depending upon the JVM; for example, Sun JVM 1.4.1 requires euro format the local currency if the current locale’s country belongs to the Euro Zone.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A currency string or a variable that contains one.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>
Usage
For examples of ColdFusion code and output that shows differences between earlier ColdFusion releases and ColdFusion MX in accepting input formats and displaying output, see LSCurrencyFormat.

**Note:** If the locale belongs to a Euro zone country and the currency is a correctly formatted euro value for the locale, this function returns True for all JVMs, including Sun 1.3.1. As a result, with 1.3.1-compliant JVMs, the LSIsCurrency function does not ensure that LSParseCurrency returns a value. If a currency uses the older country-specific format for Euro Zone locales, the LSIsCurrency function returns False for newer JVMs, such as Sun 1.4.1 and 1.6, and True for older JVMs, such as Sun 1.3.1.

**Note:** To set the default display format of date, time, number, and currency values, use the SetLocale function.

Example

```cfml
<h3>LSIsCurrency Example</h3>
<cfif IsDefined("FORM.locale")>
  <!--- if locale is defined, set locale to that entry --->
  <cfset NewLocale = SetLocale(FORM.locale)>

  <p>Is the value "<cfoutput>#FORM.myValue#</cfoutput>" a proper currency value for <cfoutput>#GetLocale()#</cfoutput>?
  <p>Answer: <cfoutput>#LSIsCurrency(FORM.myValue)#</cfoutput>
</cfif>
<p><form action = "LSIsCurrency.cfm">
  Select a locale for which you would like to check a currency value:
  <!--- check the current locale for server --->
  <cfset serverLocale = GetLocale()>
  <cfset NewLocale = SetLocale(serverLocale.lc)>
</form>
```

**LSIsDate**

**Description**
Determines whether a string is a valid representation of a date/time value in the current locale.

**Returns**
True, if the string can be formatted as a date/time value in the current locale; False, otherwise.

**Category**
Date and time functions, Display and formatting functions, International functions

**Function syntax**

```
LSIsDate(string [, locale])
```

**See also**
CreateDate, GetLocale, IsNumericDate, LDateFormat, ParseDateTime, SetLocale; Handling data in ColdFusion in the Developing ColdFusion Applications

**History**
ColdFusion 8: Added the locale parameter.
ColdFusion MX:

- Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed behavior: this function accepts a dash or hyphen character only in the Dutch(Standard) and Portuguese (Standard) locales. If called this way (for example, LsIsDate("3-1-2002")) in any other locale, this function returns False. (Earlier releases returned True.)
- Changed behavior: when using the SUN JRE 1.3.1 on an English(UK) locale, this function returns False for a date that has a one-digit month or day (for example, 1/1/01). To work around this, insert a zero in a one-digit month or day (for example, 01/01/01).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Usage

A date/time object is in the range 100 AD–9999 AD.

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

Example

```cftags
<cfif IsDefined("FORM.locale")>
  <!--- if locale is defined, set locale to that entry --->
  <cfset NewLocale = SetLocale(FORM.locale)>
  <p>Is the value "<cfoutput>#FORM.myValue#</cFOUTPUT>" a proper date value for <cfoutput>#GetLocale()#</cfoutput>?
  <p>Answer: <cfoutput>#LSIsDate(FORM.myValue)#</cfoutput>
</cfif>
```

```cftags
<form action = "LSIsDate.cfm">
  <p>Select a locale for which you would like to check a date value:
  <!--- check the current locale for server --->
  <cfset serverLocale = GetLocale()>
</form>
```

**LSIsNumeric**

Description

Determines whether a string is a valid representation of a number in the current locale.

Returns

True, if the string represents a number the current locale; False, otherwise.

Category

Decision functions, International functions, String functions

Function syntax

`LSIsNumeric(string [, locale])`
See also
GetLocale, SetLocale; Handling data in ColdFusion in the Developing ColdFusion Applications

History
ColdFusion 8: Added the locale parameter.
ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Usage
To set the default display format of date, time, number, and currency values, use the SetLocale function.

Example
<h3>LSIsNumeric Example</h3>

```coldfusion
<cfif IsDefined("FORM.locale")>
    <!--- if locale is defined, set locale to that entry --->
    <cfset NewLocale = SetLocale(FORM.locale)>
</cfif>

<p>Is the value "<cfoutput>#FORM.myValue#</cFOUTPUT>" a proper numeric value for <cfoutput>#GetLocale()#</cfoutput>?  
Answer: <cfoutput>#LSIsNumeric(FORM.myValue)#</cfoutput>
</cfif>

<p><form action = "LSIsNumeric.cfm">
    Select a locale for which to check a numeric value:  
    ...
```

**LSNumberFormat**

Description
Formats a number in a locale-specific format.

Returns
A formatted number.

- If no mask is specified, it returns the number formatted as an integer
- If no mask is specified, truncates the decimal part; for example, it truncates 34.57 to 35
- If the specified mask cannot correctly mask a number, it returns the number unchanged
- If the parameter value is "" (an empty string), it returns 0.
Category
Display and formatting functions, International functions

Function syntax
LSNumberFormat(number [, mask, locale])

See also
GetLocale, SetLocale; Handling data in ColdFusion in the Developing ColdFusion Applications

History
ColdFusion 8: Added the locale parameter.

ColdFusion MX:
• Changed behavior: if the specified mask format cannot correctly mask a number, this function returns the number unchanged. (In earlier releases, it truncated the number or threw an error.) (If no mask is specified, ColdFusion MX truncates the decimal part as ColdFusion 5 does. For example, it truncates 1234.567 to 1235.)
• Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to format</td>
</tr>
<tr>
<td>mask</td>
<td>LSNumberFormat mask characters apply, except: dollar sign, comma, and dot are mapped to their locale-specific equivalents.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

The following table lists the LSNumberFormat mask characters:

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>_</td>
<td>(Underscore.) Digit placeholder.</td>
</tr>
<tr>
<td>9</td>
<td>Digit placeholder. (Shows decimal places more clearly than _.)</td>
</tr>
<tr>
<td>.</td>
<td>Location of a mandatory decimal point (or locale-appropriate symbol).</td>
</tr>
<tr>
<td>0</td>
<td>Located to the left or right of a mandatory decimal point. Pads with zeros.</td>
</tr>
<tr>
<td>(</td>
<td>If number is less than zero, puts parentheses around the mask.</td>
</tr>
<tr>
<td>+</td>
<td>Puts plus sign before positive number; minus sign before negative number.</td>
</tr>
<tr>
<td>-</td>
<td>Puts space before positive number; minus sign before negative number.</td>
</tr>
<tr>
<td>,</td>
<td>Separates every third decimal place with a comma (or locale-appropriate symbol).</td>
</tr>
<tr>
<td>L,C</td>
<td>Left-justifies or center-justifies number within width of mask column. First character of mask must be L or C. The default value is right-justified.</td>
</tr>
<tr>
<td>$</td>
<td>Puts a dollar sign (or locale-appropriate symbol) before formatted number. First character of mask must be the dollar sign ($).</td>
</tr>
<tr>
<td>^</td>
<td>Separates left and right formatting.</td>
</tr>
</tbody>
</table>
**Note:** If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or hyphen mask character, respectively.

**Usage**

This function uses Java standard locale formatting rules on all platforms.

The position of symbols in format masks determines where the codes take effect. For example, if you put a dollar sign at the far left of a format mask, ColdFusion displays a dollar sign at the left edge of the formatted number. If you separate the dollar sign on the left edge of the format mask by at least one underscore, ColdFusion displays the dollar sign just to the left of the digits in the formatted number.

These examples show how symbols determine formats:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.37</td>
<td>$_________</td>
<td>&quot;$4.37&quot;</td>
</tr>
<tr>
<td>4.37</td>
<td><em>$</em>_______</td>
<td>&quot; $4.37&quot;</td>
</tr>
</tbody>
</table>

The positioning can also show where to put a minus sign for negative numbers:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-4.37</td>
<td>-_________</td>
<td>&quot;-4.37&quot;</td>
</tr>
<tr>
<td>-4.37</td>
<td><em>-</em>_______</td>
<td>&quot; -4.37&quot;</td>
</tr>
</tbody>
</table>

The positions for a symbol are: far left, near left, near right, and far right. The left and right positions are determined by the side of the decimal point on which the code character is shown. For formats that do not have a fixed number of decimal places, you can use a caret (^) to separate the left fields from the right.

An underscore determines whether the code is placed in the far or near position. Most code characters’ effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.21</td>
<td>C(<strong>^</strong>)</td>
<td>&quot;( 3.21 )&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C__(^__)</td>
<td>&quot; (3.21 )&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C(<strong>^)</strong>_</td>
<td>&quot;( 3.21)&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C__(^)___</td>
<td>&quot; (3.21)&quot;</td>
</tr>
</tbody>
</table>

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

When converting from string to double, to prevent rounding errors, this function adds a rounding factor of 1.55431234752E-014 to the converted number. For example, without adding the rounding factor, converting the string value 1.275 to double with two digits of precision results in a value of 1.27499999999999999, which would be rounded up to 1.27. By adding the rounding factor, the conversion correctly results in a value of 1.28.

If you round off a double, such as 1.994999999999999999999999999999, where the last decimal is 10E-14, the rounding factor can cause an incorrect result.
Example

```cfml
<h3>LSNumberFormat Example</h3>
<p>LSNumberFormat returns a number value using the locale convention.
</p>
<!-- loop through a list of locales and show number values --
<cfset oldlocale = SetLocale()>
<cfloop LIST = "Server.Coldfusion.SupportedLocales"
    index = "locale" delimiters = ",">
    <cfoutput><p><b><i>#locale#</i></b><br>
        #LSNumberFormat(-1234.5678, "_________")#<br>
        #LSNumberFormat(-1234.5678, "_________.___")#<br>
        #LSNumberFormat(1234.5678, "_________" )#<br>
        #LSNumberFormat(1234.5678, "_________.___")#<br>
        #LSNumberFormat(1234.5678, "$_(_________.___)")#<br>
        #LSNumberFormat(-1234.5678, "$_(_________.___)")#<br>
        #LSNumberFormat(1234.5678, "+_________.___")#<br>
        #LSNumberFormat(1234.5678, "-_________.___")#<br>
    </cfoutput>
</cfloop>
```

LSParseCurrency

**Description**

Converts a locale-specific currency string into a formatted number. Attempts conversion by comparing the string with each the three supported currency formats (none, local, international) and using the first that matches.

**Returns**

A formatted number (string representation of a number) that matches the value of the parameter.

**Category**

International functions, String functions

**Function syntax**

```cfml
LSParseCurrency(string [, locale])
```

**See also**

LSParseEuroCurrency, LSCurrencyFormat, LSEuroCurrencyFormat, LSIsCurrency; Locale-specific content in the Developing ColdFusion Applications

**History**

ColdFusion 8: Added the locale parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A locale-specific string a variable that contains one</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Usage
This function uses the locale formatting rules of the JVM (specified in the ColdFusion Administrator Java and JVM page) on all platforms. These rules changed between Sun JVM 1.3.1 and JVM 1.4.1:

- JVM 1.3.1 requires that the local and international versions of currencies of countries in the Euro zone be formatted using the older, country-specific designations, such as 100.000,00 DM or DEM100.000,00 for the German (Standard) locale. Use the `LSParseEuroCurrency` function to parse euro currencies in these locales with JVM 1.3.1.

- JVM 1.4.1 requires that currencies for Euro zone countries be expressed as euros; for example 100.000,00 BADCHAR or EUR100.000,00.

  Note: The `LSIsCurrency` function always returns `True` if the locale is in the Euro currency zone and the currency is expressed in euros, including when using JVM 1.3.1. As a result, with older JVMs, `LSIsCurrency` does not ensure that `LSParseCurrency` returns a value.

  To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

  For a list of the locale-specific formats used to parse the currency, see `LSCurrencyFormat`.

Example
```
<h3>LSParseCurrency Example</h3>
<p>LSParseCurrency converts a locale-specific currency string to a number.
Attempts conversion through each of the three default currency formats.</p>
<!---- loop through a list of locales; show currency values for 123,456 units --->
<cfloop LIST="#Server.Coldfusion.SupportedLocales#" index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><b><i>#locale#</i></b><br>
    Local: #LSCurrencyFormat(123456.78, "local")#<br>
    Parsed local Currency: #LSParseCurrency(LSCurrencyFormat(123456.78, "local"))#<br>
    International: #LSCurrencyFormat(123456.78999, "international")#<br>
    Parsed International Currency: #LSParseCurrency(LSCurrencyFormat(123456.78999, "international"))#<br>
    None: #LSCurrencyFormat(123456.78999, "none")#<br>
    Parsed None formatted currency: #LSParseCurrency(LSCurrencyFormat(123456.78999, "none"))#<br>
  </cfoutput>
</cfloop>
```

LSParseDateTime

Description
Converts a string that is a valid date/time representation in the current locale into a date/time object.

Returns
A date/time object.

Category
Date and time functions, Display and formatting functions, International functions, String functions
**Function syntax**
```
LSParseDateTime(date/time-string [, locale, format])
```

**See also**
LSDateFormat, ParseDateTime, SetLocale, GetLocale; Locales in the Developing ColdFusion Applications

**History**
ColdFusion 10: Added the `format` parameter.
ColdFusion 8: Added the `locale` parameter.
ColdFusion MX:
- Changed formatting behavior: this function might not parse string formats that worked with earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed how the `date/time-string` parameter value is processed: ColdFusion processes the `date/time-string` parameter value time zone information differently than in earlier releases, as described in the Usage section.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>date/time-string</code></td>
<td>A string a variable that contains one, in a format that is readable in the current locale.</td>
</tr>
<tr>
<td><code>format</code></td>
<td>Optional, provides the format of the string. This string is used to parse the given date string to date time object.</td>
</tr>
<tr>
<td><code>locale</code></td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

**Usage**
This function can parse any date, time, or date/time combination that conforms to Java standard locale formatting rules for the current locale.

The following table lists some of the date/time values you can pass to this function in the English (US) locale. You can also pass only the date or the time parts of these formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>m/dd/yy h:mm:ss</td>
<td>1/30/02 7:02:33</td>
</tr>
<tr>
<td>m/dd/yy h:mm tt</td>
<td>1/30/02 7:02 AM</td>
</tr>
<tr>
<td>m/dd/yyyy h:mm</td>
<td>1/30/2002 7:02 AM</td>
</tr>
<tr>
<td>mmm mmm dd, yyyy h:mm:ss tt</td>
<td>Jan 30, 2002 7:02:12 AM</td>
</tr>
<tr>
<td>MMMM dd, yyyy h:mm:ss tt zzz</td>
<td>January 30, 2002 7:02:23 AM PST</td>
</tr>
<tr>
<td>ddd, MMMM dd, yyyy h:mm:ss</td>
<td>Wed, Jan 30, 2002 07:02:12</td>
</tr>
<tr>
<td>dddd, MMMM dd, yyyy h:mm:ss tt zzz</td>
<td>Wednesday, January 30, 2002 7:02:12 AM PST</td>
</tr>
</tbody>
</table>

Valid dates are in the range 100 AD–9999 AD. Two-digit years in the range 00-29 are interpreted as being 2000-2029. Two-digit years in the range 30-99 are interpreted as being 1930-1999

Last updated 7/9/2012
This function corrects for differences between the current time zone and any time zone specified in the input parameter.

- If a time zone specified in the date/time-string parameter is different from the time zone setting of the computer, ColdFusion adjusts the time value to its equivalent in the computer time zone.
- If a time zone is not specified in the date/time-string parameter, ColdFusion does not adjust the time value.

**Note:** This function does not accept POP dates, which include a time zone offset value.

In the following example, the parameter format specifies the way in which the given date string should be read:

```cftmpl
<cfoutput>#lsParseDateTime("01/08/2011","en","MM/dd/yyyy")#</cfoutput>
```

### Example

<h3>LSParseDateTime Example - returns a locale-specific date/time object</h3>

```cftmpl
<!--- loop through a list of locales and show date values for Now()--->
<cfloop LIST = "Server.Coldfusion.SupportedLocales"
index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput>
    <p><b><i>#locale#</i></p>
    <p>Locale-specific formats:
    #LSDateFormat(Now(), "mmm-dd-yyyy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now(), "mmmm d, yyyy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now(), "mm/dd/yyyy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now(), "d-mmm-yyyy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now(), "ddd, mmmm dd, yyyy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now(), "d/m/yy")# #LSTimeFormat(Now())#
    #LSDateFormat(Now())# #LSTimeFormat(Now())#
    </p>
    Standard Date/Time:
    #LSParseDateTime("#LSDateFormat(Now())# #LSTimeFormat(Now())#")#
  </cfoutput>
<cfset oldlocale = SetLocale(oldlocale)>
</cfloop>
```

### LSParseEuroCurrency

**Description**

Formats a locale-specific currency string as a number. Attempts conversion through each of the default currency formats (none, local, international). Ensures correct handling of euro currency for Euro zone countries.

**Returns**

A formatted number that matches the value of the string.

**Category**

International functions, String functions

**Function syntax**

LSParseEuroCurrency(currency-string [, locale])

**See also**

LSParseCurrency, LSEuroCurrencyFormat, SetLocale; Locale-specific content in the Developing ColdFusion Applications

Last updated 7/9/2012
History
ColdFusion 8: Added the locale parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>currency-string</td>
<td>Locale-specific string or a variable that contains one.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Usage
This function determines whether the current locale’s country belongs to the Euro Zone, whose members have converted to the euro; if so, the currency-string parameter must be formatted in euros on all JVMs, including Sun JVM 1.3.1. If the country is not in the Euro zone, the string must follow the locale formatting rules of the JVM. For examples of valid currency formats in all supported locales, see “LSEuroCurrencyFormat” on page 1162.

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see SetLocale.

Example
 Loop through all available locales. Create string representations of the value 123,456 in the three supported currency formats, and parse the results back to numbers.

```cfml
<cfloop list="Server.Coldfusion.SupportedLocales#" index="locale" delimiters=",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput>
        Current Locale: <b><i>#locale#</i></b><br>
        Value in local currency: #localCurrency#<br>
        Parsed using LSParseEuroCurrency: #LSParseEuroCurrency(localCurrency)#<br>
    </cfoutput>
    <cfset localCurrency = LSEuroCurrencyFormat(123456, "local")>
    <cfset IntlCurrency = LSEuroCurrencyFormat(123456, "international")>
    <cfset Currency = LSEuroCurrencyFormat(123456, "none")>
</cfloop>
```

LSParseNumber

Description
Converts a string that is a valid numeric representation in the current locale into a formatted number.
Returns
A formatted number that matches the value of the string.

Category
International functions, String functions

Function syntax
LSParseNumber(string [, locale])

See also
LSParseDateTime, SetLocale; Locales in the Developing ColdFusion Applications

History
ColdFusion 8: Added the locale parameter.
ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases.
This function uses Java standard locale formatting rules on all platforms.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>

Usage
This function uses Java standard locale formatting rules on all platforms.
To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

Example

```cfml
<h3>LSParseNumber Example</h3>
<p>LSParseNumber converts a locale-specific string to a number.
Returns the number matching the value of string.
</p>
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#" index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput><p><B><I>#locale#</I></B><br>
    #LSNumberFormat(-1234.5678, "_________")#<br>
    #LSNumberFormat(-1234.5678, "_________.__")#<br>
    #LSNumberFormat(1234.5678, "_________")#<br>
    #LSNumberFormat(1234.5678, "_________.__")#<br>
    #LSNumberFormat(1234.5678, "$_(_________.__")#<br>
    #LSNumberFormat(-1234.5678, "$_(_________.__")#<br>
    #LSNumberFormat(1234.5678, "+_________.__")#<br>
    #LSNumberFormat(1234.5678, "-_________.__")#<br>
    The actual number:<br>
    #LSParseNumber(LSNumberFormat(1234.5678, "_________"))#<br>
    <hr noshade>
</cfoutput>
</cfloop>
```
LSTimeFormat

Description
Formats the time part of a date/time string into a string in a locale-specific format.

Returns
A string representing the time value.

Category
Date and time functions, Display and formatting functions, International functions

Function syntax
LSTimeFormat(time [, mask ])

See also
LSParseDateTime, LSDateFormat, TimeFormat; Locales in the Developing ColdFusion Applications

History
ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.

ColdFusion MX:
- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following mask parameter options: short, medium, long, and full.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| string    | A date/time value  
A string that is convertible to a time value  
A date/time object is in the range 100 AD–9999 AD. |
| mask      | Masking characters that determine the format:  
- h: Hours; no leading zero for single-digit hours (12-hour clock)  
- hh: Hours; leading zero for single-digit hours. (12-hour clock)  
- H: Hours; no leading zero for single-digit hours (24-hour clock)  
- HH: Hours; leading zero for single-digit hours (24-hour clock)  
- m: Minutes; no leading zero for single-digit minutes  
- mm: Minutes; leading zero for single-digit minutes  
- s: Seconds; no leading zero for single-digit seconds  
- ss: Seconds; leading zero for single-digit seconds  
- l: Milliseconds  
- t: One-character time marker string, such as A or P.  
- tt: Multiple-character time marker string, such as AM or PM |

The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:  
- short: includes hours, minutes; may include AM or PM  
- medium: includes hours, minutes; may include AM or PM  
- long: medium plus time zone  
- full: long, may also include an hour designator  
The default value is short.

Usage

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the `GetTimeZoneInfo` function.

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

If no seconds value is passed to this function, and the mask value is s, the default output seconds format is one zero; for example, `lstimeformat(6:39, "h:m:s")` returns 6:39:0. If the mask value is ss, it returns 6:39:00.
Example
<h3>LSTimeFormat Example</h3>

<p>LSTimeFormat returns a time value using the locale convention.

<!--- loop through a list of locales and show time values --->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
    index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput>
        <p><b><i>#locale#</i></b><br/>
        #LSTimeFormat(Now())#<br/>
        #LSTimeFormat(Now(), 'hh:mm:ss')#<br/>
        #LSTimeFormat(Now(), 'hh:mm:ssst')#<br/>
        #LSTimeFormat(Now(), 'hh:mm:ssstt')#<br/>
        #LSTimeFormat(Now(), 'HH:mm:ss')#<br/>
    </cfoutput>
</cfloop>

LTrim

Description
Removes leading spaces from a string.

Returns
A copy of the string, without leading spaces.

Category
Display and formatting functions, String functions

Function syntax
LTrim(string)

See also
RTrim, ToBase64

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>
Example

```<h3>LTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string: "#FORM.myText#"
Your string: "#LTrim(FORM.myText)#" (left trimmed)
</pre>
</cfoutput>
</cfif>
</cfif>

<form action = "ltrim.cfm">
<p>Type in some text, and it will be modified by LTrim to remove leading spaces from the left</p>
<input type = "Text" name = "myText" value = " TEST">
<input type = "Submit" name = "">
</form>

Functions m-r

Max

Description
Determines the greater of two numbers.

Returns
The greater of two numbers.

Category
Mathematical functions

Function syntax
Max(number1, number2)

See also
Min

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1, number2</td>
<td>Numbers</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Example

```html
<h3>Max Example</h3>
<cfif IsDefined("FORM.myNum1")>
  <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
    <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1, FORM.myNum2)#</cfoutput></p>
    <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1, FORM.myNum2)#</cfoutput></p>
  </cfifelse>
  <p>Please enter two numbers</p>
</cfif>
</cfif>
<form action = "max.cfm">
  <h3>Enter two numbers, see the maximum and minimum of them</h3>

  Number 1 <input type = "Text" name = "MyNum1">
  <br>Number 2 <input type = "Text" name = "MyNum2">
  <br><input type = "Submit" name = "" value = "See results">
</form>

Mid

Description
Extracts a substring from a string.

Returns
A string; the set of characters from `string`, beginning at `start`, of length `count`.

Category
String functions

Function syntax
Mid(string, start, count)

See also
`Left`, `Len`, `Right`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. Must be single-quotation mark or double-quotation mark delimited.</td>
</tr>
<tr>
<td>start</td>
<td>A positive integer or a variable that contains one. Position at which to start count. Positions start with 1, not 0.</td>
</tr>
<tr>
<td>count</td>
<td>A positive integer or a variable that contains one. Number of characters to return. (Zero is not valid, but it does not throw an error.)</td>
</tr>
</tbody>
</table>
Example

```coldfusion
<cfif IsDefined("Form.myText")>
  <!--- If len returns 0 (zero), then show error message. --->
  <cfif Len(Form.myText)>
    <cfif Len(Form.myText) LTE Form.RemoveChars>
      <cfoutput>
        Your string #Form.myText# only has #Len(Form.myText)# characters. You cannot output the #Form.removeChars# middle characters of this string because it is not long enough.</cfoutput>
    </cfifelseif Form.startPos GTE Len(Form.myText)>
    <cfoutput>
      Your string #Form.myText# only has #Len(Form.myText)# characters. You cannot start at position #Form.startPos#.</cfoutput>
  </cfifelse>
  <cfoutput>
    Your original string: <strong>#Form.myText#</strong>
    Your changed string, showing only the <strong>#Form.removeChars#</strong> middle characters: <strong>#Mid(Form.myText, Form.startPos, Form.removeChars)#</strong>
  </cfoutput>
</cfif>
<cfelse>
  <p style="color: red; font-weight: bold">Please enter a string of more than 0 (zero) characters.</p>
</cfif>
<form action="#CGI.ScriptName#" method="POST">
  <p>Type in some text</p>
  <input type="Text" name="myText"></input>
  <p>Enter a starting position (from the beginning of the entered text)</p>
  <input name="startPos" type="text" size="1"></input>
  <p>How many characters do you want to show?</p>
  <select name="RemoveChars">
    <option value="1">1</option>
    <option value="3" selected>3</option>
    <option value="5">5</option>
    <option value="7">7</option>
    <option value="9">9</option>
  </select>
  <input type="Submit" name="Submit" value="Remove characters"></input>
</form>

Min

Description
Determined the lesser of two numbers.

Returns
The lesser of two numbers.

Category
Mathematical functions
Function syntax
Min(number1, number2)

See also
Max

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1, number2</td>
<td>Numbers</td>
</tr>
</tbody>
</table>

Example
<h3>Min Example</h3>
<cfif IsDefined("FORM.myNum1")>
  <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
    <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1, FORM.myNum2)#</cfoutput>
    <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1, FORM.myNum2)#</cfoutput>
  <cfelse>
    <p>Please enter two numbers
  </cfif>
</cfif>

<form action = "min.cfm">
<h3>Enter two numbers, and see the maximum and minimum of the two numbers</h3>
Number 1 <input type = "Text" name = "MyNum1">
<br>Number 2 <input type = "Text" name = "MyNum2">
<br><input type = "Submit" name = "" value = "See results">
</form>

Minute

Description
Extracts the minute value from a date/time object.

Returns
The ordinal value of the minute, in the range 0–59.

Category
Date and time functions

Function syntax
Minute(date)

See also
DatePart, Hash, Second
ColdFusion Functions

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```cfoutput>
<h3>Minute Example</h3>

The time is currently #TimeFormat(Now())#. We are in hour #Hour(Now())#, Minute #Minute(Now())# and Second #Second(Now())# of the day.
</cfoutput>
```

### Month

**Description**

Extracts the month value from a date/time object.

**Returns**

The ordinal value of the month, in the range 1 (January) – 12 (December).

**Category**

*Date and time functions*

**Function syntax**

`Month(date)`

**See also**

*DatePart*, *MonthAsString*, *Quarter*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Date/time object, in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

**Usage**

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

**Note:** You can pass the `CreateDate` function or the `Now` function as the date parameter of this function; for example: `#Month(CreateDate(2001, 3, 3))#`. 
Example

Example

More information about your date:

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.</p>
<p>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week.</p>
<p>This is day #DayOfWeek(yourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.</p>
<p>We are in week #Week(yourDate)# of #Year(yourDate)# (day #DayofYear(yourDate)# of #DaysinYear(yourDate)#). <br>
</p><cfif IsLeapYear(Year(yourDate))>
This is a leap year
</cfif>
<cfelse>This is not a leap year
</cfif>
</cfoutput>
</cfif>

MonthAsString

Description
Determines the name of the month that corresponds to month_number.

Returns
A string; the name of the specified month, in the current locale.

Category
Date and time functions, String functions

Function syntax

MonthAsString(month_number [, locale])

See also
DatePart, Month, Quarter

History
ColdFusion 8: Added the locale parameter.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>month_number</td>
<td>An integer in the range 1 – 12.</td>
</tr>
<tr>
<td>locale</td>
<td>Locale to use instead of the locale of the page when processing the function</td>
</tr>
</tbody>
</table>
Example
<h3>MonthAsString Example</h3>

```cfml
<cfif IsDefined("FORM.year")>
<p>More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day #DayOfWeek(yourDate)# in the week.
<br>This is day #Day(YourDate)# in the month of #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
<br>We are in week #Week(yourDate)# of #Year(yourDate)# day #DayofYear(yourDate)# of #DaysinYear(yourDate)#. 
<cfif IsLeapYear(Year(yourDate))>This is a leap year <cfelse>This is not a leap year</cfif>
</cfoutput>
</cfif>
</cfoutput>
</cfif>

Now

Description
gets the current date and time of the computer running the ColdFusion server. The return value can be passed as a parameter to date functions such as DaysInYear or FirstDayOfMonth.

Returns
A date/time object; the current date and time of the computer running the ColdFusion server.

Category
Date and time functions

Function syntax
Now()

See also
CreateDate, DatePart

Example
<h3>Now Example</h3>
<p>Now returns the current date and time as a valid date/time object.

<p>The current date/time value is <cfoutput>#Now()#</cfoutput>
<p>You can also represent this as <cfoutput>#DateFormat(Now())#, #TimeFormat(Now())#</cfoutput>
NumberFormat

Description
Creates a custom-formatted number value. Supports the numeric formatting used in the U.S. For international number formatting, see LSNumberFormat.

Returns
A formatted number value:
- If no mask is specified, returns the value as an integer with a thousands separator.
- If the parameter value is "" (an empty string), returns 0.

Category
Display and formatting functions

Function syntax
NumberFormat(number [, mask ])

See also
DecimalFormat, DollarFormat, IsNumeric, LSNumberFormat

History
ColdFusion MX: Changed behavior: if the mask format cannot correctly mask a number, this function returns the number unchanged. (It does not truncate the number nor throw an error.) (If no mask is selected, ColdFusion MX rounds the decimal part as ColdFusion 5 does. For example, it rounds 34.567 to 35.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A number.</td>
</tr>
<tr>
<td>mask</td>
<td>A string or a variable that contains one. Set of characters that determine how ColdFusion displays the number</td>
</tr>
</tbody>
</table>

The following table explains mask characters:

<table>
<thead>
<tr>
<th>Mask character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>_ (underscore)</td>
<td>Optional. Digit placeholder.</td>
</tr>
<tr>
<td>9</td>
<td>Optional. Digit placeholder. (Shows decimal places more clearly than _)</td>
</tr>
<tr>
<td>.</td>
<td>Location of a mandatory decimal point.</td>
</tr>
<tr>
<td>0</td>
<td>Located to the left or right of a mandatory decimal point. Pads with zeros.</td>
</tr>
<tr>
<td>()</td>
<td>If number is less than zero, puts parentheses around the mask.</td>
</tr>
<tr>
<td>+</td>
<td>Puts plus sign before positive number; minus sign before negative number.</td>
</tr>
<tr>
<td>-</td>
<td>Puts a space before positive number; minus sign before negative number.</td>
</tr>
<tr>
<td>,</td>
<td>Separates every third decimal place with a comma.</td>
</tr>
</tbody>
</table>
ColdFusion Functions

Note: If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or minus sign, respectively.

Usage
This function uses Java standard locale formatting rules on all platforms.

The position of symbols in format masks determines where the codes take effect. For example, if you put a dollar sign at the far left of a format mask, ColdFusion displays a dollar sign at the left edge of the formatted number. If you separate the dollar sign on the left edge of the format mask by at least one underscore, ColdFusion displays the dollar sign just to the left of the digits in the formatted number.

These examples show how symbols determine formats:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.37</td>
<td>$_____</td>
<td>&quot;$ 4.37&quot;</td>
</tr>
<tr>
<td>4.37</td>
<td><em>$</em>____</td>
<td>&quot; $4.37&quot;</td>
</tr>
<tr>
<td>-4.37</td>
<td>-______</td>
<td>&quot;- 4.37&quot;</td>
</tr>
<tr>
<td>-4.37</td>
<td><em>-</em>_____</td>
<td>&quot; -4.37&quot;</td>
</tr>
</tbody>
</table>

The positioning can also show where to place the minus sign for negative numbers:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-4.37</td>
<td>-_____</td>
<td>&quot;- 4.37&quot;</td>
</tr>
<tr>
<td>-4.37</td>
<td><em>-</em>_____</td>
<td>&quot; -4.37&quot;</td>
</tr>
</tbody>
</table>

The positions for a symbol are: far left, near left, near right, and far right. The left and right positions are determined by the side of the decimal point on which the code character is shown. For formats that do not have a fixed number of decimal places, you can use a caret (^) to separate the left fields from the right.

An underscore determines whether the code is placed in the far or near position. Most code characters’ effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

<table>
<thead>
<tr>
<th>Number</th>
<th>Mask</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.21</td>
<td>C__(^__)</td>
<td>&quot;( 3.21 )&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C__(^)</td>
<td>&quot; (3.21)&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C(__^)</td>
<td>&quot;( 3.21)&quot;</td>
</tr>
<tr>
<td>3.21</td>
<td>C__(^)</td>
<td>&quot; (3.21)&quot;</td>
</tr>
</tbody>
</table>

When converting from string to double, to prevent rounding errors, this function adds a rounding factor of 1.5543122344752E-014 to the converted number. For example, without adding the rounding factor, converting the string value 1.275 to double with two digits of precision results in a value of 1.27499999999999999, which would be rounded up to 1.27. By adding the rounding factor, the conversion correctly results in a value of 1.28.
If you round off a double such as 1.99499999999999999999999999999, where the last decimal is 10E-14, the rounding factor can cause an incorrect result.

To set the default display format of date, time, number, and currency values, use the `SetLocale` function.

**Example**

```coldfusion
<h3>NumberFormat Example</h3>

<cfloop FROM = 1000 TO = 1020 INDEX = "counter"> 
    <cfset CounterRoot2 = counter * sqr(2)> 
    <!--- Show result in default format, adding comma for thousands place; and in custom format, displaying to two decimal places ---> 
    <cfoutput> 
        <pre>#counter# * Square Root of 2: #NumberFormat(CounterRoot2, '_____.__')#</pre> 
        <pre>#counter# * Square Root of 2: #NumberFormat(CounterRoot2)#</pre> 
    </cfoutput> 
</cfloop>
```

**ObjectEquals**

**Description**

Identifies any conflict between CFC instances on the client and the server.

**Returns**

**Category**

“Other functions” on page 732

**Function Syntax**

`objectEquals( Param1 ,Param2)`

**See Also**

Conflict management in *Developing ColdFusion Applications*.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param 1</td>
<td>New instance of the CFC on the client.</td>
</tr>
<tr>
<td>param 2</td>
<td>Original instance of the CFC.</td>
</tr>
</tbody>
</table>
Example
<cfset isNotConflict = ObjectEquals(originalobject, serverobject)>
<cfif isNotConflict>
  <cfif operation eq "UPDATE">
    <cfset obj = ORMGetSession().merge(clientobject)>
    <cfset EntitySave(obj)>
  <cfelseif operation eq "DELETE">
    <cfset obj = ORMGetSession().merge(originalobject)>
    <cfset EntityDelete(obj)>
  </cfif>
  </cfif>
<cfelse>
</cfelse>

ObjectLoad

Description
Loads a serialized ColdFusion array, CFC, DateTime object, Java object, query, or structure into memory as the corresponding object.

Returns
The deserialized ColdFusion object, such as a CFC or a query object.

Category
Other functions

Function syntax
ObjectLoad(binaryObject)
ObjectLoad(filepath)

See also
ObjectSave

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binaryObject</td>
<td>A binary object returned by ObjectSave function.</td>
</tr>
<tr>
<td>filepath</td>
<td>A string specifying the path to a file containing a serialized complexobject, such as a query or CFC, or a variable that is a serializable binary representation of a complex object. This parameter must be the name of a file or an object returned by the SaveCFObj function.</td>
</tr>
</tbody>
</table>

Usage
This function is useful for handling dynamic data that has a relatively long period of usefulness and takes substantial time or resources to obtain. It lets you save the data in a file and use it in multiple application instances.
For example, you can create a CFC that stores a query that takes long time to run and retrieves infrequently updated data. If you use the `ObjectSave` function to initially save the CFC as a file, you can then deserialize the CFC file on future application starts and improve application performance.

Example

```coldfusion
<!--- Create the component object. --->
<cfobject component="tellTime" name="tellTimeObj">
<!--- Save the component object to a file. --->
<cfset ObjectSave(tellTimeObj, "data.out")/>
<!--- Load the component object again. --->
<cfset ObjLoaded = ObjectLoad("data.out") >
<!--- Invoke the methods from loaded objects. --->
<cfinvoke component="#ObjLoaded#" method="getLocalTime" returnvariable="localTime">  
<cfinvoke component="#ObjLoaded#" method="getUTCTime" returnvariable="UTCTime">  
<!--- Display the results. --->
<h3>Time Display Page</h3>
<cfoutput>
Server's Local Time: #localTime#<br>
Calculated UTC Time: #UTCTime# 
</cfoutput>
```

**ObjectSave**

**Description**
Converting a ColdFusion array, CFC, `DateTime` object, Java object, query, or structure into a serializable binary object and optionally saves the object in a file.

**Returns**
A serializable binary representation of the object.

**Category**
Other functions

**Function syntax**

```coldfusion
ObjectSave(object[, filePath])
```

**See also**

`ObjectLoad`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>The complex object, such as a query or CFC, that will be serialized.</td>
</tr>
<tr>
<td>filePath</td>
<td>The path of the file in which to save the serialized data.</td>
</tr>
</tbody>
</table>
Usage
This function is useful for handling dynamic data that has a relatively long period of usefulness and takes substantial time or resources to obtain. It lets you save the data in a file and use it in multiple application instances.

For example, you can create a CFC that stores a query that takes long time to run and retrieves infrequently updated data. If you use the `ObjectSave` function to initially save the CFC as a file, and deserialize the CFC file on future application starts, you can improve application performance.

Example
<h3>Saving and loading an object</h3>
<pre>&lt;cfobject component="tellTime" name="tellTimeObj"&gt;
&lt;cfset ObjectSave(tellTimeObj, "data.out")/&gt;
&lt;cfset ObjLoaded = ObjectLoad("data.out")&gt;
&lt;cfinvoke component="#ObjLoaded#" method="getLocalTime" returnvariable="localTime"&gt;
&lt;cfinvoke component="#ObjLoaded#" method="getUTCTime" returnvariable="UTCTime"&gt;
&lt;cfoutput&gt;
Server's Local Time: #localTime#
Calculated UTC Time: #UTCTime#
&lt;/cfoutput&gt;
</pre>

**onWSAuthenticate**

Description
Authenticates the user

Syntax
`OnWSAuthenticate(username, password, connectionInfo)`
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Name of the user that has to be authenticated.</td>
</tr>
<tr>
<td>password</td>
<td>Password for the user.</td>
</tr>
<tr>
<td>connectionInfo</td>
<td>A struct that contains the following keys:</td>
</tr>
<tr>
<td></td>
<td>• Authenticated: YES</td>
</tr>
<tr>
<td></td>
<td>• ConnectionTime: Connection time stamp.</td>
</tr>
<tr>
<td></td>
<td>• clientID: Unique ID of the client.</td>
</tr>
<tr>
<td></td>
<td>Custom keys are also supported.</td>
</tr>
<tr>
<td></td>
<td>For example, you can specify the user's role, status, or age.</td>
</tr>
<tr>
<td></td>
<td>The connectionInfo is shared across all the channels for a given WebSocket</td>
</tr>
<tr>
<td></td>
<td>client. Also, modifications are persisted across all the subscriptions for</td>
</tr>
<tr>
<td></td>
<td>that client.</td>
</tr>
</tbody>
</table>

Example

The following example uses the function onWSAuthenticate, validates the user, and associates a user role.

*Note: For this example to work, ensure that you implement the user-defined functions.*

```coldfusion
component
{
    this.name="websocketsampleapp23";
    this.wschannels=[{name="stocks",cfclistener="stocksListener"}];

    function onWSAuthenticate(username, password, connectionInfo)
    {
        //write appropriate logic to fetch user password in function checkPassword

        If(checkPassword(username) eq password)
        {
            connectionInfo.authenticated="YES";
            //Role is the custom information that you provide
            connectionInfo.role = "admin";

            return true;
        }
        else{
            connectionInfo.authenticated="NO";
            return false;
        }
        wriedump("#connectionInfo#","console");
    }
}
```

**ORMClearSession**

Description

Clears the Hibernate session associated with the given data source.

Last updated 7/9/2012
The function clears the first level cache and removes the objects that are not yet saved to the database.

If you do not specify the data source, the Hibernate session associated with the default data source is cleared.

Category
ORM functions

Function Syntax
Ormclearsession([datasource])

See Also
ORMCloseSession, ORMGetSession, ORMFlush, ORMGetSessionFactory, ORMClearSession() in Developing ColdFusion Applications.

**ORMCloseSession**

Description
Closes the Hibernate session associated with the data source in the request. If you do not specify a data source, the Hibernate session associated with the default data source is closed.

Category
ORM functions

Function Syntax
ormclosesession([datasource])

See Also
ORMGetSession, ORMClearSession, ORMFlush, ORMGetSessionFactory, ORMCloseSession() in Developing ColdFusion Applications.

**ORMCloseAllSessions**

Description
Closes all Hibernate sessions in the request.

Function Syntax
ormcloseallsessions()

See Also
ORMGetSession, ORMClearSession, ORMFlush, ORMGetSessionFactory, ORMCloseSession() in Developing ColdFusion Applications.

Last updated 7/9/2012
**ORMEvictCollection**

**Description**
This method is used to evict all the collection or association data for the given entity name and collection name, from the secondary cache. If the primary key is specified, then, the collection or association data of the entity with the primary key is evicted.

**Category**
ORM functions

**See Also**
ORMEvictEntity, ORMEvictQueries, Evict content from secondary cache in *Developing ColdFusion Applications*

**Function Syntax**
```coldfusion
ormevictcollection("<entity_name>", "<collection_name>", [primarykey])
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity name</td>
<td>Entity name of the persistent CFC.</td>
</tr>
<tr>
<td>collection name</td>
<td>Name of the collection in the component</td>
</tr>
<tr>
<td>primary key</td>
<td>Primary key of the collection or association data of the entity</td>
</tr>
</tbody>
</table>

**Example**
To evict all the association or collection data of collection arts belonging to the component CArtists:
```
<cfset ORMEvictCollection("CArtists", "arts")>
```

**ORMEvictEntity**

**Description**
This method is used to evict items for the given entity name, from the secondary cache. If the primary key is specified, then the data of the entity with that primary key is evicted. Primary key should be a value in case of simple primary key or should be a struct in case of composite primary key.

**Category**
ORM functions

**See Also**
ORMEvictCollection, ORMEvictQueries, Evict content from secondary cache in *Developing ColdFusion Applications*

**Function Syntax**
```coldfusion
ORMEvictEntity("<entity_name>", [primarykey])
```
 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component name</td>
<td>Entity name of the persistent CFC</td>
</tr>
<tr>
<td>primary key</td>
<td>Primary key value of the component</td>
</tr>
</tbody>
</table>

Example
To evict all the cache data of CArtist entity:

```cftag
<cfset ORMEvictEntity("CArtists")>
```

To evict the cache data of CArtists entity whose primary key is 1:

```cftag
<cfset ORMEvictEntity("CArtists", 1)>
```

ORMEvictQueries

Description
This method is used to evict the data of all the queries from the default query cache of the specified data source. If cache name is specified, then the data of all queries belonging to the cache region with the given cache name are evicted. If no data source is specified, the default query cache of the default data source is evicted.

Category
ORM functions

See Also
ORMEvictEntity, ORMEvictCollection, Evict content from secondary cache in Developing ColdFusion Applications

Syntax

```cftag
ORMEvictQueries([cachename])
ORMEvictQueries([cachename], datasource)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cachename</td>
<td>Name of the cache region that you want to evict.</td>
</tr>
<tr>
<td>datasource</td>
<td>Name of the data source whose cache you want to evict. If you do not specify the cache, the default query cache is evicted.</td>
</tr>
</tbody>
</table>

Example
Evicts the data of all the queries from the default query cache.

```cftag
<cfset ORMEvictQueries()>
```

Evicts the data of all the queries from the cache region with the name availableArtsCache.

```cftag
<cfset ORMEvictQueries("availableArtsCache")>
```
ORMExecuteQuery

Description
Executes a Hibernate Query Language (HQL) query.

By default, this function works on ORM's default data source. To use this function for another data source, specify the data source key-value pair within the queryoptions.

Syntax
ORMExecuteQuery(hql, [params] [,unique])
ORMExecuteQuery(hql, [,unique] [, queryoptions])
ORMExecuteQuery(hql, params [,unique] [,queryOptions])

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hql</td>
<td>The HQL query that has to be executed.</td>
</tr>
<tr>
<td>Params</td>
<td>Object parameter for the entity.</td>
</tr>
<tr>
<td>Unique</td>
<td>Specifies if the object parameter is unique.</td>
</tr>
<tr>
<td>Queryoptions</td>
<td>Key-value pair of options for the query.</td>
</tr>
</tbody>
</table>

Example
<cfset artistArr = ORMExecuteQuery("from Artists where artistid=1", true, {datasource="cfartgallery"})>
<cfset countArray = ORMExecuteQuery("select count(*) from Authors", [], false, {datasource="cfbookclub"})>

ORMFlush

Description
Flushes the Hibernate session associated with the data source in the request. ORMFlush flushes all pending CRUD operations in the request. Any changes made in the objects, in the current ORM session, are saved to the database.

If you do not specify the data source, the Hibernate session associated with the default data source is flushed.

Category
ORM functions

Function Syntax
ormflush([datasource])

See Also
ORMCloseSession, ORMClearSession, ORMGetSession, ORMGetSessionFactory, ORMFlush() in Developing ColdFusion Applications.
ORMFlushall

Description
Flushes all the current Hibernate sessions in the request.

Function syntax
ormFlushall()

See Also
ORMCloseSession, ORMClearSession, ORMGetSession, ORMGetSessionFactory, ORMFlush() in Developing ColdFusion Applications.

ORMGetSession

Description
Returns the Hibernate session associated with the data source in the request. If ORM is not configured for this data source, it results in an exception. If data source is not specified, the Hibernate session of the default data source is returned.

Use this session object to call the APIs, which, otherwise, ColdFusion does not expose.

For information on session APIs, see:
http://docs.jboss.org/hibernate/core/3.3/api/org/hibernate/Session.html

Category
ORM functions

Function Syntax
ormGetSession([datasource])

See Also
ORMCloseSession, ORMClearSession, ORMFlush, ORMGetSessionFactory, ORMGetSession() in Developing ColdFusion Applications.

ORMGetSessionFactory

Description
Returns the Hibernate Session Factory object associated with the data source. Results in an error if ORM is not configured for this data source. If you do not specify the data source, the Hibernate session factory object associated with the default data source is returned.

For information on Session API, go to the following URL:
http://docs.jboss.org/hibernate/core/3.3/api/org/hibernate/SessionFactory.html

Category
ORM functions
Function Syntax
Ormgetsessionfactory([datasource])

See Also
ORMCloseSession, ORMClearSession, ORMFlush, ORMGetSession in Developing ColdFusion Applications.

ORMIndex

Description
Performs offline indexing.

Syntax
ORMIndex();
ORMIndex("entity_name");
ORMIndex("entityName_list");
ORMIndex (entityObject);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityName</td>
<td>Name of the entity that has to be indexed.</td>
</tr>
<tr>
<td>entityName_list</td>
<td>Comma-separated list of entity names for indexing.</td>
</tr>
<tr>
<td>entityObject</td>
<td>Variable name of a specific entity instance for indexing.</td>
</tr>
</tbody>
</table>

Usage
If you use this function without specifying any parameters, all persistent entities of a given application are indexed.

Example
EmpObjs = EntityLoad("Employee",{lastname="Bond"});
for (EmpObj in EmpObjs)
{
  ormindex(EmpObj);
}

ORMIndexPurge

Description
Clears all indexed data for all entities or specified entities in the current application scope.

Syntax
ORMIndexPurge();
ORMIndexPurge("entityName");
ORMIndexPurge("entityName_list");

Last updated 7/9/2012
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityName</td>
<td>Name of the entity to be loaded.</td>
</tr>
<tr>
<td>entityName_list</td>
<td>Comma-separated list of entity names for purging.</td>
</tr>
</tbody>
</table>

Usage

If you use this function without specifying `entityName`, all persistent entities of the application are purged.

Example

```coldfusion
ORMIndexPurge();
ORMIndexPurge("Employee");
```

**ORMReload**

Description
Reinitializes ORM for the application.

If you make any change to the persistent metadata of the CFCs, then you might want to reload the ORM.

Returns
Returns ORM session factory instance.

Category
“ORM functions” on page 731

Function Syntax
ORMReload()

Usage
Adobe recommends that you use this function only during the time of development.

See Also
ColdFusion ORM
Example

component
{
    this.name = Hash(GetCurrentTemplatePath());
    /* define the application wide datasource */
    this.datasource = "cfartgallery";
    /* enable hibernate support for this application */
    this.ormenabled = true;
    /* create a struct of ORM settings */
    this.ormsettings = {};
    /* turn on event handling */
    this.ormsettings.eventhandling = true;
/**
* @output true
*/
    public boolean function onRequestStart( targetPage )
{
    /* this is to ensure that ORM is up-to-date for demo */
    ORMReload();
    return true;
    }
}

ORMSearch

Description
Searches for given text in specific properties or entities.

Returns
A struct that contains the following:

- An array of structs (with the entity and score being the keys) in the following format:
  data - [{entity: entity1, score: entity1_score}, {entity: entity2, score: entity2_score}, ...... ]
- maxTotalRecord (number of possible results)

Syntax
ORMSearch("query_text", "entityName")
ORMSearch("query_text", "entityName", fields)
ORMSearch("query_text", "entityName", fields, optionMap)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_text</td>
<td>The text to be searched for or a complete Lucene query.</td>
</tr>
<tr>
<td></td>
<td>In the case of ORMSearch(&quot;query_text&quot;, &quot;entityName&quot;), only Lucene query is supported.</td>
</tr>
<tr>
<td></td>
<td>For details of Lucene query, see <a href="http://lucene.apache.org/core/old_versioned_docs_versions/3_0_0/queryparsersyntax.html">http://lucene.apache.org/core/old_versioned_docs_versions/3_0_0/queryparsersyntax.html</a></td>
</tr>
<tr>
<td>entityName</td>
<td>Name of the entity to be searched.</td>
</tr>
<tr>
<td>fields</td>
<td>Fields in which search has to be performed. This can be an array of strings.</td>
</tr>
<tr>
<td></td>
<td>If you are performing a Lucene query, you need not specify this field. In other words, if you do not specify this value, a Lucene query is performed.</td>
</tr>
<tr>
<td></td>
<td>Field name is case-sensitive.</td>
</tr>
<tr>
<td>optionMap</td>
<td>Extra options that can be passed while executing Lucene query.</td>
</tr>
<tr>
<td></td>
<td>The options are:</td>
</tr>
<tr>
<td></td>
<td>• sort: Sorts based on indexfieldname you specified.</td>
</tr>
<tr>
<td></td>
<td>• offset: Specifies the position from which to retrieve the objects.</td>
</tr>
<tr>
<td></td>
<td>• maxResults: Specifies the maximum number of objects to be retrieved.</td>
</tr>
</tbody>
</table>

Usage

When you perform a date search, use the format yyyymmdd as shown in the following example:

```coldfusion
objs = ORMSearch("datecheck:[#dateformat(dateadd("d",5,now()),"yyyymmdd") TO #dateformat(dateadd("d",35,now()),"yyyymmdd")],"C2",[],{maxresults=2});
```

If you are performing a time search, use the UTC format.

**Example 1: ORM search based on Lucene query**

```coldfusion
ORMSearch("FirstName:ch*","Employee");
ORMSearch("ch*","Employee",["FirstName"]);
objs = ORMSearch('FirstName:ch*','Employee',[],{sort="salary",maxresults=5,offset=2});
```

**Example 2: ORM search on multiple entities**

```coldfusion
ORMSearch("john*","DeveloperEntity,UserEntity",["firstname"]);
```

In this example, first name is searched in the DeveloperEntity and UserEntity and a composite array of entities are returned.

**Example 3: ORM search on all subentities based on Lucene query**

This example shows how to perform ORM search on all subentities that inherit a super entity. Assume that USEmployeeEntity and UKEmployeeEntity are extending EmployeeEntity. You can search both the subentities using the following code:

```coldfusion
ORMSearch("john*","EmployeeEntity","["FirstName"]");
```

**Example 4: ORM search in relationships**

In this example, products and categories have a many-to-one relationship. You can search all products of a specific category using the following code:

```coldfusion
ORMSearch("CategoryID.CategoryName:In*","cproducts",[]);
```
Note that search in related objects works only for many-to-one relationship and one-to-one relationship.

**ORMSearchOffline**

**Description**
Performs search on the indexed properties but returns only the stored fields.

For this function to work, specify `indexStore=true` on the properties on which you want to perform the search.

**Returns**
A struct that contains the following:

- An array of structs (with the `entity` and `score` being the keys) in the following format:

  ```data -[
  \{entity: entity1, score: entity1_score\}, \{entity: entity2, score: entity2_score\}, ...
  ]```

- `maxTotalRecord` (number of possible results)
- `fields_to_be_selected` as keys.

**Syntax**

```java
ORMSearchOffline(query_text, entityName, fields_to_be_selected);
ORMSearchOffline(query_text, entityName, fields_to_be_selected, fields);
ORMSearchOffline(query_text, entityName, fields_to_be_selected, fields, optionMap);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_text</td>
<td>The text to be searched for or a complete Lucene query. For details of Lucene query, see <a href="http://lucene.apache.org/core/old_versioned_docs/versions/">http://lucene.apache.org/core/old_versioned_docs/versions/</a>.</td>
</tr>
<tr>
<td>entityName</td>
<td>Name of the entity to be searched.</td>
</tr>
<tr>
<td>fields_to_be_selected</td>
<td>Fields to be returned as keys in the resultant struct.</td>
</tr>
<tr>
<td>fields</td>
<td>Fields in which search has to be performed.</td>
</tr>
<tr>
<td>optionMap</td>
<td>Extra options that can be passed while executing Lucene query. The options can be:</td>
</tr>
<tr>
<td></td>
<td>• <code>sort</code>: Sorts based on <code>indexfieldname</code> you specified.</td>
</tr>
<tr>
<td></td>
<td>• <code>offset</code>: Specifies the position from which to retrieve the objects.</td>
</tr>
<tr>
<td></td>
<td>• <code>maxResults</code>: Specifies the maximum number of objects to be retrieved.</td>
</tr>
</tbody>
</table>

**Example 1**

```java
ORMSearchOffline('FirstName:"ch*"', "Employee", ["id","firstname"]);
```

**Example 2**

In the following example, offline search is performed on the property `FirstName` and first name and last name are returned as keys in the resultant struct.
ORMSearchOffline("ch*", "Employee", ["FirstName", "LastName"], ["FirstName"], {sort="salary", maxresults=5, offset=2});

**Example 3**

In this example, the `resultObj` in the query is an array of structs. The individual structs contain all the selected fields (passed as third parameter).

<cfset resultObj = ORMSearchOffline('Java Rocks', 'Book', [bookId, summary, Author.name, title], [title, short_summary])>

### ParagraphFormat

**Description**

Replaces characters in a string:

- Single newline characters (CR/LF sequences) with spaces
- Double newline characters with HTML paragraph tags (`<p>`)  

**Returns**

A copy of the string, with characters converted.

**Category**

Display and formatting functions, String functions

**Function syntax**

`ParagraphFormat(string)`

**See also**

`StripCR`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

**Usage**

This function is useful for displaying data entered in `textarea` fields.
Example

```html
<h3>ParagraphFormat Example</h3>
<p>Enter text into this textarea, and see it returned as HTML.</p>
<cfif IsDefined("FORM.myTextArea")>
  <p>Your text area, formatted</p>
  <cfoutput>#ParagraphFormat(FORM.myTextArea)#</cfoutput>
</cfif>

<!--- use #Chr(10)#Chr(13)# to simulate a line feed/carriage return combination; i.e., a return --->
<form action = "paragraphformat.cfm">
  <textarea name = "MyTextArea" cols = "35" ROWS = 8>
  This is sample text and you see how it scrolls
  From one line
  to the next
  </textarea>
  <input type = "Submit" name = "Show me the HTML version">
</form>
```

### ParameterExists

**Description**

This function is deprecated. Use the IsDefined function.

Determines whether a parameter exists. ColdFusion does not evaluate the argument.

**History**

ColdFusion MX: Deprecated this function. It might not work, and might cause an error, in later releases.

### ParseDateTime

**Description**

 Parses a date/time string according to the English (U.S.) locale conventions. (To format a date/time string for other locales, use the LSParseDateTime function.)

**Returns**

A date/time object

**Category**

Date and time functions, Display and formatting functions

**Function syntax**

```
ParseDateTime(date/time-string [, pop-conversion ])
```

**See also**

IsDate, IsNumericDate, SetLocale

Last updated 7/9/2012
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time string</td>
<td>A string containing a date/time value formatted according to U.S. locale conventions. Can represent a date/time in the range 100 AD–9999 AD. Years 0-29 are interpreted as 2000-2029; years 30-99 are interpreted as 1930-1999.</td>
</tr>
</tbody>
</table>
| pop-conversion | • pop: specifies that the date/time string is in POP format, which includes the local time of the sender and a time-zone offset from UTC. ColdFusion applies the offset and returns a value with the UTC time.  
  • standard: (the default) function does no conversion. |

Usage

This function is similar to CreateDateTime, but it takes a string instead of enumerated date/time values. These functions are provided primarily to increase the readability of code in compound expressions.

To calculate a difference between time zones, use the GetTimeZoneInfo function.

To set the default display format of date, time, number, and currency values, use the SetLocale function.

Example

```cfml
<h3>ParseDateTime Example</h3>
<cfif IsDefined("form.theTestValue")>
  <cfif IsDate(form.theTestValue)>
    <h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is a valid date</h3>
    <p>The parsed date/time is: <cfoutput>#ParseDateTime(form.theTestValue)#</cfoutput></p>
  </cfif>
  <cfelse>
    <h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is not a valid date</h3>
  </cfelse>
</cfif>
<form action="#CGI.ScriptName#" method="POST">
  <p>Enter an expression, and discover if it can be evaluated to a date value.</p>
  <input type="Text" name="TheTestValue" value="<CFOUTPUT>#DateFormat(Now())#<TimeFormat(Now())#</CFOUTPUT>">
</form>
```

Pi

Description

Gets the mathematical constant \( \pi \), accurate to 15 digits.

Returns

The number 3.14159265358979.

Category

Mathematical functions

Function syntax

`Pi()`
See also
ASin, Cos, Sin, Tan

Example
<h3>Pi Example</h3>
<!--- By default, ColdFusion displays only 11 significant digits. Use NumberFormat to display all 15. --->
The Pi function Returns the number
<cfoutput>
#NumberFormat(Pi(), "_._______________")#, </cfoutput> the mathematical constant pi, accurate to 15 digits.

**PrecisionEvaluate**

**Description**
Evaluates one or more string expressions, dynamically, from left to right, using BigDecimal precision arithmetic to calculate the values of arbitrary precision arithmetic expressions.

**Returns**
An object; the result of the evaluations.

**Category**
Mathematical functions, Dynamic evaluation functions

**Function syntax**
PrecisionEvaluate(string_expression1 [, string_expression2 , ... ])

See also
Evaluate, Using Expressions and Number Signs in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string_expression1, string_expression2...</td>
<td>Expressions to evaluate</td>
</tr>
</tbody>
</table>

**Usage**
The **PrecisionEvaluate** function lets you calculate arbitrarily long decimal (BigDecimal precision) values. BigDecimal precision arithmetic accepts and generates decimal numbers of any length, and does not use exponential notation.

The **PrecisionEvaluate** function calculates arbitrary precision results only for addition, subtraction, multiplication, and division. If you use any of the following operations, ColdFusion performs normal integer or floating point arithmetic and does not return BigDecimal values.

- exponentiation (^)
- modulus (MOD or %)
- integer division (/)
This function differs from the `Evaluate` function only in its use of BigDecimal precision arithmetic to calculate numeric values; otherwise the two functions are identical. The results of an evaluation on the left can have meaning in an expression to the right, and the function returns the result of evaluating the rightmost expression. If a string expression contains a single- or double-quotation mark, the mark must be escaped.

If an expression, such as 1/3, results in an infinitely repeating decimal value, ColdFusion limits the decimal part to 20 digits.

**Note:** To increase processing efficiency, do not put the arithmetic expressions to evaluate in quotation marks (".

ColdFusion compiles `PrecisionEvaluate(a*b)` more efficiently than it compiles `PrecisionEvaluate("a*b")`, although both formats produce the same results.

**Example**

```cfml
<h3>PrecisionEvaluate Example</h3>
<cfif IsDefined("FORM.myExpression")>
  <cftry>
    <!--- Evaluate the expression and display the result. --->
    <cfset theExpression = PrecisionEvaluate(Form.myExpression)>
    <cfoutput>
      The value of the expression #FORM.MyExpression# is #theExpression#.br>
    </cfoutput>
    <cfcatch type="any">
      <cfoutput>Could not evaluate the expression #Form.myExpression#.</cfoutput>
    </cfcatch>
  </cftry>
</cfif>

<cfform preservedata="yes">
  <h3>Enter a ColdFusion expression for evaluation.</h3>
  <p>Try using some really big decimal numbers.</p>
  <cfinput type="text" name="myExpression" size="60"/>
  <br>
  <cfinput type="submit" name="submit">
</cfform>
```

**PreserveSingleQuotes**

**Description**

Prevents ColdFusion from automatically escaping single-quotation mark characters that are contained in a variable. ColdFusion does not evaluate the argument.

**Returns**

(None)

**Category**

Other functions

**Function syntax**

`PreserveSingleQuotes(variable)`
ColdFusion Functions

History
ColdFusion MX: Changed behavior: ColdFusion automatically escapes simple-variable, array-variable, and structure-variable references within a cfquery tag body or block. (Earlier releases did not automatically escape array-variable references.)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>Variable that contains a string in which to preserve single-quotation marks.</td>
</tr>
</tbody>
</table>

Usage
This function is useful in SQL statements to defer evaluation of a variable reference until runtime. This prevents errors that result from the evaluation of a single-quote or apostrophe data character (for example, "Joe's Diner") as a delimiter.

Example A: Consider this code:

```<cfset mystring = '"Newton's Law', 'Fermat's Theorem"'>
PreserveSingleQuotes(#mystring#) is <cfoutput>
  #PreserveSingleQuotes(mystring)#
</cfoutput>```

The output is as follows:

```
PreserveSingleQuotes(#mystring#) is 'Newton's Law', 'Fermat's Theorem'
```

Example B: Consider this code:

```<cfset list0 = "'1','2', '3' ">
<cfquery sql = "select * from foo where bar in (#list0#)">
ColdFusion escapes the single-quote characters in the list as follows:

```
"'1', '2', '3'
```

The cfquery tag throws an error.

You code this function correctly as follows:

```<cfquery sql = "select * from foo where bar in (#preserveSingleQuotes(list0)#)">**tharwood 11/16```

This function ensures that ColdFusion evaluates the code as follows:

`'1', '2', '3' `
Example

This is a useful function for creating lists of information to return from a query. In this example, we pick the list of Centers in Suisun, San Francisco, and San Diego, using the SQL grammar IN to modify a WHERE clause, rather than looping through the result set after the query is run.

```cfset List = "'Suisun', 'San Francisco', 'San Diego'"
<cfquery name = "GetCenters" datasource = "cfdocexamples">
  SELECT Name, Address1, Address2, City, Phone
  FROM Centers
  WHERE City IN (#PreserveSingleQuotes(List)#)
</cfquery>
<p>We found #GetCenters.RecordCount# records.
<cfoutput query = "GetCenters">
  #Name#
  #Address1#
  #Address2#
  #City#
  #Phone#
</cfoutput>
```

**Quarter**

**Description**
Calculates the quarter of the year in which a date falls.

**Returns**
An integer, 1–4.

**Category**
Date and time functions

**Function syntax**
Quarter(date)

**See also**
DatePart, Month

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

**Usage**
When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.
Example
<h3>Quarter Example</h3>

Today, <cfoutput>#DateFormat(Now())#</cfoutput>, is in Quarter <cfoutput>#Quarter(Now())#</cfoutput>.

**QueryAddColumn**

Description
Adds a column to a query and populates its rows with the contents of a one-dimensional array. Pads query columns, if necessary, to ensure that all columns have the same number of rows.

Returns
The number of the column that was added.

Category
Query functions

Function syntax
QueryAddColumn(query, column-name [, datatype], array-name)

See also
QueryNew, QueryAddRow, QuerySetCell; Managing data types for columns in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added the datatype parameter.

ColdFusion MX: Changed behavior: if a user attempts to add a column whose name is invalid, ColdFusion throws an error. (In earlier releases, ColdFusion permitted the add operation, but the user could not reference the column after adding it.)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>Name of a query object.</td>
</tr>
<tr>
<td>column-name</td>
<td>Name of the new column.</td>
</tr>
<tr>
<td>datatype</td>
<td>(Optional) Column data type. ColdFusion generates an error if data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid:</td>
</tr>
<tr>
<td></td>
<td>• Integer: 32-bit integer</td>
</tr>
<tr>
<td></td>
<td>• Bigint: 64-bit integer</td>
</tr>
<tr>
<td></td>
<td>• Double: 64-bit decimal number</td>
</tr>
<tr>
<td></td>
<td>• Decimal: Variable length decimal, as specified by java.math.BigDecimal</td>
</tr>
<tr>
<td></td>
<td>• VarChar: String</td>
</tr>
<tr>
<td></td>
<td>• Binary: Byte array</td>
</tr>
<tr>
<td></td>
<td>• Bit: Boolean (1=True, 0=False)</td>
</tr>
<tr>
<td></td>
<td>• Time: Time</td>
</tr>
<tr>
<td></td>
<td>• Date: Date (can include time information)</td>
</tr>
<tr>
<td>array-name</td>
<td>Name of an array whose elements populate the new column.</td>
</tr>
</tbody>
</table>

Usage

You can add columns to query objects, such as queries retrieved with the cfquery tag or queries created with the QueryNew function. You cannot use the QueryAddColumn function on a cached query. This function is useful for generating a query object from the arrays of output parameters that Oracle stored procedures can generate.

Adobe recommends that you use the optional datatype parameter. Without this parameter, ColdFusion must try to determine the column’s data type when it uses the query object in a query of queries. Determining the data type requires additional processing, and can result in errors if ColdFusion does not guess the type correctly.

Example

The following example creates a query object, uses the QueryAddColumn function to add three columns to the object, and displays the results. Because two of the arrays that provide the data are shorter than the third, QueryAddColumn adds padding to the corresponding columns in the query.
<!--- Make a query. --->
<cfset myQuery = QueryNew("")>

<!--- Create an array. --->
<cfset FastFoodArray = ArrayNew(1)>
<cfset FastFoodArray[1] = "French Fries">
<cfset FastFoodArray[2] = "Hot Dogs">
<cfset FastFoodArray[3] = "Fried Clams">
<cfset FastFoodArray[4] = "Thick Shakes">

<!--- Use the array to add a column to the query. --->
<cfset nColumnNumber = QueryAddColumn(myQuery, "FastFood", "VarChar", FastFoodArray)>

<!--- Create a second array. --->
<cfset FineCuisineArray = ArrayNew(1)>
<cfset FineCuisineArray[1] = "Lobster">
<cfset FineCuisineArray[2] = "Flambe">

<!--- Use the array to add a second column to the query. --->
<cfset nColumnNumber2 = QueryAddColumn(myQuery, "FineCuisine", "VarChar", FineCuisineArray)>

<!--- Create a third array. --->
<cfset HealthFoodArray = ArrayNew(1)>
<cfset HealthFoodArray[1] = "Bean Curd">
<cfset HealthFoodArray[2] = "Yogurt">
<cfset HealthFoodArray[3] = "Tofu">

<!--- Use the array to add a third column to the query. --->
<cfset nColumnNumber3 = QueryAddColumn(myQuery, "HealthFood", "VarChar", HealthFoodArray)>

<!--- Display the results. --->
<table cellspacing = "2" cellpadding = "2" border = "0">
<tr>
<th align = "left">Fast Food</th>
<th align = "left">Fine Cuisine</th>
<th align = "left">Health Food</th>
</tr>
<cfoutput query = "myQuery">
<tr>
<td>#FastFood#</td>
<td>#FineCuisine#</td>
<td>#HealthFood#</td>
</tr>
</cfoutput>
</table>

**QueryAddRow**

**Description**
Adds a specified number of empty rows to a query.

**Returns**
The number of rows in the query
Category
Query functions

Function syntax
QueryAddRow(query [, number])

See also
QueryAddColumn, QuerySetCell, QueryNew; Creating a recordset with the QueryNew() function in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>Name of an executed query.</td>
</tr>
<tr>
<td>number</td>
<td>Number of rows to add to the query. The default value is 1.</td>
</tr>
</tbody>
</table>

Usage
Enhancements in ColdFusion 10 lets you specify a struct, an array of structs, or arrays with single or multiple dimensions to add rows to the query as shown in the following example:

```coldfusion
queryAddRow(myQuery1, [
    {id=2, name="Two"},
    {id=3, name="Three"},
    {id=4, name="Four"}
]);
queryAddRow(myQuery2, {id=4, name="Four"});
queryAddRow(myQuery1, [
    [1, "One"],
    [2, "Two"],
    [3, "Three"]
]);
```
Example
<h3>QueryAddRow Example</h3>

<!-- start by making a query -->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT Course_ID, Number, Descript
    FROM Courses
</cfquery>

<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput> rows.</p>

<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
    <cfset temp = QueryAddRow(GetCourses)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
    <cfset Temp = QuerySetCell(GetCourses, "Descript", "Description of variable #CountVar#")>
</cfloop>

<p>After the QueryAddRow action, the query has <cfoutput>#GetCourses.RecordCount#</cfoutput> records.</p>

<cfoutput query="GetCourses">
<pre>#Course_ID# #Number# #Descript#</pre>
</cfoutput>

QueryConvertForGrid

Description
Converts query data to a structure that contains a paged subset of the query. Used in CFC functions that return data to Ajax format cfgrid controls in response to a bind expression.

Returns
A structure that contains one page of data from the query.

Category
Query functions

Function syntax
QueryConvertForGrid(query, page, pageSize)

See also
cfgrid, Dynamically filling form data in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>Name of the query whose data is returned.</td>
</tr>
<tr>
<td>page</td>
<td>The specific page of query data to be returned. Pages are numbered starting with 1.</td>
</tr>
<tr>
<td>pageSize</td>
<td>Number of rows of query data on a page.</td>
</tr>
</tbody>
</table>

Usage

You can also create the return value for a cfgrid bind CFC without using this function if your query returns only a single grid page of data at a time. For more information see Using Ajax User Interface Components and Features in the Developing ColdFusion Applications.

Example

The following example shows how a CFC function that is called by an Ajax format cfgrid tag bind attribute. uses the QueryConvertForGrid function to prepare query data to return to the grid. The CFML page with the cfgrid tag has the following code:

```cfml
<cfform>
  <cfgrid format="html" name="grid01" pagesize=5 sort=true bind="cfc:places.getData({cfgridpage},{cfgridpagesize}, {cfgridsortcolumn},{cfgridsortdirection})" selectMode="row">
    <cfgridcolumn name="Emp_ID" display=true header="Employee ID"/>
    <cfgridcolumn name="FirstName" display=true header="Name"/>
    <cfgridcolumn name="Email" display=true header="Email"/>
  </cfgrid>
</cfform>
```

The getData function in the places.cfc page has the following code:

```cfml
<cffunction name="getData" access="remote" output="false">
  <cfargument name="page" />
  <cfargument name="pageSize" />
  <cfargument name="gridsortcolumn" />
  <cfargument name="gridstartdirection" >
  <cfset query = "SELECT Emp_ID, FirstName, Email FROM Employees" >
  <cfif gridsortcolumn neq "" or gridstartdirection neq "">
    <cfset query=query & " order by #gridsortcolumn# #gridstartdirection#"> 
  </cfif>
  <cfquery name="team" datasource="cfdocexamples">
    <cfoutput>#query#</cfoutput>
  </cfquery>
  <cfreturn QueryConvertForGrid(team, page, pageSize)> 
</cffunction>
```

QueryNew

Description

Creates an empty query (query object).
Returns
An empty query with a set of named columns, or an empty query.

Category
Query functions

Function syntax
QueryNew(columnlist [, columntypelist])

History
ColdFusion MX 7: Added columntypelist parameter.

See also
QueryAddColumn, QueryAddRow, QuerySetCell; Managing data types for columns in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnlist</td>
<td>Comma-delimited list of column names, or an empty string.</td>
</tr>
<tr>
<td>columntypelist</td>
<td>(Optional) Comma-delimited list specifying column data types. ColdFusion generates an error if the data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid:</td>
</tr>
<tr>
<td></td>
<td>• Integer: 32-bit integer</td>
</tr>
<tr>
<td></td>
<td>• BigInt: 64-bit integer</td>
</tr>
<tr>
<td></td>
<td>• Double: 64-bit decimal number</td>
</tr>
<tr>
<td></td>
<td>• Decimal: Variable length decimal, as specified by java.math.BigDecimal</td>
</tr>
<tr>
<td></td>
<td>• VarChar: String</td>
</tr>
<tr>
<td></td>
<td>• Binary: Byte array</td>
</tr>
<tr>
<td></td>
<td>• Bit: Boolean (1=True, 0=False)</td>
</tr>
<tr>
<td></td>
<td>• Time: Time</td>
</tr>
<tr>
<td></td>
<td>• Date: Date (can include time information)</td>
</tr>
</tbody>
</table>

Usage
If you specify an empty string in the columnlist parameter, use the QueryAddColumn function to add columns to the query.

Adobe recommends that you use the optional columntypelist parameter. Without this parameter, ColdFusion must try to determine data types when it uses the query object in a query of queries. Determining data types requires additional processing, and can result in errors if ColdFusion does not guess a type correctly.

Enhancements in ColdFusion 10 lets you initialize the query data. You can specify a struct, an array of structs, or arrays with single or multiple dimensions to initialize the query as shown in the following example:
myQuery1 = queryNew("id,name","Integer,VarChar", {id=1,name="One"});
myQuery2 = queryNew("id,name","Integer,VarChar", 
    [{id=1,name="One"},
     {id=2,name="Two"},
     {id=3,name="Three"}
    ]);  
myQuery2 = queryNew("id,name","Integer,VarChar", 
    [[1,"One"],
     [2,"Two"],
     {3,"Three"}        
    ]);  

Example
The following example uses the QueryNew function to create an empty query with three columns. It populates two rows of the query and displays the contents of the query object and its metadata.

```coldfusion
<!--- Create a new three-column query, specifying the column data types --->
<cfset myQuery = QueryNew("Name, Time, Advanced", "VarChar, Time, Bit")>

<!--- Make two rows in the query --->
<cfset newRow = QueryAddRow(MyQuery, 2)>

<!--- Set the values of the cells in the query --->
<cfset temp = QuerySetCell(myQuery, "Name", "The Wonderful World of CMFL", 1)>
<cfset temp = QuerySetCell(myQuery, "Time", "9:15 AM", 1)>
<cfset temp = QuerySetCell(myQuery, "Advanced", False, 1)>
<cfset temp = QuerySetCell(myQuery, "Name", "CFCs for Enterprise Applications", 2)>
<cfset temp = QuerySetCell(myQuery, "Time", "12:15 PM", 2)>
<cfset temp = QuerySetCell(myQuery, "Advanced", True, 2)>

<h4>The query object contents</h4>
<cfoutput query = "myQuery">
    #Name# #Time# #Advanced#
</cfoutput>
<br>
<br>
<h4>Using individual query data values</h4>
<cfoutput>
    #MyQuery.name[2]# is at #MyQuery.Time[2]#
</cfoutput>
<br>
<br>
<h4>The query metadata</h4>
<cfset querymetadata=getMetaData(myQuery)>
<cfoutput>
    <cfdump var="#querymetadata#">
</cfoutput>

**QuerySetCell**

**Description**
Sets a cell to a value. If no row number is specified, the cell on the last row is set.

Starting with ColdFusion MX 7, you cannot add a string literal (for example, "All") to a column that is of type numeric, although this was allowed in previous versions of ColdFusion.

**Returns**
True, if successful; False, otherwise.
Category
Query functions

Function syntax
QuerySetCell(query, column_name, value [, row_number ])

See also
QueryAddColumn, QueryAddRow, QueryNew; Creating a recordset with the QueryNew() function in the Developing ColdFusion Applications

History
ColdFusion MX 7: Changed the behavior of the function so that it does type validation.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>Name of an executed query.</td>
</tr>
<tr>
<td>column_name</td>
<td>Name of a column in the query.</td>
</tr>
<tr>
<td>value</td>
<td>Value to set in the cell.</td>
</tr>
<tr>
<td>row_number</td>
<td>Row number. The default value is last row.</td>
</tr>
</tbody>
</table>

Example
<!--- This example shows the use of QueryAddRow and QuerySetCell --->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT Course_ID, Descript
    FROM Courses
</cfquery>
<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput> rows.
<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
    <cfset temp = QueryAddRow(GetCourses)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Descript", "Description of variable #CountVar#")>
</cfloop>
<p>After the QueryAddRow action, the query has <cfoutput>#GetCourses.RecordCount#</cfoutput> records.
<cfoutput query="GetCourses">PRE>#{Course_ID} #Course_Number# #Descript#</pre> </cfoutput>
QuotedValueList

Description
Gets the values of each record returned from an executed query. ColdFusion does not evaluate the arguments.

Returns
A delimited list of the values of each record returned from an executed query. Each value is enclosed in single-quotations marks.

Category
Query functions, List functions

Function syntax
QuotedValueList(query.column [, delimiter ])

See also
ValueList

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query.column</td>
<td>Name of an executed query and column. Separate query name and column name with a period.</td>
</tr>
<tr>
<td>delimiter</td>
<td>A string or a variable that contains one character(s) that separate column data.</td>
</tr>
</tbody>
</table>

Example
<!--- use the contents of one query to create another dynamically --->
<cfset List = "'BIOL', 'CHEM'">
<!--- first, get the department IDs in our list --->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
  SELECT Dept_ID FROM Departments
  WHERE Dept_ID IN (#PreserveSingleQuotes(List)#)
</cfquery>

<!--- now, select the courses for that department based on the quotedValueList produced from our previous query --->
<cfquery name = "GetCourseList" datasource = "cfdocexamples">
  SELECT * 
  FROM CourseList 
  WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>

<!--- now, output the results --->
List the course numbers that are in BIOL and CHEM (uses semicolon (;) as the delimiter):<br>
<cfoutput>
#QuotedValueList(GetCourseList.CorNumber,;)#
</cfoutput>
Rand

Description
Generates a pseudo-random number.

Returns
A pseudo-random decimal number, in the range 0 – 1.

Category
Mathematical functions, Security functions

Function syntax
Rand([algorithm])

History
ColdFusion MX 7: Added the algorithm parameter.

See also
Randomize, RandRange

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm</td>
<td>(Optional) The algorithm to use to generate the random number. ColdFusion installs a cryptography library with the following algorithms:</td>
</tr>
<tr>
<td></td>
<td>• CFMX_COMPAT: the algorithm used in ColdFusion (default).</td>
</tr>
<tr>
<td></td>
<td>• SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm</td>
</tr>
<tr>
<td></td>
<td>• IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm).</td>
</tr>
</tbody>
</table>

Usage
Call the Randomize function before calling this function to seed the random number generator. Seeding the generator ensures that the Rand function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

ColdFusion MX uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, cannot provide technical support for third-party security providers.

Example
The following example uses the SHA1PRNG algorithm to generate a single random number:

```cfml
<h3>Rand Example</h3>
<cfoutput>
<p>Rand("SHA1PRNG") returned: #Rand("SHA1PRNG")#</p>
<p><A HREF = "#CGI.SCRIPT_NAME#">Try again</A></p>
</cfoutput>
```
Randomize

Description
Seeds the pseudo-random number generator with an integer number, ensuring repeatable number patterns.

Returns
A pseudo-random decimal number, in the range 0–1.

Category
Mathematical functions, Security functions

Function syntax
Randomize(number[, algorithm])

History
ColdFusion MX 7: Added the algorithm parameter.

See also
Rand, RandRange

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Integer number. If the number is not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.</td>
</tr>
</tbody>
</table>
| algorithm | (Optional) The algorithm to use to generate the seed number. ColdFusion installs a cryptography library with the following algorithms:  
  - CFMX_COMPAT: the algorithm used in ColdFusion (default).  
  - SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm.  
  - IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm). |

Usage
Call this function before calling Rand to seed the random number generator. Seeding the generator ensures that the Rand function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

In Standard Edition, for all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

In Enterprise Edition, ColdFusion also installs the RSA BSafe Crypto-J library. This provider adds the following algorithms: FIPS186PRNG, MD5PRNG, DummyPRNG, OBFPNG. DummyPRNG always returns 0.

Example
The following example calls the Randomize function to seed the random number generator and generates 10 random numbers. To show the effect of the seed, submit the form with the same value multiple times.
<h3>Randomize Example</h3>

<!--- Do the following only if the form has been submitted. --->
<cfif IsDefined("Form.myRandomInt")>

<!--- Make sure submitted value is a number and display its value. --->
<cfif IsNumeric(FORM.myRandomInt)>
  <cfoutput>
    <b>Seed value is #FORM.myRandomInt#</b><br>
  </cfoutput>
</cfif>

<!--- Call Randomize to seed the random number generator. --->
<cfset r = Randomize(FORM.myRandomInt, "SHA1PRNG")>

  <cfoutput>
    <b>Random number returned by Randomize(#Form.myRandomInt#, "SHA1PRNG"): #r#</b><br>
  </cfoutput>
</cfif>

<!--- Form to specify the seed value. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
  <p>Enter a number to seed the randomizer: <input type = "Text" name = "MyRandomInt" value="12345"></p>
  <p><input type = "Submit" name = ""></p>
</form>

**RandRange**

**Description**
Generates a pseudo-random integer in the range between two specified numbers.

**Returns**
A pseudo-random integer.

**Category**
Mathematical functions, Security functions

**Function syntax**
RandRange(number1, number2[, algorithm])
History
ColdFusion MX 7: Added the algorithm parameter.

See also
Rand, Randomize

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number1, number2</td>
<td>Integer numbers. If the numbers are not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.</td>
</tr>
</tbody>
</table>
| algorithm   | (Optional) The algorithm to use to generate the random number. ColdFusion installs a cryptography library with the following algorithms:
  • CFMX_COMPAT: the algorithm used in ColdFusion (default).
  • SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm
  • IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm.) |

Usage
Very large positive or negative values for the number1 and number2 parameters might result in poor randomness in the results. To prevent this problem, do not specify numbers outside the range -1,000,000,000 – 1,000,000,000.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, cannot provide technical support for third-party security providers.

Example
The following example contains a form that requires random number range values, and lets you optionally specify a random number seed value. It uses cfform controls and attributes to specify a default range, ensure that the range fields have values, and validate that the field values are in a specified integer range. When you submit the form, it checks whether the seed field has an empty string; if the field has a value, the code uses the number to seed the random number generator. It then generates and displays the random number.
<h3>RandRange Example</h3>

<!---- Do the following only if the form has been submitted. --->
<cfif IsDefined("Form.mySeed")>

<!---- Do the following only if the seed field has a non-empty string. --->
<cfif Form.mySeed NEQ ">

<cfoutput>
  <b>Seed value is #FORM.mySeed#</b>
</cfoutput>
<br>

<!---- Call Randomize to seed the random number generator. --->
<cfset r = Randomize(FORM.mySeed, "SHA1PRNG")>
<cfelse>

  <b>No Seed value submitted</b>
</cfif>

<!---- Generate and display the random number. --->
<cfoutput><p><b>
  RandRange returned: #RandRange(FORM.myInt, FORM.myInt2, "SHA1PRNG")#
</b></p></cfoutput>
</cfif>

<!---- This form uses cfform input validation to check the input range. --->
<cfform action = "#CGI.SCRIPT_NAME#">

<p>Enter the random number Range: From
<cfinput type = "Text" name = "MyInt" value = "1"
  RANGE = "-1000000000,1000000000"
  message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
  validate = "integer" required = "Yes">
To
<cfinput type = "Text" name = "MyInt2" value = "9999"
  RANGE = "-1000000000,1000000000"
  message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
  validate = "integer" required = "Yes"></p>

<p>Enter a number to seed the randomizer:
<cfinput type = "Text" name = "mySeed" RANGE = "-1000000000,1000000000"
  message = "Please enter a value between -1000000000,1000000000"
  validate = "integer" required = "No"></p>
<p><input type = "Submit" name = ""></p>
</cfform>

ReEscape

Description
Takes a string and escapes characters that match regular expression control characters.

Returns
String appended with the escape characters

Syntax
reEscape(string)
Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>The string in which you have to escape characters that match regular expression characters.</td>
</tr>
</tbody>
</table>

Example

```cfoutput>
#reescape("*.{}[]example")#
</cfoutput>```

REFind

Description

Uses a regular expression (RE) to search a string for a pattern. The search is case sensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the Developing ColdFusion Applications.

Returns

Depends on the value of the returnsubexpressions parameter:

- If returnsubexpressions = "False":
  - The position in the string where the match begins
  - 0, if the regular expression is not matched in the string
- If returnsubexpressions = "True": a structure that contains two arrays, len and pos. The array elements are as follows:
  - If the regular expression is found in the string, the first element of the len and pos arrays contains the length and position, respectively, of the first match of the entire regular expression.
  - If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  - If the regular expression is not found in the string, the first element of the len and pos arrays contains 0.

Category

String functions

Function syntax

```coldfusion
REFind(reg_expression, string [, start, returnsubexpressions ] )
```

See also

Find, FindNoCase, REFindNoCase, REReplace, REReplaceNoCase
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_expression</td>
<td>Regular expression for which to search. Case sensitive.</td>
</tr>
<tr>
<td>string</td>
<td>A string, or a variable that contains one, in which to search.</td>
</tr>
<tr>
<td>start</td>
<td>Optional. A positive integer, or a variable that contains one. Position in the string at which to start search. The default value is 1.</td>
</tr>
<tr>
<td>returnsubexpressions</td>
<td>Optional. Boolean. Whether to return substrings of reg_expression, in arrays named len and pos:</td>
</tr>
<tr>
<td></td>
<td>• True: if the regular expression is found, the first array element contains the length and position, respectively, of the first match. If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group. If the regular expression is not found, the arrays each contain one element with the value 0.</td>
</tr>
<tr>
<td></td>
<td>• False: the function returns the position in the string where the match begins. Default.</td>
</tr>
</tbody>
</table>

Usage

This function finds the first occurrence of a regular expression in a string. To find the second and subsequent instances of the expression or of subexpressions in it, you call this function more than once, each time with a different start position. To determine the next start position, use the returnsubexpressions parameter, and add the value returned in the first element of the length array to the value in the first element of the position array.

Example

```<h3>REFind Example</h3>
<p>This example shows the use of the REFind function with and without the <i>returnsubexpressions</i> parameter set to True. If you do not use the <i>returnsubexpressions</i> parameter, REFind returns the position of the first occurrence of a regular expression in a string starting from the specified position. Returns 0 if no occurrences are found.</p>

<p>REFind("a+c+", "abcaaccdd"): <cfoutput>#REFind("a+c+", "abcaaccdd")#</cfoutput></p>
<p>REFind("a+c++", "abcaaccdd"): <cfoutput>#REFind("a+c++", "abcaaccdd")#</cfoutput></p>
<p>REFind("[:upper:]", "abcaacCDD"): <cfoutput>#REFind("[:upper:]", "abcaacCDD")#</cfoutput></p>
<p>REFind("[\?&]=", "report.cfm?rep = 1234&u = 5"): <cfoutput>#REFind("[\?&]=", "report.cfm?rep = 1234&u = 5")#</cfoutput></p>
<p>!--- Set startPos to one; returnMatchedSubexpressions = TRUE --->
<cfset teststring = "The cat in the hat hat came back!"</cfset>
<p>The string in which the function is to search is: <cfoutput>&#teststring#</cfoutput>.</p>
<p>The first call to REFind to search this string is: <b>REFind("[A-Za-z]+","testString","TRUE")</b></p>
<p>This function returns a structure that contains two arrays: pos and len.</p>"
<p>To create this structure you can use a CFSET statement, for example:</p>

```cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")
<cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")>
```<br>

```cfoutput>
  The number of elements in each array: #ArrayLen(st.pos)#.
</cfoutput></p>

<p>The number of elements in the pos and len arrays is always one if you do not use parentheses in the regular expression.</p>

<p>The value of st.pos[1] is: <cfoutput>#st.pos[1]#.</cfoutput></p>

<p>The value of st.len[1] is: <cfoutput>#st.len[1]#.</cfoutput></p>

```cfoutput>
  Substring is &lt;b>#Mid(testString,st.pos[1],st.len[1])#</b&gt;
</cfoutput></p>

```

<p>However, if you use parentheses in the regular expression, the first element contains the position and length of the first instance of the whole expression. The position and length of the first instance of each parenthesized subexpression within is included in additional array elements.</p>

```cfset st1 = REFind("([[:alpha:]])\[ \]+(\1)",testString,1,"TRUE")
<cfset st1 = REFind("([[:alpha:]])\[ \]+(\1)",testString,1,"TRUE")>
```<br>

<p>The number of elements in each array is <cfoutput>#ArrayLen(st1.pos)#.</cfoutput></p>

```cfoutput>
  First whole expression match; position is <cfoutput>#st1.pos[1]#;
  length is #st1.len[1]#; whole expression match is <b>#Mid(testString,st1.pos[1],st1.len[1])#</b></cfoutput></p>

```cfloop index = "1" from = "2" to = "#ArrayLen(st1.pos)#"
  <cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
  Substring is &lt;b>#Mid(testString,st1.pos[i],st1.len[i])#</b&gt;</cfoutput></cfloop></br>
```

### REFindNoCase

**Description**

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case-insensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the *Developing ColdFusion Applications*.

**Returns**

Depends on the value of the `returnsubexpressions` parameter:

- **If `returnsubexpressions` = "False"**:
  - The position in the string where the match begins
• 0, if the regular expression is not matched in the string
• If \texttt{returnsubexpressions = "True"}: a structure that contains two arrays, \texttt{len} and \texttt{pos}. The array elements are as follows:
  • If the regular expression is found in the string, the first element of the \texttt{len} and \texttt{pos} arrays contains the length and position, respectively, of the first match of the entire regular expression.
  • If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  • If the regular expression is not found in the string, the first element of the \texttt{len} and \texttt{pos} arrays contains 0.

\textbf{Category}
\textbf{String functions}

\textbf{Function syntax}
\texttt{REFindNoCase(reg_expression, string [, start, returnsubexpressions])}

\textbf{See also}
\texttt{Find, FindNoCase, REFind, REReplace, REReplaceNoCase}

\textbf{Parameters}

\begin{tabular}{|l|l|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
\texttt{reg_expression} & Regular expression for which to search. Case-insensitive. \\
& For more information, see Using Regular Expressions in Functions in the \textit{Developing ColdFusion Applications}. \\
\texttt{string} & A string or a variable that contains one. String in which to search. \\
\texttt{start} & Optional. A positive integer or a variable that contains one. Position at which to start search. The default value is 1. \\
\texttt{returnsubexpressions} & Optional. Boolean. Whether to return substrings of \texttt{reg_expression}, in arrays named \texttt{len} and \texttt{pos}: \\
& • True: if the regular expression is found, the first array element contains the length and position, respectively, of the first match. If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group. If the regular expression is not found, the arrays each contain one element with the value 0. \\
& • False: the function returns the position in the string where the match begins. Default. \\
\hline
\end{tabular}

\textbf{Usage}
This function finds the first occurrence of a regular expression in a string. To find the second and subsequent instances of the expression or of subexpressions in it, you call this function more than once, each time with a different start position. To determine the next start position, use the \texttt{returnsubexpressions} parameter, and add the value returned in the first element of the length array to the value in the first element of the position array.
Example

<h3>REFindNoCase Example</h3>

This example demonstrates the use of the REFindNoCase function with and without the <i>returnsubexpressions</i> parameter set to True.

If you do not use the <i>returnsubexpressions</i> parameter, REFindNoCase returns the position of the first occurrence of a regular expression in a string starting from the specified position. Returns 0 if no occurrences are found.

```coldfusion
<cfoutput>
REFindNoCase("a+c", "abcaaccdd"): #REFindNoCase("a+c", "abcaaccdd")#
</cfoutput>
<cfoutput>
REFindNoCase("a+c", "abcaaccdd"): #REFindNoCase("a+c", "abcaaccdd")#
</cfoutput>
<cfoutput>
REFindNoCase("[[:alpha:]]+", "abcaacCDD"): #REFindNoCase("[[:alpha:]]+", "abcaacCDD")#
</cfoutput>
<cfoutput>
REFindNoCase("[\?&]rep = ", "report.cfm?rep = 1234&u = 5"):
</cfoutput>
</cfoutput>

If you do use the <i>returnsubexpression</i> parameter, REFindNoCase returns the position and length of the first occurrence of a regular expression in a string starting from the specified position. The position and length variables are stored in a structure. To access position and length information, use the keys <i>pos</i> and <i>len</i>, respectively.

```coldfusion
<cfset teststring = "The cat in the hat came back!">
<cfoutput>
The string in which the function is to search is: #teststring#.</cfoutput>
<cfoutput>
The first call to REFindNoCase to search this string is: REFindNoCase("[[:alpha:]]+",testString,1,"True")</cfoutput>
<cfoutput>
This function returns a structure that contains two arrays: pos and len. To create this structure you can use a CFSET statement, for example:

```coldfusion
&lt;CFSET st = REFindNoCase("[[:alpha:]]+",testString,1,"True")&gt;
<cfset st = REFindNoCase("[[:alpha:]]+",testString,1,"True")>
<cfoutput>
The number of elements in each array: #ArrayLen(st.pos)#.
</cfoutput>
<cfoutput>
The number of elements in the pos and len arrays will always be one, if you do not use parentheses to denote subexpressions in the regular expression.</cfoutput>
<cfoutput>
The value of st.pos[1] is: #st.pos[1]#. The value of st.len[1] is: #st.len[1]#.
</cfoutput>
<cfoutput>
Substring is <b>#Mid(testString,st.pos[1],st.len[1])#</b>
</cfoutput>
<cfoutput>
However, if you use parentheses to denote subexpressions in the regular expression, the first element contains the position and length of the first instance of the whole expression. The position and length of the first instance of each subexpression within will be included in additional array elements.
<br>*</cfoutput>
<cfoutput>
For example:
&lt;CFSET st1 = REFindNoCase("[[:alpha:]]\+[ ]+(\")",testString,1,"True")&gt;</cfoutput>
```
<cfset st1 = REFindNoCase("([[:alpha:]]+)\[ ]+(\])",testString,1,"True")>

<p>The number of elements in each array is</p>
<cfoutput>
    #ArrayLen(st1.pos)#
</cfoutput>.</p>

<p>First whole expression match; position is</p>
<cfoutput>
    #st1.pos[1]#; length is #st1.len[1]#;
    whole expression match is <B>#Mid(testString,st1.pos[1],st1.len[1])#</B>
</cfoutput></p>

<p>Subsequent elements of the arrays provide the position and length of the
    first instance of each parenthesized subexpression therein.</p>
<cfloop index = "i" from = "2" to = "#ArrayLen(st1.pos)#">
    <p><cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
        Substring is <B>#Mid(testString,st1.pos[i],st1.len[i])#</B></cfoutput></p>
</cfloop><br>

**REMatch**

**Description**

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case

sensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular

Expressions in Functions in the *Developing ColdFusion Applications*.

**Returns**

An array of strings that match the expression.

**Category**

String functions

**Function syntax**

REMatch(reg_expression, string)

**See also**

Find, FindNoCase, REFind, REReplace, REReplaceNoCase, REMatchNoCase

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_expression</td>
<td>Regular expression for which to search. Case sensitive.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
</tbody>
</table>
Usage
This function finds all occurrence of a regular expression in a string.

Example
<!--- Find all the URLs in a web page retrieved via cfhttp: --->
<!--- The search is case sensitive. --->
result = REMatch("https?://([-\w\.]+)+(:\d+)?(/([^/\._]*(\?\S+)?)?)?", cfhttp.filecontent);

REMatchNoCase

Description
Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case-insensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the Developing ColdFusion Applications.

Returns
An array of strings that match the expression.

Category
String functions

Function syntax
REMatchNoCase(reg_expression, string)

See also
Find, FindNoCase, REFind, REReplace, REReplaceNoCase, REMatch

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_expression</td>
<td>Regular expression for which to search. Case-insensitive. For more information, see Using Regular Expressions in Functions in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
</tbody>
</table>

Example
<!--- Find all the URLs in a web page retrieved via cfhttp: --->
result = REMatch("https?://([-\w\.]+)+(:\d+)?(/([^/\._]*(\?\S+)?)?)?", cfhttp.filecontent);

ReleaseComObject

Description
Releases a COM Object and frees up resources that it used.

Returns
Nothing.
Category
Extensibility functions

Function syntax
ReleaseComObject(objectName)

See also
CreateObject, cfobject

History
ColdFusion MX 6.1: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objectName</td>
<td>Variable name of a COM object that was created using the CreateObject function or cfobject tag.</td>
</tr>
</tbody>
</table>

Usage
This function forcefully terminates and releases the specified COM object and all COM objects that it created. Use this function when the object is no longer in use, to quickly free up resources. If the COM object has a method, such as a quit method, that terminates the program, call this method before you call the ReleaseComObject function.

This function can improve processing efficiency, but is not required for an application to work. If you do not use this function, the Java garbage collection mechanism eventually frees the resources. If you use this function on an object that is in use, the object is prematurely released and your application will get exceptions.

Example
<h3>ReleaseComObject Example</h3>
<cfscript>
obj = CreateObject("Com", "excel.application.9");
//code that uses the object goes here??I'd like to fill this in with something??
obj.quit();
ReleaseComObject(obj);
</cfscript>

RemoveCachedQuery

Description
Removes the query with the details you provide from query cache.

Returns
Nothing

Syntax
removeCachedQuery(SQL, datasource, [params], [region])

History
ColdFusion 10: Added this function.
Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL</td>
<td>The query SQL.</td>
</tr>
<tr>
<td>datasource</td>
<td>The datasource you ran the query on.</td>
</tr>
<tr>
<td>params</td>
<td>(Optional) Array of parameter values passed to SQL.</td>
</tr>
<tr>
<td>region</td>
<td>(Optional) Specifies the cache region where you can place the cache object.</td>
</tr>
</tbody>
</table>

Example

```
<cfset sql = "SELECT * from art where artid = ?">
<cfset params = ArrayNew(1)>
<cfset params[1] = 1>
<cfquery name="q" datasource="cfartgallery" cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
     SELECT * from art where artid = <cfqueryPARAM value = "1" CFSQLType = 'CF_SQL_INTEGER'>
</cfquery>
<cfset a = arrayNew(1)>
<cfset a[1] = 1>
<cfset removeCachedQuery(sql,"cfartgallery", a)>
```

RemoveChars

Description
Removes characters from a string.

Returns
A copy of the string, with count characters removed from the specified start position. If no characters are found, returns zero.

Category
String functions

Function syntax
`RemoveChars(string, start, count)`

See also
`Insert, Len`

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>start</td>
<td>A positive integer or a variable that contains one. Position at which to start search.</td>
</tr>
<tr>
<td>count</td>
<td>Number of characters to remove.</td>
</tr>
</tbody>
</table>
Example

<h3>RemoveChars Example</h3>
Returns a string with <I>count</I> characters removed from the start position. Returns 0 if no characters are found.

```cfif IsDefined("FORM.myString")>
  <cfif (FORM.numChars + FORM.start) GT Len(FORM.myString)>
    <p>Your string is only <cfoutput>#Len(FORM.myString)# characters long. Please enter a longer string, select fewer characters to remove or begin earlier in the string.</p>
  </cfif>
  <cfoutput>
    <p>Your original string: #FORM.myString#</p>
    <p>Your modified string:#RemoveChars(FORM.myString, FORM.start, FORM.numChars)#</p>
  </cfoutput>
</cfif>
```

**RepeatString**

**Description**
Creates a string that contains a specified number of repetitions of the specified string.

**Returns**
A string.

**Category**
String functions

**Function syntax**
RepeatString(<i>string</i>, <i>count</i>)

**See also**
CJustify, LJustify, RJustify

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
<tr>
<td>count</td>
<td>Number of repeats.</td>
</tr>
</tbody>
</table>
Example

Example

RepeatString returns a string created from string, repeated a specified number of times.

<ul>
<li>RepeatString("-", 10): <cfoutput>#RepeatString("-", 10)#</cfoutput></li>
<li>RepeatString("<br>", 3): <cfoutput>#RepeatString("<br>", 3)#</cfoutput></li>
<li>RepeatString("", 5): <cfoutput>#RepeatString("", 5)#</cfoutput></li>
<li>RepeatString("abc", 0): <cfoutput>#RepeatString("abc", 0)#</cfoutput></li>
<li>RepeatString("Lorem Ipsum", 2):
<cfoutput>#RepeatString("Lorem Ipsum", 2)#</cfoutput></li>
</ul>

Replace

Description
Replaces occurrences of substring1 in a string with substring2, in a specified scope. The search is case sensitive.

Returns
The string, after making replacements.

Category
String functions

Function syntax

Replace(string, substring1, substring2 [, scope ])

See also
Find, RFind, ReplaceNoCase, ReplaceList, REReplace

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one. String in which to search.</td>
</tr>
<tr>
<td>substring1</td>
<td>A string or a variable that contains one. String for which to search</td>
</tr>
<tr>
<td>substring2</td>
<td>String that replaces substring1</td>
</tr>
<tr>
<td>scope</td>
<td>• one: replaces the first occurrence (default)</td>
</tr>
<tr>
<td></td>
<td>• all: replaces all occurrences</td>
</tr>
</tbody>
</table>

Usage
To remove a string, specify the empty string ("") as substring2.

You do not need to escape comma characters in strings. For example, the following code deletes the commas from the sentence:

replace("The quick brown fox jumped over the lazy cow, dog, and cat.", ",", ",", "All")
Example
<h3>Replace Example</h3>
<p>The Replace function returns <i>string</i> with <i>substring1</i> replaced by <i>substring2</i> in the specified scope. This is a case-sensitive search.</p>
<cfif IsDefined("FORM.MyString")>
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput></p>
<p>You wanted to replace the substring <cfoutput>#FORM.MySubstring1#</cfoutput> with the substring <cfoutput>#FORM.MySubstring2#</cfoutput>.</p>
<p>The result: <cfoutput>#Replace(FORM.myString, FORM.MySubstring1, FORM.mySubString2)#</cfoutput></p>
</cfif></p>

ReplaceList

Description
Replaces occurrences of the elements from a delimited list in a string with corresponding elements from another delimited list. The search is case sensitive.

Returns
A copy of the string, after making replacements.

Category
List functions, String functions

Function syntax
ReplaceList(string, list1, list2)
ReplaceList(string, list1, list2, delimiter)
ReplaceList(string, list1, list2, delimiter_list1, delimiter_list2)

See also
Find, REFind, Replace, REReplace

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string, or a variable that contains one, within which to replace substring</td>
</tr>
<tr>
<td>list1</td>
<td>Comma-delimited list of substrings for which to search</td>
</tr>
<tr>
<td>list2</td>
<td>Comma-delimited list of replacement substrings</td>
</tr>
<tr>
<td>delimiter</td>
<td>Common delimiter for both search and replacement.</td>
</tr>
<tr>
<td>delimiter_list1</td>
<td>Delimiter for search.</td>
</tr>
<tr>
<td>delimiter_list2</td>
<td>Delimiter for replacement.</td>
</tr>
</tbody>
</table>
Usage
The list of substrings to replace is processed sequentially. If a list1 element is contained in list2 elements, recursive replacement might occur. The second example shows this.

Example 1
<p>The ReplaceList function returns <i>string</i> with <i>substringlist1</i> (e.g. "a,b") replaced by <i>substringlist2</i> (e.g. "c,d") in the specified scope.
</p><cfif IsDefined("FORM.MyString")>
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>. You wanted to replace the substring <cfoutput>#FORM.MySubstring1#</cfoutput> with the substring <cfoutput>#FORM.MySubstring2#</cfoutput>. The result: <cfoutput>#Replacelist(FORM.myString, FORM.MySubstring1, FORM.mySubString2)#</cfoutput>.</p>
</cfif>
<form action = "replacelist.cfm" method="post">
<p>String 1 <br><input type = "Text" value = "My Test String" name = "MyString">
</p><p>Substring 1 (find this list of substrings) <br><input type = "Text" value = "Test, String" name = "MySubstring1">
</p><p>Substring 2 (replace with this list of substrings) <br><input type = "Text" value = "Replaced, Sentence" name = "MySubstring2">
</p><p><input type = "Submit" value = "Replace and display" name = ""></p>
</form>

Example 2
In the following example, the delimiter applies to both the lists:

Example 3
In the following example, delimiter is specific to individual lists:
ReplaceNoCase

Description
Replaces occurrences of substring1 with substring2, in the specified scope. The search is case-insensitive.

Returns
A copy of the string, after making replacements.

Category
String functions

Function syntax
ReplaceNoCase(string, substring1, substring2 [, scope ])

See also
Find, REFind, Replace, ReplaceList, REReplace

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string (or variable that contains one) within which to replace substring.</td>
</tr>
<tr>
<td>substring1</td>
<td>String (or variable that contains one) to replace, if found.</td>
</tr>
<tr>
<td>substring2</td>
<td>String (or variable that contains one) that replaces substring1.</td>
</tr>
</tbody>
</table>
| scope     | • one: replaces the first occurrence (default).  
           | • all: replaces all occurrences. |

Example
<h3>ReplaceNoCase Example</h3>
<p>The ReplaceNoCase function returns <i>string</i> with <i>substring1</i> replaced by <i>substring2</i> in the specified scope. The search/replace is case-insensitive.

<cfif IsDefined("FORM.MyString")>
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>
<p>You wanted to replace the substring <cfoutput>#FORM.MySubstring1#</cfoutput>
   with the substring <cfoutput>#FORM.MySubstring2#</cfoutput>.  
<p>The result: <cfoutput>#ReplaceNoCase(FORM.myString, FORM.MySubstring1, FORM.mySubString2)#</cfoutput>
</cfif>

REReplace

Description
Uses a regular expression (RE) to search a string for a string pattern and replace it with another. The search is case sensitive.
Returns
If the `scope` parameter is set to `one`, returns a string with the first occurrence of the regular expression replaced by the value of `substring`.

If the `scope` parameter is set to `all`, returns a string with all occurrences of the regular expression replaced by the value of `substring`.

If the function finds no matches, it returns a copy of the string unchanged.

Category
String functions

Function syntax
```plaintext
REReplace(string, reg_expression, substring [, scope ])
```

See also
`REFind`, `Replace`, `ReplaceList`, `REReplaceNoCase`

History
ColdFusion MX: Added supports for the following special codes in a replacement substring, to control case conversion:

- \u - uppercase the next character
- \l - lowercase the next character
- \U - uppercase until \E
- \L - lowercase until \E
- \E - end \U or \L

For more information on new features, see `REFind`.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>A string or a variable that contains one. String within which to search.</td>
</tr>
<tr>
<td><code>reg_expression</code></td>
<td>Regular expression to replace. The search is case sensitive.</td>
</tr>
<tr>
<td><code>substring</code></td>
<td>A string or a variable that contains one. Replaces <code>reg_expression</code>.</td>
</tr>
</tbody>
</table>
| `scope`       | • `one`: replaces the first occurrence (default).  
                | • `all`: replaces all occurrences. |

Usage
For details on using regular expressions, see Using Regular Expressions in Functions in the Developing ColdFusion Applications.
Example
<p>The REReplace function returns &lt;i&gt;string&lt;/i&gt; with a regular expression replaced with &lt;i&gt;substring&lt;/i&gt; in the specified scope. Case-sensitive search.
<p>REReplace("CABARET","C|B","G","ALL"):  
<cfoutput>#REReplace("CABARET","C|B","G","ALL")#</cfoutput>  
REReplace("CABARET","[A-Z]","G","ALL"):  
<cfoutput>#REReplace("CABARET","[A-Z]","G","ALL")#</cfoutput>  
REReplace("I love jellies","jell(y|ies)","cookies"):  
<cfoutput>#REReplace("I love jellies","jell(y|ies)","cookies")#</cfoutput>  
REReplace("I love jelly","jell(y|ies)","cookies"):  
<cfoutput>#REReplace("I love jelly","jell(y|ies)","cookies")#</cfoutput>

REReplaceNoCase

Description
Uses a regular expression to search a string for a string pattern and replace it with another. The search is case-insensitive.

Returns
- If scope = "one": returns a string with the first occurrence of the regular expression replaced by the value of substring.
- If scope = "all": returns a string with all occurrences of the regular expression replaced by the value of substring.
- If the function finds no matches: returns a copy of the string, unchanged.

Category
String functions

Function syntax
REReplaceNoCase(string, reg_expression, substring [, scope ])

See also
REFind, REFindNoCase, Replace, ReplaceList

History
ColdFusion MX: Changed behavior: this function inserts the following special characters in regular expression replacement strings, to control case conversion: \u, \U, \l, \L, and \E. If any of these strings is present in a ColdFusion 5 application, insert a backslash before it (for example, change "\u" to "\\u").

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
</tbody>
</table>
Usage
For details on using regular expressions, see Using Regular Expressions in Functions in the Developing ColdFusion Applications.

Example
<p>The REReplaceNoCase function returns &lt;i&gt;string&lt;/i&gt; with a regular expression replaced with &lt;i&gt;substring&lt;/i&gt; in the specified scope. This is a case-insensitive search.
<p>REReplaceNoCase("cabaret","C|B","G","ALL"):  
<cfoutput>#REReplaceNoCase("cabaret","C|B","G","ALL")#</cfoutput>
<p>REReplaceNoCase("cabaret","[A-Z]","G","ALL"):  
<cfoutput>#REReplaceNoCase("cabaret","[A-Z]","G","ALL")#</cfoutput>
<p>REReplaceNoCase("I LOVE JELLIES","jell(y|ies)","cookies"):  
<cfoutput>#REReplaceNoCase("I LOVE JELLIES","jell(y|ies)","cookies")#</cfoutput>
<p>REReplaceNoCase("I LOVE JELLY","jell(y|ies)","cookies"):  
<cfoutput>#REReplaceNoCase("I LOVE JELLY","jell(y|ies)","cookies")#</cfoutput>

RestDeleteApplication

Description
Unregisters the directory path if it is already registered.

Returns
Nothing

Syntax
RestDeleteApplication("dirPath")

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirPath</td>
<td>Required. Path to the directory to be unregistered. If the path is not valid, it results in an error.</td>
</tr>
</tbody>
</table>

Example
<cfset RestDeleteApplication("C:/ColdFusion10/cfusion/wwwroot/restexample/")>
RestSetResponse

Description
Sets the custom responses.

Syntax
restSetResponse(response)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>response</td>
<td>A struct that contains the response details.</td>
</tr>
</tbody>
</table>

Example

```cfm
<cffunction name="create" httpMethod="POST" produces="application/xml">
   <cfargument name="id" type="numeric" argtype="FormParam">
   <cfargument name="name" type="String" argtype="FormParam">
   <!--- create the customer. --->
   <cfset response=structNew()>
   <cfset response.status=201>
   <cfset response.content="<customer id="&id&"><name>"&name&"</name></customer>">
   <cfset response.headers=structNew()>
   <cfset response.headers.location="http://localhost:8500/rest/CustomerService/customers/123">
   restSetResponse(response);
</cffunction>
```

RestInitApplication

Description
Registers the directory path with the service mapping provided. If no service mapping is provided, the application name is used. If the rest application is already registered, it is refreshed.

Returns
Nothing

Syntax

RestInitApplication( "dirPath" [, "serviceMapping"] )

Properties

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirPath</td>
<td>Required. Path to the directory to be registered.</td>
</tr>
<tr>
<td>serviceMapping</td>
<td>Optional. Alternate string to be used for application name while calling the REST service.</td>
</tr>
</tbody>
</table>

Example

```cfm
<cfset RestInitApplication("C:/ColdFusion10/cfusion/wwwroot/restexample/", "restexample")>
```
Reverse

Description
Reverses the order of items, such as the characters in a string or the digits in a number.

Returns
A copy of string, with the characters in reverse order.

Category
String functions

Function syntax
Reverse(string)

See also
Left, Mid, Right

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

Usage
You can call this function on a number with code such as the following:

```coldfusion
<cfoutput>reverse(6*2) equals #reverse(6*2)#<cfoutput>
```

This code outputs the following:

```coldfusion
reverse(6*2) equals 21
```

Example

```coldfusion
<h3>Reverse Example</h3>

<p>Reverse returns your string with the positions of the characters reversed.
<cfif IsDefined("FORM.myString")>
    <cfif FORM.myString is not ">
        <p>Reverse returned:
        <cfoutput>#Reverse(FORM.myString)#</cfoutput>
    </cfif>
<cfelse>
    <p>Please enter a string to be reversed.
</cfif>
</cfif>

<form action = "reverse.cfm">
    <p>Enter a string to be reversed:
    <input type = "Text" name = "MyString">
    <p><input type = "Submit" name = "">
</form>
```

Last updated 7/9/2012
**Right**

**Description**
Gets a specified number of characters from a string, beginning at the right.

Returns the specified number of characters from the end (or right side) of the specified string.

**Returns**
- If the length of the string is greater than or equal to count, the rightmost count characters of the string.
- If count is greater than the length of the string, the whole string.
- If count is greater than 1, and the string is empty, an empty string.

**Category**
String functions

**Function syntax**
Right(string, count)

**See also**
Left, Mid, Reverse

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one.</td>
</tr>
<tr>
<td>count</td>
<td>A positive integer that specifies the maximum number of characters to return.</td>
</tr>
</tbody>
</table>

**Example**
```cfml
<!--- Simple Right Example--->
<cfoutput>
#Right("See the quick red fox jump over the fence", 9)#
<br>
#Right("ColdFusion", 6)#
</cfoutput>

<!--- Right Example using form input --->
<h3>Right Example</h3>
<cfif IsDefined("Form.MyText")>
    <cfif Len(FORM.myText) LTE FORM.RemoveChars>
        <cfoutput><p style="color: red; font-weight: bold">Your string #FORM.myText# only has #Len(FORM.myText)# characters. You cannot output the #FORM.removeChars# rightmost characters of this string because it is not long enough.</p></cfoutput>
    <cfelse>
        <cfoutput>Your original string: <strong>#FORM.myText#</strong>
        <p>Your changed string, showing only the <strong>#FORM.removeChars#</strong> rightmost characters: <strong>#right(FORM.myText, FORM.removeChars)#</strong></p>
    </cfelse>
</cfif>
```

Last updated 7/9/2012
RJustify

Description
Right justifies characters of a string.

Returns
A copy of a string, right-justified in the specified field length.

Category
Display and formatting functions, String functions

Function syntax
RJustify(string, length)

See also
CJustify, LJustify

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string enclosed in quotation marks, or a variable that contains one.</td>
</tr>
<tr>
<td>length</td>
<td>A positive integer or a variable that contains one. Length of field in which to justify string.</td>
</tr>
</tbody>
</table>
Example
<cfparam name = "jstring" default = ">
<cfif IsDefined("FORM.justifyString")>
   <cfset jstring = rjustify(FORM.justifyString, 35)>
</cfif>
<html>
<head>
<title>RJustify Example</title>
</head>
<body>
<h3>RJustify Function</h3>
<p>Enter a string. It will be right justified within the sample field</p>
<form action = "rjustify.cfm">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>
size = 35 name = "justifyString"</p>
<p><input type = "Submit" name = "" > <input type = "reset"/>
</form>

Round

Description
Rounds a number to the closest integer.

Returns
An integer.

Category
Mathematical functions

Function syntax
Round(number)

See also
Ceiling, Fix, Int

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Number to round</td>
</tr>
</tbody>
</table>

Usage
Use this function to round a number. This function rounds numbers that end with .5 up to the nearest integer. It rounds 3.5 to 4 and -3.5 to -3.
Example

Example Code:

```html
<h3>Round Example</h3>
<p>This function rounds a number to the closest integer.</p>
<ul>
  <li>Round(7.49) : <cfoutput>#Round(7.49)#</cfoutput></li>
  <li>Round(7.5) : <cfoutput>#Round(7.5)#</cfoutput></li>
  <li>Round(-10.775) : <cfoutput>#Round(-10.775)#</cfoutput></li>
  <li>Round(-35.5) : <cfoutput>#Round(-35.5)#</cfoutput></li>
  <li>Round(35.5) : <cfoutput>#Round(35.5)#</cfoutput></li>
  <li>Round(1.2345*100)/100 : <cfoutput>#Round(1.2345*100)/100#</cfoutput></li>
</ul>
```

**RTrim**

**Description**

Removes spaces from the end of a string.

**Returns**

A copy of `string`, after removing trailing spaces.

**Category**

String functions

**Function syntax**

`RTrim(string)`

**See also**

`LTrim`, `Trim`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>
Example

<h3>RTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string:"#FORM.myText#"  
Your string:"#RTrim(FORM.myText)#" (right trimmed) 
</pre>
</cfoutput>
</cfif>

<form action = "Rtrim.cfm" method="post">
<p>Enter some text. It will be modified by Rtrim to remove spaces from the right.</p>
<p><input type = "Text" name = "myText" value = "TEST ">
</p>
</form>

Functions

Second

Description
Extracts the ordinal for the second from a date/time object.

Returns
An integer in the range 0–59.

Category
Date and time functions

Function syntax
Second(date)

See also
DatePart, Hash, Minute

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object</td>
</tr>
</tbody>
</table>

Usage
When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.
Example
<!--- This example shows the use of Hour, Minute, and Second --->
<h3>Second Example</h3>
<cfoutput>
The time is currently #TimeFormat(Now())#. We are in hour #Hour(Now())#, Minute #Minute(Now())# and Second #Second(Now())# of the day.
</cfoutput>

SendGatewayMessage

Description
Sends an outgoing message through a ColdFusion event gateway.

Returns
String. The value returned depends on the gateway type.

Category
Extensibility functions

Function syntax
SendGatewayMessage(gatewayID, data)

See also
GetGatewayHelper; IM gateway message sending commands, SMS Gateway CFEvent structure and commands, CFML event gateway SendGatewayMessage data parameter, and Sending a message using the SendGatewayMessage function in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayID</td>
<td>Identifier of the gateway to send the message. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion Administrator Event Gateways section’s Gateways page.</td>
</tr>
<tr>
<td>data</td>
<td>A ColdFusion structure. The contents of the structure depend on the event gateway type, but typically include a MESSAGE field that contains the message to send and a field that contains the destination address.</td>
</tr>
</tbody>
</table>

Usage
The SendGatewayMessage function calls the specified gateway’s outgoingMessage method. The value returned by the function depends on the gateway type. The following table describes the return values for standard ColdFusion gateway types:
Example
The following example uses an instance of the CFML gateway to log messages asynchronously to a file. To use this example, configure an instance of the CFML gateway with the name “Asynch Logger” in the ColdFusion Administrator. This gateway instance must use a CFC that takes the message and logs it. For sample CFC code, see Using the CFML event gateway for asynchronous CFCs in the Developing ColdFusion Applications.

Sending an event to the CFML event gateway that is registered in the ColdFusion Administrator as Asynch Logger.<br>
<cfscript>
status = false;
props = structNew();
props.message = "Replace me with a variable with data to log";
status = SendGatewayMessage("Asynch Logger", props);
if (status IS True) WriteOutput('Event Message "#props.message#" has been sent.');
</cfscript>

SerializeJSON

Description
Converts ColdFusion data into a JSON (JavaScript Object Notation) representation of the data.

Returns
A string that contains a JSON representation of the parameter value.

Category
Conversion functions

Syntax
SerializeJSON(var[, serializeQueryByColumns])

See also

History
ColdFusion 8: Added function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>var</td>
<td>A ColdFusion data value or variable that represents one.</td>
</tr>
<tr>
<td>serializeQueryByColumns</td>
<td>A Boolean value that specifies how to serialize ColdFusion queries.</td>
</tr>
<tr>
<td></td>
<td>• false (the default): Creates an object with two entries: an array of column names and an array of row arrays. This format is required by the HTML format cfgrid tag.</td>
</tr>
<tr>
<td></td>
<td>• true: Creates an object that corresponds to WDDX query format.</td>
</tr>
<tr>
<td></td>
<td>For more information, see the Usage section.</td>
</tr>
</tbody>
</table>

Usage

This function is useful for generating JSON format data to be consumed by an Ajax application.

The `SerializeJSON` function converts ColdFusion dates and times into strings that can be easily parsed by the JavaScript `Date` object. The strings have the following format:

MonthName, DayNumber Year Hours:Minutes:Seconds

The `SerializeJSON` function converts the ColdFusion date time object for October 3, 2007 at 3:01 PM, for example, into the JSON string "October, 03 2007 15:01:00".

The `SerializeJSON` function with a `serializeQueryByColumns` parameter (the default) converts a ColdFusion query into a row-oriented JSON Object with the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMNS</td>
<td>An array of the names of the columns.</td>
</tr>
<tr>
<td>DATA</td>
<td>A two-dimensional array, where:</td>
</tr>
<tr>
<td></td>
<td>• Each entry in the outer array corresponds to a row of query data.</td>
</tr>
<tr>
<td></td>
<td>• Each entry in the inner arrays is a column field value in the row, in the same order as the COLUMNS array entries.</td>
</tr>
</tbody>
</table>

For example, the `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `false` converts a ColdFusion query with two columns, City, and State, and two rows of data into following format:

{"COLUMNS": ["CITY", "STATE"], "DATA": [["Newton", "MA"], ["San Jose", "CA"]]

The `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `true` converts a ColdFusion query into a column-oriented JSON Object that is equivalent to the WDDX query representation. The JSON Object has three elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWCOUNT</td>
<td>The number of rows in the query.</td>
</tr>
<tr>
<td>COLUMNS</td>
<td>An array of the names of the columns.</td>
</tr>
<tr>
<td>DATA</td>
<td>An Object with the following:</td>
</tr>
<tr>
<td></td>
<td>• The keys are the query column names</td>
</tr>
<tr>
<td></td>
<td>• The values are arrays that contain the column data</td>
</tr>
</tbody>
</table>

The `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `true` converts a ColdFusion query with two columns, City, and State, and two rows of data into following format:
Note: The SerializeJSON function generates an error if you try to convert binary data into JSON format.

The SerializeJSON function converts all other ColdFusion data types to the corresponding JSON types. It converts structures to JSON Objects, arrays to JSON Arrays, numbers to JSON Numbers, and strings to JSON Strings.

Note: ColdFusion internally represents structure key names using all-uppercase characters, and, therefore, serializes the key names to all-uppercase JSON representations. Any JavaScript that handles JSON representations of ColdFusion structures must use all-uppercase structure key names, such as $CITY or $STATE. You also use the all-uppercase names $COLUMNS and $DATA as the keys for the two arrays that represent ColdFusion queries in JSON format.

Example
This example creates a JSON-format data feed with simple weather data for two cities. The data feed is in the form of a JavaScript application that consists of a single function call that has a JSON Object as its parameter. The example code does the following:

1 Creates a query object with two rows of weather data. Each row has a city, the current temperature, and an array of forecast structures, with each with the high, low, and weather prediction for one day. Normally, datasource provides the data; to keep the example simple, the example uses the same prediction for all cities and days.
2 Converts the query to a JSON format string and surrounds it in a JavaScript function call.
3 Writes the result to the output.

If you view this page in your browser, you see the resulting JavaScript function and JSON parameter. To use the results of this page in an application, put this file and the example for the DeserializeJSON function in an appropriate location under your ColdFusion web root, replace the URL in the DeserializeJSON example code with the correct URL for this page, and run the DeserializeJSON example.
<!--- Generate a clean feed by suppressing white space and debugging information. --->
<cfprocessingdirective suppresswhitespace="yes">
<cfsetting showdebugoutput="no">
<!--- Generate the JSON feed as a JavaScript function. --->
<cfcontent type="application/x-javascript">
<cfscript>
// Construct a weather query with information on cities.
// To simplify the code, we use the same weather for all cities and days.
// Normally this information would come from a data source.
weatherQuery = QueryNew("City, Temp, Forecasts");
QueryAddRow(weatherQuery, 2);
theWeather=StructNew();
theWeather.High=73;
theWeather.Low=53;
theWeather.Weather="Partly Cloudy";
weatherArray=ArrayNew(1);
for (i=1; i<=5; i++) weatherArray[i]=theWeather;
querySetCell(weatherQuery, "City", "Newton", 1);
querySetCell(weatherQuery, "Temp", "65", 1);
querySetCell(weatherQuery, "Forecasts", weatherArray, 1);
querySetCell(weatherQuery, "City", "San Jose", 2);
querySetCell(weatherQuery, "Temp", 75, 2);
querySetCell(weatherQuery, "Forecasts", weatherArray, 2);

// Convert the query to JSON.
// The SerializeJSON function serializes a ColdFusion query into a JSON structure.
theJSON = SerializeJSON(weatherQuery);

// Wrap the JSON object in a JavaScript function call.
// This makes it easy to use it directly in JavaScript.
writeOutput("onLoad( "&theJSON&" )");
</cfscript>
</cfprocessingdirective>

SessionInvalidate

Description
Invalidates or cleans up the current session.

Note: The sessionInvalidate() method does not invalidate the underlying J2EE session.

Returns
None

Category
Display and formatting functions

Syntax
sessionInvalidate()
See also

SessionRotate

History
ColdFusion 10: Added this function.

Parameters
None

Usage
Use this function to invalidate the existing session.

Example
Application.cfc

```cfcomponent>
<cfset this.sessionManagement = true />
<cfset this.name = "session_app" />
</cfcomponent>

sessionInvalidate.cfm

```cif isDefined("url.invalidate") >
  <cfset sessionInvalidate() />
</cif>
```cif isDefined("url.name") >
  <cfset session.name = url.name />
</cif>
```cifdump var="#session#" label="SESSION">
<cfoutput>
<a href="sessionInvalidate.cfm?name=BOB">Set session.name = BOB</a> <br/>
<a href="sessionInvalidate.cfm?invalidate=TRUE">Invalidate the session</a>
</cfoutput>

SessionRotate

Description
Renews the session when started. For example, you want to generate a new session after a successful login. It prevents session attacks, because the session before and after a successful authentication is different.

The method,

• Creates a session
• Copies the data from the old session to the new session
• Invalidates the old session
• Invalidates or overwrites the old session cookies
• Creates new session cookies if the old session cookies are invalidated
• Copies and updates client storage data to new session keys
Returns
None

Category
Display and formatting functions

Syntax
SessionRotate()

See also
SessionInvalidate

History
ColdFusion 10: Added this function.

Parameters
None

Usage
Use this function to rotate the session.

Example
Application.cfc
<cfcomponent>
<cfset this.sessionManagement = true />
<cfset this.name = "session_app" />
</cfcomponent>

sessionRotate.cfm
<cfif isDefined("url.rotate") >
   <cfset sessionRotate()/>
<cfif>
<cfif isDefined("url.name") >
    <cfset session.name = url.name />
<cfif>
<cfdump var="#session#" label="SESSION">
<cfoutput>
<a href="sessionRotate.cfm?name=BOB">Set session.name = BOB </a> <br/>
<a href="sessionRotate.cfm?rotate=TRUE">Rotate the session</a>
</cfoutput>

sessionGetMetaData

Description
Returns meta data related to the current session.

Returns
Meta data structure related to the current session
### sessionGetMetaData

**Syntax**

```
sessionGetMetaData()
```

**History**

ColdFusion 10: Added this function.

**Example**

```
<cfset metaData = sessionGetMetaData()>
```

### SetEncoding

**Description**

Sets the character encoding (character set) of Form and URL scope variable values; used when the character encoding of the input to a form, or the character encoding of a URL, is not in UTF-8 encoding.

**Returns**

None

**Category**

International functions, System functions

**Function syntax**

```
SetEncoding(scope_name, charset)
```

**See also**

GetEncoding, cfcontent, cfprocessingdirective, URLDecode, URLEncodedFormat; Locales in the Developing ColdFusion Applications

**History**

ColdFusion MX: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scope_name</td>
<td>- url&lt;br&gt;- form</td>
</tr>
<tr>
<td>charset</td>
<td>The character encoding in which text in the scope variables is encoded. The following list includes commonly used values:&lt;br&gt;- utf-8&lt;br&gt;- iso-8859-1&lt;br&gt;- windows-1252&lt;br&gt;- us-ascii&lt;br&gt;- shift_jis&lt;br&gt;- iso-2022-jp&lt;br&gt;- euc-jp&lt;br&gt;- euc-kr&lt;br&gt;- big5&lt;br&gt;- euc-cn&lt;br&gt;- utf-16</td>
</tr>
</tbody>
</table>

Usage

Use this function when the character encoding of the input to a form or the character encoding of a URL is not in UTF-8 encoding. For example, Traditional Chinese characters are often in Big5 encoding. This function resets URL and Form variables, so you should call it before using these variables (typically, in the Application.cfm page or Application.cfc file). Calling this function first also avoids interpreting the characters of the variables incorrectly.

For more information on character encoding, see the following web pages:

- [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encoding and the web, and has several useful links.
- [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- [java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html](http://java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html) lists the character encoding that Java 1.4.1, and therefore the default ColdFusion configuration, can interpret. If you use a JVM that does not conform to the Sun Java 2 Platform, Standard Edition, v 1.4.1, the supported locales may differ. The list uses Java internal names, not the IANA character encoding names that you normally use in the SetEncoding charset parameter and other ColdFusion attributes and parameters. Java automatically converts standard IANA names to its internal names as needed.
Example

```html
<!--- This example sends and interprets the contents of two fields as big5 encoded text. Note that the form fields are received as URL variables because the form uses the GET method. --->

<form action="#cgi.script_name#" method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type='Submit' value='Submit'>
</form>

<cfif IsDefined("URL.xxx")>
  <cfscript>
    SetEncoding("url", "big5");
    WriteOutput("URL.XXX is " & URL.xxx & "<br>");
    WriteOutput("URL.YYY is " & URL.yyy & "<br>");
    theEncoding = GetEncoding("URL");
    WriteOutput("The URL variables were decoded using '" & theEncoding & "' encoding.\n\n" & theEncoding & "' encoding.");
  </cfscript>
</cfif>
```

SetLocale

Description
Sets the country/language locale for ColdFusion processing and the page returned to the client. The locale value determines the default format of date, time, number, and currency values, according to language and regional conventions.

Returns
The locale value prior to setting the new locale, as a string.

Category
International functions, System functions

Function syntax
`SetLocale(new_locale)`

See also
`GetHttpTimeString, GetLocale, GetLocaleDisplayName`; Locales in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added support for all locales supported by the ColdFusion Java runtime.

ColdFusion MX:
- Changed formatting behavior: this function might return a different value than in earlier releases. This function uses Java standard locale determination and formatting rules on all platforms.
• Deprecated the Spanish (Mexican) locale option. It might not work, and it might cause an error, in later releases.
• Changed the Spanish (Modern) option: it now sets the locale to Spanish (Standard).

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_locale</td>
<td>The name of a locale; for example, &quot;English (US)&quot;</td>
</tr>
</tbody>
</table>

Usage

You can specify any locale name that is listed in the Server.Coldfusion.SupportedLocales variable. This variable is a comma-delimited list of all locale names supported by the JVM, plus the locale names that were required by ColdFusion prior to ColdFusion MX 7.

The following locale names were used in ColdFusion releases through ColdFusion MX 6.1, and continue to be supported. If you use any of these values in the SetLocale function, the GetLocale function returns the name you set, not the corresponding Java locale name.

<table>
<thead>
<tr>
<th>Chinese (China)</th>
<th>French (Belgian)</th>
<th>Korean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chinese (Hong Kong)</td>
<td>French (Canadian)</td>
<td>Norwegian (Bokmal)</td>
</tr>
<tr>
<td>Chinese (Taiwan)</td>
<td>French (Standard)</td>
<td>Norwegian (Nynorsk)</td>
</tr>
<tr>
<td>Dutch (Belgian)</td>
<td>French (Swiss)</td>
<td>Portuguese (Brazilian)</td>
</tr>
<tr>
<td>Dutch (Standard)</td>
<td>German (Austrian)</td>
<td>Portuguese (Standard)</td>
</tr>
<tr>
<td>English (Australian)</td>
<td>German (Standard)</td>
<td>Spanish (Modern)</td>
</tr>
<tr>
<td>English (Canadian)</td>
<td>German (Swiss)</td>
<td>Spanish (Standard)</td>
</tr>
<tr>
<td>English (New Zealand)</td>
<td>Italian (Standard)</td>
<td>Swedish</td>
</tr>
<tr>
<td>English (UK)</td>
<td>Italian (Swiss)</td>
<td></td>
</tr>
<tr>
<td>English (US)</td>
<td>Japanese</td>
<td></td>
</tr>
</tbody>
</table>

ColdFusion determines the locale value as follows:

• By default, ColdFusion uses the JVM locale, and the default JVM locale is the operating system locale. You can set JVM locale value explicitly in ColdFusion in the ColdFusion Administrator Java and JVM Settings page JVM Arguments field; for example:
  -Duser.language=de -Duser.region=DE.
• A locale set using the SetLocale function persists for the current request or until it is reset by another SetLocale function in the request.
• If a request has multiple SetLocale functions, the current locale setting affects how locale-sensitive ColdFusion tags and functions, such as the functions that start with LS format data. The last SetLocale function that ColdFusion processes before sending a response to the requestor (typically the client browser) determines the value of the response Content-Language HTTP header. The browser that requested the page displays the response according to the rules for the language specified by the Content-Language header.
• ColdFusion ignores any SetLocale functions that follow a cfflush tag.

Because this function returns the previous locale setting, you can save the original locale value. You can restore the original locale by calling SetLocale again with the saved variable. For example, the following line saves the original locale ins a Session variable:
<cfset Session.oldlocale = SetLocale(newLocale)>

The variable `server.ColdFusion.SupportedLocales` is initialized at startup with a comma-delimited list of the locales that ColdFusion and the operating system support. If you call `SetLocale` with a locale that is not in the list, the call generates an error.

*Note*: ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

**Example**

```html
<h3>SetLocale Example</h3>
<p>SetLocale sets the locale to the specified new locale for the current session.
A locale encapsulates the set of attributes that govern the display and formatting of date, time, number, and currency values.
<p>The locale for this system is `<cfoutput>#GetLocale()#</cfoutput>`
<p>`<cfoutput>I:the old locale was #SetLocale("English (UK)")#</cfoutput>`
<p>The locale is now `<cfoutput>#GetLocale()#</cfoutput>`
```

### SetProfileString

**Description**

Sets the value of a profile entry in an initialization file.

**Returns**

An empty string, upon successful execution; otherwise, an error message.

**Category**

System functions

**Function syntax**

```text
SetProfileString(iniPath, section, entry, value)
```

**See also**

`GetProfileSections`, `GetProfileString`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iniPath</td>
<td>Absolute path of initialization file</td>
</tr>
<tr>
<td>section</td>
<td>Section of the initialization file in which the entry is to be set</td>
</tr>
<tr>
<td>entry</td>
<td>Name of the entry to set</td>
</tr>
<tr>
<td>value</td>
<td>Value to which to set the entry</td>
</tr>
</tbody>
</table>
Example
<h3>SetProfileString Example</h3>
This example uses SetProfileString to set the time-out value in an initialization file. Enter the full path of your initialization file, specify the time-out value, and submit the form.

<!--- This section checks whether the form was submitted. If so, this section sets the initialization path and time-out value to the path and time-out value specified in the form --->
<cfif Isdefined("Form.Submit")>

<cfset IniPath = FORM.iniPath>
<cfset Section = "boot loader">
<cfset MyTimeout = FORM.MyTimeout>
<cfset timeout = GetProfileString(IniPath, Section, "timeout")>

<cfif timeout Is Not MyTimeout>
<cfif MyTimeout Greater Than 0>

<hr size = "2" color = ":0000A0">
<p>Setting the time-out value to <cfoutput>#MyTimeout#</cfoutput></p>
</cfif>
<cfset code = SetProfileString(IniPath, Section, "timeout", MyTimeout)>
<p>Value returned from SetProfileString: <cfoutput>#code#</cfoutput></p>
<cfelse>

<hr size = "2" color = "red">
<p>The time-out value should be greater than zero in order to provide time for user response.</p>
</cfif>
</cfif>
<p>The time-out value in your initialization file is already <cfoutput>#MyTimeout#</cfoutput>.</p>
</cfif>
<cfset timeout = GetProfileString(IniPath, Section, "timeout")>
<cfset default = GetProfileString(IniPath, Section, "default")>
<h4>Boot Loader</h4>
<p>The time-out is set to: <cfoutput>#timeout#</cfoutput>.</p>
<p>Default directory is: <cfoutput>#default#</cfoutput>.</p>
SetVariable

**Description**
Sets a variable in the `name` parameter to the value of the `value` parameter.

**Returns**
The new value of the variable.

**Category**
Dynamic evaluation functions

**Function syntax**
SetVariable(`name`, `value`)

**See also**
DE, Evaluate, IIf

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Variable name</td>
</tr>
<tr>
<td>value</td>
<td>A string, the name of a string, or a number</td>
</tr>
</tbody>
</table>

**Usage**
You can use direct assignment statements in place of this function to set values of dynamically named variables. To do so, put the dynamically named variable in quotation marks and number signs (#); for example:

```cfset DynamicVar2 = "ABD">
<cfset "#DynamicVar2#" = "Test Value2">
```
Also, the following lines are equivalent:

```cfml
<cfset "myVar#i#" = myVal>
SetVariable("myVar & i", myVal)
```

For more information, see Using Expressions and Number Signs in the Developing ColdFusion Applications.

**Example**

```cfml
<h3>SetVariable Example</h3>

```cif```
```
<cfif IsDefined("FORM.myVariable")>
<br>--- strip out url, client., cgi.. session., caller. --->
<br>--- This example only lets you set form variables --->
<cfset myName = ReplaceList(FORM.myVariable,
    "url,client,cgi,session,caller", "FORM,FORM,FORM,FORM,FORM")>
<cfset temp = SetVariable(myName, FORM.myValue)>
<cfset varName = myName>
<cfset varNameValue = Evaluate(myName)>
<cfoutput>
<p>Your variable, #varName#
<p>The value of #varName# is #varNameValue#
</cfoutput>
```

```cfi```

**Sgn**

**Description**

Determines the sign of a number.

**Returns**

- 1, if *number* is positive.
- 0, if *number* is 0.
- -1, if *number* is negative.

**Category**

Mathematical functions

**Function syntax**

`Sgn(number)`

**See also**

*Abs*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A number</td>
</tr>
</tbody>
</table>
Example

<h3>Sgn Example</h3>
<p>Sgn determines the sign of a number. Returns 1 if number is positive; 0 if number is 0; -1 if number is negative.</p>
<p>Sgn(14): <cfoutput>#Sgn(14)#</cfoutput></p>
<p>Sgn(21-21): <cfoutput>#Sgn(21-21)#</cfoutput></p>
<p>Sgn(-0.007): <cfoutput>#Sgn(-0.007)#</cfoutput></p>

Sin

Description
Calculates the sine of an angle that is entered in radians.

Returns
A number; the sine of the angle.

Category
Mathematical functions

Function syntax
Sin(number)

See also
ASin, Cos, ACos, Tan, Atn, Pi

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Angle, in radians for which to calculate the sine.</td>
</tr>
</tbody>
</table>

Usage
The range of the result is -1 to 1.

To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.

Note: Because the function uses floating point arithmetic, it returns a very small number (such as 6.123239574E-17) for angles that should produce 0. To test for a 0 value, check whether the value is less than 0.0000000000001.
Example

```cfml
Example</h3>
<!---- Calculate sine if form has been submitted ---->
<cfif IsDefined("FORM.sinNum")>
<!---- Make sure input is a number ---->
  <cfif IsNumeric(#FORM.sinNum#)>
<!---- Convert degrees to radians, call the Sin function. ---->
  <cfset sinValue=#Sin((Form.sinNum * PI()) / 180)#>
<!---- 0.00000000000001 is the function's precision limit.
If absolute value of returned sine value is
less, set result to 0 ---->
  <cfif Abs(sinValue) LT 0.00000000000001>
    <cfset sinValue=0>
  </cfif>
  <cfoutput>
    Sin(#FORM.sinNum#) = #sinValue#<br>  
  </cfoutput>
</cfif>
</cfoutput>
</cfif>
<!---- If input is not a number, show an error message ---->
</h4>You must enter a numeric angle in degrees.</h4>
</cfif>
</cfif>
<form action="#CGI.script_name#" method="post">
Enter an angle in degrees to get its sine:
<br><input type = "Text" name = "sinNum" size = "15">
<br><br>
<input type = "Submit" name = "">&nbsp;&nbsp;
<input type = "RESET">
</form>

Sleep

Description
Causes the current thread to stop processing for a specified period of time.

Returns
Does not return a value.

Category
System functions

Syntax
```cfml
Sleep(duration)
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>duration</td>
<td>Time, in milliseconds, to stop processing the thread.</td>
</tr>
</tbody>
</table>

Description

The `Sleep` function is useful when one thread must wait until another thread performs some action. The thread that must wait uses the `Sleep` function to stop processing for a time, and, when it awakens, checks to see if the other thread is ready. If it is not, the thread can sleep again. This type of action is useful, for example, when one thread must wait for another thread to complete initialization operations that apply to both threads.

The `Sleep` function behaves identically to the `cfthread` tag with an `action` attribute value of `sleep`.

Example

The following example has two threads. The second thread (threadB) uses the `Sleep` function to ensure that the first thread (threadA) has completed before it starts processing.
<!--- ThreadA loops to simulate an initialization activity that might take time. --->
<cfthread name="threadA" action="run">
  <cfset thread.j=1>
  <cfloop index="i" from="1" to="99999">
    <cfset thread.j=thread.j+1>
  </cfloop>
</cfthread>

<!--- ThreadB loops while threadA is not finished, sleeping for 1/2 second each time. --->
<cfthread name="threadB" action="run">
  <cfscript>
    thread.sleepTimes=0;
    thread.initialized=false;
    while ((threadA.Status != "COMPLETED") && (threadA.Status != "TERMINATED")) {
      sleep(500);
      thread.sleepTimes++;
    }
    // Only do the post-initialization code if the threadA completed.
    If (threadA.Status == "COMPLETED") {
      thread.initialized=true;
      // Post-initialization code would go here.
    }
  </cfscript>
</cfthread>

<!Join the threads. --->
<cfthread action="join" name="threadA,threadB" timeout="10000"/>

<!--- Display the thread information. --->
<!--- Different actions might be taken based on the thread status information. --->
<cfoutput>
  threadA index value: #threadA.j#<br />
  threadA status: #threadA.Status#<br />
  threadB status: #threadB.Status#<br />
  threadB sleepTimes: #threadB.sleepTimes#<br />
  threadB initialized: #threadB.initialized#<br />
</cfoutput>

SpanExcluding

Description
Gets characters from a string, from the beginning and stops when it encounters any of the characters in a specified set of characters. The search is case sensitive.

For example, SpanExcluding("MyString", "inS") excludes "String" from "MyString" and returns "My". Because, in the string "MyString", after "My", the character 'S' (which is present in the second string "inS") is encountered.

Returns
A string; characters from string, from the beginning to a character that is in set.

Category
String functions

Last updated 7/9/2012
Function syntax
SpanExcluding(string, set)

See also
GetToken, SpanIncluding; Caching parts of ColdFusion pages in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>set</td>
<td>A string or a variable that contains one. Must contain one or more characters</td>
</tr>
</tbody>
</table>

Example
<h3>SpanExcluding Example</h3>

```<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string up until one of the characters in the set is:
<cfoutput>#SpanExcluding(FORM.myString, FORM.mySet)#</cfoutput>
</cfif>

<p>Returns all characters from string from beginning to a character from the set of characters. The search is case-sensitive.

<form method = post action = "spanexcluding.cfm">
<p>Enter a string:
<br><input type = "Text" name = "myString" value = "Hey, you!">
<p>And a set of characters:
<br><input type = "Text" name = "mySet" value = "Ey">
<br><input type = "Submit" name = "">
</form>```

SpanIncluding

Description
Gets characters from a string, from the beginning and stops when it encounters any character that is not in a specified set of characters. The search is case sensitive.

For example, SpanIncluding("mystring", "mystery") returns "myst". Because, in the string "mystring", after "myst", the character 'i' (which is not present in the second string "mystery") is encountered.

Returns
A string; characters from string, from the beginning to a character that is not in set.

Category
String functions

Function syntax
SpanIncluding(string, set)
See also
GetToken, SpanExcluding; Caching parts of ColdFusion pages in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains the search string.</td>
</tr>
<tr>
<td>set</td>
<td>A string or a variable that contains a set of characters. Must contain one or more characters.</td>
</tr>
</tbody>
</table>

Example

<h3>SpanIncluding Example</h3>
<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string, until the characters in the set have been found, is: <cfoutput>#SpanIncluding(FORM.myString, FORM.mySet)#</cfoutput></cfif>
<p>Returns characters of a string, from beginning to a character that is not in set. The search is case-sensitive.

Performing a form submission:
<form action = "spanincluding.cfm" method="post">
<br>Enter a string:<br>
<br>Enter a string: <br><input type = "Text" name = "myString" value = "Hey, you!">
<br>And a set of characters:<br>
<br>And a set of characters: <br><input type = "Text" name = "mySet" value = "ey,H">
<br><input type = "Submit" name = "">
</form>

SpreadsheetAddColumn

Description
Adds a column or column data to an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetAddColumn(SpreadsheetObj, data[, startRow, startColumn, insert]);

See also
SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetAddRows, SpreadsheetDeleteColumn, SpreadsheetDeleteColumns, SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetShiftColumns
History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the column.</td>
</tr>
<tr>
<td>data</td>
<td>A comma delimited list of cell entries, one per row being added to the column.</td>
</tr>
<tr>
<td>startRow</td>
<td>This parameter is optional. The number of the row at which to start adding the column data. If insert=&quot;true&quot;, all rows in the column above the start row have empty cells. If you omit this parameter the columns are inserted starting at the first row, following the last current column, and you cannot specify a column.</td>
</tr>
<tr>
<td>startColumn</td>
<td>This parameter is optional. The number of the column in which to add the column data.</td>
</tr>
<tr>
<td>insert</td>
<td>This parameter is optional. A Boolean value specifying whether to insert a column. If false, the function replaces data in the specified column entries.</td>
</tr>
</tbody>
</table>

Usage
The spreadsheetAddColumn function can accept either two or five arguments.

You can specify the spreadsheetAddColumn function using two parameters as follows:
<cfset spreadsheetAddColumn(SpreadsheetObj,"newcol1,newcol2,newcol3")>

You can specify the spreadsheetAddColumn function using five parameters as follows:
<cfset spreadsheetAddColumn(SpreadsheetObj,"newcol1,newcol2,newcol3",2,3,false)>

Example
The following example creates an Excel spreadsheet object from a query and inserts a new column 2, with data starting at row 3. The existing columns 2 and greater increment by one.
<!--- Get the spreadsheet data as a query. --->
<cfquery
ame="courses" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
   // We need an absolute path, so get the current directory path.
   theFile = GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
   // Create a new Spreadsheet object and add the query data.
   theSheet = SpreadsheetNew("CourseData");
   SpreadsheetAddRows(theSheet, courses);
   // Insert a new second column to the sheet, with data starting in row 3.
   SpreadsheetAddColumn(theSheet,
     3, 2, true);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="#theSheet#" sheet=1
   sheetname="courses" overwrite=true>

SpreadsheetAddImage

Description
Adds an image to an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetAddImage(SpreadsheetObj, imagePath, anchor)
SpreadsheetAddImage(SpreadsheetObj, imageData, imageType, anchor)

See also
SpreadsheetAddColumn, SpreadsheetAddRow, SpreadsheetAddRows

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the column.</td>
</tr>
<tr>
<td>anchor</td>
<td>The image location, as a comma delimited list in either of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• startRow, startColumn, endRow, endColumn</td>
</tr>
<tr>
<td></td>
<td>• startXPosition, startYPosition, endXPosition, endYPositions, startRow, startColumn, endRow, endColumn</td>
</tr>
<tr>
<td></td>
<td>The first format specifies only the row and column numbers, the second also specifies the positions in the cell, using pixel X and Y coordinates relative to the cell upper left corner. If you use the first format, the image corner positions within the top left and bottom right cell are 0,0 and 0,255.</td>
</tr>
<tr>
<td>imageData</td>
<td>A ColdFusion image object.</td>
</tr>
<tr>
<td>imageFilePath</td>
<td>The absolute path to the image file.</td>
</tr>
<tr>
<td>imageType</td>
<td>The image format, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• jpg or jpeg</td>
</tr>
<tr>
<td></td>
<td>• png</td>
</tr>
<tr>
<td></td>
<td>• dib</td>
</tr>
</tbody>
</table>

Usage

Example

The following example creates a PNG format chart, puts it in a new spread sheet as rows 5-12 and column 5-10, and saves the sheet to disk.

```xml
<cfchart format="png"
    scalefrom="-100" scaleTo="100"
    gridlines="5"
    name="test">
    <cfchartseries type="line">
        <cfchartdata item="Point1" value="-50">
        <cfchartdata item="Point2" value="-25">
        <cfchartdata item="Point3" value="1">
        <cfchartdata item="Point4" value="25">
        <cfchartdata item="Point5" value="50">
        <cfchartdata item="Point6" value="75">
        <cfchartdata item="Point7" value="99">
    </cfchartseries>
</cfchart>
<cfscript>
    theDir=GetDirectoryFromPath(GetCurrentTemplatePath());
    SpreadsheetObj=SpreadsheetNew();
    SpreadsheetAddImage(SpreadsheetObj,test,"png","5,5,12,10");
</cfscript>
<cfspreadsheet action="write" name=SpreadsheetObj filename="#theDir#imagesheet.xls"
    sheetname="chart" overwrite=true>
```

Last updated 7/9/2012
SpreadsheetAddFreezePane

Description
Locks or freezes specific rows or columns in the worksheet.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetAddFreezePane(spreadsheetobj, freezcol, freezrow[, col, row])

See also
SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow,
SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the freeze pane.</td>
</tr>
<tr>
<td>freezcol</td>
<td>Specifies the column boundary of the freeze pane. The columns contained within the column boundary are frozen, while the rest of the worksheet scrolls.</td>
</tr>
<tr>
<td>freezrow</td>
<td>Specifies the row boundary of the freeze pane. The rows contained within the row boundary are frozen, while the rest of the worksheet scrolls.</td>
</tr>
<tr>
<td>col</td>
<td>This parameter is optional. The column that should appear next to the freezcol that you specify. This parameter is useful in hiding data. For example, in a worksheet, you can specify column 5 to appear immediately after column 2, and hide column 3 and column 4.</td>
</tr>
<tr>
<td>row</td>
<td>This parameter is optional. The row that should appear next to the freezrow that you specify. This parameter is useful in hiding data. For example, in a worksheet, you can specify row 10 to appear immediately after row 7, and hide row 8 and row 9.</td>
</tr>
</tbody>
</table>

Usage
You can keep an area of the worksheet visible while scrolling to another area of the worksheet by freezing panes. When you freeze a pane, you lock or freeze specific rows and columns in the worksheet. The rows and columns that are frozen in the worksheet are indicated by a solid line.

Note: You cannot split the pane into two worksheet areas.

Example
The following example freezes the spreadsheet at column 3 and row 2 of the worksheet.

SpreadSheetAddFreezePane(SpreadsheetObj, 3, 2);
The following example freezes the spreadsheet at column 3 and row 2, and hides data in column 4 and rows 3 to 10.

```
SpreadSheetAddFreezePane(SpreadsheetObj, 3, 2, 5, 10);
```

### SpreadsheetAddInfo

**Description**
Sets document properties for a new spreadsheet or modifies properties for an existing spreadsheet.

**Returns**
This function does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**

```
SpreadsheetAddInfo(spreadsheetobj, property_struct)
```

**See also**

*SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow,*

*SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows*

**History**

ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object from which to get the value.</td>
</tr>
<tr>

<tr>
<td></td>
<td>• COMPANY</td>
</tr>
<tr>
<td></td>
<td>• SUBJECT</td>
</tr>
<tr>
<td></td>
<td>• TITLE</td>
</tr>
</tbody>
</table>

**Usage**
This function is supported by Microsoft Office Excel 2007 (.xlsx) and Microsoft Office 2003 (.xls).
Example
<cfspreadsheet action="read" src="#filename#" name="a">
<cfset info = StructNew()>
<cfset info.title="Title">
<cfset info.category="Category test">
<cfset info.author="ABC">
<cfset info.comments="Comments for this file">
<cfset spreadsheetaddInfo(a,info)>
<cfspreadsheet action="write" filename="#dirname#SingleSheet.xls" name=a overwrite="yes">

**SpreadsheetAddRow**

**Description**
Adds a row to an Excel spreadsheet object.

**Returns**
Does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**
SpreadsheetAddRow(spreadsheetObj, data [,row, column, insert])

**See also**
SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRows, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

**History**
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the column.</td>
</tr>
<tr>
<td>data</td>
<td>A comma delimited list of cell entries, one per column.</td>
</tr>
<tr>
<td>row</td>
<td>The number of the row to insert. The row numbers of any existing rows with numbers equal to or greater than this value are incremented by one. If you specify a value for this parameter, you must also specify a value for column. If you omit this parameter the rows are inserted following the last current row, and you cannot specify a column.</td>
</tr>
<tr>
<td>column</td>
<td>The number of the column in which to add the column data. All columns in the row to the left of the start column have empty cells. If you specify a value for this parameter, you must also specify a value for row.</td>
</tr>
<tr>
<td>insert</td>
<td>This parameter is optional. The default value is true. A Boolean value specifying whether to insert a row. If false, the function replaces data in the specified row entries.</td>
</tr>
</tbody>
</table>
Usage

Example
The following example adds a row of data as row 10. The data starts at column 2, and any existing row numbers 10 and higher increment by one.

<!---- Get the spreadsheet data as a query. ---->
<cfquery
   name="courses" datasource="cfdocexamples"
cachingwithin="#CreateTimeSpan(0, 6, 0, 0)#">
   SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
   FROM COURSELIST
</cfquery>

<cfscript>
   //We need an absolute path, so get the current directory path.
   theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
   //Create a new Spreadsheet object and add the query data.
   theSheet = SpreadsheetNew("CourseData");

   SpreadsheetAddRows(theSheet, courses);
   //Insert a new eighth row to the sheet, with data starting in column 1.
   SpreadsheetAddRow(theSheet,"150,ENGL,95,Poetry 1",8,1);
</cfscript>

<!---- Write the spreadsheet to a file, replacing any existing file. ---->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
   sheet=1 sheetname="courses" overwrite=true>

SpreadsheetAddRows

Description
Adds multiple rows from a query to an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetAddrows(spreadsheetObj, data[, row, column, insert])

See also
SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the column.</td>
</tr>
<tr>
<td>data</td>
<td>A query object with the row data or an array.</td>
</tr>
<tr>
<td>row</td>
<td>The number of the row at which to insert the rows. The row numbers of any existing rows with numbers equal to or greater than this value are incremented by number of added rows. If you specify a value for this parameter, you must also specify a value for column. If you omit this parameter the rows are inserted following the last current row.</td>
</tr>
<tr>
<td>column</td>
<td>The number of the column in which to add the column data. All columns in the row to the left of the start column have empty cells. If you specify a value for this parameter, you must also specify a value for row.</td>
</tr>
<tr>
<td>insert</td>
<td>This parameter is optional. The default value is true. A Boolean value specifying whether to insert a row. If false, the function replaces data in the specified row entries.</td>
</tr>
</tbody>
</table>

Example

The following example creates a spreadsheet by creating a new Excel spreadsheet object and using the AddRows function to add the data from a query.

```coldfusion
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    /// We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    // Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet, courses);
    SpreadsheetAddRows(theSheet, ["1,a", "2,B,b"]);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" sheet=1 sheetname="courses" overwrite=true>

SpreadsheetAddSplitPane

Description

Splits panes into four separate worksheet areas.

Returns

Does not return a value.

Category

Microsoft Office Integration
Function syntax
SpreadsheetAddSplitPane(spreadsheetobj, x-position, y-position, splitcol, splitrow [,position])

See also
SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow,
SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the split pane.</td>
</tr>
<tr>
<td>x-position</td>
<td>Specifies the x-axis position of the first quadrant. The x-position value is 1/20th the value of a pixel in the worksheet.</td>
</tr>
<tr>
<td>y-position</td>
<td>Specifies the y-axis position of the first quadrant. The y-position value is 1/20th the value of a pixel in the worksheet.</td>
</tr>
<tr>
<td>splitcol</td>
<td>Specifies the columns that appear in quadrant 2 of the spreadsheet.</td>
</tr>
<tr>
<td>splitrow</td>
<td>Specifies the rows that appear in quadrant 3 of the spreadsheet.</td>
</tr>
<tr>
<td>position</td>
<td>This attribute is optional. Specifies the position to apply the split bar to split the pane. It can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• LOWER_LEFT</td>
</tr>
<tr>
<td></td>
<td>• LOWER_RIGHT</td>
</tr>
<tr>
<td></td>
<td>• UPPER_RIGHT</td>
</tr>
<tr>
<td></td>
<td>• UPPER_LEFT</td>
</tr>
</tbody>
</table>

Usage
You can split the pane into four worksheet areas in the spread sheet. The split is applied at the pixel level. You can adjust the worksheet area by dragging the split bar, as required.

Note: You cannot split the pane into two worksheet areas.

Example
The following example splits the spreadsheet into four quadrants. The x and y positions are at 2000 and 2000 values. Column 5 of the spreadsheet appears in quadrant 2; and row 7 of the spreadsheet appears in quadrant 7. The split bar appears at the lower left side of the spreadsheet.

SpreadSheetAddSplitPane(spreadsheetobj, 2000, 2000, 5, 7, LOWER_LEFT);

SpreadsheetCreateSheet

Description
Creates an additional spreadsheet.
Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetCreateSheet(spreadsheetObj, [sheetname])

See also
SpreadsheetAddColumn, SpreadsheetDeleteColumns, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetShiftColumns, SpreadsheetSetActiveSheet

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which you create the additional sheet.</td>
</tr>
<tr>
<td>sheetname</td>
<td>Name of the new sheet. This is optional.</td>
</tr>
</tbody>
</table>

Example
The following example creates two sheets: CourseData and EvaluationSheet.

```cfdml
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#"> SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME FROM COURSELIST </cfquery>

<cfscript>
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls;
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);
    //Add a new sheet.
    SpreadsheetCreateSheet (theSheet, "EvaluationSheet");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

Last updated 7/9/2012
**SpreadsheetDeleteColumn**

**Description**
Deletes the data from a column of an Excel spreadsheet object. It does not delete the column.

**Returns**
Does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**

```
SpreadsheetDeleteColumn(spreadsheetObj, column)
```

**See also**

SpreadsheetAddColumn, SpreadsheetDeleteColumns, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetShiftColumns

**History**
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to delete the columns.</td>
</tr>
<tr>
<td>column</td>
<td>The column to delete.</td>
</tr>
</tbody>
</table>

**Example**
The following example deletes the data from column 2 from a spreadsheet.
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls"
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);
    //Delete the second column of the sheet.
    SpreadsheetDeleteColumn(theSheet,2);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>

SpreadsheetDeleteColumns

Description
Deletes the data from multiple columns of an Excel spreadsheet object. This function does not remove the columns.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetDeleteColumns(spreadsheetObj, range)

See also
SpreadsheetAddColumn, SpreadsheetDeleteColumn, SpreadsheetDeleteRow, SpreadsheetDeleteRows,
SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetShiftColumns

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to delete the columns.</td>
</tr>
<tr>
<td>range</td>
<td>A string containing the columns to delete, using any combination of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• startColumn-endColumn — Delete columns in a single range.</td>
</tr>
<tr>
<td></td>
<td>• column, column, column… — Delete one or more individual columns.</td>
</tr>
<tr>
<td></td>
<td>You can also provide both the formats together. For example, 1, 2, 3-5, 7-12.</td>
</tr>
</tbody>
</table>

Example

The following example deletes the data from columns 2-4 and column 6 from a spreadsheet.

```cfml
<!--- Get the spreadsheet data as a query. --->
<cfquery
  name="courses" datasource="cfdocexamples"
  cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
  SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
  FROM COURSELIST
</cfquery>

<cfscript>
  ///We need an absolute path, so get the current directory path.
  theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls"
  //Create a new Excel spreadsheet object and add the query data.
  theSheet = SpreadsheetNew("CourseData");

  SpreadsheetAddRows(theSheet,courses);
  //Delete columns 2 though 4 and 6.
  SpreadsheetDeleteColumns(theSheet,"2-4,6");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="#theSheet#"
  sheet=1 sheetname="courses" overwrite=true>

SpreadsheetDeleteRow

Description  
Deletes all data from a row of an Excel spreadsheet object. It does not delete the row.

Returns  
Does not return a value.

Category  
Microsoft Office Integration

Function syntax  
SpreadsheetDeleteRow(spreadsheetObj, row)
See also
SpreadsheetDeleteColumn, SpreadsheetDeleteColumns, SpreadsheetDeleteRows, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to delete the row.</td>
</tr>
<tr>
<td>row</td>
<td>The row to delete.</td>
</tr>
</tbody>
</table>

Example
The following example deletes row 10 from a spreadsheet.

<!--- Get the spreadsheet data as a query. --->
<cfquery
  name="courses" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
  SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
  FROM COURSELIST
</cfquery>

<cfscript>
  ///We need an absolute path, so get the current directory path.
  theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls"
  //Create a new Excel spreadsheet object and add the query data.
  theSheet = SpreadsheetNew("CourseData");
  SpreadsheetAddRows(theSheet,courses);
  //Delete row 10.
  SpreadsheetDeleteRow(theSheet,"10");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
sheet=1 sheetname="courses" overwrite=true>

SpreadsheetDeleteRows

Description
Deletes all data from multiple rows of an Excel spreadsheet object. It does not delete the row.

Returns
Does not return a value.

Category
Microsoft Office Integration
Function syntax
SpreadsheetDeleteRows(spreadsheetObj, range)

See also
SpreadsheetDeleteColumn, SpreadsheetDeleteColumns, SpreadsheetDeleteRow, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to delete the rows.</td>
</tr>
<tr>
<td>range</td>
<td>The rows to delete, using any combination of the following form:</td>
</tr>
<tr>
<td></td>
<td>• startRow-endRow — Insert rows in a single range.</td>
</tr>
<tr>
<td></td>
<td>• row, row, row... — Insert one or more individual rows.</td>
</tr>
<tr>
<td></td>
<td>You can also provide both the formats together. For example, 1, 2, 3-5, 7-12.</td>
</tr>
</tbody>
</table>

Example
The following example deletes rows 1 and 5-10 from a spreadsheet.

```cfc
cfquery	name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#"
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC,LASTUPDATE
    FROM COURSELIST
</cfquery>

cfscript
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    //Delete rows 1 and 5 through 10.
    SpreadsheetDeleteRows(theSheet,"1,5-10");
</cfscript>

cfspreadsheet
    action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true
```

SpreadsheetFormatCell

Description
Formats the contents of a single cell of an Excel spreadsheet object.
ColdFusion Functions

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetFormatCell(spreadsheetObj, format, row, column)

See also
SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to set the format.</td>
</tr>
<tr>
<td>format</td>
<td>A structure containing the format information. For details see Usage.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell.</td>
</tr>
</tbody>
</table>

Usage
The format structure can specify any or all of the following values

<table>
<thead>
<tr>
<th>Name</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>left (default), right, center, justify, general, fill, and center_selection</td>
</tr>
<tr>
<td>bold</td>
<td>A Boolean value. The default value is false.</td>
</tr>
<tr>
<td>bottomborder</td>
<td>A border format, any of the following:</td>
</tr>
<tr>
<td></td>
<td>none (default), thin, medium, dashed, hair, thick, double, dotted, medium_dashed, dash_dot, medium_dash_dot, dash_dot, medium_dash_dot_dot, slanted_dash_dot</td>
</tr>
<tr>
<td>bottombordercolor</td>
<td>See the color field for the complete list of colors.</td>
</tr>
<tr>
<td>color</td>
<td>Any value in the org.apache.poi.hssf.util.HSSFColor class:</td>
</tr>
<tr>
<td></td>
<td>black, brown, olive_green, dark_green, dark_teal, dark_blue, indigo, grey_80_percent, orange, dark_yellow, green, teal, blue, blue_grey, grey_50_percent, red, light_orange, lime, sea_green, aqua, light_blue, violet, grey_40_percent, pink, gold, yellow, bright_green, turquoise, dark_red, sky_blue, plum, grey_25_percent, rose, light_yellow, light_green, light_turquoise, light_turquoise, pale_blue, lavender, white, cornflower_blue, lemon_chiffon, maroon, orchid, coral, royal_blue, light_cornflower_blue</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
Enhancements made in ColdFusion 9.0.1

You can preformat a cell while you use SpreadSheetFormatCell as shown in the following example:

```cfscript
<cfscript>
sheet = SpreadsheetNew();
SpreadsheetFormatCell(sheet, {dataformat="@"}, 1, 1);
spreadsheetSetCellValue(sheet, '000006534', 1, 1);
</cfscript>
```

Here, the cell is preformatted and the data is taken as it is provided.

Example

The following example creates a sheet, sets a simple format for the cell at row 3 column 4, and writes the result to a file:

```cfquery
name="courses" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#”
SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
FROM COURSELIST
</cfquery>

```cfscript
///We need an absolute path, so get the current directory path.
theFile = GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
//Create a new Excel spreadsheet object and add the query data.
theSheet = SpreadsheetNew("CourseData");
SpreadsheetAddRows(theSheet, courses);
// Define a format for the cell.
format1 = StructNew();
format1.font = "serif";
format1.fontsize = "12";
format1.color = "dark_green";
format1.bold = "true";
format1.alignment = "center";
SpreadsheetFormatCellRange(theSheet, {verticalalignment="VERTICAL_TOP"}, 3, 4, 30, 10);
</cfscript>
```

```cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true
</cfspreadsheet>
```

The following examples show how to use dataformat:

<table>
<thead>
<tr>
<th>Name</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>textwrap</td>
<td>A Boolean value. The default value is false.</td>
</tr>
<tr>
<td>topborder</td>
<td>A border format. See bottomborder for valid values.</td>
</tr>
<tr>
<td>topbordercolor</td>
<td>See the color field for the complete list of colors.</td>
</tr>
<tr>
<td>verticalalignment</td>
<td>Any of the following: vertical_top, vertical_bottom, vertical_center, vertical_justify</td>
</tr>
<tr>
<td></td>
<td>For example,</td>
</tr>
<tr>
<td></td>
<td>&lt;cfscript&gt;SpreadsheetFormatCellRange(theSheet, {verticalalignment=&quot;VERTICAL_TOP&quot;}, 3, 4, 30, 10);&lt;/cfscript&gt;</td>
</tr>
<tr>
<td>underline</td>
<td>A Boolean value. The default value is false.</td>
</tr>
</tbody>
</table>
<cfset a = spreadsheetnew()>
<cfset format = structnew()>
<cfset format.dataformat = "0.00">
<cfset spreadsheetaddrow(a,"1,2,3,4",2,1)>
<cfset spreadsheetformatrow(a,format,2)>
<cfset format.dataformat = "0.00%">
<cfset spreadsheetaddrow(a,"1,2,3,4",4,1)>
<cfset spreadsheetformatrow(a,format,4)>
<cfset format.dataformat = "0.00E+00">
<cfset spreadsheetaddrow(a,".00000000000001",5,1)>
<cfset spreadsheetformatrow(a,format,5)>

**SpreadsheetFormatColumn**

**Description**
Formats the contents of a single column of an Excel spreadsheet object.

**Returns**
Does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**
`SpreadsheetFormatColumn(spreadsheetObj, format, column)`

**See also**
`SpreadsheetFormatCell, SpreadsheetFormatColumns, SpreadsheetFormatRow, SpreadsheetFormatRows`

**History**
ColdFusion 9: Added the function.

Last updated 7/9/2012
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to set the format.</td>
</tr>
<tr>
<td>format</td>
<td>A structure containing the format information. For details see SpreadsheetFormatCell.</td>
</tr>
<tr>
<td>column</td>
<td>The column number.</td>
</tr>
</tbody>
</table>

Example

The following example creates a sheet, sets a format for column 5, and writes the result to a file:

```cfdml
<!--- Get the spreadsheet data as a query. --->
cfquery
  name="courses" datasource="cfdocexamples"
  cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#"
  SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
  FROM COURSELIST
</cfquery>

<cfscript>
  ///We need an absolute path, so get the current directory path.
  theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
  //Create a new Excel spreadsheet object and add the query data.
  theSheet = SpreadsheetNew("CourseData");
  SpreadsheetAddRows(theSheet,courses);
  // Define a format for the column.
  format1=StructNew()
  format1.font="Courier";
  format1.fontsize="10";
  format1.color="dark_blue;";
  format1.italic="true";
  format1.bold="true";
  format1.alignment="left";
  format1.textwrap="true";
  format1.fgcolor="pale_blue";
  format1.bottomborder="dotted";
  format1.bottombordercolor="blue_grey";
  format1.leftborder="thick";
  format1.leftbordercolor="blue_grey";
  format1.rightborder="thick";
  format1.rightbordercolor="blue_grey";
  SpreadsheetFormatColumn(theSheet,format1,5);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
cfspreadsheet action="write" filename="#theFile#" name="theSheet"
  sheet=1 sheetname="courses" overwrite=true>

SpreadsheetFormatCellRange

Description

Formats the cells within the given range.

Last updated 7/9/2012
Returns
Nothing

Category
Microsoft Office Integration

Function syntax
SpreadsheetFormatCellRange (spreadsheetObj, format, startRow, startColumn, endRow, endColumn)

See also
SpreadsheetFormatCell, SpreadsheetFormatColumns, SpreadsheetFormatRow, SpreadsheetFormatRows

History
ColdFusion 9.0.1: Added the function. Supports preformatting of a cell while you use this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object for which you want to format the cells.</td>
</tr>
<tr>
<td>format</td>
<td>A structure that contains format information.</td>
</tr>
<tr>
<td>startRow</td>
<td>The number of the first row to format.</td>
</tr>
<tr>
<td>startColumn</td>
<td>The number of the first column to format.</td>
</tr>
<tr>
<td>endRow</td>
<td>The number of the last row to format.</td>
</tr>
<tr>
<td>endColumn</td>
<td>The number of the last column to format.</td>
</tr>
</tbody>
</table>
Example
<!--- Get the spreadsheet data as a query. ---->
<cfquery
   name="courses" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
   SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC,LASTUPDATE
   FROM COURSELIST
</cfquery>

<!--- We need an absolute path, so get the current directory path. --->
theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";

//Create a new Excel spreadsheet object and add the query data.
theSheet = SpreadsheetNew("CourseData");
SpreadsheetAddRows(theSheet,courses);

// Define a format for the column.
format1=StructNew()
format1.font="Courier";
format1.fontsize="10";
format1.color="dark_blue";
format1.italic="true";
format1.bold="true";
format1.alignment="left";
SpreadsheetFormatCellRange(theSheet,format1, 3,4,30,10);

<!--- Write the spreadsheet to a file, replacing any existing file. ---->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
sheet=1 sheetname="courses" overwrite=true>

SpreadsheetFormatColumns

Description
Formats the contents of multiple columns of an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetFormatColumns(spreadsheetObj, format, columns)

See also
SpreadsheetFormatCell, SpreadsheetFormatColumn, SpreadsheetFormatRow, SpreadsheetFormatRows

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to set the format.</td>
</tr>
<tr>
<td>format</td>
<td>A structure containing the format information. For details see SpreadsheetFormatCell.</td>
</tr>
<tr>
<td>columns</td>
<td>The columns to format, in one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• startColumn-endColumn — Insert columns in a single range.</td>
</tr>
<tr>
<td></td>
<td>• column,column,column… — Insert one or more individual columns.</td>
</tr>
</tbody>
</table>

Example

The following example creates a sheet, sets a format for columns 1-5, and writes the result to a file:

```coldfusion
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithint="#CreateTimeSpan(0, 6, 0, 0)#">
        SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
        FROM COURSELIST
    </cfquery>

<cfscript>
    /// We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    // Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue;";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    format1.textwrap="true";
    format1.fgcolor="pale_blue";
    format1.bottomborder="dotted";
    format1.bottombordercolor="blue_grey";
    format1.leftborder="thick";
    format1.leftbordercolor="blue_grey";
    format1.rightborder="thick";
    format1.rightbordercolor="blue_grey";
    SpreadsheetFormatColumns(theSheet,format1,"1-5");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
</cfspreadsheet>
```
SpreadsheetFormatRow

Description
Formats the contents of a single row of an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetFormatRow(spreadsheetObj, format, row)

See also
Other Spreadsheet* functions
SpreadsheetFormatCell, SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetFormatRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to set the format.</td>
</tr>
<tr>
<td>format</td>
<td>A structure containing the format information. For details see SpreadsheetFormatColumn.</td>
</tr>
<tr>
<td>row</td>
<td>The row number.</td>
</tr>
</tbody>
</table>

Example
The following example creates a sheet, sets a format for rows 1, 3, and 5, and writes the result to a file:
<!--- Get the spreadsheet data as a query. --->
<cfquery name="courses" datasource="cfdocexamples" cachedwithins="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE FROM COURSELIST
</cfquery>

<cfscript>
    /// We need an absolute path, so get the current directory path.
    theFile = GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    // Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);
    // Define a format for the column.
    format1 = StructNew();
    format1.font = "Courier";
    format1.fontsize = "10";
    format1.color = "dark_blue;";
    format1.italic = "true";
    format1.bold = "true";
    format1.alignment = "left";
    format1.textwrap = "true";
    format1.fgcolor = "pale_blue";
    format1.bottomborder = "thick";
    format1.bottombordercolor = "blue_grey";
    format1.topbordercolor = "blue_grey";
    format1.topborder = "thick";
    format1.leftborder = "dotted";
    format1.leftbordercolor = "blue_grey";
    format1.rightborder = "dotted";
    format1.rightbordercolor = "blue_grey";
    SpreadsheetFormatRow(theSheet, format1, "5");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" sheet=1 sheetname="courses" overwrite=true>

SpreadsheetFormatRows

Description
Formats the contents of multiple rows of an Excel spreadsheet object.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetFormatRows(spreadsheetObj, format, rows)
See also
SpreadsheetFormatCell, SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetFormatRow

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to set the format.</td>
</tr>
<tr>
<td>format</td>
<td>A structure containing the format information. For details see SpreadsheetFormatColumn.</td>
</tr>
<tr>
<td>row</td>
<td>The rows to format, in one of the following formats:</td>
</tr>
<tr>
<td></td>
<td>• startRow-endRow — Insert rows in a single range.</td>
</tr>
<tr>
<td></td>
<td>• row, row, row... — Insert one or more individual rows.</td>
</tr>
<tr>
<td></td>
<td>You can also provide the formats together. For example, 1-5, 6, 7, 9-12.</td>
</tr>
</tbody>
</table>

Example
The following example creates a sheet, sets a format for rows 1, 3, and 5, and writes the result to a file:
<!--- Get the spreadsheet data as a query. --->
<cfquery>
  name="courses" datasource="cfdocexamples"
  cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC,LASTUPDATE FROM COURSELIST
</cfquery>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
  sheet=1 sheetname="courses" overwrite=true>
  SpreadsheetGetCellComment
</cfspreadsheet>

SpreadsheetGetCellComment

Description
Gets the comment for an Excel spreadsheet object cell as a structure with formatting information, or all comments for the object.

Returns
If the parameters include the row and column: a structure containing the comment information for the specified cell. If the function has only a spreadsheetObj parameter, an array containing a structure for each comment. Each structure has the following information:
ColdFusion Functions

Category
Microsoft Office Integration

Function syntax
SpreadsheetGetCellComment(spreadsheetObj[, row, column])

See also
SpreadsheetFormatCell, SpreadsheetGetCellFormula, SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellComment, SpreadsheetSetCellFormula, SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to get the comment.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell from which to get the comment.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell from which to get the comment.</td>
</tr>
</tbody>
</table>

Example
The following example sets and gets a comment for the cell at row 3 column 5.
We need an absolute path, so get the current directory path.

```cfscript```
theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "comment.xls";
// Create an Excel spreadsheet object.
theSheet = SpreadsheetNew();
// Define a cell comment.

comment1.anchor="1,1,15,20";
comment1.author="Adobe Systems";
comment1.bold="true";
comment1.color="lavender";
comment1.comment="This is the cell in row three, column 5 (E).";
comment1.fillcolor="yellow";
comment1.font="Courier";
comment1.horizontalalignment="left";
comment1.linestyle="dashsys";
comment1.size="10";
comment1.verticalalignment="top";
// Set the comment.
SpreadsheetSetCellComment(theSheet,comment1,3,5);
// Get the comment from the Excel spreadsheet object.
theComment=SpreadsheetGetCellComment(theSheet,3,5);
```cfscript```

```cfoutput```
Row, Column: #theComment.row#, #theComment.column#<br />
Author: #theComment.author#<br />
Comment: #theComment.comment#
```cfoutput```

<!-- Write the spreadsheet to a file, replacing any existing file. --->
```cfspreadsheet```
action="write" filename="#theFile#" name="#theSheet#
    sheet=1 sheetname="courses" overwrite=true```

## SpreadsheetGetCellFormula

### Description

Gets the formula for an Excel spreadsheet object cell, or all formulas for the object.

### Returns

If the parameters include the row and column: a string containing the formula. If the function has the `spreadsheetObj` parameter, an array containing structures for each formula.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetGetCellFormula(spreadsheetObj[, row, column])
```

### See also

`SpreadsheetGetCellComment`, `SpreadsheetFormatCell`, `SpreadsheetGetCellValue`, `SpreadsheetMergeCells`, `SpreadsheetSetCellComment`, `SpreadsheetSetCellFormula`, `SpreadsheetSetCellValue`
History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to get the formula.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell from which to get the formula.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell from which to get the formula.</td>
</tr>
</tbody>
</table>

Usage
If you specify only the `spreadsheetObj` parameter, the function returns an array of the structures with the following contents. The array has one entry for each cell that contains a formula.

<table>
<thead>
<tr>
<th>Field</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>formula</td>
<td>The formula for the cell.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell.</td>
</tr>
</tbody>
</table>

Example
The following example sets a cell formula, and gets the cell formula and value.

```
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the values of column 3 rows 1-10 to the row number.
    for (i=1; i<= 10; i=i+1)
        SpreadsheetSetCellValue(theSheet,i,i,3);
    //Set the formula for the cell in row 11 column 3 to be the sum of
    //Columns 1-10.
    SpreadsheetSetCellFormula(theSheet,"SUM(C1:C10)",11,3);
    //Get the formula from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellFormula(theSheet,11,3);
    //Get the value of row 11 column 5 from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,11,3);
</cfscript>

<cfoutput>
Row 11, Column 3 value: #SpreadsheetGetCellValue(theSheet,11,3)#<br />
Row 11, Column 3 formula: #SpreadsheetGetCellFormula(theSheet,11,3)#<br />
</cfoutput>

SpreadsheetGetCellValue

Description
Gets the Value for an Excel spreadsheet object cell.

Returns
A string containing the cell value.
Category
Microsoft Office Integration

Function syntax
SpreadsheetGetCellValue(spreadsheetObj, row, column)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula,
SpreadsheetMergeCells, SpreadsheetSetCellComment, SpreadsheetSetCellFormula,
SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which to get the value.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell from which to get the formula.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell from which to get the formula.</td>
</tr>
</tbody>
</table>

Example
The following lines create an Excel spreadsheet object, set the value of the cell at row 3, column 5 - 365, gets the value and displays it:

```cfscript
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the value of the cell at row 3 column 5.
    SpreadsheetSetCellValue(theSheet,365,3,5);
    //Get the value from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,3,5);
    WriteOutput("The value of column 5 row 3 is: " & theValue);
</cfscript>
```

SpreadsheetInfo

Description
Gets the property of an Excel spreadsheet object.

Returns
Returns a spreadsheet property that can be one of the following:

- AUTHOR
- CATEGORY
- COMMENTS
- CREATIONDATE
- LASTEDITED
ColdFusion Functions

- LASTAUTHOR
- LASTSAVED
- KEYWORDS
- MANAGER
- COMPANY
- SUBJECT
- TITLE
- SHEETS
- SHEETNAMES
- SPREADSHEETTYPES

Category
Microsoft Office Integration

Function syntax
SpreadsheetInfo(spreadsheetobj)

See also
SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow,
SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object from which to get the value.</td>
</tr>
</tbody>
</table>

Usage
This function is supported by Microsoft Office Excel 2007 and Microsoft Office 2003.

Example
<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" name="SpreadsheetObj" >
<cfset info = SpreadsheetInfo(SpreadsheetObj)>
<cfoutput> AUTHOR : #info.author#<br> </cfoutput>
<cfoutput> Creation Date : #info.creationdate#<br> </cfoutput>
<cfoutput> LAST AUTHOR : #info.lastauthor#<br> </cfoutput>
<cfoutput> SHEETS : #info.sheets#<br> </cfoutput>
<cfoutput> SPREADSHEETTYPE : #info.SPREADSHEETTYPES#<br> </cfoutput>
<cfoutput> SUBJECT : #info.SUBJECT#<br> </cfoutput>
<cfoutput> TITLE : #info.TITLE#<br> </cfoutput>
**SpreadsheetMergeCells**

**Description**
Merges a rectangular block of two or more Excel spreadsheet object cells.

**Returns**
Does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**

```
SpreadsheetMergeCells(spreadsheetObj, startRow, endRow, startColumn, endColumn)
```

**See also**

SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula, SpreadsheetGetCellValue, SpreadsheetSetCellComment, SpreadsheetSetCellFormula, SpreadsheetSetCellValue

**History**
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object containing the cells to merge.</td>
</tr>
<tr>
<td>startRow</td>
<td>The number of the first row to merge.</td>
</tr>
<tr>
<td>endRow</td>
<td>The row number of the last row to merge.</td>
</tr>
<tr>
<td>startColumn</td>
<td>The column number of the first cell to merge.</td>
</tr>
<tr>
<td>endColumn</td>
<td>The column number of the last cell to merge.</td>
</tr>
</tbody>
</table>

**Usage**
If you merge two cells using this function, the merged cell by default displays the value in the cell that is on the left-hand side of the spreadsheet. For example, if you merge the cell (20,3) and cell (20,4), then the value in the cell (20, 3) is displayed. If the cell (20, 3) is blank, then after merging, the cell displays blank.

**Example**
The following example merges cells 4-6 in rows 1-3 of an Excel spreadsheet object. It puts text in the merged cells and saves the sheet to a file so you can see the result.
<cfscript>
    /// We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "mergecells.xls";
    // Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    // Merges cells 4-6 in the first three rows of the Excel spreadsheet object.
    SpreadsheetMergeCells(theSheet,1,3,4,6);
    // Set the value of the merged cell.
    SpreadsheetSetCellValue(theSheet,"Columns 4-6 of rows 1-3 are merged",1,4);
</cfscript>

<!-- Write the spreadsheet to a file, replacing any existing file. -->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>

SpreadsheetNew

Description
Creates a ColdFusionExcel spreadsheet object, which represents a single sheet of an Excel document.

Returns
ColdFusionExcel spreadsheet object.

Category
Microsoft Office Integration

Function syntax
SpreadsheetNew([sheetName, xmlformat])

See also
All Other Spreadsheet* functions; see Microsoft Office Integration list.

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sheetName</td>
<td>A string containing the sheet name to assign to the Excel spreadsheet object.</td>
</tr>
<tr>
<td>xmlformat</td>
<td>A Boolean value. True or Yes: Creates a .xlsx file that is supported by Microsoft Office Excel 2007. False or No: Creates a .xls file.</td>
</tr>
</tbody>
</table>

Usage
This function supports Microsoft Office Excel 2007.

To create a simple .xls spreadsheet object with a default worksheet name, your code can be as follows:
<cfset SpreadsheetObj = spreadsheetNew()>

To create a simple .xls spreadsheet object by specifying the worksheet name as "mySheet", your code can be as follows:
ColdFusion Functions

<cfset SpreadsheetObj = spreadsheetNew("mySheet")>

To create spreadsheet objects that are supported by Microsoft Office Excel 2007 (.xlsx), your code can be as follows:
<cfset SpreadsheetObj = spreadsheetNew("true")>
<cfset SpreadsheetObj = spreadsheetNew("mysheet", "yes")>

Note: You can specify either "true" or "yes" to create a .xlsx file.

Example
The following example creates an Excel spreadsheet object with the sheet name Expenses, sets a cell value, and saves
the result to a file.
<cfscript>
///We need an absolute path, so get the current directory path.
theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "newSpreadsheet.xls";
//Create a new Excel spreadsheet object.
theSheet = SpreadsheetNew("Expenses");
//Set the value a cell.
SpreadsheetSetCellValue(theSheet,"365",1,4);
</cfscript>
<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>

SpreadsheetRead

Description
Reads a sheet from a spreadsheet file and stores it in a ColdFusion spreadsheet object.

Returns
Returns spreadsheet object.

Category
Microsoft Office Integration

Function syntax
SpreadsheetRead(fileName [, sheetName|sheet])

See also
SpreadsheetWrite, SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow,
SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows,
SpreadsheetShiftRows

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fileName</td>
<td>A string specifying the path to the spreadsheet file.</td>
</tr>
<tr>
<td>sheetName</td>
<td>Optional parameter; name of the sheet. You can specify sheet or sheetName.</td>
</tr>
<tr>
<td>sheet</td>
<td>Optional parameter; number of the sheet. You can specify sheet or sheetName.</td>
</tr>
</tbody>
</table>

Usage
Use this function to read an Excel file with multiple sheets.

Example
```cfs
<cfscript>
    a = SpreadsheetRead("C:\Files\Report.xls","Annual Report")
</cfscript>
```

**SpreadsheetReadBinary**

Description
Reads and stores content from a spreadsheet object and returns it as a byte array.

Returns
Returns a byte array of the stored spreadsheet information using the `cfcontent` tag.

Category
Microsoft Office Integration

Function syntax
`SpreadsheetReadBinary(spreadsheetobj)`

See also
`SpreadsheetAddColumn`, `SpreadsheetAddImage`, `SpreadsheetAddRow`, `SpreadsheetDeleteRow`, `SpreadsheetDeleteRows`, `SpreadsheetFormatRow`, `SpreadsheetFormatRows`, `SpreadsheetShiftRows`

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObject</td>
<td>The Excel spreadsheet object to read.</td>
</tr>
</tbody>
</table>
Usage

Example

```coldfusion
<cfheader name="Content-Disposition" value="inline; filename=test.xls">
<cfset a = spreadsheetnew()>
<cfset spreadsheetAddRow(a,"a,b,c")>
<!---You can do all the processing--->
<cfset bin = spreadsheetReadBinary(a)>
<cfcontent type="application/vnd-ms.excel" variable="#bin#" reset="true">
```

**SpreadsheetRemoveSheet**

Description

Deletes a spreadsheet.

Returns

Nothing

Category

Microsoft Office Integration

Function syntax

`SpreadsheetRemoveSheet (spreadsheetObj, sheetname)`

See also

`SpreadsheetSetActiveSheetNumber, SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftRows`

History

ColdFusion 9.0.1: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object from which you delete the sheet.</td>
</tr>
<tr>
<td>sheetname</td>
<td>Name of the sheet that must be removed.</td>
</tr>
</tbody>
</table>

Example

```coldfusion
<cfset spreadsheetVar= spreadsheetNew("New")>
<cfset spreadsheetCreateSheet(spreadsheetVar,"A")>
<cfset spreadsheetCreateSheet(spreadsheetVar,"B")>
<cfspreadsheet action="write" filename="#dirname#mySpreadSheet.xls" name="#spreadsheetVar" overwrite="true" >
<cfspreadsheet action="read" src="#dirname#mySpreadSheet.xls" name="#spreadsheetVar" >
<cfspreadsheet action="removeSheet" spreadsheetVar="B"#
<cfspreadsheet action="write" filename="#dirname#mySpreadSheet.xls" name="#spreadsheetVar" overwrite="true" >
```
**SpreadsheetSetActiveSheet**

**Description**
Sets a specified sheet as active sheet.

**Returns**
Does not return a value.

**Category**
Microsoft Office Integration

**Function syntax**

```
SpreadsheetSetActiveSheet(spreadsheetobj, sheetname)
```

**See also**

- SpreadsheetSetActiveSheetNumber,
- SpreadsheetAddColumn,
- SpreadsheetAddImage,
- SpreadsheetAddRow,
- SpreadsheetDeleteRow,
- SpreadsheetDeleteRows,
- SpreadsheetFormatRow,
- SpreadsheetFormatRows,
- SpreadsheetShiftRows

**History**
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the split pane.</td>
</tr>
<tr>
<td>sheetname</td>
<td>The spreadsheet that must be set as active.</td>
</tr>
</tbody>
</table>

**Usage**

You can set only one sheet as active at a time. Therefore, any sheet operation is limited to a particular sheet. For operations in any other sheet, you must set that sheet as active.

**Example**

The following example shows how to switch from one sheet to another and perform operations.
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls"
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);
    //Create a new sheet.
    SpreadsheetCreateSheet (theSheet, "EvaluationSheet");
    //Set the sheet as active.
    SpreadsheetSetActiveSheet (theSheet, "EvaluationSheet");
    //Add a new row to the sheet.
    SpreadsheetAddRows(theSheet, courses);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="#theSheet"
sheet=1 sheetname="courses" overwrite=true>

SpreadsheetSetActiveSheetNumber

Description
Sets a specified sheetnumber as active sheet.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetSetActiveSheetNumber(spreadsheetobj, sheetnumber)

See also
SpreadsheetSetActiveSheet, SpreadsheetAddColumn, SpreadsheetAddImage, SpreadsheetAddRow,
SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows,
SpreadsheetShiftRows

History
ColdFusion 9: Added the function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the split pane.</td>
</tr>
<tr>
<td>sheetnumber</td>
<td>The spreadsheet number that must be set as active.</td>
</tr>
</tbody>
</table>

Usage

You can set only one sheet as active at a time. Therefore, any sheet operation is limited to a particular sheet. For operations in any other sheet, you must set that sheet as active.

Example

The following example shows how to switch from one sheet to another and perform operations.

```cfc
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>
<cfset theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls">
<cfspreadsheet action="read" name=theSheet src="#theFile#" sheet="1">
    <cfscript>
        SpreadsheetAddRows(theSheet,courses);
        //Set the sheetnumber 2 as active.
        SpreadsheetSetActiveSheetNumber (theSheet, 2);
        //Add a new row to the sheet 2.
        SpreadsheetAddRows(theSheet,courses);
    </cfscript>

    <!--- Write the spreadsheet to a file, replacing any existing file. --->
    <cfspreadsheet action="write" filename="#theFile#" name="theSheet"
        sheet=1 sheetname="courses" overwrite=true>
</cfspreadsheet>
```

**SpreadsheetSetCellComment**

**Description**

Specifies the comment for an Excel spreadsheet object cell.

**Returns**

Does not return a value.

**Category**

Microsoft Office Integration

**Function syntax**

`SpreadsheetSetCellComment(spreadsheetObj, comment, row, column)`
See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula, SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellFormula, SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the comment.</td>
</tr>
<tr>
<td>comment</td>
<td>A structure containing the comment including text, formatting, and placement in the cell. See Usage for the structure contents.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell to which to add the comment.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell to which to add the comment.</td>
</tr>
</tbody>
</table>

Usage
The comment structure can have the following fields. Excel determines the default field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Valid values</th>
</tr>
</thead>
<tbody>
<tr>
<td>anchor</td>
<td>A comma separated list of integers specifying the position and size of the comment, in rows and columns, in the order top column, left row, bottom column, right row. For example: “4,8,6,11” specifies a comment with an upper left corner in row 4 column 8 and a lower right corner in row 6 column 11.</td>
</tr>
<tr>
<td>author</td>
<td>The author’s name.</td>
</tr>
<tr>
<td>bold</td>
<td>A Boolean value specifying whether the text is bold.</td>
</tr>
<tr>
<td>color</td>
<td>The text color, Any value in the Apache org.apache.poi.hssf.util.HSSFColor class: black, brown, olive_green, dark_green, dark_teal, dark_blue, indigo, grey_80_percent, orange, dark_yellow, green, teal, blue, blue_grey, grey_50_percent, red, light_orange, lime, sea_green, aqua, light_blue, violet, grey_40_percent, pink, gold, yellow, bright_green, turquoise, dark_red, sky_blue, plum, grey_25_percent, rose, light_yellow, light_green, light_turquoise, light_turquoise, pale_blue, lavender, white, cornflower_blue, lemon_chiffon, maroon, orchid, coral, royal_blue, light_cornflower_blue.</td>
</tr>
<tr>
<td>fillcolor</td>
<td>A J2SE v1.4 java.awt.Color class color value: white, lightGray, light_gray, gray, darkGray, dark_gray, black, red, pink, orange, yellow, green, magenta, cyan, blue. (Because ColdFusion is case independent, you do not need to specify the values if defined in the Java class.)</td>
</tr>
<tr>
<td>font</td>
<td>Any valid system font name.</td>
</tr>
<tr>
<td>horizontalalignment</td>
<td>The horizontal alignment of the text: left, center, right, justify, distributed.</td>
</tr>
<tr>
<td>italic</td>
<td>A Boolean value specifying whether the text is italic.</td>
</tr>
<tr>
<td>linestyle</td>
<td>The style of the top and right borders of the comment box: solid, dashsys, dotsys, dashdotsys, dashdotdotsys, dotgel, dashgel, longdashgel, dashdotgel, longdashdotgel, longdashdotdotgel.</td>
</tr>
<tr>
<td>linestylecolor</td>
<td>A Java color value (Does not work: BUG 72501).</td>
</tr>
<tr>
<td>size</td>
<td>The size of the text in points.</td>
</tr>
</tbody>
</table>
Example
The following example sets and gets a comment for the cell at row 3 column 5.

```cfscript
///We need an absolute path, so get the current directory path.
theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "comment.xls";
//Create an Excel spreadsheet object.
theSheet = SpreadsheetNew();
// Define a cell comment.

comment1-structNew()
comment1.anchor="0,0,5,8";
comment1.author="Adobe Systems";
comment1.bold="true";
comment1.color="dark_green";
comment1.comment="This is the cell in row three, column 5 (E).";
comment1.fillcolor="light_gray";
comment1.font="Courier";
comment1.horizontalalignment="left";
comment1.linestyle="dashsys";
comment1.size="10";
comment1.verticalalignment="top";

//Set the comment.
SpreadsheetSetCellComment(theSheet,comment1,3,5);
//Get the comment from the Excel spreadsheet object.
theComment=SpreadsheetGetCellComment(theSheet,3,5);
</cfscript>

<cfoutput>
Row,Column: #theComment.row#,#theComment.column#<br />
Author: #theComment.author#<br />
Comment: #theComment.comment#
</cfoutput>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
SpreadsheetSetCellFormula

Description
Specifies the formula for an Excel spreadsheet object cell.
Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetSetCellFormula(spreadsheetObj, formula, row, column)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula,
SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellComment,
SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the comment.</td>
</tr>
<tr>
<td>formula</td>
<td>A string containing the formula.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell to which to add the formula.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell to which to add the formula.</td>
</tr>
</tbody>
</table>

Usage
This function replaces any existing value, including specific entered values.

Example
The following line sets the formula for the cell at row 2 column 11 to be the sum of the cells in the column’s rows 1 through 12.

The following example sets a cell formula, and gets the cell formula and value.
<cfscript>
//Create a new Excel spreadsheet object.
theSheet=SpreadsheetNew();
//Set the values of column 3 rows 1-10 to the row number.
for (i=1; i<= 10; i=i+1)
    SpreadsheetSetCellValue(theSheet,i,i,3);
//Set the formula for the cell in row 11 column 3 to be the sum of
//Columns 1-10.
SpreadsheetSetCellFormula(theSheet,"SUM(C1:C10)",11,3);
//Get the formula from the Excel spreadsheet object.
theValue=SpreadsheetGetCellFormula(theSheet,11,3);
//Get the value of row 11 column 5 from the Excel spreadsheet object.
theValue=SpreadsheetGetCellValue(theSheet,11,3);
</cfscript>

<cfoutput>
Row 11, Column 3 value: #SpreadsheetGetCellValue(theSheet,11,3)#<br />
Row 11, Column 3 formula: #SpreadsheetGetCellFormula(theSheet,11,3)#<br />
</cfoutput>

SpreadsheetSetCellValue

Description
Specifies the value of an Excel spreadsheet object cell.

Category
Microsoft Office Integration

Function syntax
SpreadsheetSetCellValue(spreadsheetObj, value, row, column)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula,
SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellComment,
SpreadsheetSetCellFormula

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to add the comment.</td>
</tr>
<tr>
<td>value</td>
<td>A string containing the cell value.</td>
</tr>
<tr>
<td>row</td>
<td>The row number of the cell to which set the value.</td>
</tr>
<tr>
<td>column</td>
<td>The column number of the cell to which set the value.</td>
</tr>
</tbody>
</table>
Example
The following lines create an Excel spreadsheet object, set the value of the cell at row 3, column 5 to 365, and get the value:

```cfcscript
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the value of the cell at row 3 column 5.
    SpreadsheetSetCellValue(theSheet,365,3,5);
    //Get the value from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,3,5);
    WriteOutput("The value of column 5 row 3 is: " & theValue);
</cfscript>
```

**SpreadsheetSetColumnWidth**

**Description**
Sets the width of a column in a worksheet.

**Returns**
Nothing

**Category**
Microsoft Office Integration

**Function syntax**

```
SpreadsheetSetColumnWidth(spreadsheetobj, column number, width)
```

**See also**

- SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula,
- SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellFormula,
- SpreadsheetSetCellValue

**History**
ColdFusion 9: Added the function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to set the column width.</td>
</tr>
<tr>
<td>column number</td>
<td>Specifies the column to set the width.</td>
</tr>
<tr>
<td>width</td>
<td>Specifies the width in points.</td>
</tr>
</tbody>
</table>

Example
The following example creates a spreadsheet, adds columns to the spreadsheet, and sets the column width for the newly added columns.
<cfscript>
a=SpreadSheetNew();
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8");
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8",2,1);
</cfscript>
<cfset SpreadSheetSetColumnWidth(a,2,10)>
<cfset SpreadSheetSetColumnWidth(a,3,25)>
<cfspreadsheet action="write" filename="#expandpath('.')#/b.xls" name="a" overwrite="true">

SpreadsheetSetFooter

Description
Adds a footer to the specified worksheet.

Category
Microsoft Office Integration

Function syntax
SpreadsheetSetFooter(spreadsheetobj, left footer, center footer, right footer)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula,
SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellFormula,
SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the footer.</td>
</tr>
<tr>
<td>left footer</td>
<td>Adds the footer in the left side of the worksheet.</td>
</tr>
<tr>
<td>center footer</td>
<td>Adds the footer in the center of the worksheet.</td>
</tr>
<tr>
<td>right footer</td>
<td>Adds the footer in the right side of the worksheet.</td>
</tr>
</tbody>
</table>

Usage
The footer that you add appears on the printed worksheet document.

Example
The following example adds a footer in the left side of the worksheet.

<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" sheet="2" name="SpreadsheetObj" >
<cfset spreadsheetSetHeader(SpreadsheetObj,"left header","center header","right header")>
<cfset spreadsheetSetFooter(SpreadsheetObj,"left footer","center footer","right footer")>
<cfspreadsheet action="write" filename="#dirname#MySheet.xls" name="SpreadsheetObj" overwrite="true" >
SpreadsheetSetHeader

Description
Adds a header to the specified worksheet.

Returns
Nothing

Category
Microsoft Office Integration

Function syntax
SpreadsheetSetHeader(spreadsheetobj, left header, center header, right header)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula, SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellFormula, SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to add the header.</td>
</tr>
<tr>
<td>left header</td>
<td>Adds the header in the left side of the worksheet.</td>
</tr>
<tr>
<td>center header</td>
<td>Adds the header in the center of the worksheet.</td>
</tr>
<tr>
<td>right header</td>
<td>Adds the header in the right side of the worksheet.</td>
</tr>
</tbody>
</table>

Usage
The header that you add appears on the printed worksheet document.

Example
The following example adds a header in the center of the worksheet.

<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" sheet="2" name="SpreadsheetObj" /><cfset spreadsheetSetHeader(SpreadsheetObj,"left header","center header","right header")><cfset spreadsheetSetFooter(SpreadsheetObj,"left footer","center footer","right footer")><cfspreadsheet action="write" filename="#dirname#MySheet.xls" name="SpreadsheetObj" overwrite="true" />

SpreadsheetSetRowHeight

Description
Sets the height of a row in a worksheet.
Returns
Nothing

Category
Microsoft Office Integration

Function syntax
SpreadSheetSetRowHeight(spreadsheetobj, row number, height)

See also
SpreadsheetGetCellComment, SpreadsheetFormatCell, SpreadsheetGetCellFormula, SpreadsheetGetCellValue, SpreadsheetMergeCells, SpreadsheetSetCellFormula, SpreadsheetSetCellValue

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetobj</td>
<td>The Excel spreadsheet object to which to set the column width.</td>
</tr>
<tr>
<td>row number</td>
<td>Specifies the row to set the height.</td>
</tr>
<tr>
<td>height</td>
<td>Specifies the height in points.</td>
</tr>
</tbody>
</table>

Usage

Example
The following example creates a spreadsheet, adds rows to the spreadsheet, and sets the row height for the newly added rows.

```cfscript>
a=SpreadSheetNew();
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8");
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8",2,1);
</cfscript>
<cfset SpreadSheetSetRowHeight(a,2,10)>
<cfset SpreadSheetSetRowHeight(a,3,25)>
<cfspreadsheet action="write" filename="#expandpath('.')#/b.xls" name="a" overwrite="true">

SpreadsheetShiftColumns

Description
Shifts one or more columns in Excel spreadsheet object left or right.

Returns
Does not return a value.
ColdFusion Functions

Category
Microsoft Office Integration

Function syntax
SpreadsheetShiftColumns(spreadsheetObj, start[, cols])
SpreadsheetShiftColumns(spreadsheetObj, start, end [, cols])

See also
SpreadsheetAddColumn, SpreadsheetDeleteColumn, SpreadsheetDeleteColumns,
SpreadsheetFormatColumn, SpreadsheetFormatColumns, SpreadsheetShiftRows

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to make the shift.</td>
</tr>
<tr>
<td>start</td>
<td>The number of the first, or only, column to shift</td>
</tr>
<tr>
<td>end</td>
<td>The number of the last column to shift. If you omit this parameter, the function shifts a single column.</td>
</tr>
<tr>
<td>columns</td>
<td>The positive (right) or negative (left) number of columns by which to shift the columns. If you omit this parameter, the function shifts the column right by one unit.</td>
</tr>
</tbody>
</table>

Usage

Example
The following line shifts columns 6 and 7 two columns to the left.

```cfset SpreadsheetShiftColumns(spreadsheetObj,10,11,2)><cfscript>
    // We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "shiftcolumns.xls";
    // Create a new Excel spreadsheet object.
    theSheet = SpreadsheetNew("Expenses");
    // Set some cell values, indicating their initial location.
    SpreadsheetSetCellValue(theSheet,"Cell D10",10,4);
    SpreadsheetSetCellValue(theSheet,"Cell E12",12,5);
    SpreadsheetSetCellValue(theSheet,"Cell F12",12,6);
    SpreadsheetSetCellValue(theSheet,"Cell G13",13,7);
    // Shift columns 6 and 7 left 2 columns.
    SpreadsheetShiftColumns(theSheet,6,7,-2);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>
SpreadsheetShiftRows

Description
Shifts one or more rows in Excel spreadsheet object up or down. The contents of the shifted row, including empty cells, overwrites data in the column to which it is shifted.

Returns
Does not return a value.

Category
Microsoft Office Integration

Function syntax
SpreadsheetShiftRows(spreadsheetObj, start[, rows])

See also
SpreadsheetAddRow, SpreadsheetAddRows, SpreadsheetDeleteRow, SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftColumns

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object in which to make the shift.</td>
</tr>
<tr>
<td>start</td>
<td>The number of the first row to shift</td>
</tr>
<tr>
<td>end</td>
<td>The number of the last row to shift. If you omit this parameter, the function shifts a single row.</td>
</tr>
<tr>
<td>rows</td>
<td>The positive (down) or negative (up) number of rows by which to shift the rows. If you omit this parameter, the function shifts the row down by one unit.</td>
</tr>
</tbody>
</table>

Usage

Example
The following line shifts 10 and 11 down two rows. Notice that the shifted rows completely overwrite the previous rows 12 and 13.
<cfscript>
  // We need an absolute path, so get the current directory path.
  theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "shiftrows.xls";
  // Create a new Excel spreadsheet object.
  theSheet = SpreadsheetNew("Expenses");
  // Set some cell values, indicating their initial location.
  SpreadsheetSetCellValue(theSheet,"Cell D10",10,4);
  SpreadsheetSetCellValue(theSheet,"Cell E11",11,5);
  SpreadsheetSetCellValue(theSheet,"Cell A12",12,1);
  SpreadsheetSetCellValue(theSheet,"Cell B13",13,2);
  // Shift rows 10 and 11 down 2 rows.
  SpreadsheetShiftRows(theSheet,10,11,2);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>

SpreadsheetWrite

Description
Writes single sheet to a new XLS file from a ColdFusion spreadsheet object.

Category
Microsoft Office Integration

Function syntax
SpreadsheetWrite(SpreadsheetObj, fileName)
SpreadsheetWrite(SpreadsheetObj, fileName [,overwrite])
SpreadsheetWrite(SpreadsheetObj, fileName [, password])
SpreadsheetWrite(SpreadsheetObj, fileName [, password,overwrite])

See also
SpreadsheetRead, SpreadsheetAddRow, SpreadsheetAddRows, SpreadsheetDeleteRow,
SpreadsheetDeleteRows, SpreadsheetFormatRow, SpreadsheetFormatRows, SpreadsheetShiftColumns

History
ColdFusion 9: Added the function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spreadsheetObj</td>
<td>The Excel spreadsheet object to which to write.</td>
</tr>
<tr>
<td>fileName</td>
<td>The pathname of the file that is written.</td>
</tr>
<tr>
<td>overwrite</td>
<td>A Boolean value specifying whether to overwrite an existing file. Specify yes to overwrite.</td>
</tr>
<tr>
<td>password</td>
<td>Password to protect the active sheet. Password is applicable only for Excel 97 - 2003 file formats. It will be ignored for XML file format (Excel 2007).</td>
</tr>
</tbody>
</table>
Usage
Use this function to:

- Write multiple sheets to a single file.
- Update an existing file, read all sheets in the file, modify one or more sheets, and to rewrite the entire file.

Example
<cfscript>
spreadsheet = SpreadSheetRead("C:\Files\Report.xls","Annual Report");
SpreadSheetWrite(spreadsheet,"C:\Files\Report.xls","Password","yes");
</cfscript>

Example 2
<cfscript>
spObj = spreadsheetread(#dirname#SingleSheet.xls","Sheet2");
spreadsheetCreateSheet(spObj,"A");
spreadsheetaddrow(spObj,"x,x,x,x",3,1);
spreadsheetgetActiveSheet(spObj,"A");
spreadsheetaddrow(spObj,"z,z,z,z",3,1);
spreadsheetgetActiveSheetNumber(spObj,1);
spreadsheetaddrow(spObj,"a,b,c,d,e",3,1);
SpreadsheetWrite(spObj,"#dirname#SingleSheet1.xls","yes");
</cfscript>

Sqr

Description
Calculates the square root of a number.

Returns
Number; square root of number.

Category
Mathematical functions

Function syntax
Sqr(number)

See also
Abs

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>A positive integer or a variable that contains one. Number whose square root to get.</td>
</tr>
</tbody>
</table>

Usage
The value in number must be greater than or equal to 0.
Example

<h3>Sqr Example</h3>

<p>Returns the square root of a positive number.</p>

<p>Sqr(2): <cfoutput>#{Sqr(2)}#</cfoutput></p>
<p>Sqr(Abs(-144)): <cfoutput>#{Sqr(Abs(-144))}#</cfoutput></p>
<p>Sqr(25^2): <cfoutput>#{Sqr(25^2)}#</cfoutput></p>

**StripCR**

**Description**
Deletes return characters from a string.

**Returns**
A copy of `string`, after removing return characters.

**Category**
Display and formatting functions, String functions

**Function syntax**
`StripCR(string)`

**See also**
ParagraphFormat

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

**Usage**
Useful for preformatted (between `<pre>` and `</pre>` tags) HTML display of data entered in textarea fields.
Example

```html
<h3>StripCR Example</h3>

<p>Function StripCR is useful for preformatted HTML display of data (PRE) entered in textarea fields.</p>

```cfif isdefined("Form.myTextArea")```
```pre
<cfoutput>#StripCR(Form.myTextArea)#</cfoutput>
</pre>
```cfif>
```
<!--- use Chr(10)##Chr(13)# to simulate line feed/carriage return combination --->
<cfoutput><textarea name="MyTextArea" cols="35" rows="8">
This is sample text and you see how it scrolls
  <cfoutput>Chr(10)##Chr(13)#</cfoutput>
From one line
  <cfoutput>Chr(10)##Chr(13)##Chr(10)##Chr(13)##</cfoutput>
to the next
</textarea></cfoutput>
<input type="Submit" name="Show me the HTML version">
</form>
```

**StructAppend**

**Description**

Appends one structure to another.

**Returns**

True, upon successful completion; False, otherwise.

**Category**

Structure functions

**Function syntax**

StructAppend(struct1, struct2, overwriteFlag)

**See also**

Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

**History**

ColdFusion MX: Changed behavior: this function can be used on XML objects.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct1</td>
<td>Structure to which struct2 is appended.</td>
</tr>
<tr>
<td>struct2</td>
<td>Structure that contains the data to append to struct1</td>
</tr>
<tr>
<td>overwriteFlag</td>
<td>True or Yes: values in struct2 overwrite corresponding values in struct1. Default.</td>
</tr>
<tr>
<td></td>
<td>False or No: values in struct2 do not overwrite corresponding values in struct1.</td>
</tr>
</tbody>
</table>

Usage

This function appends the fields and values of struct2 to struct1; struct2 is not modified. If struct1 already contains a field of struct2, overwriteFlag determines whether the value in struct2 overwrites it.

A structure’s keys are unordered.

Example

```html
<html>
<body>
<!---- Create a Name structure --->
<cfset nameCLK=StructNew()>
<cfset nameCLK.first="Chris">
<cfset nameCLK.middle="Lloyd">
<cfset nameCLK.last="Gilson">
<!---- Create an address struct --->
<cfset addrCLK=StructNew()>
<cfset addrCLK.street="17 Gigantic Rd">
<cfset addrCLK.city="Watertown">
<cfset addrCLK.state="MA">
<cfset addrCLK.zip="02472">
<!---- Create a Person structure --->
<cfset personCLK=StructNew()>
<cfset personCLK.name=#nameCLK#>
<cfset personCLK.addr=#addrCLK#>
<!---- Display the contents of the person struct before the Append --->
<p>
The person struct <b>before</b> the Append call:<br/>
<cfloop collection=#personCLK# item="myItem">
  <cfoutput>
    #myItem#
  </cfoutput>
</cfloop>
<!---- Merge the address struct into the top-level person struct --->
<cfset bSuccess = StructAppend( personCLK, addrCLK )>

<!---- Display the contents of the person struct, after the Append --->
<p>
The person struct <b>after</b> the Append call:<br/>
<cfloop collection=#personCLK# item="myItem">
  <cfoutput>
    #myItem#
  </cfoutput>
</cfloop>
</body>
</html>
```
**StructClear**

**Description**
Removes all data from a structure.

**Returns**
True, on successful execution; False, otherwise.

**Category**
Structure functions

**Function syntax**
```
StructClear(structure)
```

**See also**
Structure functions; Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

**History**
ColdFusion MX: Changed behavior: this function can be used on XML objects.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to clear</td>
</tr>
</tbody>
</table>

**Usage**
Do not call this function on a session variable. For more information, see TechNote, “ColdFusion 4.5 and the StructClear(Session) function,” at go.adobe.com/kb/ts_tn_17479_en-us. (The article applies to ColdFusion 4.5, 5.x, and ColdFusion MX.)
Example
<!--- Shows StructClear function. Calls cf_addemployee custom tag which
uses the addemployee.cfm file. --->
<body>
<h1>Add New Employees</h1>
<!-- Establish params for first time through --->
<cfparam name = "Form.firstname" default = ">
<cfparam name = "Form.lastname" default = ">
<cfparam name = "Form.email" default = ">
<cfparam name = "Form.phone" default = ">
<cfparam name = "Form.department" default = ">
<cfif form.firstname eq ">
  <p>Please fill out the form.
</cfelse>
<cfelse>
  <cfoutput>
    <cfscript>
      employee = StructNew();
      StructInsert(employee, "firstname", Form.firstname);
      StructInsert(employee, "lastname", Form.lastname);
      StructInsert(employee, "email", Form.email);
      StructInsert(employee, "phone", Form.phone);
      StructInsert(employee, "department", Form.department);
    </cfscript>
  </cfoutput>
  <!--- Call the custom tag that adds employees --->
  <cf_addemployee empinfo = "/employee/">
  <cfscript>StructClear(employee);</cfscript>
</cfif>

StructCopy

Description
Copies a structure. Copies top-level keys, values, and arrays in the structure by value; copies nested structures by
reference.

Returns
A copy of a structure, with the same keys and values; if structure does not exist, throws an exception.

Category
Structure functions

Function syntax
StructCopy(structure)

See also
Structure functions; Structure functions in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to copy</td>
</tr>
</tbody>
</table>
Usage
The following code shows how this function copies a structure that contains a string field, a number field, and a two-dimensional array at the top-level:

```cfoutput>
  <cfset assignedCopy = StructNew()>
  <cfset assignedCopy.string = #struct.string#>
  <cfset assignedCopy.number = #struct.number#>
  <cfset assignedCopy.array = ArrayNew(2)>
  <cfset assignedCopy.array[1][1] = #struct.array[1][1]#>
  <cfset assignedCopy.array[1][2] = #struct.array[1][2]#>
</cfoutput>
```

The following code shows how `StructCopy` copies a nested structure:

```cfoutput>
  <cfset assignedCopy.nestedStruct = struct.nestedStruct>
</cfoutput>
```

To copy a structure entirely by value, use “Duplicate” on page 883.

The following table shows how variables are assigned:

<table>
<thead>
<tr>
<th>Variable type</th>
<th>Assigned by</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure.any_simple_value</td>
<td>Value</td>
</tr>
<tr>
<td>Boolean</td>
<td></td>
</tr>
<tr>
<td>Binary</td>
<td></td>
</tr>
<tr>
<td>Base64</td>
<td></td>
</tr>
<tr>
<td>structure.array</td>
<td>Value</td>
</tr>
<tr>
<td>structure.nested_structure</td>
<td>Reference</td>
</tr>
<tr>
<td>structure.object</td>
<td>Reference</td>
</tr>
<tr>
<td>structure.query</td>
<td>Reference</td>
</tr>
</tbody>
</table>
Example

<!--- This code shows assignment by-value and by-reference. --->
// This script creates a structure that StructCopy copies by value. <br>
<cfscript>
    // Create elements.
    s = StructNew();
    s.array = ArrayNew(2);

    // Assign simple values to original top-level structure fields.
    s.number = 99;
    s.string = "hello tommy";

    // Assign values to original top-level array.
    s.array[1][1] = "one one";
    s.array[1][2] = "one two";
</cfscript>

<!--- Output original structure --->
<hr>
<b>Original Values</b><br>
<cfoutput>
    // Simple values <br>
    s.number = #s.number#<br>
    s.string = #s.string#<br>
    // Array value <br>
    s.array[1][1] = #s.array[1][1]#<br>
    s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>

// Copy this structure to a new structure. <br>
<cfset copied = StructCopy(s)>

<cfscript>
    // Change the values of the original structure. <br>
    s.number = 100;
    s.string = "hello tommy (modified)";
    s.array[1][1] = "one one (modified)";
    s.array[1][2] = "one two (modified)";
</cfscript>

<!--- Output modified structure --->
<hr>
<b>Modified Original Values</b><br>
<cfoutput>
    // Simple values <br>
    s.number = #s.number#<br>
    s.string = #s.string#<br>
    // Array value <br>
    s.array[1][1] = #s.array[1][1]#<br>
    s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>

// Copied structure values should be the same as the original.<br>
<cfoutput>
    // Simple values <br>
    copied.number = #copied.number#<br>
    copied.string = #copied.string#<br>
    // Array value <br>
</cfoutput>
copied.array[1][1] = #copied.array[1][1]#
/copied.array[1][2] = #copied.array[1][2]#
</coutput>

// This script creates a structure that StructCopy copies by reference.
<cfscript>
// Create elements.
s = StructNew();
s.nested = StructNew();
s.nested.array = ArrayNew(2);
// Assign simple values to nested structure fields.
s.nested.number = 99;
s.nested.string = "hello tommy";
// Assign values to nested array.
s.nested.array[1][1] = "one one";
s.nested.array[1][2] = "one two";
</cfscript>

<!--- Output original structure --->
<hr>
<b>Original Values</b>
<cfoutput>
// Simple values <br>
s.nested.number = #s.nested.number#<br>
s.nested.string = #s.nested.string#<br>
// Array values <br>
s.nested.array[1][1] = #s.nested.array[1][1]#<br>
s.nested.array[1][2] = #s.nested.array[1][2]#<br>
</cfoutput>

// Use StructCopy to copy this structure to a new structure. <br>
<cfset copied = StructCopy(s)> 
// Use Duplicate to clone this structure to a new structure. <br>
<cfset duplicated = Duplicate(s)> 

<cfscript>
// Change the values of the original structure.
s.nested.number = 100;
s.nested.string = "hello tommy (modified)";
s.nested.array[1][1] = "one one (modified)";
s.nested.array[1][2] = "one two (modified)";
</cfscript>

<!--- Output modified structure --->
<hr>
<b>Modified Original Values</b>
<cfoutput>
// Simple values <br>
s.nested.number = #s.nested.number#<br>
s.nested.string = #s.nested.string#<br>
// Array value <br>
s.nested.array[1][1] = #s.nested.array[1][1]#<br>
s.nested.array[1][2] = #s.nested.array[1][2]#<br>
</cfoutput>

<hr>
<b>Copied structure values should reflect changes to original.</b><br>
<cfoutput>
    // Simple values  
    copied.nested.number = #copied.nested.number#<br>
    copied.nested.string = #copied.nested.string#<br>

    // Array values  
    copied.nested.array[1][1] = #copied.nested.array[1][1]#<br>
    copied.nested.array[1][2] = #copied.nested.array[1][2]#<br>
</cfoutput>

<hr>

<b>Duplicated structure values should remain unchanged.</b><br>
<cfoutput>
    // Simple values  
    duplicated.nested.number = #duplicated.nested.number#<br>
    duplicated.nested.string = #duplicated.nested.string#<br>

    // Array value  
    duplicated.nested.array[1][1] = #duplicated.nested.array[1][1]#<br>
    duplicated.nested.array[1][2] = #duplicated.nested.array[1][2]#<br>
</cfoutput>

### StructCount

**Description**
Counts the keys in a structure.

**Returns**
A number; if structure does not exist, throws an exception.

**Category**
Structure functions

**Function syntax**
```
StructCount(structure)
```

**See also**
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

**History**
ColdFusion MX: Changed behavior: this function can be used on XML objects.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to access</td>
</tr>
</tbody>
</table>
Example

<!--- This view-only example shows use of StructCount. --->
This file is similar to addemployee.cfm, which is called by
StructNew, StructClear, and StructDelete. To test, copy
StructCount function to appropriate place in addemployee.cfm.

<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
  <cfif StructIsEmpty(attributes.EMPINFO)>
  <cfoutput>Error. No employee data was passed.</cfoutput>
  <cfexit method = "ExitTag">
  <cfelse>
  <cfquery name = "AddEmployee" datasource = "cfdocexamples">
  INSERT INTO Employees
  (FirstName, LastName, Email, Phone, Department)
  VALUES
  <cfoutput>
  ('#StructFind(attributes.EMPINFO, "firstname")#',
  '#StructFind(attributes.EMPINFO, "lastname")#',
  '#StructFind(attributes.EMPINFO, "email")#',
  '#StructFind(attributes.EMPINFO, "phone")#',
  '#StructFind(attributes.EMPINFO, "department")#'
  )
  </cfoutput>
  </cfquery>
  </cfif>
<cfoutput>
Employee Add Complete
</cfoutput>
</cfcase>
</cfswitch> --->

StructDelete

Description
Removes an element from a structure.

Returns
Boolean value. The value depends on the indicatenotexisting parameter value.

Category
Structure functions

Function syntax
StructDelete(structure, key [, indicatenotexisting ])

See also
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: this function can be used on XML objects.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure or a variable that contains one. Contains element to remove.</td>
</tr>
<tr>
<td>key</td>
<td>Element to remove.</td>
</tr>
<tr>
<td>indicatenotexisting</td>
<td>• True: returns Yes if key exists; No if it does not.</td>
</tr>
<tr>
<td></td>
<td>• False: returns Yes regardless of whether key exists. Default.</td>
</tr>
</tbody>
</table>

Example

```cfml
<h3>StructDelete Function</h3>
<!--- Delete the surrounding comments to make this page work --->
<p>This example uses the StructInsert and StructDelete functions.
</p>
<cfparam name = "firstname" default = "Mary">
<cfparam name = "lastname" default = "Sante">
<cfparam name = "email" default = "msante@allaire.com">
<cfparam name = "phone" default = "777-777-7777">
<cfparam name = "department" default = "Documentation">

<cfif IsDefined("FORM.Delete")>
<cfoutput>
Field to be deleted: #form.field#
</cfoutput>
</cfoutput>
<p>
<CFScript>
employee = StructNew();
StructInsert(employee, "firstname", firstname);
StructInsert(employee, "lastname", lastname);
StructInsert(employee, "email", email);
StructInsert(employee, "phone", phone);
StructInsert(employee, "department", department);
</CFScript>
Before deletion, employee structure looks like this:
<cfdump var="#employee#">
<br>
<cfset rc = StructDelete(employee, "#form.field#", "True")>
```
<cfoutput>
  Did I delete the field "#form.field#"? The code indicates: #rc#<br>
  The structure now looks like this:<br>
  <cfdump var="#employee#">
<br>
</cfoutput>
</cfif>
<br><br>
<form method="post" action="#CGI.Script_Name#">
  <p>Select the field to be deleted:&nbsp;
  <select name = "field">
    <option value = "firstname">first name
    <option value = "lastname">last name
    <option value = "email">email
    <option value = "phone">phone
    <option value = "department">department
  </select>
  <input type = "submit" name = "Delete" value = "Delete">
</form>
Delete this comment to make this page work --->

**StructEach**

**Description**
Used to loop over elements in a structure by accessing key-value pairs.

**Returns**
Nothing

**Category**
Closure functions

**Syntax**

```
structEach(array, function(key, value) {});
```

**See also**
Other closure functions.

**History**
ColdFusion 10: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct</td>
<td>Name of the structure object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each key-value pair in the struct.</td>
</tr>
<tr>
<td>key</td>
<td>Key in a struct.</td>
</tr>
<tr>
<td>value</td>
<td>Value in a struct.</td>
</tr>
</tbody>
</table>
**StructFilter**

**Description**
Used to filter the key value pairs in a struct.

**Returns**
A new struct

**Category**
Closure functions

**Syntax**

```
structFilter(struct,function(key, value){return true|false;});
```

**See also**
Other closure functions.

**History**
ColdFusion 10: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct</td>
<td>Name of the struct object.</td>
</tr>
<tr>
<td>function</td>
<td>Inline function executed for each element in the array. Returns true if the key value pair in the struct has to be included in the resultant struct.</td>
</tr>
<tr>
<td>key</td>
<td>Key in a struct.</td>
</tr>
<tr>
<td>value</td>
<td>Value in a struct.</td>
</tr>
</tbody>
</table>

**StructFind**

**Description**
Determines the value associated with a key in a structure.

**Returns**
The value associated with a key in a structure; if `structure` does not exist, throws an exception.

**Category**
Structure functions

**Function syntax**

```
StructFind(structure, key)
```

**See also**
Structure functions; Structure functions in the Developing ColdFusion Applications

Last updated 7/9/2012
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure that contains the value to return</td>
</tr>
<tr>
<td>key</td>
<td>Key whose value to return</td>
</tr>
</tbody>
</table>

Usage
A structure's keys are unordered.

Example
<!--- This view-only example shows the use of StructFind. --->
<p>This file is identical to addemployee.cfm, which is called by StructNew, StructClear, and StructDelete. It adds employees. Employee information is passed through the employee structure (EMPINFO attribute). In UNIX, you must also add the Emp_ID.<!--- <cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
<cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
<cfexit method = "ExitTag">
<cfelse>
<cfquery name = "AddEmployee" datasource = "cfdocexamples">
INSERT INTO Employees (FirstName, LastName, Email, Phone, Department) VALUES
<cfoutput>
( #StructFind(attributes.EMPINFO, "firstname")#, #StructFind(attributes.EMPINFO, "lastname")#, #StructFind(attributes.EMPINFO, "email")#, #StructFind(attributes.EMPINFO, "phone")#, #StructFind(attributes.EMPINFO, "department")# )
</cfoutput>
</cfquery>
</cfif>
<cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch> --->

StructFindKey

Description
Searches recursively through a substructure of nested arrays, structures, and other elements, for structures whose values match the search key in the value parameter.

Returns
An array that contains structures with values that match value.

Category
Structure functions
Function syntax

```
StructFindKey(top, value, scope)
```

See also

Structure functions; Structure functions in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top</td>
<td>ColdFusion object (structure or array) from which to start search. This parameter requires an object, not a name of an object.</td>
</tr>
<tr>
<td>value</td>
<td>String or a variable that contains one for which to search.</td>
</tr>
</tbody>
</table>
| scope     | • one: returns one matching key. Default.  
|           | • all: returns all matching keys.  
|           | If the key is not found, an empty array is returned. |

Usage

Returns an array that includes one structure for each of the specified values it finds. The fields of each of these structures are:

- **Value**: value held in the found key
- **Path**: string that can be used to reach the found key
- **Owner**: parent object that contains the found key

A structure's keys are unordered.

Example

```
<cfset aResults = StructFindKey( #request#, "bass" )>
```

**StructFindValue**

Description

Searches recursively through a substructure of nested arrays, structures, and other elements for structures with values that match the search key in the `value` parameter.

Returns

An array that contains structures with values that match the search key `value`. If none are found, returns an array of size 0.

Category

Structure functions

Function syntax

```
StructFindValue( top, value [, scope])
```
ColdFusion Functions

See also
Structure functions; Structure functions in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top</td>
<td>ColdFusion structure from which to start search. This parameter requires an object, not a name of an object.</td>
</tr>
<tr>
<td>value</td>
<td>String or a variable that contains one for which to search. The type must be a simple object. Arrays and structures are not supported.</td>
</tr>
<tr>
<td>scope</td>
<td>• one: function returns one matching key (default). • all: function returns all matching keys.</td>
</tr>
</tbody>
</table>

Usage
The fields of each structure in the returned array are:
• Key: name of the key in which the value was found
• Path: string which could be used to reach the found key
• Owner: parent object that contains the found key
A structure’s keys are unordered.

Example
<cfset aResults = StructFindValue( #request#, "235" )>

StructGet

Description
Gets a structure(s) from a specified path.

Returns
An alias to the variable in the pathDesired parameter. If necessary, StructGet creates structures or arrays to make pathDesired a valid variable "path."

Category
Structure functions

Function syntax
StructGet(pathDesired)

See also
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

History
ColdFusion MX:
• Changed behavior: this function can be used on XML objects.
· Changed behavior: if there is no structure or array present in `pathDesired`, this function creates structures or arrays to make `pathDesired` a valid variable “path.”

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pathDesired</code></td>
<td>Pathname of variable that contains structure or array from which ColdFusion retrieves structure.</td>
</tr>
</tbody>
</table>

Usage

You can inadvertently create invalid structures using this function. For example, if array notation is used to expand an existing array, the specified new element is created, regardless of the type currently held in the array.

Example

```coldfusion
<!--- GetStruct() test --->
<cfset test = StructGet( "dog.myscope.test" )>
<cfset test.foo = 1>
<cfif NOT IsDefined("dog")>
    Dog is not defined<br>
</cfif>
<cfif NOT IsDefined("dog.myscope")>
    Dog.Myscope is not defined<br>
</cfif>
<cfif NOT IsDefined("dog.myscope.test")>
    Dog.Myscope.Test is not defined<br>
</cfif>
<cfif NOT IsDefined("dog.myscope.test.foo")>
    Dog.Myscope.Test.Foo is not defined<br>
</cfif>
<cfoutput>
    #dog.myscope.test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test" )>
<cfset test.foo = 2>
<cfoutput>
    #request.myscope[1].test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test[2]" )>
<cfset test.foo = 3>
<cfoutput>
    #request.myscope[1].test[2].foo#<br>
</cfoutput>
```

**StructInsert**

Description

Inserts a key-value pair into a structure.

Returns

True, upon successful completion. If `structure` does not exist, or if `key` exists and `allowoverwrite = "False"`, ColdFusion throws an exception.
Category
Structure functions

Function syntax
StructInsert(structure, key, value [, allowoverwrite ])

See also
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

History
ColdFusion MX: Changed behavior: this function can be used on XML objects.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to contain the new key-value pair.</td>
</tr>
<tr>
<td>key</td>
<td>Key that contains the inserted value.</td>
</tr>
<tr>
<td>value</td>
<td>Value to add.</td>
</tr>
<tr>
<td>allowoverwrite</td>
<td>Optional. Whether to allow overwriting a key. The default value is False.</td>
</tr>
</tbody>
</table>

Usage
A structure’s keys are unordered.

Example

```
<cfparam name = "FORM.lastname" default = "">  
<cfparam name = "FORM.email" default = "">  
<cfparam name = "FORM.phone" default = "">  
<cfparam name = "FORM.department" default = "">  

<cfif FORM.firstname EQ ">
    <p>Please fill out the form.</p>
<cfelse>
    <cfoutput>
    <CFScript>
    employee = StructNew();
    StructInsert(employee, "firstname", FORM.firstname);
    StructInsert(employee, "lastname", FORM.lastname);
    StructInsert(employee, "email", FORM.email);
    StructInsert(employee, "phone", FORM.phone);
    StructInsert(employee, "department", FORM.department);
    </CFScript>
    <p>First name is #StructFind(employee, "firstname")#</p>  
    <p>Last name is #StructFind(employee, "lastname")#</p>  
    <p>Email is #StructFind(employee, "email")#</p>  
    <p>Phone is #StructFind(employee, "phone")#</p>  
    <p>Department is #StructFind(employee, "department")#</p>  
    </cfoutput>
```
<!-- Call the custom tag that adds employees -->
<cf_addemployee EMPINFO = "#employee#">
</cfif>

<form action = "structinsert.cfm">
<p>First Name:  
<input name = "firstname" type = "text" hspace = "30" maxlength = "30">
</p>
<p>Last Name:  
<input name = "lastname" type = "text" hspace = "30" maxlength = "30">
</p>
<p>Email:  
<input name = "email" type = "text" hspace = "30" maxlength = "30">
</p>
<p>Phone:  
<input name = "phone" type = "text" hspace = "20" maxlength = "20">
</p>
<p>Department:  
<input name = "department" type = "text" hspace = "30" maxlength = "30">
</p>
<p><input type = "submit" value = "OK"></p>
</form>

### StructIsEmpty

**Description**

Determines whether a structure contains data.

**Returns**

True, if `structure` is empty; if `structure` does not exist, ColdFusion throws an exception.

**Category**

Decision functions, Structure functions

**Function syntax**

`StructIsEmpty(structure)`

**See also**

Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

**History**

ColdFusion MX: Changed behavior: this function can be used on XML objects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to test</td>
</tr>
</tbody>
</table>
Example

<!--- This example illustrates use of StructIsEmpty. --->
<p>This file is identical to addemployee.cfm, which is called by StructNew,
StructClear, and StructDelete. It adds employees. Employee information
is passed through employee structure (EMPINFO attribute). In UNIX, you
must also add the Emp_ID.</p>
<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
  <!--- Add the employee; In UNIX, you must also add the Emp_ID --->
  <cfquery name = "AddEmployee" datasource = "cfdocexamples">
    INSERT INTO Employees
      (FirstName, LastName, Email, Phone, Department)
    VALUES
      ("#StructFind(attributes.EMPINFO, "firstname")#",
       "#StructFind(attributes.EMPINFO, "lastname")#",
       "#StructFind(attributes.EMPINFO, "email")#",
       "#StructFind(attributes.EMPINFO, "phone")#",
       "#StructFind(attributes.EMPINFO, "department")#"
  )
  </cfquery>
</cfcase>
</cfswitch>

**StructKeyArray**

**Description**
Finds the keys in a ColdFusion structure.

**Returns**
An array of keys; if structure does not exist, ColdFusion throws an exception.

**Category**
Structure functions

**Function syntax**
StructKeyArray(structure)

**See also**
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure from which to extract a list of keys</td>
</tr>
</tbody>
</table>

Usage

A structure's keys are unordered.

Example

```coldfusion
<cfset employee = StructNew()>  
<cfif Isdefined("Form.Submit")>
  <cfif Form.Submit is "OK">    
    <cfset employee.firstname = FORM.firstname>
    <cfset employee.lastname = FORM.lastname>
    <cfset employee.email = FORM.email>
    <cfset employee.phone = FORM.phone>
    <cfset employee.company = FORM.company>
  </cfif>
  <cfelseIf Form.Submit is "Clear">    
    <cfset rc = StructClear(employee)> 
  </cfif>
</cfif>

This example uses the StructNew function to create a structure called "employee" that supplies employee info. Its fields are filled by the form. After you enter employee information in structure, the example uses StructKeyArray function to copy all of the keys from the structure into an array. </p>

```
<tr><td>Company:</td><td><input name = "company" type = "text" value = "" hspace = "30" maxlength = "30"></td></tr>
<tr><td><input type = "submit" name = "submit" value = "OK"></td><td><b>After you submit the FORM, scroll down to see the array.</b></td></tr>
</table>
</form>

<cfif NOT StructISEmpty(employee)>
  <hr size = "2" color = "#0000A0">
  <cfset keysToStruct = StructKeyArray(employee)>
  <cfloop index = "i" from = "1" to = "#ArrayLen(keysToStruct)#">
    <p><cfoutput>Key#i# is #keysToStruct[i]#</cfoutput></p>
    <p><cfoutput>Value#i# is #employee[keysToStruct[i]]#</cfoutput></p>
  </cfloop>
</cfif>

**StructKeyExists**

**Description**
Determines whether a specific key is present in a structure.

**Returns**
True, if key is in structure.

**Category**
Decision functions, Structure functions

**Function syntax**
StructKeyExists(structure, "key")

**See also**
Structure functions; Structure functions in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Name of structure to test</td>
</tr>
<tr>
<td>key</td>
<td>Key to test</td>
</tr>
</tbody>
</table>

**Usage**
This function can sometimes be used in place of the IsDefined function, when working with the URL and Form scopes, which are structures. The following pieces of code are equivalent:
A structure’s keys are unordered.

Example

```cfml
<!--- This example shows the use of StructKeyExists. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew, StructClear, and StructDelete. To test, copy the &lt;CFELSEif&gt; statement to the appropriate place in addemployee.cfm. It is a custom tag to add employees. Employee information is passed through the employee structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.

<cfswitch expression = "#ThisTag.ExecutionMode#">
  <cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
      <cfoutput>Error. No employee data was passed.</cfoutput>
      <cfexit method = "ExitTag">
    <cfelseIf NOT StructKeyExists(attributes.EMPINFO, "department")>
      <cfscript>StructUpdate(attributes.EMPINFO, "department", "Unassigned");</cfscript>
      <cfexit method = "ExitTag">
    <cfelse>
      StructKeyList
    </cfelse>
  </cfcase>
</cfswitch>
```

**StructKeyList**

Description
Extracts keys from a ColdFusion structure.

Returns
A list of keys; if `structure` does not exist, ColdFusion throws an exception.

Category
Structure functions

Function syntax
```csh
StructKeyList(structure [, delimiter])
```

See also
Structure functions; Modifying a ColdFusion XML object in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure from which to extract a list of keys.</td>
</tr>
<tr>
<td>delimiter</td>
<td>Optional. Character that separates keys in list. The default value is comma.</td>
</tr>
</tbody>
</table>

Usage
A structure’s keys are unordered.
Example

<!-- This example shows how to use StructKeyList to list the keys in a structure. It uses StructNew function to create structure and fills it with information user enters in form fields. -->

<!-- This section creates structure and checks whether Submit has been pressed. If so, code defines fields in the employee structure with what the user entered in the form. -->
<cfset employee = StructNew()>
<cffif Isdefined("Form.Submit")>
  <cffif Form.Submit is "OK">
    <cfset employee.firstname = FORM.firstname>
    <cfset employee.lastname = FORM.lastname>
    <cfset employee.email = FORM.email>
    <cfset employee.phone = FORM.phone>
    <cfset employee.company = FORM.company>
  </cffif>
  <cffelseif Form.Submit is "Clear">
    <cfset rc = StructClear(employee)>
  </cffelseif>
</cffif>

<html>

</form>

<cfif NOT StructISEmpty(employee)>
    <hr size = "2" color = "#0000A0">
    <cfset keysToStruct = StructKeyList(employee,"<li>")>
    <p>Here are the keys to the structure:</p>
    <ul>
    <li><cfoutput>'#keysToStruct#'</cfoutput></li>
    </ul>
    <p>If fields are correct, we can process new employee information. If they are not correct, consider rewriting application.</p>
</cfif>

### StructNew

**Description**

Creates a structure.

**Returns**

A structure.

**Category**

Structure functions

**Function syntax**

StructNew()

**See also**

Structure functions; Structure functions in the Developing ColdFusion Applications

**Parameters**

None
Example

```cfc
<!--- Shows StructNew. Calls CF_ADDEMPLOYEE, which uses the |
    addemployee.cfm file to add employee record to database. --->
<h1>Add New Employees</h1>
<cfparam name = "FORM.firstname" default = "">
<cfparam name = "FORM.lastname" default = "">
<cfparam name = "FORM.email" default = "">
<cfparam name = "FORM.phone" default = "">
<cfparam name = "FORM.department" default = "">
<cfif FORM.firstname EQ ">
  <p>Please fill out the form.
<cfelse>
  <cfoutput>
    <cfscript>
      employee = StructNew();
      StructInsert(employee, "firstname", FORM.firstname);
      StructInsert(employee, "lastname", FORM.lastname);
      StructInsert(employee, "email", FORM.email);
      StructInsert(employee, "phone", FORM.phone);
      StructInsert(employee, "department", FORM.department);
    </cfscript>
    <p>First name is #StructFind(employee, "firstname")#</p>
    <p>Last name is #StructFind(employee, "lastname")#</p>
    <p>Email is #StructFind(employee, "email")#</p>
    <p>Phone is #StructFind(employee, "phone")#</p>
    <p>Department is #StructFind(employee, "department")#
  </cfoutput>
<cfif FORM.firstname EQ ">
</cfelse>
<cfif FORM.firstname EQ ">
</cfif>
```

StructSort

Description

Returns a sorted array of the top level keys in a structure. Sorts using alphabetic or numeric sorting, and can sort based on the values of any structure element.

Returns

An array of top-level key names (strings), sorted by the value of the specified subelement.

Category

Structure functions

Function syntax

```cfc
StructSort(base, sortType, sortOrder, pathToSubElement)
```

See also

Structure functions; Structure functions in the Developing ColdFusion Applications
ColdFusion Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base</td>
<td>A ColdFusion structure with one field (an associative array).</td>
</tr>
<tr>
<td>localeSensitive</td>
<td>Specify if you wish to do a locale sensitive sorting. The default value is false.</td>
</tr>
<tr>
<td>sortType</td>
<td>• numeric&lt;br&gt;• text: case sensitive (all lowercase letters precede the first uppercase letter). Default.&lt;br&gt;• textnocase</td>
</tr>
<tr>
<td>sortOrder</td>
<td>• asc: ascending (a to z) sort order. Default.&lt;br&gt;• desc: descending (z to a) sort order</td>
</tr>
<tr>
<td>pathToSubElement</td>
<td>String or a variable that contains one.&lt;br&gt;Path to apply to each top-level key, to reach element value by which to sort. The default value is nothing (top-level entries sorted by their own values).</td>
</tr>
</tbody>
</table>

Usage

The pathToSubElement string does not support array notation, and only supports substructures of structures.

This function does not sort or change the structure.

In ColdFusion 10, added support for all Java supported locale-specific characters (including support for umlaut characters). A flag for this support has been added for sorttype = "text" or sorttype = "textnocase".

Example

```cfscript
salaries = StructNew() ;
employees = StructNew() ;
departments = StructNew() ;
for ( i=1; i lt 6; i=i+1 )
{
    salary = 120000 - i*10000 ;
salaries["employee#i#"] = salary ;

    employee = StructNew() ;
    employee["salary"] = salary ;
    // employee.salary = salary ;
    employees["employee#i#"] = employee ;

    departments["department#i#"] = StructNew() ;
    departments["department#i#"].boss = employee ;
}
</cfscript>

<cfoutput>
<p>list of employees based on the salary (text search): <br>
1) #ArrayToList( StructSort( salaries ) )#<br>
2) #ArrayToList( StructSort( salaries, "text", "ASC" ) )#<br>
3) #ArrayToList( StructSort( salaries, "textnocase", "ASC" ) )#<br>
4) #ArrayToList( StructSort( salaries, "text", "DESC" ) )#<br>
<p>list of employees based on the salary (numeric search): <br>
5) #ArrayToList( StructSort( salaries, "numeric", "ASC" ) )#<br>
</p>
</cfoutput>

Last updated 7/9/2012
6) #ArrayToList( StructSort( salaries, "numeric", "DESC" ) )#
   <p>list of employees based on the salary (subfield search): <br>
7) #ArrayToList( StructSort( employees, "numeric", "DESC", "salary" ) )#
8) #ArrayToList( StructSort( employees, "text", "ASC", "salary" ) )#
   <p>list of departments based on the salary (sub-sub-field search): <br>
9) #ArrayToList( StructSort( departments, "text", "ASC", "boss.salary" ) )#
</cfoutput>

<!--- add an invalid element and test that it throws an error --->
<p><p>
<cfset employees[ "employee4" ] = StructNew()>
<cftry>
   <cfset temp = StructSort( employees, "text", "ASC", "salary" )>
   <cfoutput>We have a problem - this was supposed to throw an exception! <br>
</cfoutput>
</cftry>
<cfcatch type="any">
   <cfoutput>
      ERROR: <b>This error was expected!</b> <br>
      #cfcatch.message# - #cfcatch.detail# <br>
   </cfoutput>
</cfcatch>
</cftry>

**StructUpdate**

**Description**
Updates a key with a value.

**Returns**
True, on successful execution; if the structure does not exist, ColdFusion throws an error.

**Category**
Structure functions

**Function syntax**
StructUpdate(structure, key, value)

**See also**
Structure functions; Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

**History**
ColdFusion MX: Changed behavior: this function can be used on XML objects.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>structure</td>
<td>Structure to update</td>
</tr>
<tr>
<td>key</td>
<td>Key, the value of which to update</td>
</tr>
<tr>
<td>value</td>
<td>New value</td>
</tr>
</tbody>
</table>
Example

<!--- This example shows the use of StructUpdate. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew, StructClear, and StructDelete. To test this file, copy the &lt;CFELSEIF&gt; statement to the appropriate place in addemployee.cfm. It is an example of a custom tag used to add employees. Employee information is passed through the employee structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.</p>

```cfc
cfswitch expression = "#ThisTag.ExecutionMode#"
cfcase value = "start"
   <cfif StructIsEmpty(attributes.EMPINFO)>
   <cfoutput>Error. No employee data was passed.</cfoutput>
   <cfexit method = "ExitTag">
   <cfelseif StructFind(attributes.EMPINFO, "department") EQ "">
   <cfscript>
   StructUpdate(attributes.EMPINFO, "department", "Unassigned");
   </cfscript>
   <cfexit method = "ExitTag">
   </cfelse>
</cfcase>
```

Functions t-z

Tan

Description
Calculates the tangent of an angle that is entered in radians.

Returns
A number; the tangent of an angle.

Category
Mathematical functions

Function syntax

```
Tan(number)
```

See also
Atn, Cos, ACos, Sin, ASin, Pi

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Angle, in radians, for which to calculate the tangent.</td>
</tr>
</tbody>
</table>

Usage
To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.
Note: Because the function uses floating point arithmetic, it can return a small number (such as 6.1232339574E-017) for angles that must produce 0 and can return a large number (such as 1.63312393532E+016) for infinity or not a number. To test for a 0 value, check whether the value is less than 0.0000000000001. To test for an infinite value, check whether the value is more than 1E15.

Example

```
<cfif IsDefined("FORM.tanNum")>
<!--- Make sure input is a number --->
<cfif IsNumeric(#FORM.tanNum#)>
<!--- Convert degrees to radians, call the Tan function. --->
<cfset tanValue=#Tan((Form.tanNum * PI()) / 180)#>
<!--- 0.0000000000001 is the function's precision limit. If absolute value of returned value is less, set result to 0 --->
<cfif Abs(tanValue) LT 0.0000000000001>
<cfset tanValue=0>
</cfif>
</cfif>
<cfoutput>
Tan(#FORM.tanNum#) = #tanValue#<br><br>
</cfoutput>
<cfelse>
<!--- If input is not a number, show an error message --->
<h4>You must enter a numeric angle in degrees.</h4>
</cfif>
</cfif>
<form action="#CGI.script_name#" method="post">
Enter an angle in degrees to get its tangent:<br>
<input type = "Text" name = "tanNum" size = "15">
<br><br>
<input type = "Submit" name = ">&nbsp;&nbsp;
<input type = "RESET"
</form>

ThreadJoin

Description
Makes the current thread wait until the thread or threads specified complete processing.

Category
Exception handling functions, Data output functions

Function syntax
ThreadJoin([threadName], [timeout])

See also
cfscript, cfthrow, cftry, cfcatch

History
ColdFusion 9: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threadName</td>
<td>The name of the thread or threads to join to the current thread. To specify multiple threads, use a comma-separated list.</td>
</tr>
<tr>
<td>timeout</td>
<td>The number of milliseconds for which to suspend thread processing.</td>
</tr>
</tbody>
</table>

Usage
Makes the current thread wait until the thread or threads specified in the threadName parameter complete processing, or until the period specified in the timeout parameter passes, before continuing processing.

- **ThreadJoin()**: Current thread waits for all ColdFusion threads to complete processing.
- **ThreadJoin(threadName)**: Makes current thread wait for the specified thread to finish execution.
- **ThreadJoin(threadName, timeout)**: Makes the current thread wait until execution timeout for one or many threads specified by threadName. If you do not specify a timeout and the thread you are joining to does not finish, the current thread also cannot finish processing.

Example

```cfs
<cfscript>
thread name="t1"
{
    sleep(5000);
}
thread name="t2"
{
    threadjoin("t1",1000);
}
threadjoin("t2");
</cfscript>
<cfoutput>Status of the thread T1 = #t1.Status#<br></cfoutput>
<cfoutput>Status of the thread T2 = #t2.Status#<br></cfoutput>
```

**ThreadTerminate**

Description
Terminates the thread specified by threadName. Behaves same as cfthread action="terminate".

Category
Exception handling functions, Data output functions

Function syntax
ThreadTerminate(threadName)

See also
cfscript, cfthrow, cftry, cfcatch

History
ColdFusion 9: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threadName</td>
<td>The name of the thread to stop.</td>
</tr>
</tbody>
</table>

Usage

Use this function to stop processing of the thread specified in the `threadName`. If you terminate a thread, the thread scope includes an ERROR metadata structure that provides information about the termination.

Example

```
<cfscript>
    thread name="t1"
    {
        sleep(3000);
    }
    sleep(1000);
    threadTerminate("t1");
    sleep(1000);
</cfscript>
<cfoutput>Status of the thread = #t1.Status#<br></cfoutput>
```

Throw

Description

A function equivalent of the `cfthrow` tag and is used in the `<cfscript>` mode.

Parameters

Same as the `cfthrow` tag.

Category

Exception handling functions, Data output functions

Function syntax

For name=value pair:

```
throw (message = "message", type = "exception type", detail, errorCode = "error code", extendedInfo = "additional info", object = "java exception object")
```

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the attributes, use an empty string instead.

See also

`cfscript`, `cfthrow`, `cftry`, `cfcatch`

Usage

You can call this function by passing arguments as name=value pair or as positional arguments. For positional notations, specify the arguments in the sequence mentioned in the function syntax.
Example
<cfscript>
function TotalInterest(principal, annualRate, months)
{
    var years = 0;
    var interestRate = 0;
    var totalInterest = 0;
    principal = REReplace(trim(principal), "\$", "", "ALL");
    annualRate = Replace(trim(annualRate), ",", ",", "ALL");

    if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
        Throw(type="InvalidData",message="All values must be greater than 0.");
    }

    //Use of Throw function in cfcscript

    interestRate = annualRate / 100;
    years = months / 12;
    totalInterest = principal * (((1 + interestRate) ^ years) - 1);
    return DollarFormat(totalInterest);
}

try {
    WriteOutput(TotalInterest("$2500.00", "5.5%", "12");
} catch(InvalidData ex){
    //Display exception details on screen
    WriteOutput("<p>An InvalidData exception was thrown.</p>";)
    WriteOutput("<p>#ex.message#</p>;
}
</cfscript>

TimeFormat

Description
Formats a time value using U.S. English time formatting conventions.

Returns
A custom-formatted time value. If no mask is specified, returns a time value using the hh:mm tt format. For international time formatting, see LSTimeFormat.

Category
Date and time functions, Display and formatting functions

Function syntax
TimeFormat(time [, mask ])

See also
CreateTime, Now, ParseDateTime, LSTimeFormat, DateFormat

History
ColdFusion 10: The mask "m or M" for minute is deprecated. Recommended "n or N".
ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.
ColdFusion MX:

- Changed the way extra characters are processed: this function processes extra characters within the mask value differently than in earlier releases, as follows:
  - ColdFusion 5 and earlier: the function returns the time format and an apostrophe-delimited list of the extra characters. For example, `TimeFormat(Now(), "hh:mm:ss dog")` returns `8:17:23 d'o'g`.
  - ColdFusion MX: the function returns the time format and the extra characters. For example, for the call above, it returns `8:17:23 dog`.

If the extra characters are single-quoted (for example, `hh:mm:ss 'dog'`), ColdFusion 5 and ColdFusion MX return the time format and the extra characters: `8:17:23 dog`.

- Added support for the following mask parameter options: short, medium, long, and full.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>A date/time value or string to convert</td>
</tr>
<tr>
<td>mask</td>
<td>Masking characters that determine the format:</td>
</tr>
<tr>
<td></td>
<td>• h: hours; no leading zero for single-digit hours (12-hour clock)</td>
</tr>
<tr>
<td></td>
<td>• hh: hours; leading zero for single-digit hours (12-hour clock)</td>
</tr>
<tr>
<td></td>
<td>• H: hours; no leading zero for single-digit hours (24-hour clock)</td>
</tr>
<tr>
<td></td>
<td>• HH: hours; leading zero for single-digit hours (24-hour clock)</td>
</tr>
<tr>
<td></td>
<td>• m: minutes; no leading zero for single-digit minutes</td>
</tr>
<tr>
<td></td>
<td>• mm: minutes; a leading zero for single-digit minutes</td>
</tr>
<tr>
<td></td>
<td>• s: seconds; no leading zero for single-digit seconds</td>
</tr>
<tr>
<td></td>
<td>• ss: seconds; leading zero for single-digit seconds</td>
</tr>
<tr>
<td></td>
<td>• l or L: milliseconds, with no leading zeros</td>
</tr>
<tr>
<td></td>
<td>• t: one-character time marker string, such as A or P</td>
</tr>
<tr>
<td></td>
<td>• tt: multiple-character time marker string, such as AM or PM</td>
</tr>
<tr>
<td></td>
<td>• short: equivalent to h:mm tt</td>
</tr>
<tr>
<td></td>
<td>• medium: equivalent to h:mm:ss tt</td>
</tr>
<tr>
<td></td>
<td>• long: medium followed by three-letter time zone; as in, 2:34:55 PM EST</td>
</tr>
<tr>
<td></td>
<td>• full: same as long</td>
</tr>
</tbody>
</table>

### Usage
When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.
Database query results for date and time values can vary in sequence and formatting unless you use functions to format the results. To ensure that dates and times display with appropriate formatting, and that users of your ColdFusion application are not confused by dates and times displayed, Adobe recommends that you use the `DateFormat` and `TimeFormat` functions to format date and time values from queries. For more information and examples, see TechNote, "ColdFusion (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results," at go.adobe.com/kb/ts_tn_18070_en-us.

**Example**

```cfscript
<cfset todayDate = #Now()#>
<body>
<h3>TimeFormat Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.</p>
<p>Using Timeformat, we can display the value in different ways:
<cfoutput>
<ul>
<li>#TimeFormat(todayDate)#
<li>#TimeFormat(todayDate, "hh:mm:ss")#
<li>#TimeFormat(todayDate, "hh:mm:sst")#
<li>#TimeFormat(todayDate, "hh:mm:sstt")#
<li>#TimeFormat(todayDate, "HH:mm:ss")#
</ul>
</cfoutput>
<p>To generate a standard ISO 8601 W3C Date and Time string like 1997-07-16T19:20, concatenate a DateFormat function, the character T, and a TimeFormat function. For example: `dateformat(now(), "yyyy-mm-dd")#T#TimeFormat(now(), "HH:mm:ss")` produces:
</p>
<cfoutput>#dateformat(now(), "yyyy-mm-dd")#T#TimeFormat(now(), "HH:mm:ss")#</cfoutput>
</body>
```

### ToBase64

**Description**
Calculates the Base64 representation of a string or binary object. The Base64 format uses printable characters, allowing binary data to be sent in forms and e-mail, and stored in a database or file.

**Returns**
The Base64 representation of a string or binary object.

**Category**
Conversion functions, String functions

**Function syntax**

```
ToBase64(string or binary_object[, encoding])
```

**See also**
- `BinaryEncode` for conversion of binary data to base64
- `cffile` for information about loading and reading binary data
- `cfwddx` for information about serializing and deserializing binary data
• `IsBinary` and `ToBinary` for checking for binary data and converting a Base64 object to binary format

**History**
ColdFusion MX: Added the `encoding` parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

### ToBinary

**Description**
Calculates the binary representation of Base64-encoded data or of a PDF document.

**Returns**
A binary representation of the data.

**Category**
Conversion functions, String functions

**Function syntax**

```
ToBinary(Data)
```

### See also
- BinaryDecode for conversion of binary-encoded data, including Base64, to binary data

Last updated 7/9/2012
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>A variable representing data in Base64-encoded format or a PDF document.</td>
</tr>
</tbody>
</table>

Usage

The `ToBinary` function can take as a parameter a PDF document variable (specified by the `cfpdf` tag name attribute). In this case, the `ToBinary` function returns a byte array (byte[]) representation of the document. You can use the results of this function, for example, to store the PDF in a database as a BLOB, or, in a `cfcontent` tag, to write the PDF to the browser. You can use this binary representation with a read operation in the `cfpdf` tag to create a variable.

The following example reads an unprotected PDF file, applies protections, and displays it in the browser:

```cfc
<cfpdf action="read" source="Copy of coldfusion11.pdf" name="p">
<cfpdf action="protect" source="p" newUserpassword="user" permissions="none"
        newOwnerpassword="owner">
<cfcontent type="application/pdf" variable="#toBinary(p)#">
Adobe recommends that you use the `BinaryDecode` function to convert Base64 encoded data to binary data in all new applications.

If you pass a binary value to this function, it returns the input value.

Example

```cfc
<!----- Initialize data. ----->
<cfset charData = "">
<!----- Create a string of ASCII characters (32-255); concatenate them. ----->
<cfloop index = "data" from = "32" to = "255">
    <cfset ch = chr(data)>
    <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of all characters (32 to 255) from the ASCII table.<br>
<cfoutput>#charData#</cfoutput></p>
<!----- Create a Base64 representation of this string. ----->
<cfset data64 = toBase64(charData)>
<!----- Convert string to binary. ----->
<cfset binaryData = toBinary(data64)>
<!----- Convert binary back to Base64. ----->
<cfset another64 = toBase64(binaryData)>
<!----- Compare another64 with data64 to ensure that they are equal. ----->
<cfif another64 eq data64>
    <h3>Base64 representation of binary data is identical to the Base64 representation of string data.</h3>
<cfelse>
    <h3>Conversion error.</h3>
</cfif>
```

Last updated 7/9/2012
**ToScript**

**Description**
Creates a JavaScript or ActionScript expression that assigns the value of a ColdFusion variable to a JavaScript or ActionScript variable. This function can convert ColdFusion strings, numbers, arrays, structures, and queries to JavaScript or ActionScript syntax that defines equivalent variables and values.

**Returns**
A string that contains a JavaScript or ActionScript variable definition corresponding to the specified ColdFusion variable value.

**Category**
Conversion functions, Extensibility functions

**Function syntax**

ToScript(cfvar, javascriptvar, outputformat, ASFormat)

**See also**
cfwddx; WDDX JavaScript Objects

**History**
ColdFusion MX 7: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfvar</td>
<td>A ColdFusion variable. This can contain one of the following:</td>
</tr>
<tr>
<td></td>
<td>• String</td>
</tr>
<tr>
<td></td>
<td>• Number</td>
</tr>
<tr>
<td></td>
<td>• Array</td>
</tr>
<tr>
<td></td>
<td>• Structure</td>
</tr>
<tr>
<td></td>
<td>• Query</td>
</tr>
<tr>
<td>javascriptvar</td>
<td>A string that specifies the name of the JavaScript variable that the ToScript function creates.</td>
</tr>
<tr>
<td>outputformat</td>
<td>Optional. A Boolean value that determines whether to create WDDX (JavaScript) or ActionScript style output for structures and queries:</td>
</tr>
<tr>
<td></td>
<td>• True: creates WDDX-style output (default).</td>
</tr>
<tr>
<td></td>
<td>• False: creates ActionScript-style output.</td>
</tr>
<tr>
<td>ASFormat</td>
<td>Optional. A Boolean value that specifies whether to use ActionScript shortcuts in the script:</td>
</tr>
<tr>
<td></td>
<td>• False: does not use ActionScript shortcuts to create new Objects and new Arrays when generating the script. Instead, generates New Object() and New Array() in the script (default).</td>
</tr>
</tbody>
</table>
Usage
To use a ColdFusion variable in JavaScript or ActionScript, the `ToScript` function must be in a `cfoutput` region and be surrounded by number signs (#). For example, the following code uses the `ToScript` function to convert a ColdFusion variable to a JavaScript variable:

```
<cfset thisString="hello world">
<script type="text/javascript" language="JavaScript">
    <cfoutput>
        var #toScript(thisString, "jsVar")#;
    </cfoutput>
</script>
```

When ColdFusion runs this code, it sends the following to the client:

```
<script type="text/javascript" language="JavaScript">
    var jsVar = "hello world";
</script>
```

An HTML script tag must enclose the JavaScript code. The `cfoutput` tag does not need to be inside the script block; it can also surround the block.

WDDX-style output generates JavaScript code that creates a `WDDXRecordset` object, where the key of each record set entry is a column name, and the value of the recordlist entry is an array of the corresponding query column entries, as follows:

```
WDDXQuery = new WddxRecordset();
col0 = new Array();
col0[0] = "John";
col0[1] = "John";
WDDXQuery["firstname"] = col0;
col0 = null;
col1 = new Array();
col1[0] = "Lund";
col1[1] = "Allen";
WDDXQuery["lastname"] = col1;
col1 = null;
```

To use WDDX-style output, first load the `cf_webroot/CFIDE/scripts/wddx.js` script, which defines JavaScript WDDX objects, as in the following line:

```
<script type="text/javascript" src="/CFIDE/scripts/wddx.js" /></script>
```

For more information on WDDX in JavaScript, see “WDDX JavaScript Objects” on page 1686.

ActionScript-style output generates code that creates an array of objects, where the array is indexed by row number, and the objects consist of column name - column value pairs, as follows:

```
ActionScriptQuery = new Array();
ActionScriptQuery[0] = new Object();
ActionScriptQuery[0]["firstname"] = "John";
ActionScriptQuery[0]["lastname"] = "Lund";
ActionScriptQuery[1] = new Object();
ActionScriptQuery[1]["firstname"] = "John";
ActionScriptQuery[1]["lastname"] = "Allen";
```

An ActionScript-style array does not require you to include the wddx.js file, and creates a variable that you can use in ActionScript on a Flash format form, for example, in an `onChange` attribute.
If the outputformat parameter is False, setting ASFormat to True causes ToScript to use the ActionScript shortcut [] in place of NewArray() and the shortcut {} in place of NewObject(). Using these shortcuts allows you to pass ActionScript into cfform attributes without triggering ActionScript validation. If ASFormat is False, ToScript generates NewArray() and NewObject() in the script.

Example
The following example shows the results of converting a ColdFusion string, array, and query object to JavaScript variables. It also uses the string and array in JavaScript code.

Example:
The following example shows the results of converting a ColdFusion string, array, and query object to JavaScript variables. It also uses the string and array in JavaScript code.
This section converts the following query object to both WDDX format and ActionScript type JavaScript objects.<br>

<!--- Query a database --->
<cfquery name="thisQuery" datasource="cfdocexamples">
  SELECT FirstName, LastName
  FROM employee
  WHERE FirstName = 'John'
</cfquery>
<br>
The Query in ColdFusion
<cftable query="thisQuery" headerlines="1" colheaders>
  <cfcol align="left" width="9" header="<b>FirstName</b>" text="#FirstName#">
  <cfcol align="left" width="9" header="<b>LastName</b>" text="#LastName#">
</cftable>
<br>
<strong>JavaScript generated by ToScript(thisQuery, "WDDXQuery"): </strong><br>
#toScript(thisQuery, "WDDXQuery")#;<br>
<br>
<strong>JavaScript generated by ToScript(thisQuery, "ActionScriptQuery", False):</strong><br>
#toScript(thisQuery, "ActionScriptQuery", False)#;<br>
<br>
<!--- Convert to both WDDX format and ActionScript format --->
<script type="text/javascript" language="JavaScript">
  #ToScript(thisQuery, "WDDXQuery")#;
  #ToScript(thisQuery, "ActionScriptQuery", False)#;
</script>
<br>
<!--- For brevity, this example does not use JavaScript query variables --->
</cfoutput>

**ToString**

**Description**
Converts a value to a string.

**Returns**
A string.

**Category**
Conversion functions, String functions

**Function syntax**
ToString(value[, encoding])

**See also**
ToBase64, ToBinary, CharsetEncode; Using XML and WDDX in the *Developing ColdFusion Applications*
History
ColdFusion MX:

- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255.)
- Added the `encoding` parameter.
- Added ability to convert an XML document object to a string.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value to convert to a string; can be a simple value such as an integer, a binary object, or an XML document object.</td>
</tr>
</tbody>
</table>
| encoding  | The character encoding (character set) of the string. Optional for binary data, Generates an error if used for a simple value or XML document object. The following list includes commonly used values:  
  - `utf-8`
  - `iso-8859-1`
  - `windows-1252`
  - `us-ascii`
  - `shift_jis`
  - `iso-2022-jp`
  - `euc-jp`
  - `euc-kr`
  - `big5`
  - `euc-cn`
  - `utf-16`
  For more information on character encoding, see: [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html). The default value is the encoding of the page on which the function is called. See `cfcontent`. |

Usage
This function can convert simple values and binary values that do not contain Byte zero. If this function cannot convert a value, it throws an exception. This function can also convert an XML document object to a string XML representation.

Adobe recommends that you use the `CharsetEncode` function to convert binary data to a string.
Example
<h3>ToString Example</h3>
<!---- Initialize data. ------>
<cfset charData = ">
<!---- Create string of ASCII characters (32-255) and concatenate them. ---->
<cfloop index = "data" from = "32" to = "255">
    <cfset ch = chr(data)>
    <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of characters (32 to 255)
    from the ASCII table.<br>
    <cfoutput>#charData#</cfoutput></p>
<!------ Create a Base64 representation of this string. ------>
<cfset data64 = toBase64(#charData#)>
<p>The following string is the Base64 representation of the string.<br>
    <cfoutput>#data64#</cfoutput></p>
<!---- Create a binary representation of Base64 data. ---->
<cfset dataBinary = toBinary(data64)>
<!---- Create the string representation of the binary data. ----->
<cfset dataString = ToString(dataBinary)>
<p>The following is the string representation of the binary data.<br>
    <cfoutput>#dataString#</cfoutput></p>

Trace

Description
A function equivalent of the <cftrace> tag and is used in the <cfscript> mode.

Parameters
Same as the <cftrace> tag.

Category
Debugging functions

Function syntax
trace (var, text, type, category, inline, abort)

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

See also
cfscript, cftrace

Usage
You can call this function as name=value pair or as positional argument.
1367

COLDFUSION 10 CFML REFERENCE
ColdFusion Functions

Example
<cfscript>
function TotalInterest(principal, annualRate, months) {
var years = 0;
var interestRate = 0;
var totalInterest = 0;
principal = REReplace(trim(principal), "[\$]", "", "ALL");
annualRate = Replace(trim(annualRate), "%", "", "ALL");
if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
Throw(type="InvalidData",message="All values must be greater than 0.");
}
interestRate = annualRate / 100;
years = months / 12;
totalInterest = principal * (((1 + interestRate) ^ years) - 1);
return DollarFormat(totalInterest);
}
try {
Trace(type="Information", inline="true", text="Calculating interest."); //Use of
trace function in cfsript
WriteOutput(TotalInterest("$2500.00", "5.5%", "12"));
Trace(type="Information", inline="true", text="Interest calculation done.");
}
catch(InvalidData ex) {
//Displayig exception details on screen
WriteOutput("<p>An InvalidData exception was thrown.</p>");
WriteOutput("<p>#ex.message#</p>");
//Writting the exception to log file under logs folder of web server.
WriteLog(type="Error", file="myapp.log", text="[#ex.type#] #ex.message#");
}

TransactionCommit
Description
Commits the current active transaction.
Returns
Nothing
Category
“Transaction functions” on page 734
Function Syntax
TransactionCommit()

See also
TransactionRollback, TransactionSetSavePoint

History
ColdFusion 9: Added this function.

Last updated 7/9/2012


Usage
You can call this function only from within an active transaction.

Example
```cfc
<cfscript>
q = new query();
q.setDatasource("cfartgallery");
WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
transaction
{
    q.execute(sql="insert into art (artid,artistid,artname,description,price) values
    (60,3,'tom','tom',2000)");
    transactionSetSavePoint('sp1');
    WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
    transaction
    {
        q.execute(sql="update art set artistid=4 where artid = 60");
        transactionSetSavePoint('sp2');
        WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
        transaction
        {
            try
            {            
                q.execute(sql="update art set artistid='badvalue' where artid = 60");
            }
            catch(any e)
            {
                WriteLog("rolling back the transaction");
                transactionRollback("sp1");
            }
        }
    }
}
WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
transaction
{
    WriteLog("deleting the record");
    q.execute(sql="delete from art where artid = 60");
    WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
}
</cfscript>
```

TransactionRollback

Description
Rolls back the current active transaction to the specified savepoint.

Returns
Nothing

Category
“Transaction functions” on page 734
Function Syntax
TransactionRollback([savepoint])

See also
TransactionCommit, TransactionSetSavePoint

History
ColdFusion 9: Added this function.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savepoint</td>
<td>An optional string identifier for the savepoint. Savepoints let you roll back portions of a transaction.</td>
</tr>
</tbody>
</table>

Usage
You can call this function only from within an active transaction.
If you do not specify a savepoint, the current active transaction rolls back to the top-level (original) transaction.

Example
See the example for TransactionCommit.

TransactionSetSavePoint

Description
Creates and stores a new savepoint for the current transaction. You can add multiple savepoints by calling this function multiple times.

Returns
Nothing

Category
“Transaction functions” on page 734

Function Syntax
TransactionSetSavepoint(savepoint)

See also
TransactionCommit, TransactionRollback

History
ColdFusion 9: Added this function.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>savepoint</td>
<td>An optional string identifier for the savepoint. Savepoints let you roll back portions of a transaction.</td>
</tr>
</tbody>
</table>
Usage
You can call this function only from within an active transaction.

Example
See the example for TransactionCommit.

Trim

Description
Removes leading and trailing spaces and control characters from a string.

Returns
A copy of the string parameter, after removing leading and trailing spaces and control characters.

Category
String functions

Function syntax
Trim(string)

See also
LTrim, RTrim

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains a string</td>
</tr>
</tbody>
</table>

Example

```cftags
<h3>Trim Example</h3>
<cfif IsDefined("FORM.myText")>
  <cfoutput>
    <pre>
    Your string:"#FORM.myText#"
    Your string:"#Trim(FORM.myText)#"
    (trimmed on both sides)
    </pre>
  </cfoutput>
</cfif>
<form method = "post" action = "trim.cfm">
  <p>Type in some text, and it will be modified by trim to remove leading spaces from the left and right</p>
  <p><input type = "Text" name = "myText" value = " TEST ">
  <input type = "Submit" name = ""></p>
</form>
```
UCase

Description
Converts the alphabetic characters in a string to uppercase.

Returns
A copy of a string, converted to uppercase.

Category
String functions

Function syntax
UCase(string)

See also
LCase

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

Example

```cfc
<h3>UCase Example</h3>

<cfif IsDefined("FORM.sampleText")>
  <cfif FORM.sampleText is not ">
    <p>Your text, <cfoutput>#FORM.sampleText#</cfoutput>, returned in uppercase is <cfoutput>#UCase(FORM.sampleText)#</cfoutput>.
  </cfif>
  <cfelse>
    <p>Please enter some text.</p>
  </cfif>
</cfif>

<form action = "ucase.cfm">
  <p>Enter your sample text, and press "submit" to see the text returned in uppercase: </p>
  <p><input type = "Text" name = "SampleText" value = "sample">

  <input type = "Submit" name = "submit">
</form>
```

URLDecode

Description
Decodes a URL-encoded string.

Returns
A copy of a string, decoded.
Category
Conversion functions, Other functions, String functions

Function syntax
URLDecode(urlEncodedString[, charset])

See also
URLEncodedFormat; Tags and functions for globalizing applications in the Developing ColdFusion Applications

History
ColdFusion MX 6.1: Changed the default charset: the default charset is the character encoding of the URL scope.
ColdFusion MX:
- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)
- Added the charset parameter.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>urlEncodedString</td>
<td>URL-encoded string or a variable that contains one.</td>
</tr>
</tbody>
</table>
| charset | The character encoding in which the URL is encoded. Optional. The following list includes commonly used values:  
- utf-8  
- iso-8859-1  
- windows-1252  
- us-ascii  
- shiftjis  
- iso-2022-jp  
- euc-jp  
- euc-kr  
- big5  
- euc-cn  
- utf-16  
For more information on character encoding, see: www.w3.org/International/O-charset.html. The default value is the character encoding of the URL scope. |

Usage
URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as %81. A space is encoded with a plus sign.
Query strings in HTTP are always URL-encoded.
Example
This example creates, encodes, and decodes a string that contains ASCII character codes:

```cfscript
// Build string
s = "";
for (c = 1; c lte 256; c = c + 1)
{
    s = s & chr(c);
}
// Encode string and display result
enc = URLEncodedFormat(s);
WriteOutput("Encoded string is: '#enc#'.<br>");
// Decode and compare result with original
dec = URLDecode(enc);
if (dec neq s)
{
    WriteOutput("Decoded is not the same as encoded.");
}
else
{
    WriteOutput("All's quiet on the Western front.");
}
</cfscript>

URLEncodedFormat

Description
Generates a URL-encoded string. For example, it replaces spaces with %20, and non-alphanumeric characters with equivalent hexadecimal escape sequences. Passes arbitrary strings within a URL (ColdFusion automatically decodes URL parameters that are passed to a page).

Returns
A copy of a string, URL-encoded.

Category
Conversion functions, Other functions, String functions

Function syntax
URLEncodedFormat(string [, charset ])

See also
URLDecode; Tags and functions for globalizing applications in the Developing ColdFusion Applications

History
ColdFusion MX 6.1: Changed the default encoding to be the response character encoding.
ColdFusion MX: Added the charset parameter.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>charset</td>
<td>The character encoding in which the string is encoded. Optional. The following list includes commonly used values: • utf-8 • iso-8859-1 • windows-1252 • us-ascii • shift_jis • iso-2022-jp • euc-jp • euc-kr • big5 • euc-cn • utf-16 For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>. The default value is the character encoding of the response. See <code>cfcontent</code>.</td>
</tr>
</tbody>
</table>

Usage

URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as %81. A space is replaced with %20. Query strings in HTTP are always URL-encoded.

Example

```cfc
<h3>URLEncodedFormat Example</h3>
<cfif IsDefined("url.myExample")>
  <p>The url variable url.myExample was passed from the previous link ... its value is:
  <br><b>"<cfoutput>#url.myExample#</cfoutput>"</b>
</cfif>
<p>This function returns a URL encoded string.
<cfset s = "My url-encoded string has special characters & other stuff">
<p> <A HREF = "urlencodedformat.cfm?myExample=<cfoutput>#URLEncodedFormat(s)#"></cfoutput>">Click me</A>
```

URLSessionFormat

Description

Depending on whether a client computer accepts cookies, this function does the following:

- If the client does not accept cookies: automatically appends all required client identification information to a URL
• If the client accepts cookies: does not append information

This function automatically determines which identifiers are required, and sends only the required information. It provides a more secure and robust method for supporting client identification than manually encoding the information in each URL, because it sends only required information, when it is required, and it is easier to code.

Returns
A URL; if cookies are disabled for the browser, client and session data are appended.

Category
Other functions; Maintaining client identity in the Developing ColdFusion Applications

Function syntax
URLSessionFormat(request_URL)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_URL</td>
<td>URL of a ColdFusion page</td>
</tr>
</tbody>
</table>

Usage
In the following example, the cfform tag posts a request to another page and sends the client identification, if necessary. If cookie support is detected, the function returns the following:

myactionpage.cfm

If the detected cookie is not turned on, or cookie support cannot be reliably detected, the function return value is as follows:

myactionpage.cfm?jsessionid=xxxx;cfid=xxxx&cftoken=xxxxxxxx

Example
<cfform method="Post" action="#URLSessionFormat("MyActionPage.cfm")#">
</cfform>

Val

Description
Converts numeric characters that occur at the beginning of a string to a number.

Returns
A number. If conversion fails, returns zero.

Category
Conversion functions, String functions

Function syntax
Val(string)
See also

IsNumeric

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>

Usage

This function works as follows:

- If TestValue = "234AS6??", Val(TestValue) returns 234.
- If TestValue = "234'5678'9?'", Val(TestValue) returns 234.
- If TestValue = "BG234", Val(TestValue) returns the value 0, (not an error).
- If TestValue = "0", Val(TestValue) returns the value 0, (not an error).

Example

```cfm
<h3>Val Example</h3>
<cfif IsDefined("FORM.theTestValue")>
  <cfif Val(FORM.theTestValue) is not 0>
    <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> can be converted to a number:</h3>
    <cfoutput>#Val(FORM.theTestValue)#</cfoutput>
  </cfif>
</cfif>
<form action = "val.cfm">
  <p>Enter a string, and determine whether its beginning can be evaluated to a numeric value.</p>
  <p>
    <input type = "Text" name = "TheTestValue" value = "123Boy">
  </p>
  <input type = "Submit" name = "">
</form>
```

ValueList

Description

Inserts a delimiter between each value in an executed query. ColdFusion does not evaluate the arguments.

Returns

A delimited list of the values of each record returned from an executed query.

Category

List functions, Query functions
Function syntax
ValueList(query.column [, delimiter ])

See also
QuotedValueList

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query.column</td>
<td>Name of an executed query and column. Separate query name and column name with a period.</td>
</tr>
<tr>
<td>delimiter</td>
<td>A delimiter character to separate column data items. The default value is comma (,).</td>
</tr>
</tbody>
</table>

Example

```cftml
<h3>ValueList Example</h3>

<!--- use the contents of a query to create another dynamically --->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
  SELECT Dept_ID FROM Departments
  WHERE Dept_ID IN ('BIOL')
</cfquery>

<cfquery name = "GetCourseList" datasource = "cfdocexamples">
  SELECT * FROM CourseList
  WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>

Value list of all BIOL Course ID's using (-) as the delimiter:<br>
<cfoutput>
#ValueList(GetCourseList.Course_ID, "--")#<br>
</cfoutput>

Value list of all BIOL Course Numbers using (;) as the delimiter:<br>
<cfoutput>
#ValueList(GetCourseList.CourseNumber, ";")#<br>
</cfoutput>

VerifyClient

Description
Requires remote invocations of the page or calls to functions on the page to include an encrypted security token.

Returns
Does not return a value.

Category
Security functions

Function syntax
VerifyClient()
See also
cffunction, Improving security in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function.

Parameters
Does not take any parameters

Usage
Use this function to help prevent security attacks where an unauthorized party attempts to perform an action on the server, such as changing a password. As a general rule, use this feature for Ajax requests to the server to perform sensitive actions, such as updating passwords.

If you call this function, you must enable client management or session management in your application; otherwise, you do not get an error, but ColdFusion does not verify clients. Use this function only on pages that respond to client-side ColdFusion Ajax features, such as bind expressions. These features include code that correctly sends the security token when needed.

Week

Description
From a date/time object, determines the week number within the year.

Returns
An integer in the range 1–53; the ordinal of the week, within the year.

Category
Date and time functions

Function syntax
Week(date)

See also
DatePart

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage
When passing date as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.
Example

```<h3>Week Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
#DayOfWeek(yourDate)# in the week.
<br>This is day #Day(YourDate)# in the month of
#MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
<br>We are in week #Week(YourDate)# of #Year(YourDate)# (day
#DayOfYear(YourDate)# of #DaysInYear(YourDate)#).
<cfif IsLeapYear(Year(yourDate))>This is a leap year
<cfelse>This is not a leap year
</cfif>
</cfoutput>
</cfif>
</cfif>```

Wrap

**Description**
Wraps text so that each line has a specified maximum number of characters.

*Note: The wrap function does not insert line breaks by placing the `<br>` tag in HTML text. Instead, it wraps the text in the display without adding the `<br>` tag.*

**Returns**
String containing the wrapped text.

**Category**
String functions

**Function syntax**
`Wrap(string, limit[, strip])`

**See also**
cfmail

**History**
ColdFusion MX 6.1: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String or variable that contains one. The text to wrap.</td>
</tr>
<tr>
<td>limit</td>
<td>Positive integer maximum number of characters to allow on a line.</td>
</tr>
<tr>
<td>strip</td>
<td>Boolean value specifying whether to remove all existing newline and carriage return characters in the input string with spaces before wrapping the text. The default value is False.</td>
</tr>
</tbody>
</table>
Usage
Inserts line break at the location of the first white space character (such as a space, tab, or new line) before the specified limit on a line. If a line has no whitespace characters before the limit, inserts a line break at the limit. Uses the operating-system specific line break: newline for UNIX, carriage return and newline on Windows.
If you specify the strip parameter, all existing line breaks are removed, so any paragraph formatting is lost.
Use this function to limit the length of text lines, such as text to be included in a mail message. The cfmail and cfmailpart tag wrapText attributes use this function.

Example
<h3>Wrap Example</h3>
<cfset inputText="This is an example of a text message that we want to wrap. It is rather long and needs to be broken into shorter lines."">
<cfoutput>#Wrap(inputText, 59)#</cfoutput>

WriteDump

Description
A function equivalent to the <cfdump> tag which can be used in <cfscript>.

Parameters
Same as <cfdump> tag.

Category
Other functions, Data output functions

Function syntax
WriteDump (var, output, format, abort, label, metainfo, top, show, hide, keys, expand, showUDFs);

See also
cfdump, cfscript

History
ColdFusion 9: Added this function.

Usage
You can call this function providing arguments as name=value pair or as positional arguments.
For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.
Example
<cfscript>
filename = "log.txt";
try {
    result = FileOpen(expandpath(filename));
    WriteDump(result);
}
catch(Expression exception) {
    WriteOutput("<p>An Expression exception was thrown.</p>");
    WriteOutput("<p>#exception.message#</p>");
    WriteLog(type="Error", file="myapp.log", text="#exception.type" #exception.message#);
}
</cfscript>

WriteLog

Description
A function equivalent of the cflog tag, which can be used in <cfscript>.

Parameters
Same as the <cflog> tag.

Category
Data output functions

Function syntax
WriteLog (text, type, application, file, log)

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

See also
cfscript, cflog

Usage
You can call this function as name=value pair or as positional argument.
Example
<cfscript>
//Example: 1
function TotalInterest(principal, annualRate, months) {
    var years = 0;
    var interestRate = 0;
    var totalInterest = 0;
    principal = REReplace(trim(principal), "[^$]", ",", "ALL");
    annualRate = Replace(trim(annualRate), ",", ",", "ALL");
    if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
        Throw(type="InvalidData",message="All values must be greater than 0.");
    }
    interestRate = annualRate / 100;
    years = months / 12;
    totalInterest = principal * (((1 + interestRate) ^ years) - 1);
    return DollarFormat(totalInterest);
}
try {
    Trace(type="Information", inline="true", text="Calculating interest.");
    WriteOutput(TotalInterest("$2500.00", "5.5\%", "12");
    Trace(type="Information", inline="true", text="Interest calculation done.");
}
catch(InvalidData ex) {
    //Writing the exception to log file under logs folder of web server.
    WriteLog(type="Error", file="myapp.log", text="[#ex.type#] #ex.message#");
}
</cfscript>

WriteOutput

Description
Appends text to the page-output stream.
This function writes to the page-output stream regardless of conditions established by the cfsetting tag.

Category
Other functions, System functions, Data output functions

Function syntax
WriteOutput(string)

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
</tbody>
</table>
Usage
Within the cftag and cfmail tags, this function does not output to the current page; it writes to the current SQL statement or mail text. Do not use WriteOutput within cfquery and cfmail.

Although you can call this function anywhere within a page, it is most useful inside a cfscript block.

Example

```coldsourcescript
<cfscript>
employee = StructNew();
StructInsert(employee, "firstname", FORM.firstname);
StructInsert(employee, "lastname", FORM.lastname);
StructInsert(employee, "email", FORM.email);
StructInsert(employee, "phone", FORM.phone);
StructInsert(employee, "department", FORM.department);
WriteOutput("About to add " & FORM.firstname & ", " & FORM.lastname);
</cfscript>
```

WsGetAllChannels

Description
Sends messages to a specific channel based on the filter criteria (which is a struct).

Returns
Nothing

Function syntax

```coldsourcescript
WSGetAllChannels()
WSGetAllChannels("channelName")
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channelName</td>
<td>If specified, returns all sub-channels listed under the entered channel name. If left unspecified, the function returns all channels registered under the current application.</td>
</tr>
</tbody>
</table>

WsGetSubscribers

Description
Returns an array of struct with clientID and subscriberInfo as the keys.

Returns
Nothing

Function syntax

```coldsourcescript
WSgetSubscribers(channel)
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>Channel whose list of subscribers you wish to retrieve.</td>
</tr>
</tbody>
</table>

**WsPublish**

**Description**
 Sends messages to a specific channel based on the filter criteria (which is a struct).

**Category**
 Other functions, System functions, Data output functions

**Function syntax**
 WsPublish(String channel, Object message)
 WsPublish(channel,message [,filterCriteria])

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>Specific channel to which the server publishes its response.</td>
</tr>
<tr>
<td>message</td>
<td>Response sent by the server to all clients subscribed to a specific channel.</td>
</tr>
<tr>
<td>filterCriteria</td>
<td>Conditions to filter eligible clients that need to be notified for a given channel.</td>
</tr>
</tbody>
</table>

**Example**

```cft模板
cfscript>
  if(isdefined("form.publish"))
      WsPublish(#form.channel#, #form.message#);
</cfscript>
<cfform method="post">
    <cfselect name="channel">
      <option>
        stocks
      </option>
      <option>
        news
      </option>
      <option>
        products
      </option>
    </cfselect>
    Message: <input id="message" name="message" type="text">
    <cfinput id="publish" name="publish" value="publish" type="submit">
</cfform>
```
**WSSendMessage**

**Description**
Sends messages to a specific client that invokes the method. This can be included as a part of the function that is called by the `invoke` WebSocket JavaScript method.

**Returns**
Nothing

**Syntax**
```
WSSendMessage(message)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Required. The message object. This can be of type Any.</td>
</tr>
</tbody>
</table>

**XmlChildPos**

**Description**
Gets the position of a child element within an XML document object.

**Returns**
The position, in an XmlChildren array, of the Nth child that has the specified name.

**Category**
XML functions

**Function syntax**
```
XmlChildPos(elem, childName, N)
```

**See also**
`IsXmlElem, XmlElemNew, XmlSearch, XmlTransform`; Using XML and WDDX in the Developing ColdFusion Applications

**History**
ColdFusion MX: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem</td>
<td>XML element within which to search.</td>
</tr>
<tr>
<td>childName</td>
<td>XML child element for which to search. Must be an immediate child of the elem parameter.</td>
</tr>
<tr>
<td>N</td>
<td>Index of XML child element for which to search.</td>
</tr>
</tbody>
</table>
Usage
You can use the returned index in the ArrayInsertAt and ArrayDeleteAt functions to change XML document objects. If the specified child is not found, the function returns -1.

Example
The following example searches XML document element, xmlobject.employee.name[1], for its second Status element child and uses the position in an ArrayDeleteAt function to remove the element:

```xml
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
  <employee>
    <!--- A list of employees --->
    <name EmpType="Regular">
      <first>Almanzo</first>
      <last>Wilder</last>
      <Status>Medical Absence</Status>
      <Status>Extended Leave</Status>
    </name>
    <name EmpType="Contract">
      <first>Laura</first>
      <last>Ingalls</last>
    </name>
  </employee>
</cfxml>

<!--- Find the second Status child of the first employee.name element --->
<cfscript>
  elempos=XMLChildPos(xmlobject.employee.name[1], "Status", 2);
  ArrayDeleteAt(xmlobject.employee.name[1].XmlChildren, elempos);
</cfscript>

<!--- Dump the resulting document object to confirm the deletion --->
<cfdump var="#xmlobject#"/>

XmlElemNew

Description
Creates an XML document object element.

Returns
An XML document object element.

Category
XML functions

Function syntax
XmlElemNew(xmlObj[, namespace], childName)

See also
<cfxml, IsXmlElem, XmlChildPos, XmlFormat, XmlNew, XmlParse> Using XML and WDDX in the Developing ColdFusion Applications

Last updated 7/9/2012
ColdFusion Functions

History
ColdFusion MX 7: Added the namespace parameter.
ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlObj</td>
<td>Name of the XML document object in which you are creating the element</td>
</tr>
<tr>
<td>namespace</td>
<td>(Optional) URI of the namespace to which this element belongs</td>
</tr>
<tr>
<td>childName</td>
<td>Name of the element to create</td>
</tr>
</tbody>
</table>

Usage
The function’s return variable specifies the location of the new element in the document object. It must specify a valid location in the document object identified by the xmlObj parameter. The following statements show this use:

```cfc
ArrayAppend(MyDoc.MyRoot.XmlChildren, XmlElemNew(MyDoc,"childNode"));
```

If you do not specify a namespace URI and use a namespace prefix in the childName parameter, ColdFusion checks to see if a namespace URI has already been specified for the prefix, and if so, uses that namespace.

Example
The following example creates and displays a ColdFusion document object:

```cfc
<cfscript>
MyDoc = XmlNew();
MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");
if (testVar IS TRUE)
    MyDoc.MyRoot.XmlText = "The value of testVar is True."
else
    MyDoc.MyRoot.XmlText = "The value of testVar is False."
for (i = 1; i LTE 4; i = i + 1)
{
    MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";
}
</cfscript>
<cfdump var=#MyDoc#>
```

XmlFormat

Description
Escapes special XML characters in a string so that the string can be used as text in XML.

Returns
A copy of the string parameter that is safe to use as text in XML.

Category
String functions, XML functions
Function syntax

XmlFormat(string, escapeChars)

See also
cfxml, XmNew, XmlParse, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

History

ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A string or a variable that contains one</td>
</tr>
<tr>
<td>escapeChars</td>
<td>Set to true to escape the characters restricted as per XML standards. For details, see <a href="http://www.w3.org/TR/2006/REC-xml11-20060816/#NT-RestrictedChar">http://www.w3.org/TR/2006/REC-xml11-20060816/#NT-RestrictedChar</a>.</td>
</tr>
</tbody>
</table>

Usage

This function escapes characters as follows:

<table>
<thead>
<tr>
<th>Text character</th>
<th>Escaped representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than symbol (&gt;)</td>
<td>&gt;</td>
</tr>
<tr>
<td>Less than symbol (&lt;)</td>
<td>&lt;</td>
</tr>
<tr>
<td>Single-quotation mark (')</td>
<td>'</td>
</tr>
<tr>
<td>Double-quotation mark (&quot; )</td>
<td>&quot;</td>
</tr>
<tr>
<td>Ampersand symbol (&amp;)</td>
<td>&amp;</td>
</tr>
<tr>
<td>Carriage return (but not line feed)</td>
<td>Removed from the text.</td>
</tr>
<tr>
<td>High ASCII characters in the range 159-255.</td>
<td>Replaced by unicode escape sequence; for example, É (capital E with an Acute symbol) is replaced by &amp;xE9;</td>
</tr>
</tbody>
</table>

Example

The following example shows how XmlFormat escapes special XML characters. Use the View Source command in the browser to see the results. ColdFusion interprets the "" in the second text string as representing a single-quotation mark in text before it applies the XmlFormat function.

```xml
<?xml version = "1.0"?>
<cfoutput>
<someXML>
    <someElement someAttribute="#XmlFormat("a quoted value", "true")#">
       #XmlFormat("Body of element with <, >, ", " and & goes here.", "true")#
    </someElement>
</someXML>
</cfoutput>
```

XmlGetNodeType

Description

Determines the type of an XML document object node.
ColdFusion Functions

Returns
A string identifying the XML node type. The following values are valid:

| ATTRIBUTE_NODE | CDATA_SECTION_NODE |
| COMMENT_NODE   | DOCUMENT_FRAGMENT_NODE |
| DOCUMENT_NODE  | DOCUMENT_TYPE_NODE   |
| ENTITY_NODE    | ENTITY_NODE          |
| ENTITY_REFERENCE_NODE | NOTATION_NODE |
| PROCESSING_INSTRUCTION_NODE | TEXT_NODE |

If the argument is not a document object node, the function generates an error.

Category
XML functions

Function syntax
XmlGetNodeType(xmlNode)

See also
IsXmlAttribute, IsXmlDoc, IsXmlElem, IsXmlNode, IsXmlRoot, XmlChildPos, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

History
ColdFusion MX 7: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlNode</td>
<td>An XML DOM object node</td>
</tr>
</tbody>
</table>

Usage
The XmlGetNodeType function can determine the types of the nodes returned by the XmlSearch function, or the types of the entries in an element’s XmlNodes array.

Example
The following example checks the node types of various parts of an XML document object:
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
  <?xml version="1.0" encoding="UTF-8"?>
  <order id="4323251">
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
      <item id="43">
        <!-- This item is coded to show several node types -->
        <!-- <![CDATA["Our Best" hammer & chisel set!!!]]> --> Imported from France
        <quantity>1</quantity>
        <unitprice>15.95</unitprice>
      </item>
    </items>
  </order>
</cfxml>

<!--- Display the node types --->
<cfoutput>
  <h3>Node Types</h3>
  xmlobject: #XMLGetNodeType(xmlobject)#<br>
  xmlobject.order: #XMLGetNodeType(xmlobject.order)#<br><br>
  Now check the types of all the nodes in the xmlobject.order.items.item element's XmlNode array.<br>
  Note the many apparently empty Text nodes generated by whitespace characters in the XML text source.<br>
  <cfset descnodes=xmlobject.order.items.item.XmlNodes>
  <cfloop from="1" to="#ArrayLen(descnodes)#" index="i">
    #i# Node type is: #XMLGetNodeType(descnodes[i])#<br>
    #i# Node name is: #descnodes[i].XmlName#<br>
    <cfif (descnodes[i].XmlValue NEQ ")")>
      #i# Node value is: #descnodes[i].XmlValue#<br>
    </cfif>
  </cfloop>
</cfoutput>

**XmlNew**

**Description**
Creates an XML document object.

**Returns**
An empty XML document object.

**Category**
XML functions

**Function syntax**
XmlNew([caseSensitive])
See also
cfxml, IsXmlDoc, ToString, XmlFormat, XmlParse, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

History
ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| caseSensitive | Determines how ColdFusion processes the case of XML document object component identifiers:  
|             | • True: maintains case  
|             | • False: ColdFusion ignores case. Default. |

Usage
An XML document object is represented in ColdFusion as a structure.

The caseSensitive parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

• If True, the element or attribute names “name” and “NAME” refer to different elements or attributes.
• If False, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as xmlChildren[1]) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

To convert an XML document object into a string, use the ToString function.

Example
The following example creates and displays a ColdFusion document object:

```
<cfset testVar = True>
<cfscript>
   MyDoc = XmlNew();
   MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");
   if (testVar IS TRUE)
      MyDoc.MyRoot.XmlText = "The value of testVar is True.";
   else
      MyDoc.MyRoot.XmlText = "The value of testVar is False.";
   for (i = 1; i LTE 4; i = i + 1) {
      MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";
   }
</cfscript>
<cfdump var=#MyDoc#>
```
**XmlParse**

**Description**
Converts XML text into an XML document object.

**Returns**
An XML document object.

**Category**
Conversion functions, XML functions

**Function syntax**
```
XmlParse(xmlText [, caseSensitive [, validator]])
```

**See also**
cfxml, IsXML, ToString, XmlFormat, XmlNew, XmlSearch, XmlTransform, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications

**History**
ColdFusion MX 7:
- Added the `validator` parameter.
- Added support for filenames and URLs in the `xmlText` parameter.
- Added support for relative URLs and pathnames.
ColdFusion MX: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xmlText</code></td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• A string containing XML text.</td>
</tr>
<tr>
<td></td>
<td>• The name of an XML file.</td>
</tr>
<tr>
<td></td>
<td>• The URL of an XML file; valid protocol identifiers include http, https, ftp, and file.</td>
</tr>
<tr>
<td><code>caseSensitive</code></td>
<td>• Yes: maintains the case of document elements and attributes.</td>
</tr>
<tr>
<td></td>
<td>• No: Default</td>
</tr>
<tr>
<td><code>validator</code></td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• The name of a Document Type Definition (DTD) or XML Schema file.</td>
</tr>
<tr>
<td></td>
<td>• The URL of a DTD or Schema file; valid protocol identifiers include http, https, ftp, and file.</td>
</tr>
<tr>
<td></td>
<td>• A string representation of a DTD or Schema.</td>
</tr>
<tr>
<td></td>
<td>• An empty string; in this case, the XML file must contain an embedded DTD or Schema identifier, which is used to validate the document.</td>
</tr>
</tbody>
</table>
Usage
If you specify a relative URL or pathname in a parameter, ColdFusion uses the directory (or, for URLs, the logical directory) that contains the current ColdFusion page as the path root.

The `caseSensitive` parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

- If true, the element or attribute names “name” and “NAME” refer to different elements or attributes.
- If false, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```plaintext
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

The optional `validator` parameter specifies a DTD or Schema to use to validate the document. If the parser encounters a validation error, ColdFusion generates an error and stops parsing the document. Specify a `validator` parameter to make the `XmlParse` function validate your document. If you do not specify a `validator` parameter, the XML file must specify the DTD or schema using the `xsi:noNamespaceSchemaLocation` tag. If you specify a `validator` parameter, also specify a `caseSensitive` parameter.

**Note:** If you specify an empty string as the third parameter to the `XMLParse` function and specify a validator such as `xsi:noNamespaceSchemaLocation` within an XML document, it must specify a complete URL. However, with `XMLValidate`, it can be just a filename that is found relative to the CFML template doing validation.

If you do not specify a `validator` parameter, the `xmlText` parameter can specify a well-formed XML fragment, and does not have to specify a complete document.

**Note:** To convert an XML document object back into a string, use the `ToString` function.

Example
The following example has three parts: an XML file, a DTD file, and a CFML page that parses the XML file and uses the DTD for validation. The CFML file displays the returned XML document object. To show the results of invalid XML, modify the `bmenuD.xml`.

**Note:** The DTD used in the following example represents the same XML structure as the Schema used in the `XmlValidate` example

The custorder.xml file is as follows:
<xml version="1.0" encoding="UTF-8"/>
<!DOCTYPE order SYSTEM "C:\ColdFusion\wwwroot\examples\custorder.dtd">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>

The custorder.dtd file is as follows:

<!ELEMENT order (customer, items)>
<!ATTLIST order
  id CDATA #REQUIRED>
<!ELEMENT customer EMPTY>
<!ATTLIST customer
  firstname CDATA #REQUIRED
  lastname CDATA #REQUIRED
  accountNum CDATA #REQUIRED>
<!ELEMENT items (item+)>
<!ELEMENT item (name, quantity, unitprice)>
<!ATTLIST item
  id CDATA #REQUIRED>
<!ELEMENT name (#PCDATA)>
<!ELEMENT quantity (#PCDATA)>
<!ELEMENT unitprice (#PCDATA)>

The CFML file is as follows. It uses a filename for the XML file and a URL for the DTD. Note that the XML and URL paths must be absolute.

<cfset
myDoc=XMLParse("C:\ColdFusion\wwwroot\examples\custorder.xml",
false, "http://localhost:8500/examples/custorder.dtd")>
Dump of myDoc XML document object<br>
<cfdump var="#myDoc#">

XmlSearch

Description
Uses an XPath language expression to search an XML document object.
Returns
The results of the XPath search. For details, see Usage.

Category
XML functions

Function syntax
XmlSearch(xmlDoc, xPathString, params)

See also
cfxml, IsXML, XmlChildPos, XmlParse, XmlTransform; Using XML and WDDX in the Developing ColdFusion Applications

History
ColdFusion 10: Added support for XPath 2.0 syntax and for passing variables to XPath expressions
ColdFusion 8: Added support for returning any valid XPath result, not just arrays of XML object nodes.
ColdFusion MX 7: Added support for attribute searches.
ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>params</td>
<td>Optional. A struct that contains key-value pair (variable name and value) document object as shown in the following example:</td>
</tr>
<tr>
<td>xmlDoc</td>
<td>XML document object</td>
</tr>
<tr>
<td>xPathString</td>
<td>XPath expression</td>
</tr>
</tbody>
</table>

Usage
The XmlSearch function attempts to return the values returned by the search whenever possible. For example, if the XPath expression returns a Boolean, the CFML variable is assigned a true or false value.

The following table lists XPath expression result data types and how they are represented in the CFML return value.

<table>
<thead>
<tr>
<th>XPath return type</th>
<th>ColdFusion representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Boolean</td>
</tr>
<tr>
<td>Null</td>
<td>&quot;&quot; (empty string)</td>
</tr>
<tr>
<td>Number</td>
<td>Number</td>
</tr>
<tr>
<td>String</td>
<td>String</td>
</tr>
<tr>
<td>NodeSet</td>
<td>Array of XML nodes</td>
</tr>
<tr>
<td>Result Tree Fragment</td>
<td>Array of XML nodes</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Results that are Unknown or have an unresolved variable in the expression throw an error.

XPath is specified by the World Wide Web Consortium (W3C). For detailed information on XPath, including XPath expression syntax, see the W3C website at www.w3.org/TR/xpath.

**Example**

The following example extracts the elements named *last*, which contain employee last names, from an XML file, and displays the names.

The employeesimple.xml file contains the following XML:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<employee>
  <!-- A list of employees -->
  <name EmpType="Regular">
    <first>Almanzo</first>
    <last>Wilder</last>
  </name>
  <name EmpType="Contract">
    <first>Laura</first>
    <last>Ingalls</last>
  </name>
</employee>
```

The CFML file contains the following lines:

```cfml
<cfscript>
  myxmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\employeesimple.xml");
  selectedElements = XmlSearch(myxmldoc, "/employee/name/last");
  for (i = 1; i LTE ArrayLen(selectedElements); i = i + 1)
    writeoutput(selectedElements[i].XmlText & "<br>");
</cfscript>
```

**XmlTransform**

**Description**

Applies an Extensible Stylesheet Language Transformation (XSLT) to XML. The XML can be in string format or an XML document object.

**Returns**

A string containing the results of applying the XSLT to the XML.

**Category**

Conversion functions, XML functions

**Function syntax**

`XmlTransform(xml, xsl[, parameters])`

**See also**

cfxml, XmlFormat, XmlNew, XmlParse, XmlSearch, XmlValidate; Using XML and WDDX in the Developing ColdFusion Applications
History
ColdFusion 10: Added support for XSLT 2.0 syntax
ColdFusion MX 7: Added the `parameters` parameter and the ability to use a file for the XSL.
ColdFusion MX: Added this function.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xml</code></td>
<td>An XML document in string format, or an XML document object</td>
</tr>
<tr>
<td><code>xsl</code></td>
<td>XSLT transformation to apply; can be any of the following:</td>
</tr>
<tr>
<td></td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• A string containing XSL text.</td>
</tr>
<tr>
<td></td>
<td>• The name of an XSTLT file. Relative paths start at the directory containing the current CFML page.</td>
</tr>
<tr>
<td></td>
<td>• The URL of an XSLT file; valid protocol identifiers include http, https, ftp, and file. Relative paths start at the directory containing the current CFML page.</td>
</tr>
<tr>
<td><code>parameters</code></td>
<td>A structure containing XSL template parameter name-value pairs to use in transforming the document. The XSL transform defined in the <code>xslString</code> parameter uses these parameter values in processing the XML.</td>
</tr>
</tbody>
</table>

Usage
An XSLT converts an XML document to another format or representation by applying an Extensible Stylesheet Language (XSL) stylesheet to it. XSL, including XSLT syntax is specified by the World Wide Web Consortium (W3C). For detailed information on XSL and XSLT, see the W3C website at [www.w3.org/Style/XSL/](http://www.w3.org/Style/XSL/).

If the XSLT code contains include statements with relative paths, ColdFusion resolves them relative to the location of the XSLT file, or for an XSL string, the location of the current ColdFusion page.

Example
The following example converts an XML document that represents a customer order into an HTML document with the customer name and a table with the order items and quantities:

The `custorder.xml` file that represents a customer order has the following lines:
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>

The custorder.xsl XSLT file that transforms the XML to HTML that displays the customer’s name, and the items and quantities ordered has the following lines:

```xml
<?xml version="1.0"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
  <xsl:output method="html" doctype-public="-//W3C//DTD HTML 4.0 Transitional//EN" />
  <xsl:template match="/">
    <html>
      <body>
        <table border="2" bgcolor="yellow">
          <tr>
            <th>Name</th>
            <th>Price</th>
          </tr>
          <xsl:for-each select="breakfast_menu/food">
            <tr>
              <td><xsl:value-of select="name" /></td>
              <td><xsl:value-of select="price" /></td>
            </tr>
          </xsl:for-each>
        </table>
      </body>
    </html>
  </xsl:template>
</xsl:stylesheet>
```

The CFML file has the following lines:

```cfml
<cffile action="read" file="C:\CFusionMX7\wwwroot\examples\custorder.xsl" variable="xmltrans">
<cfset xmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\custorder.xml")>
<cfoutput>%XmlTransform(xmldoc, xmltrans)%</cfoutput>
```

Last updated 7/9/2012
**XmlValidate**

**Description**
Uses a Document Type Definition (DTD) or XML Schema to validate an XML text document or an XML document object.

**Returns**
The following validation structure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Errors</td>
<td>An array containing any validator error messages. These messages indicate that the document does not conform to the DTD or Schema (is not valid).</td>
</tr>
<tr>
<td>FatalErrors</td>
<td>An array containing any validator fatal error messages. Fatal errors indicate that the document contains XML formatting errors (is not well-formed XML).</td>
</tr>
<tr>
<td>Status</td>
<td>A Boolean value:</td>
</tr>
<tr>
<td></td>
<td>• True if the document is valid.</td>
</tr>
<tr>
<td></td>
<td>• False if the validation check failed.</td>
</tr>
<tr>
<td>Warning</td>
<td>An array containing any validator warnings. A well-formed and valid document can produce warning messages.</td>
</tr>
</tbody>
</table>

**Category**
XML functions

**Function syntax**
XmlValidate(xmlDoc[, validator])

**See also**
cfxml, IsXmlDoc, IsXML, XmlFormat, XmlNew, XmlParse, XmlSearch, XmlTransform; Using XML and WDDX in the Developing ColdFusion Applications

**History**
ColdFusion MX 7: Added this function.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlDoc</td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• A string containing an XML document.</td>
</tr>
<tr>
<td></td>
<td>• The name of an XML file.</td>
</tr>
<tr>
<td></td>
<td>• The URL of an XML file; valid protocol identifiers include http, https, ftp, and file.</td>
</tr>
<tr>
<td></td>
<td>• An XML document object, such as one generated by the XmlParse function.</td>
</tr>
<tr>
<td>validator</td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• A string containing a DTD or Schema.</td>
</tr>
<tr>
<td></td>
<td>• The name of a DTD or Schema file.</td>
</tr>
<tr>
<td></td>
<td>• The URL of a DTD or Schema file; valid protocol identifiers include http, https, ftp, and file.</td>
</tr>
</tbody>
</table>

Usage

If you specify a relative URL or filename in a parameter, ColdFusion uses the directory (or, for URLs, the virtual directory) that contains the current ColdFusion page as the path root.

The validator parameter specifies a DTD or Schema to use to validate the document. If you omit the parameter, the XML document must contain one of the following:

- A !DOCTYPE tag to specify the DTD or its location
- An xsi:schemaLocation or xsi:noNamespaceSchemaLocation tag to specify the Schema location

If you use a validator parameter and the XML document specifies a DTD or Schema, the XmlValidate function uses the validator parameter, and ignores the specification in the XML document.

If you do not use a validator parameter, and the XML document does not specify a DTD or Schema, the function returns a structure with an error message in the Errors field.

This function attempts to process the complete XML document, and reports all errors found during the processing. As a result, the returned structure can have a combination of Warning, Error, and FatalError fields, and each field can contain multiple error messages.

Example

The following example has three parts: an XML file, an XSD Schema file, and a CFML page that parses the XML file and uses the Schema for validation. The CFML file displays the value of the returned structure’s Status field and displays the returned structure. To show the results of invalid XML, modify the custorder.xml file.

**Note:** The Schema used in the following example represents the same XML structure as the DTD used in the XmlParse example.

The custorder.xml file is as follows:
<?xml version="1.0" encoding="UTF-8"?>
<order xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://localhost:8500/something.xsd" id="4323251" >
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
        <item id="43">
            <name>Deluxe Carpenter's Hammer</name>
            <quantity>1</quantity>
            <unitprice>15.95</unitprice>
        </item>
        <item id="54">
            <name>36" Plastic Rake</name>
            <quantity>2</quantity>
            <unitprice>6.95</unitprice>
        </item>
        <item id="68">
            <name>Standard paint thinner</name>
            <quantity>3</quantity>
            <unitprice>8.95</unitprice>
        </item>
    </items>
</order>

The custorder.xsd file is as follows:

<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    elementFormDefault="qualified">
    <xs:element name="customer">
        <xs:complexType>
            <xs:attribute name="firstname" type="xs:string" use="required"/>
            <xs:attribute name="lastname" type="xs:string" use="required"/>
            <xs:attribute name="accountNum" type="xs:string" use="required"/>
        </xs:complexType>
    </xs:element>
    <xs:element name="name" type="xs:string"/>
    <xs:element name="quantity" type="xs:string"/>
    <xs:element name="unitprice" type="xs:string"/>
    <xs:element name="item">
        <xs:complexType>
            <xs:sequence>
                <xs:element ref="name"/>
                <xs:element ref="quantity"/>
                <xs:element ref="unitprice"/>
            </xs:sequence>
            <xs:attribute name="id" type="xs:integer" use="required"/>
        </xs:complexType>
    </xs:element>
</xs:schema>
The CFML file is as follows. It uses a filename for the XML file and a URL for the Schema. The XML and URL paths must be absolute.

```cfset
myResults=XMLValidate("C:\CFusionMX7\wwwroot\examples\custorder.xml", "http://localhost:8500/examples/custorder.xsd")>
<cfoutput>
Did custorder.xml validate against custorder.xsd? #myResults.status#<br><br>
</cfoutput>
Dump of myResults structure returned by XMLValidate<br>
<cfdump var="#myResults#">
```

### Year

**Description**
From a date/time object, gets the year value.

**Returns**
The year value of `date`.

**Category**
Date and time functions

**Function syntax**

```
Year(date)
```

**See also**

DatePart, IsLeapYear
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A date/time object in the range 100 AD–9999 AD.</td>
</tr>
</tbody>
</table>

Usage

When passing a date as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.

Example

```html
<h3>Year Example</h3>
<cfif IsDefined("FORM.year")>
  More information about your date:
  <cfset yourDate = CreateDate(FORM.year,FORM.month,FORM.day)>
  <cfoutput>
    <p>Your date, #DateFormat(yourDate)#.
    <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
    day #DayOfWeek(yourDate)# in the week.
    <br>This is day #Day(yourDate)#
    in the month of #MonthAsString(Month(yourDate))#,
    which has #DaysInMonth(yourDate)# days.
    <br>We are in week #Week(yourDate)# of #Year(yourDate)#
    (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).  
    <cfif IsLeapYear(Year(yourDate))>
      This is a leap year
    </cfif>
    <cfelse>This is not a leap year
    </cfif>
  </cfoutput>
</cfif>
```

YesNoFormat

Description

Evaluates a number or Boolean value.

Returns

Yes, for a nonzero value; No for zero, false, and no Boolean values, and an empty string (" ").

Category

Decision functions, Display and formatting functions

Function syntax

YesNoFormat(value)

See also

IsBinary, IsNumeric
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>A number or Boolean value</td>
</tr>
</tbody>
</table>

Example

<h3>YesNoFormat Example</h3>
<p>The YesNoFormat function returns non-zero values as "Yes"; zero, false and no Boolean values, and empty strings (""") as "No".</p>

<cfoutput>
<ul>
<li>YesNoFormat(1):#YesNoFormat(1)#
<li>YesNoFormat(0):#YesNoFormat(0)#
<li>YesNoFormat("123"):#YesNoFormat("123")#
<li>YesNoFormat("No"):#YesNoFormat("No")#
<li>YesNoFormat(True):#YesNoFormat(True)#
</ul>
</cfoutput>
Chapter 5: Ajax JavaScript Functions

You can use the JavaScript functions listed below on pages that use ColdFusion Ajax features.

Function summary

The following table briefly describes the JavaScript functions that you can use in ColdFusion pages that use Ajax features:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ColdFusion.Ajax.submitForm</td>
<td>Submits form data without refreshing the entire page when the results are returned.</td>
</tr>
<tr>
<td>ColdFusion.Autosuggest.getAutosuggestObject</td>
<td>Lets you access underlying YUI AutoComplete object thereby providing fine-grained control over the object, for example attaching an event.</td>
</tr>
<tr>
<td>ColdFusion.FileUpload.cancelUpload</td>
<td>Cancels the file upload at any point during the file upload.</td>
</tr>
<tr>
<td>ColdFusion.FileUpload.clearAllFiles</td>
<td>Clears all the files selected for upload.</td>
</tr>
<tr>
<td>ColdFusion.FileUpload.getUrl</td>
<td>Sets URL for the fileupload control dynamically.</td>
</tr>
<tr>
<td>ColdFusion.FileUpload.startUpload</td>
<td>Starts uploading the selected files.</td>
</tr>
<tr>
<td>ColdFusion.getElementByIdValue</td>
<td>Gets the value of an attribute of a bindable ColdFusion control.</td>
</tr>
<tr>
<td>ColdFusion.grid.clearSelectedRows</td>
<td>Clears the selected rows in the grid.</td>
</tr>
<tr>
<td>ColdFusion.Grid.getBottomToolbar</td>
<td>Gets bottom toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.getGridObject</td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified HTML cfgrid control.</td>
</tr>
<tr>
<td>ColdFusion.grid.getSelectedRows</td>
<td>Fetches data for the selected rows in the grid.</td>
</tr>
<tr>
<td>ColdFusion.Grid.getTopToolbar</td>
<td>Gets the top toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.hideBottomToolbar</td>
<td>Hides the bottom toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.hideTopToolbar</td>
<td>Hides the top toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.refresh</td>
<td>Manually refreshes a displayed grid.</td>
</tr>
<tr>
<td>ColdFusion.Grid.refreshBottomToolbar</td>
<td>Refreshes the bottom toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.refreshTopToolbar</td>
<td>Refreshes the top toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.showBottomToolbar</td>
<td>Shows bottom toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.showTopToolbar</td>
<td>Displays the top toolbar that can be used to add a control, for example icon or button.</td>
</tr>
<tr>
<td>ColdFusion.Grid.sort</td>
<td>Sorts the specified HTML grid.</td>
</tr>
<tr>
<td>ColdFusion.JSON.decode</td>
<td>Converts a JSON-encoded string into a JavaScript variable</td>
</tr>
<tr>
<td>ColdFusion.JSON.encode</td>
<td>Converts a JavaScript variable into a JSON string.</td>
</tr>
<tr>
<td>ColdFusion.Layout.collapseAccordion</td>
<td>Collapses an area of an accordion layout.</td>
</tr>
<tr>
<td>ColdFusion.Layout.collapseArea</td>
<td>Collapses an area of a border layout [cflayout tag with a type attribute of border].</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ColdFusion.Layout.createAccordionPanel</td>
<td>Creates a panel in an existing accordion layout (cflayout tag with a type attribute of accordion).</td>
</tr>
<tr>
<td>ColdFusion.Layout.createTab</td>
<td>Creates a tab in an existing tabbed layout (cflayout tag with a type attribute of tab).</td>
</tr>
<tr>
<td>ColdFusion.Layout.disableSourceBind</td>
<td>Disables the source bind.</td>
</tr>
<tr>
<td>ColdFusion.Layout.disableTab</td>
<td>Disables the specified tab so it cannot be selected.</td>
</tr>
<tr>
<td>ColdFusion.Layout.enableSourceBind</td>
<td>If disabled, enables the source bind.</td>
</tr>
<tr>
<td>ColdFusion.Layout.enableTab</td>
<td>Enables the specified tab so users can select it and display the area contents.</td>
</tr>
<tr>
<td>ColdFusion.Layout.expandAccordion</td>
<td>Expands a collapsed area of an accordion layout.</td>
</tr>
<tr>
<td>ColdFusion.Layout.expandArea</td>
<td>Expands a collapsed area of a border layout.</td>
</tr>
<tr>
<td>ColdFusion.Layout.getAccordionLayout</td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified accordion type cflayout</td>
</tr>
<tr>
<td>ColdFusion.Layout.getBorderLayout</td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified border type cflayout</td>
</tr>
<tr>
<td>ColdFusion.Layout.getTabLayout</td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified tab type cflayout</td>
</tr>
<tr>
<td>ColdFusion.Layout.hideAccordion</td>
<td>Hides an accordion.</td>
</tr>
<tr>
<td>ColdFusion.Layout.hideArea</td>
<td>Hides a bordered layout area.</td>
</tr>
<tr>
<td>ColdFusion.Layout.hideTab</td>
<td>Hides a tab.</td>
</tr>
<tr>
<td>ColdFusion.Layout.selectAccordion</td>
<td>Selects an accordion and displays the layout area contents.</td>
</tr>
<tr>
<td>ColdFusion.Layout.selectTab</td>
<td>Selects a tab and displays the layout area contents.</td>
</tr>
<tr>
<td>ColdFusion.Layout.showAccordion</td>
<td>Shows an accordion that was hidden using the inithide attribute or the hideArea() function.</td>
</tr>
<tr>
<td>ColdFusion.Layout.showArea</td>
<td>Shows an area of a border layout that was hidden using the inithide attribute or the hideArea() function.</td>
</tr>
<tr>
<td>ColdFusion.Layout.showTab</td>
<td>Shows a tab that was hidden using the inithide attribute or the hideTab() function.</td>
</tr>
<tr>
<td>ColdFusion.Log.debug</td>
<td>Displays a debug-level message in the log window.</td>
</tr>
<tr>
<td>ColdFusion.Log.dump</td>
<td>Displays information about a complex variable in the log window.</td>
</tr>
<tr>
<td>ColdFusion.Log.error</td>
<td>Displays an error-level message in the log window.</td>
</tr>
<tr>
<td>ColdFusion.Log.info</td>
<td>Displays an information-level message in the log window.</td>
</tr>
<tr>
<td>ColdFusion.Map.addEvent</td>
<td>Enables event handling in a map.</td>
</tr>
<tr>
<td>ColdFusion.Map.addMarker</td>
<td>Adds a marker to the map.</td>
</tr>
<tr>
<td>ColdFusion.Map.getLatitudeLongitude</td>
<td>Gets the latitude/longitude coordinates for a given address.</td>
</tr>
<tr>
<td>ColdFusion.Map.getMapObject</td>
<td>Gets the Google map component.</td>
</tr>
<tr>
<td>ColdFusion.Map.hide</td>
<td>Hides the map if displayed.</td>
</tr>
<tr>
<td>ColdFusion.Map.refresh</td>
<td>Reloads the map.</td>
</tr>
<tr>
<td>ColdFusion.Map.setCenter</td>
<td>Sets the center of map to the address that you specify.</td>
</tr>
<tr>
<td>ColdFusion.Map.setZoomlevel</td>
<td>Sets the zoom level of the map to the new value.</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>ColdFusion.Map.show</td>
<td>Shows the map if it is hidden.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.resize</td>
<td>Changes the current size of the media player.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.setMute</td>
<td>Mutes or unmutes the sound of the media player.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.setSource</td>
<td>Sets the URL of the FLV file.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.setVolume</td>
<td>Sets the volume of sound of the media player.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.startPlay</td>
<td>Plays the FLV file.</td>
</tr>
<tr>
<td>ColdFusion.Mediaplayer.stopPlay</td>
<td>Stops playing the FLV file.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.create</td>
<td>Creates a ColdFusion message box. Equivalent to the cfmessagebox tag.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.getMessageBoxObject</td>
<td>Gets the underlying Ext JS - JavaScript Library object for the specified HTML cfmessagebox control.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.isMessageBoxDefined</td>
<td>Checks if a message box is defined.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.show</td>
<td>Displays a ColdFusion message box.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.update</td>
<td>Updates message box properties.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.updateMessage</td>
<td>Updates the message property.</td>
</tr>
<tr>
<td>ColdFusion.MessageBox.updateTitle</td>
<td>Updates the message box title.</td>
</tr>
<tr>
<td>ColdFusion.navigate</td>
<td>Displays the output of a link URL in a specified cfdiv, cflayoutarea, cfpod, or cfwindow container.</td>
</tr>
<tr>

</tbody>
</table>
### ColdFusion.Ajax.submitForm

**Description**

Submits form data without refreshing the page when the results are returned.

**Function syntax**

```
ColdFusion.Ajax.submitForm(formId, URL[, callbackhandler, errorHandler, httpMethod, async])
```

**See also**

- `cfajaxproxy`, `ColdFusion.navigate`, Using the ColdFusion.Ajax.submitForm function in the *Developing ColdFusion Applications*

**History**

ColdFusion 8: Added this function.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formId</td>
<td>The ID or name attribute of the form.</td>
</tr>
<tr>
<td>URL</td>
<td>The URL to which to submit the form.</td>
</tr>
<tr>
<td>callbackhandler</td>
<td>The JavaScript function to handle a normal response. The function must take a single argument, that contains the response body. This method is used only if the form submission is asynchronous.</td>
</tr>
</tbody>
</table>

---

More Help topics

“JavaScript Functions in ColdFusion 9 Update 1” on page 1507
Ajax JavaScript Functions

Returns
If the `asynch` argument is `false`, returns the response body. Otherwise, the function does not return a value.

Usage
If the page that calls this function does not have any ColdFusion AJAX-based controls, use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

Note: This function does not submit the contents of file fields.

Example
See Using the ColdFusion.Ajax.submitForm function in the Developing ColdFusion Applications.

ColdFusion.Autosuggest.getAutosuggestObject

Description
Lets you access underlying YUI AutoComplete object thereby providing fine-grained control over the object, for example attaching an event.

Returns
The underlying AutoComplete object.

Function syntax
ColdFusion.Autosuggest.getAutosuggestObject (Id)

Parameters
- `Id`: Name of the auto-suggest object.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorHandler</td>
<td>The JavaScript function to handle an HTTP error response. The function must take two arguments: the HTTP status code, and the error message. This method is used only if the form submission is asynchronous.</td>
</tr>
<tr>
<td>httpMethod</td>
<td>The HTTP method to use for the submission, must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• GET</td>
</tr>
<tr>
<td></td>
<td>• POST (the default)</td>
</tr>
<tr>
<td>asynch</td>
<td>A Boolean value specifying whether to submit the form asynchronously. The default value is <code>true</code>.</td>
</tr>
</tbody>
</table>
Example
<html>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<head>
    <cfajaximport tags="cfinput-autosuggest">
    <script>
        var init = function()
        {
            autosuggestobj = ColdFusion.Autosuggest.getAutosuggestObject('state');
            autosuggestobj.itemSelectEvent.subscribe(foo);
        }
        var foo = function(event,args)
        {
            var msg = "";
            msg = msg + "Event: " + event + "\n\n";
            msg = msg + "Selected Item: " + args[2] + "\n\n";
            msg = msg + "Index: " + args[1].nItemIndex + "\n\n";
            alert(msg);
        }
        var getStates = function(){
            return
            ["California","Connecticut","Colorado","Illinois","Alabama","Iowa","Utah","Alaska"];
        }
    </script>
</head>
<body>
<h3>Attaching an event handler to the autosuggest object</h3>
<form name="mycfform" method="post">
State:<br>
<input type="text" name="state"
autosuggest="javascript:getStates({cfautosuggestvalue})" autosuggestMinLength=1 autosuggestBindDelay=1>
<cfset ajaxOnLoad("init")>
</form>
</body>
</html>

ColdFusion.Chart.getChartHandle

Description
Used to get chart object for various JavaScript operations that you want to perform, for example adding or removing a series or nodes in charts.

Returns
JavaScript object

Function syntax
ColdFusion.Chart.getChartHandle()
History
ColdFusion 10: Added this function

Example
The following example shows how to add a new value to the first series of a chart with chart ID interactivebar:

ColdFusion.Chart.getChartHandle().exec('interactivebar', 'appendseriesvalues', '{"plotindex":0, "values" : [40]}');

Example
The following example shows how to add a new value to the register a click event on a chart:

ColdFusion.Chart.getChartHandle().click = function(dataObj){
    alert("Chart Clicked - ID: " + data['id']);
}

ColdFusion.FileUpload.cancelUpload

Description
At any point during the upload of files, you can choose to cancel the upload. When you cancel the upload, any further upload of files stops.

Function syntax
ColdFusion.FileUpload.cancelUpload(name)

See also
ColdFusion.FileUpload.clearAllFiles, ColdFusion.FileUpload.startUpload

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute in the cffileupload tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Example
This example includes a button for the Cancel Upload action. When you click this button, the file upload is canceled.
<h3>This is an example of the FileUpload.cancelUpload function. Add a few files to upload and click Upload. During upload, click the Cancel Upload HTML button to cancel the upload.</h3>

```javascript
function onCancel() {
  ColdFusion.FileUpload.cancelUpload('myupload');
}
</script>
<cffileupload
  url="uploadAll.cfm"
  progressbar="true"
  name="myupload"
  addButtonLabel = "Add File"
  clearButtonlabel = "Clear it"
  width=600
  height=400
  title = "File Upload"
  maxuploadsize="30"
  extensionfilter="*.jpg, *.png, *.flv, *.txt"
  BGCOLOR="#FFFFFF"
  MAXFILESELECT=10
  UPLOADBUTTONLABEL="Upload now"/>
<cfform name="form01">
  <cfinput type="button" name="cancelupld" value="Cancel Upload"
    onclick="onCancel()">
</cfform>

ColdFusion.FileUpload.clearAllFiles

Description
Before upload or after you cancel upload, you can choose to clear all the files selected for upload. When you do this, the selected files are removed from the Upload view list.

Function syntax
ColdFusion.FileUpload.clearAllFiles(name)

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute in the cffileupload tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.
Example
This example includes a button for the ClearAllFiles action. When you click this button, the files selected for upload are removed.

This is an example of the FileUpload.clearAllFiles function. Add a few files to upload and click Upload. During upload, click the Clear Upload HTML button to clear all the files selected for upload.

```html
<script language="JavaScript" type="text/javascript">
function onClear() {
    ColdFusion.FileUpload.clearAllFiles('myupload');
};
</script>

<cffileupload
    url="uploadAll.cfm"
    progressbar="true"
    name="myupload"
    addButtonLabel = "Add File"
    clearButtonlabel = "Clear it"
    width=600
    height=400
    title = "File Upload"
    maxuploadsize="30"
    extensionfilter="*.jpg, *.png, *.flv, *.txt"
    BGCOLOR="#FFFFFF"
    MAXFILESELECT=10
    UPLOADBUTTONLABEL="Upload now"/>
<cfform name="form01">
    <cfinput type="button" name="clearupload" value="Cancel Upload"
        onclick="onClear()">
</cfform>
```

Coldfusion.fileUpload.setUrl

Description
Used to set URL for the fileupload control dynamically.

Returns
Nothing

Function syntax
ColdFusion.fileUpload.setUrl(id, url)

Parameters
- id: Name of upload control.
- url: URL can be an absolute URL, relative URL, or fully qualified URL.
Example
<script language="javascript">
    var uploadDone = function(result){
        alert("File uploaded");
    }

    var setUploadUrl = function(id)
    {
        var selectedFiles = ColdFusion.FileUpload.getSelectedFiles(id);
        var uploadUrl = "/manual/ajaxui/cffileupload/setUrl/includes/_uploadall.cfm";
        alert("Upload URL : " + uploadUrl);
        if(selectedFiles.length){
            ColdFusion.FileUpload.setURL(id,uploadUrl);
            ColdFusion.FileUpload.startUpload(id);
        }
    }

    var callbackhandler = function(obj)
    {
        var fileName = obj["FILENAME"];
        var status = obj["STATUS"];<br>
        var message = obj["MESSAGE"];<br>
        var msg = "In callbackhandler()" + 
                  "FILENAME: " + fileName + 
                  "\n\n" + 
                  "STATUS: " + status + 
                  "\n\n" + 
                  "MESSAGE: " + message
        alert(msg);
    }

    var errorhandler = function()
    {
        alert("In errorhandler()");
    }

    var uploadcompleted = function()
    {
        alert("All files have been uploaded successfully");
    }
</script>
<cfform name="frmUpload">
    <br>
    <cffileupload name="uploader" hideuploadbutton="true" onComplete="uploadDone" onError="errorhandler" onUploadComplete="uploadcompleted">
        <br>
        <cfinput type="button" name="submit" value="Click to set URL and Upload Files" onClick="setUploadUrl('uploader')">
    </cfform>

**ColdFusion.FileUpload.startUpload**

**Description**
Starts uploading the selected files.

**Function syntax**
ColdFusion.FileUpload.startUpload(name)
Ajax JavaScript Functions

See also
ColdFusion.FileUpload.cancelUpload, ColdFusion.FileUpload.clearAllFiles

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute in the cffileupload tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Example
This example includes a button to start the Upload action. When you click this button, the selected files start uploading.

```html
<cfinput type="button" name="startupload" value="Start Upload" onclick="onUpload()">
</cfinput>
```

```javascript
function onUpload() {
    ColdFusion.FileUpload.startUpload('myupload');
}
</script>
```

ColdFusion.getElementValue

Description
Gets the value of an attribute of a bindable ColdFusion control.

Function syntax
ColdFusion.getElementValue(elementId [, formId, attributeName])

Last updated 7/9/2012
History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elementId</td>
<td>The ID or name attribute of the control.</td>
</tr>
<tr>
<td>formId</td>
<td>The ID attribute of the form that contains the control. Omit this attribute</td>
</tr>
<tr>
<td></td>
<td>if the element ID is unique on the page. If you omit this attribute and the</td>
</tr>
<tr>
<td></td>
<td>element ID is not unique, the function uses the first element on the page</td>
</tr>
<tr>
<td></td>
<td>with the specified ID.</td>
</tr>
<tr>
<td>attributeName</td>
<td>The control attribute to get; by default, the value attribute, or, for cfselect, the value of the selected element in the control. For cfgrid controls, use this attribute and specify the name of the column whose value you are getting; the function returns the entry in the currently selected row. For cftree controls, use this attribute and specify PATH or NODE. The function returns the item path or node value of the currently selected tree item.</td>
</tr>
</tbody>
</table>

Returns
The value of the specified attribute.

Usage
You can bind to, and get the attribute values of, the following HTML controls:

- cfgrid
- cfinput controls with checkbox, datefield, file, hidden, radio, or text types
- cfselect
- cftextarea
- cftree

ColdFusion.grid.clearSelectedRows

Description
Used to clear the selected rows in the grid.

Returns
Nothing

Function syntax
ColdFusion.grid.clearSelectedRows(id)

Parameters
- id: Name of the grid defined using cfgrid.

Usage
See the following example.
Example
Employee.cfm

<html>
<head>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<cfajaxproxy cfc="emp" jscclassname="emputils">
<script language="javascript">
var emp = new emputils();
var deleteAllSelectedRows = function(grid)
{
emp.setHTTPMethod("POST");
emp.deleteEmployees(getAllSelectedRows(grid,false));
ColdFusion.Grid.refresh(grid);
}
var getAllSelectedRows = function(grid,showalert)
{
obj = ColdFusion.Grid.getSelectedRows(grid);
jsonbj = ColdFusion.JSON.encode(obj);
if(showalert)
    alert(jsonbj);
return obj;
}
var clearAllSelectedRows = function(grid)
{
ColdFusion.Grid.clearSelectedRows(grid);
}
</script>
</head>
<body>
<cfform>
<cfgrid
format="html"
name="empListing"
selectmode="edit"
bind="cfc:emp.getEmployees({cfgridpage},{cfgridpagesize},{cfgridsortcolumn},{cfgridsortdirection})"
onchange="cfc:emp.editEmployees({cfgridaction},{cfgridrow},{cfgridchanged})"
autowidth="true"
multirowselect="true"
delete="true"
</cfform>
Last updated 7/9/2012
Employee.cfc
<cfcomponent>
<cfscript>
  empQuery = new query(name="emps", datasource="cfdocexamples");
  remote any function getEmployees(page,pageSize,gridsortcolumn="EMP_ID",gridsortdirection="ASC",empName)
  {
    var orderBy = "EMP_ID";
    var mysql = "SELECT Emp_ID, FirstName, LastName, Email FROM Employees";
    if(isdefined("arguments.empName") and trim(arguments.empName) neq ""){
      mysql = mysql & " WHERE " & "firstname = '#arguments.empName#';
    }
    if(arguments.gridsortcolumn eq "){
      mysql = mysql & " ORDER BY " & orderBy;
    }
    mysql = mysql & " " & gridsortdirection;
    return QueryConvertForGrid(empQuery.execute(sql=mysql).getResult(), page, pageSize);
  }
  remote void function editEmployees(gridaction,gridrow,gridchanged)
  {
    switch(gridaction)
    {
    case "I":
      {
        var eFName = gridrow["FIRSTNAME"];     
        var eLName = gridrow["LASTNAME"];     
        var eDept = gridrow["DEPARTMENT"];     
        var eEmail = gridrow["EMAIL"];    
        var insertSql = "insert into Employees(FirstName,LastName,Department,Email) values (" & eFName & ", " & eLName & ", " & eDept & ", " & eEmail & ");"
        empQuery.execute(sql=insertSql);
        break;
    }
In this example, setting `multirowselect=true` enables performing of batch operations on grid data, such as deleting multiple records.

In the `deleteemployees` functions, two lines have been commented out to prevent accidental deletion of data (since it is a batch operation). To see deletion, uncomment the code.

The form has a `deleteAllSelectedRows` button that illustrates how records can be deleted externally. That is, without using the delete button built in to the grid. The same approach can be used to perform other batch operations such as moving multiple files to another folder or batch updates.

*Note: Set the `httpMethod` to POST on the Proxy object carefully to avoid "request URI too large" errors as shown in the `deleteAllSelectedRows` method in Employee.cfm.*

ColdFusion.Grid.getBottomToolbar

**Description**

Gets bottom toolbar that can be used to add a control, for example icon or button.
**ColdFusion.Grid.getBottomToolbar(Id)**

**Parameters**
- **Id**: Name of the grid.

**Example**
See example in ColdFusion.Grid.refreshBottomToolbar.

**ColdFusion/Grid/gridObject**

**Description**
Gets the underlying Ext (Ext JS JavaScript library) object for the specified HTML grid.

**Function syntax**
ColdFusion.Grid.getGridObject(name)

**See also**
cfgrid, ColdFusion.Grid.refresh, ColdFusion.Grid.sort, Ext JS - JavaScript Library Documentation, Using HTML grids in the Developing ColdFusion Applications

**History**
ColdFusion 8: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the <code>name</code> attribute of the <code>cfgrid</code> tag for which you want the object.</td>
</tr>
</tbody>
</table>

**Returns**
If the grid is editable, an object of type `Ext.grid.EditableGrid`; otherwise, an object of type `Ext.grid.Grid`.

**Usage**
Use this function to get the Ext toolkit (`Ext.grid`) object that underlies the ColdFusion HTML `cfgrid` control. You can then use the raw object to modify the displayed grid. For documentation on the objects and how to manage them, see the Ext documentation.

**ColdFusion.Grid.hideBottomToolbar(Id)**

**Description**
Hides the bottom toolbar that can be used to add a control, for example icon or button.

**Function syntax**
ColdFusion.Grid.hideBottomToolbar(Id)
Parameters

- `id`: Name of the grid.

Example

See example in `ColdFusion.Grid.refreshBottomToolbar`.

---

**ColdFusion.grid.getSelectedRows**

**Description**

Used to fetch data for the selected rows in the grid.

**Returns**

An array of objects that contains row data.

**Function syntax**

`ColdFusion.grid.getSelectedRows(id)`

**Parameters**

- `id`: Name of the grid defined using `cfgrid`.

**See also**

FileUpload

**Usage**

See the example in `ColdFusion.grid.clearSelectedRows`.

**Example**

See the example in `ColdFusion.grid.clearSelectedRows`.

---

**ColdFusion.Grid.getTopToolbar**

**Description**

Gets the top toolbar that can be used to add a control, for example icon or button.

**Function syntax**

`ColdFusion.getTopToolbar(Id)`

**Parameters**

- `id`: Name of the grid.

**Example**

See example in `ColdFusion.Grid.refreshBottomToolbar`.

---

Last updated 7/9/2012
ColdFusion.Grid.hideTopToolbar

Description
Hides the top toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.hideTopToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.refresh

Description
Manually refreshes a displayed grid.

Function syntax
ColdFusion.Grid.refresh(name [, preservePage])

See also
cfgrid, ColdFusion.Grid/gridObject, ColdFusion.Grid.sort, Ext JS - JavaScript Library Documentation, Using HTML grids in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the cfgrid tag to refresh.</td>
</tr>
<tr>
<td>preservePage</td>
<td>A Boolean value specifying whether to redisplay the current page of data (true), or display the first page of data (false, the default). This attribute applies only if the grid data requires multiple grid pages to display.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function is useful to refresh a grid when an event occurs that changes the underlying data but does not normally trigger a grid update.
Example
The following code snippet comes from an example that lets users delete rows from a grid. When the user selects a grid row and clicks the delete button, the Ajax proxy calls a mycfc.deleteRow function to delete the row from the database. When the function returns successfully, the proxy calls ColdFusion.Grid.refresh to update the grid and remove the row.

```
<cfajaxproxy bind="cfc:mycfc.deleteRow({deletebutton@click},{mygrid.id@none})"
       onSuccess="ColdFusion.Grid.refresh('mygrid', true)">

ColdFusion.Grid.refreshBottomToolbar

Description
Refreshes the bottom toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function ColdFusion.Grid.showBottomToolbar.

Function syntax
ColdFusion.Grid.refreshBottomToolbar(Id)

Parameters
• Id: Name of the grid control.

Example
grid.cfc
<cfcomponent>
    <cfscript>
        remote any function
        getEmployees(page,pageSize,gridsortcolumn="EMP_ID",gridsortdirection="ASC"){  
            var startRow = (page-1)*pageSize;
            var endRow = page*pageSize;

            if(!isdefined("arguments.gridsortcolumn") or
                isdefined("arguments.gridsortcolumn") and trim(arguments.gridsortcolumn) eq ")
                gridsortcolumn = "EMP_ID";
            if(!isdefined("arguments.gridsortdirection") or
                isdefined("arguments.gridsortdirection") and arguments.gridsortdirection eq ")
                gridsortdirection = "ASC";
            var mysql = "SELECT Emp_ID, FirstName, EMail, Department FROM Employees";
            if(isdefined("arguments.gridsortcolumn") and arguments.gridsortcolumn neq ")
                mysql = mysql & " ORDER BY " & gridsortcolumn;
            if(isdefined("arguments.gridsortdirection") and arguments.gridsortdirection neq ")
                mysql = mysql & " & gridsortdirection ;
            rs1 = new query(name="team", datasource="cfdocexamples", sql=mysql).execute();
            return QueryConvertForGrid(rs1.getResult(), page, pageSize);
        }

        remote any function editEmployees(gridaction,gridrow,gridchanged){
            writelog("edit employee info");
        }
    </cfscript>
</cfcomponent>

grid.cfm

<script>
    var refreshToolbar = function(id,type){
        type == "top" ? ColdFusion.Grid.refreshTopToolbar(id) : ColdFusion.Grid.refreshBottomToolbar(id);
    }

    var hideToolbar = function(id,type){
        type == "top" ? ColdFusion.Grid.hideTopToolbar(id) : ColdFusion.Grid.hideBottomToolbar(id);
    }

    var showToolbar = function(id,type){
        (type == "top") ? ColdFusion.Grid.showTopToolbar(id) : ColdFusion.Grid.showBottomToolbar(id);
    }

    var handleToolbar = function(id,type){
        if(type == "top"){
            tbar = ColdFusion.Grid.getTopToolbar(id);
            tbar.addButton({
                text: "Add User Account",
                tooltip: "Add a user account",
                handler: addUserAccount
            });
        }
    }
</script>
else{
    bbar = ColdFusion.Grid.getBottomToolbar(id);
    bbar.add(new Ext.Toolbar.Separator());
    bbar.addButton({
        text: "Delete User Account",
        tooltip: "Delete a user account",
        handler: deleteUserAccount
    });
}

var GetUserInfo = function(){
    alert("Retrieving user account");
}

var addUserAccount = function(){
    alert("Adding new user account")
}
var deleteUserAccount = function(){
    alert("Deleting user account")
}
</script>
<cfform>

    delete="yes"
    bind="cfc:grid.getEmployees({cfgridpage},{cfgridpagesize},{cfgridsortcolumn},{cfgridsortdire
ColdFusion.Grid.refreshTopToolbar

Description
Refreshes the top toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function ColdFusion.Grid.showTopToolbar.

Function syntax
ColdFusion.Grid.refreshTopToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.showBottomToolbar

Description
Shows bottom toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.showBottomToolbar(Id)

Parameters
• Id: Name of the grid.
Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.showTopToolBar

Description
Displays the top toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.showTopToolBar(Id)

Parameters
- Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.sort

Description
Sorts the specified HTML grid.

Function syntax
ColdFusion.Grid.sort(name [, columnName, direction])

See also
cfggrid, ColdFusion.Grid.getGridObject, ColdFusion.Grid.refresh, Ext JS - JavaScript Library Documentation, Using HTML grids in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the cfgrid tag to sort.</td>
</tr>
<tr>
<td>columnName</td>
<td>The name of the column that determines the sort order.</td>
</tr>
<tr>
<td>direction</td>
<td>The sort direction. Must be one of these values:</td>
</tr>
<tr>
<td></td>
<td>• ASC (default)</td>
</tr>
<tr>
<td></td>
<td>• DESC</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.
Usage
This function sorts the data displayed by the grid by using a case-insensitive sort for string data, or a numeric sort for numeric data. It uses the specified column contents to determine the displayed grid order. When a grid has a remote data source, the bound CFC function that provides the data gets the column name and sort direction in the \texttt{cfgridsortcolumn} and \texttt{cfgridsortdirection} bind attributes. The CFC function must use these values and perform the sort appropriately.

\section*{ColdFusion.JSON.decode}

\textbf{Description}
Converts a JSON-encoded string to a JavaScript variable.

\textbf{Function syntax}
\begin{verbatim}
ColdFusion.JSON.decode(string)
\end{verbatim}

\textbf{See also}
\begin{itemize}
\item \texttt{ColdFusion.JSON.encode}, \texttt{DeserializeJSON}, \texttt{SerializeJSON}
\item Using Ajax Data and Development Features in the \textit{Developing ColdFusion Applications}, \url{http://www.json.org}
\end{itemize}

\textbf{History}
ColdFusion 8: Added this function

\textbf{Parameters}
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
\texttt{string} & The string to encode. \\
\hline
\end{tabular}

\textbf{Returns}
A Javascript variable containing the data in the JSON encoded string.

\textbf{Usage}
Use this function when you must explicitly convert between JavaScript and JSON format, for example, when you must call a remote function that is not in a CFC.

If the JSON string has a security prefix as defined by the Server Settings > Settings page of the ColdFusion Administrator or specified in the \texttt{cfapplication} or \texttt{cffunction} tags, the function strips the prefix before decoding the string.

\textbf{Example}
The following example uses the \texttt{ColdFusion.JSON.decode} and \texttt{ColdFusion.JSON.encode} functions. When the user clicks the “Call” link, the callMe function encodes the String as JSON and calls the echo CFC’s plainEcho function with the result. The function also sets the return format to plain, so that the CFC function does not automatically convert its return value to JSON, and sends plain text instead.

The echo.cfc component has two functions:

\begin{itemize}
\item The plainEcho function converts its argument from JSON to a ColdFusion variable, calls the echo function, converts the result to JSON, and returns it to the caller.
\end{itemize}
• The echo function creates a structure, sets the structure's entry to the input parameter, and returns the result. (You could call this function remotely using to see the result of calling a function that does not encode JSON when you request a plain return type. To see the results, use the cfdebug HTTP parameter when you run the main page.)

The main page has the following lines:

```xml
<cfajaxproxy cfc="echo">
<cfajaximport>

<html>
<head>
<script>
function callme()
{
    var e = new echo();
    e.setReturnFormat('plain');
    var args = {a:"Hello again!"};
    var argsJSON = ColdFusion.JSON.encode(args);
    var json = e.plainEcho(argsJSON);
    var o = ColdFusion.JSON.decode(json);
    alert(o.A);
}
</script>
</head>

<body>
<a href="javascript:callme()">Call</a>
</body>
</html>
```

The echo.cfc file has the following lines:

```xml
<cfcomponent output="false">
  <cffunction name="echo" access="remote">
    <cfargument name="text">
    <cfset var ret = StructNew()>
    <cfset ret.a = text>
    <cfreturn ret>
  </cffunction>
  <cffunction name="plainEcho" access="remote">
    <cfargument name="text">
    <cfset t = deserializeJSON(text)>
    <cfset ret = echo(t.A)>
    <cfreturn serializeJSON(ret)>
  </cffunction>
</cfcomponent>
```

### ColdFusion.JSON.encode

**Description**

Converts a JavaScript expression to a JSON-encoded string.

Last updated 7/9/2012
Function syntax
ColdFusion.JSON.encode(expression)

See also
ColdFusion.JSON.decode, DeserializeJSON, SerializeJSON, Using Ajax Data and Development Features in the Developing ColdFusion Applications, http://www.json.org

History
ColdFusion 8: Added this function

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>An expression with the data to encode.</td>
</tr>
</tbody>
</table>

Returns
A String containing the data in JSON encoded format.

Usage
Use this function when you must explicitly convert between JavaScript and JSON format, for example, when you must call a remote function that is not in a CFC.

Example
See the example in ColdFusion.JSON.decode.

**ColdFusion.Layout.collapseAccordion**

Description
Collapses an area of an accordion layout.

Function syntax
ColdFusion.Layout.collapseAccordion(layoutname, layoutareaname)

See also

History
ColdFusion 9: Added this function
ColdFusion.Layout.collapseArea

Description
Collapses an area of a border layout.

Function syntax
ColdFusion.Layout.collapseArea(layout, layoutArea)

See also
cflayout, cflayoutarea, ColdFusion.Layout.expandArea, ColdFusion.Layout.getTabLayout, ColdFusion.Layout.showArea, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the border layout that contains the area to collapse.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The position in the layout of the area to collapse. Must be one of the following: bottom, left, right, or top.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function has no effect if the area is already collapsed.
Example
The following code snippet collapses the left area of the layout border layout when the user clicks the button.

```html
<cfinput name="collapse2" width="100" value="Collapse Area 2" type="button"
    onClick="ColdFusion.Layout.collapseArea('thelayout', 'left');"/>
```

**ColdFusion.Layout.createAccordionPanel**

**Description**
Creates a panel in a ColdFusion accordion layout.

**Function syntax**
ColdFusion.Layout.createAccordionPanel(layoutname, layoutareaname, title, URL [, config])

**See also**

**History**
ColdFusion 9: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutname</td>
<td>The name attribute of the accordion layout in which to add the panel.</td>
</tr>
<tr>
<td>layoutareaname</td>
<td>The name to assign for the new accordion panel. Must be unique on the accordion.</td>
</tr>
<tr>
<td>title</td>
<td>The text to display on the panel. You can use HTML mark-up to control the title appearance.</td>
</tr>
<tr>
<td>URL</td>
<td>The URL from which to get the panel area contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.</td>
</tr>
<tr>
<td>config</td>
<td>An object containing configuration parameters. For details, see &quot;Usage&quot;.</td>
</tr>
</tbody>
</table>

**Returns**
This function does not return a value.

**Usage**
This function dynamically creates panels in an accordion layout; it is equivalent to putting a cflayoutarea tag inside a cflayout tag with a type attribute of accordion. The configuration parameter defines panel characteristics; it can have any or all the following entries:
Example
The following example creates an accordion layout with one panel. When you click the button it creates a second panel that is immediately visible and selected.

The main page looks as follows:
<html>
<head>
</head>
<body>
<cfform name="panels">
  <cfinput type="button" name="CreateAccordionPanel"
    onClick="ColdFusion.Layout.createAccordionPanel('AccordionPanel','panel2','Panel 2',"_panelUrl.cfm",{inithide:false,selected:true})"
    value="Create Panel">
</cfform>

<cflayout type="panel" name="AccordionPanel">
  <cflayoutarea name="panel1" title="Panel 1" align="left">
    Default Panel
  </cflayoutarea>
</cflayout>
</body>
</html>

The _tabURL.cfm page looks as follows:

<h3>Panel 2</h3>
This is an accordion panel

**ColdFusion.Layout.createTab**

**Description**
Creates a tab and layout area in a ColdFusion tabbed layout.

**Function syntax**

```
ColdFusion.Layout.createTab(layout, layoutArea, Title, URL [, configObject])
```

**See also**

`cflayout, cflayoutarea, ColdFusion.Layout.disableTab, ColdFusion.Layout.enableTab, ColdFusion.Layout.showArea, ColdFusion.Layout.hideTab, ColdFusion.Layout.selectTab, ColdFusion.Layout.showTab`, Using layouts in the *Developing ColdFusion Applications*

**History**

ColdFusion 8: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the tabbed layout in which to add the tab</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The name to assign to the layout area that is created for the new tab. Must be unique on the page.</td>
</tr>
<tr>
<td>title</td>
<td>The text to display on the tab. You can use HTML mark-up to control the title appearance.</td>
</tr>
<tr>
<td>URL</td>
<td>The URL from which to get the layout area contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.</td>
</tr>
<tr>
<td>configObject</td>
<td>An object containing window configuration parameters. For details, see &quot;Usage&quot;.</td>
</tr>
</tbody>
</table>
Ajax JavaScript Functions

Returns
This function does not return a value.

Usage
This function dynamically creates tabs in a tabbed layout; it is equivalent to putting a `cflayoutarea` tag inside a `cflayout` tag with a `type` attribute of `tab`. The `configuration` parameter defines tab characteristics; it can have any or all the following entries:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>align</code></td>
<td>The <code>cflayout</code> tag <code>align</code> attribute value</td>
<td>Specifies how to align child controls within the layout area. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>center</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>justify</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>left</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>right</code></td>
</tr>
<tr>
<td><code>callbackhandler</code></td>
<td></td>
<td>A function that is called when the layout tab body has loaded. This function must not take any arguments.</td>
</tr>
<tr>
<td><code>closable</code></td>
<td><code>false</code></td>
<td>A Boolean value specifying whether the user can close the window. If <code>true</code>, the tab has an X close icon.</td>
</tr>
<tr>
<td><code>disabled</code></td>
<td><code>false</code></td>
<td>A Boolean value specifying whether the tab is disabled, that is, whether user can select the tab to display its contents. Disabled tabs are grayed out. Ignored if there is a <code>true</code> <code>selected</code> entry.</td>
</tr>
<tr>
<td><code>errorHandler</code></td>
<td></td>
<td>A function that is called if an error occurs in loading the tab body. This function must take two arguments:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The HTTP status code, or <code>-1</code> if the error is not an HTTP error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• An error message</td>
</tr>
<tr>
<td><code>inithide</code></td>
<td><code>false</code></td>
<td>A Boolean value specifying whether the tab is initially hidden. To show an initially hidden tab, use the <code>ColdFusion.Layout.showTab</code> function.</td>
</tr>
<tr>
<td><code>overflow</code></td>
<td><code>auto</code></td>
<td>Specifies how to display child content whose size would cause the tab layout area to overflow the window boundaries. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>auto</code>: Show scroll bars when necessary.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>hidden</code>: Do not allow access to overflowing content.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>scroll</code>: Always show horizontal and vertical scroll bars, even if they are not needed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>visible</code>: Content can display outside the bounds of the layout area.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> In Internet Explorer, layout areas with the visible setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.</td>
</tr>
<tr>
<td><code>selected</code></td>
<td><code>false</code></td>
<td>A Boolean value specifying whether this tab is initially selected so that its contents appears in the layout.</td>
</tr>
<tr>
<td><code>style</code></td>
<td></td>
<td>A CSS style specification that controls the appearance of the layout area.</td>
</tr>
</tbody>
</table>

Example
The following example creates a tabbed layout with one tab. When you click the button it creates a second tab that is immediately visible and selected.
The main page looks as follows:

```html
<html>
<head>
</head>
<body>
<cfform name="layouts">
  <cfinput type="button" name="CreateTab"
           onClick="ColdFusion.Layout.createTab('tabLayout','tab2','Tab 2',_'tabUrl.cfm',{inithide:false,selected:true})"
           value="Create Tab">
</cfform>

<cflayout type="tab" name="tabLayout">
  <cflayoutarea name="tab1" title="Tab 1" align="left">
    Default Tab
  </cflayoutarea>
</cflayout>
</body>
</html>
```

The _tabURL.cfm page looks as follows:

```html
<h3>Tab 2</h3>
This is a simple tab
```

### ColdFusion.Layout.disableSourceBind

**Description**
Disables the source bind.

**Function syntax**

```
ColdFusion.Layout.disableSourceBind(Id)
```

**Parameters**

- **Id**: Name of the layout area.

**Usage**
Assume that you are using Coldfusion.navigate to populate content into tab or accordion panels. You can have instances where content comes from the source bind call if the source attribute is defined for cflayoutarea (and is not from ColdFusion.navigate).

In such instances, you might disable the source bind to get content using Coldfusion.navigate.

**Example**
layout.cfm uses the templates Tab1_Src.cfm, Tab2_Src.cfm, and Tab3_Src.cfm. If you run layout.cfm, you notice that clicking

- navigate populates content of tab2_src.cfm instead of navigate.cfm
- Disable Source bind ensures that the content of navigate.cfm is populated in tab2_src
- Enable Source Bind and then clicking tab2_src would again populate the content of tab2_src

Last updated 7/9/2012

layout.cfm

<script>
    var navigateToTab = function(layoutId, tabIndex){
        alert("Navigating to " + tabIndex);
        ColdFusion.Layout.selectTab(layoutId,tabIndex);
        ColdFusion.navigate('navigate.cfm',tabIndex);
    }
    var disableBind = function(tabId){
        alert("Disabling binding on source for " + tabId);
        ColdFusion.Layout.disableSourceBind(tabId);
    }
    var enableBind = function(tabId){
        alert("Enabling binding on source for " + tabId);
        ColdFusion.Layout.enableSourceBind(tabId);
    }
</script>

<cflayout type="tab" name="layout1">
    <cflayoutarea
        name = "tab1"
        overflow = "auto"
        refreshonactivate = "yes"
        title = "Tab 1"
        source = "tab1_src.cfm"/>
    <cflayoutarea
        name = "tab2"
        overflow = "auto"
        refreshonactivate = "false"
ColdFusion.Layout.enableSourceBind

Description
If disabled, enables the source bind.

Function syntax
ColdFusion.Layout.enableSourceBind(Id)

Parameters
- Id: Name of the layout area.

Usage
See usage in ColdFusion.Layout.disableSourceBind.

Example
See example in ColdFusion.Layout.disableSourceBind.

ColdFusion.FileUpload.getSelectedFiles

Description
Returns an array of objects containing the filename and size of the files selected for upload. The file size is returned in bytes.

The function also returns file upload status as YES|NO|Error.

Function syntax
ColdFusion.FileUpload.getSelectedFiles(Id)
Parameters
- \textit{id}: Name of the \texttt{cffileupload} control.

Usage
In a real life scenario, you normally use the uploader with other controls. For example, a form with three fields: name, email, and uploader. Assume that you upload the files, but forget to click Submit or you select the files, submit the form, but forget to click Upload.

You can use this function to inform the user that there are files that have been selected for upload and provide the following details:
- \textit{FILENAME}: Name of the file selected for upload.
- \textit{SIZE}: Size of the file in bytes.
- \textit{STATUS}: YES|NO|Error; YES indicates a successful upload, NO indicates that the upload is yet to occur, and Error indicates that an exception has occurred during the upload operation.

Example
The following example illustrates a scenario where the user clicks Submit and is informed about the files selected for upload:

```html
<html>
<head>
<script language="javascript">

var formatNumber = function(num){
    if(num < 1024) return num + " bytes";
    if(num < (1024 * 1024)) return (num/1024).toFixed(2) + " KB";
    if(num < (1024 * 1024 * 1024)) return (num/(1024 * 1024)).toFixed(2) + " MB";
    return (num/(1024 * 1024 * 1024)).toFixed(2) + " GB";
}

var getSelectedList = function(id){
    var files = ColdFusion.FileUpload.getSelectedFiles(id);
    var fileslist = "";
    if(files.length)
        fileslist = "You have selected The following files for upload: \n\n";
    for(var i=0;i < files.length; i++){
        fileslist = fileslist + files[i].FILENAME + " (" + formatNumber(files[i].SIZE) + ")"
        if(i != files.length-1)
            fileslist = fileslist + "\r\n";
    }
    if(files.length)
    {
        alert(fileslist);
    }
</script>
</head>
</html>
```

Last updated 7/9/2012
ColdFusion.Layout.disableTab

**Description**
Disables the specified tab so it cannot be selected.

**Function syntax**
ColdFusion.Layout.disableTab(layout, layoutArea)

**See also**
cflayout, cflayoutarea, ColdFusion.Layout.createTab, ColdFusion.Layout.enableTab, ColdFusion.Layout.showArea, ColdFusion.Layout.hideTab, ColdFusion.Layout.selectTab, ColdFusion.Layout.showTab, Using layouts in the *Developing ColdFusion Applications*

**History**
ColdFusion 8: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The <code>name</code> attribute of the tabbed layout that contains the area to disable.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The <code>name</code> attribute of the tab layout area to disable.</td>
</tr>
</tbody>
</table>

**Returns**
This function does not return a value.

**Usage**
This function has no effect on the currently selected tab. A disabled tab appears grayed out.
Example
The following example lets you enable and disable a tab by clicking a link.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>
  <!--- The tabheight attribute sets the height of all tab content areas. --->
  <cflayout type="tab" name="mainTab" tabheight="300px" style="width:400px">
    <cflayoutarea title="First Tab" name="tab1">
      <h2>The First Tab</h2>
      Here are the contents of the first tab.
    </cflayoutarea>
    <cflayoutarea title="Second Tab" name="tab2">
      <h2>The Second Tab</h2>
      This is the content of the second tab.
    </cflayoutarea>
  </cflayout>

  <p>
  Use these links to test disabling/enabling via JavaScript.
  Note that you cannot disable the currently selected tab.<br />
  <a href="" onClick="ColdFusion.Layout.enableTab('mainTab','tab1'); return false;">Click here to enable tab 1.</a><br />
  <a href="" onClick="ColdFusion.Layout.disableTab('mainTab','tab1'); return false;">Click here to disable tab 1.</a><br />
  </p>
</body>
</html>
```

**ColdFusion.Layout.enableTab**

**Description**
Enables the specified tab so it can be selected.

**Function syntax**

```
ColdFusion.Layout.enableTab(layout, layoutArea)
```

**See also**

cflayout, cflayoutarea, ColdFusion.Layout.createTab, ColdFusion.Layout.disableTab, ColdFusion.Layout.showArea, ColdFusion.Layout.hideTab, ColdFusion.Layout.selectTab, ColdFusion.Layout.showTab, Using layouts in the Developing ColdFusion Applications

**History**

ColdFusion 8: Added this function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The <code>name</code> attribute of the tabbed layout that contains the area to enable.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The <code>name</code> attribute of the tab layout area to enable.</td>
</tr>
</tbody>
</table>

Returns

This function does not return a value.

Example

See `ColdFusion.Layout.disableTab`

**ColdFusion.Layout.expandAccordion**

Description

Expands a panel in an accordion layout.

Function syntax

`ColdFusion.Layout.expandAccordion(layoutname, layoutareaname)`

See also

History

ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutname</td>
<td>The <code>name</code> attribute of the accordion layout that contains the panel to expand.</td>
</tr>
<tr>
<td>layoutareaname</td>
<td>The name of the panel to expand. Must be one of the following: bottom, left, right, or top.</td>
</tr>
</tbody>
</table>

Returns

This function does not return a value.

Usage

This function has no effect if the panel is already expanded.

Example

The following code snippet expands the left area of the panel when the user clicks the button.

```html
<cffinput name="expand2" width="100" value="Expand Area 2" type="button" onclick="ColdFusion.Layout.expandAccordion('thelayout', 'left');"/>
```
ColdFusion.Layout.expandArea

Description
Expands an area of a border layout.

Function syntax
ColdFusion.Layout.expandArea(layout, layoutArea)

See also
cflayout, cflayoutarea, ColdFusion.Layout.collapseArea, ColdFusion.Layout.getTabLayout, ColdFusion.Layout.showArea, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the border layout that contains the area to expand.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The position in the layout of the area to expand. Must be one of the following: bottom, left, right, or top.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function has no effect if the area is already expanded.

Example
The following code snippet expands the left area of the layout border layout when the user clicks the button.

```<cfinput name="expand2" width="100" value="Expand Area 2" type="button"
onClick="ColdFusion.Layout.expandArea('thelayout', 'left');">```

ColdFusion.Layout.getAccordionLayout

Description
Gets the underlying Ext (Ext JS JavaScript library) object for the specified accordion layout.

Function syntax
ColdFusion.Layout.getAccordionLayout(name)

See also
History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the accordion type cflayout tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type Ext.AccordionLayout.

Usage
Use this function to get the Ext toolkit (Ext.AccordionLayout) object that underlies the ColdFusion HTML cflayout control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the Ext documentation.

ColdFusion.Layout.getBorderLayout

Description
Gets the underlying Ext (Ext JS JavaScript library) object for the specified bordered layout.

Function syntax
ColdFusion.Layout.getBorderLayout(name)

See also
cflayout, cflayoutarea, ColdFusion.Layout.getTabLayout, Ext JS - JavaScript Library Documentation, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the border type cflayout tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type Ext.BorderLayout.

Usage
Use this function to get the Ext toolkit (Ext.BorderLayout) object that underlies the ColdFusion HTML cflayout control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the Ext documentation.
ColdFusion.Layout.getTabLayout

Description
Gets the underlying Ext (Ext JS JavaScript library) object for the specified tabbed layout.

Function syntax
ColdFusion.Layout.getTabLayout(name)

See also
cflayout, cflayoutarea, ColdFusion.Layout.getBorderLayout, Ext JS - JavaScript Library Documentation, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the border type cflayout tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type Ext.BorderLayout.

Usage
Use this function to get the Ext toolkit (Ext.BorderLayout) object that underlies the ColdFusion HTML cflayout control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the Ext documentation.

ColdFusion.Layout.hideAccordion

Description
Hides the specified panel and its accordion layout.

Function syntax
ColdFusion.Layout.hideAccordion(layoutname, layoutareaname)

See also

History
ColdFusion 9: Added this function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>layoutname</code></td>
<td>The name attribute of the accordion layout that contains the panel to hide.</td>
</tr>
<tr>
<td><code>layoutareaname</code></td>
<td>The name attribute of the panel to hide.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Example
The following example creates an accordion layout with two panels. Click the buttons to show and hide the second panel.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head></head>
<body>
    <cflayout type="accordion" name="accordionLayout" accordionheight="300px" style="width:400px">
        <cflayoutarea title="First Panel" name="panel1">
            <h2>The First Panel</h2>
            Here are the contents of the first panel.
        </cflayoutarea>

        <cflayoutarea title="Second Panel" name="panel2">
            <h2>The Second Panel</h2>
            This is the content of the second panel.
        </cflayoutarea>
    </cflayout>

    <cfform name="layouts">
        <cfinput type="button" name="ShowAccordion" value="Show Accordion" onClick="ColdFusion.Layout.showAccordion('accordionLayout','panel2')">
        <cfinput type="button" name="ShowAccordion" value="Hide Panel" onClick="ColdFusion.Layout.hideAccordion('accordionLayout','panel2')">
    </cfform>
</body>
</html>
```

**ColdFusion.Layout.hideArea**

Description
Hides an area of a border layout.

Function syntax
`ColdFusion.Layout.hideArea(layout, layoutArea)`
ColdFusion 10 CFML Reference

Ajax JavaScript Functions

See also
cflayout, cflayoutarea, ColdFusion.Layout.collapseArea, ColdFusion.Layout.expandArea, ColdFusion.Layout.showArea, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the border layout that contains the area to hide.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The position in the layout of the area to hide. Must be one of the following: bottom, left, right, or top.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function has no effect if the area is already hidden.

Example
The following code snippet hides the left area of the layout border layout when the user clicks the button.

```cfinput name="hide2" width="100" value="Hide Area 2" type="button"
   onClick="ColdFusion.Layout.hideArea('thelayout', 'left');">
```

ColdFusion.Layout.hideArea

Description
Hides the specified tab and its layout area.

Function syntax
ColdFusion.Layout.hideTab(layout, layoutArea)

See also
cflayout, cflayoutarea, ColdFusion.Layout.createTab, ColdFusion.Layout.disableTab, ColdFusion.Layout.enableTab, ColdFusion.Layout.selectTab, ColdFusion.Layout.showTab, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the tabbed layout that contains the area to hide.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The name attribute of the tab layout area to hide.</td>
</tr>
</tbody>
</table>
Returns
This function does not return a value.

Example
The following example creates a layout with two tabs. Click the buttons to show and hide the second tab.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>

<cflayout type="tab" name="tabLayout" tabheight="300px" style="width:400px">
    <cflayoutarea title="First Tab" name="tab1">
        <h2>The First Tab</h2>
        Here are the contents of the first tab.
    </cflayoutarea>

    <cflayoutarea title="Second Tab" name="tab2">
        <h2>The Second Tab</h2>
        This is the content of the second tab.
    </cflayoutarea>
</cflayout>
<br />

<cfform name="layouts">
    <cfinput type="button" name="ShowTab" value="Show Tab"
        onClick="ColdFusion.Layout.showTab('tabLayout','tab2')">
    <cfinput type="button" name="ShowTab" value="Hide Tab"
        onClick="ColdFusion.Layout.hideTab('tabLayout','tab2')">
</cfform>
</body>
</html>

ColdFusion.Layout.selectAccordion

Description
Selects the specified accordion layout and displays its panels.

Function syntax
ColdFusion.Layout.selectAccordion(layoutname, layoutareaname)

See also

History
ColdFusion 9: Added this function
ColdFusion.Layout.selectTab

Description
Selects the specified tab and displays its layout area.

Function syntax
ColdFusion.Layout.selectTab(layout, layoutArea)
See also
cflayout, cflayoutarea, ColdFusion.Layout.createTab, ColdFusion.Layout.disableTab,
ColdFusion.Layout.enableTab, ColdFusion.Layout.hideTab, ColdFusion/Layout/showTab, Using layouts in
the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the tabbed layout that contains the area to select.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The name attribute of the tab layout area to select.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function has no effect on a disabled tab.

Example
The following code lets you select each of the two tabs in a layout.

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<cflayout type="tab" name="mainTab" tabheight="300px" style="width:400px">
  <cflayoutarea title="First Tab" name="tab1">
    <h2>The First Tab</h2>
    Here are the contents of the first tab.
  </cflayoutarea>

  <cflayoutarea title="Second Tab" name="tab2">
    <h2>The Second Tab</h2>
    This is the content of the second tab.
  </cflayoutarea>
</cflayout>

<p>
Use these links to test selecting tabs via JavaScript:<br />
<a href="" onClick="ColdFusion.Layout.selectTab('mainTab','tab1'); return false;">Click here to select tab 1.</a><br />
<a href="" onClick="ColdFusion.Layout.selectTab('mainTab','tab2'); return false;">Click here to select tab 2.</a><br />
</p>

</body>
</html>
```
ColdFusion.Layout.showAccordion

Description
Shows a panel in the accordion layout that was hidden using the coldfusion.layout.hideAccordion function.

Function syntax
ColdFusion.Layout.showAccordion(layoutname, layoutareaname)

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutname</td>
<td>The name attribute of the accordion layout that contains the panels to show.</td>
</tr>
<tr>
<td>layoutareaname</td>
<td>The name attribute of the accordion layout area whose panels you want to show.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function shows only the panel of an accordion layout area; it does not show the display area. To show the display area of a hidden panel, call this function, followed by ColdFusion.Layout.selectAccordion.

This function does not show a panel that a user closed by clicking the x icon on the panel.

Example
See ColdFusion.Layout.hideAccordion.

ColdFusion.Layout.showArea

Description
Shows an area of a border layout that was hidden by using the cflayoutarea tag initide attribute or the ColdFusion.Layout.hideArea() JavaScript function.

Function syntax
ColdFusion.Layout.showArea(layout, layoutArea)
See also
cflayout, cflayoutarea, ColdFusion.Layout.collapseArea, ColdFusion.Layout.expandArea, ColdFusion.Layout.getTabLayout, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the border layout that contains the area to show.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The position in the layout of the area to show. Must be one of the following: bottom, left, right, or top.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function does not show an area that a user closed by clicking the x icon on the title bar. Other areas move, if needed, to accommodate the area.

This function has no effect if the area is already visible.

Example
The following code snippet shows the left area of the layout border layout when the user clicks the button.

```cfinput name="show2" width="100" value="Show Area 2" type="button"
        onClick="ColdFusion.Layout.showArea('thelayout', 'left');">
```

ColdFusion.Layout.showTab

Description
Shows a tab that was hidden by using the inithide attribute of the cflayoutarea tag or the hideTab() JavaScript function.

Function syntax
ColdFusion.Layout.showTab(layout, layoutArea)

See also
cflayout, cflayoutarea, ColdFusion.Layout.createTab, ColdFusion.Layout.disableTab, ColdFusion.Layout.enableTab, ColdFusion.Layout.hideTab, ColdFusion.Layout.selectTab, Using layouts in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layout</td>
<td>The name attribute of the tabbed layout that contains the tab to show.</td>
</tr>
<tr>
<td>layoutArea</td>
<td>The name attribute of the tab layout area whose tab you want to show.</td>
</tr>
</tbody>
</table>

**Returns**

This function does not return a value.

**Usage**

This function shows only the tab of a layout area; it does not show the display area. To show the display area of a hidden tab, call this function, followed by `ColdFusion.Layout.selectTab`.

This function does not show a tab that a user closed by clicking the x icon on the tab.

**Example**

See `ColdFusion.Layout.hideTab`.

---

**ColdFusion.Log.debug**

**Description**

Displays a debug-level message in a log window.

**Function syntax**

`ColdFusion.Log.debug(message [, category])`

**See also**

`ColdFusion.Log.dump, ColdFusion.Log.error, ColdFusion.Log.info`, Logging information in the Developing ColdFusion Applications

**History**

ColdFusion 8: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The text message to display in the log window. The log message can include HTML markup and JavaScript variables.</td>
</tr>
<tr>
<td>category</td>
<td>A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code>.</td>
</tr>
</tbody>
</table>

**Returns**

This function does not return a value.

**Usage**

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.
The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

**Example**

```
```

## ColdFusion.Log.dump

### Description

Displays a debug-level message in the log window that shows a `cfdump`-like representation of a complex JavaScript object. The log window does not have a separate dump level.

### Function syntax

```
ColdFusion.Log.dump(object [, category])
```

### See also

`ColdFusion.Log.debug, ColdFusion.Log.error, ColdFusion.Log.info`, Logging information in the Developing ColdFusion Applications

### History

ColdFusion 8: Added this function

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>The variable whose contents you want to display. You cannot specify additional contents, such as a text message, when you dump a complex object. To provide additional information, also use the <code>ColdFusion.Log.debug</code> function.</td>
</tr>
<tr>
<td>category</td>
<td>A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code>.</td>
</tr>
</tbody>
</table>

### Returns

This function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

**Example**

```
ColdFusion.Log.dump(objArg, "Pod A");
```
ColdFusion.Log.error

Description
Displays an error-level message in a log window.

Function syntax
ColdFusion.Log.error(message [, category])

See also
ColdFusion.Log.debug, ColdFusion.Log.dump, ColdFusion.Log.info, Logging information in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The text message to display in the log window. The log message can include HTML markup and JavaScript variables.</td>
</tr>
<tr>
<td>category</td>
<td>A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is global.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a cfajaximport tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format cfdebug or cfdebug="true" in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

Example
ColdFusion.Log.error("<b>Invalid value:</b><br>" + arg.A, "Pod A");

ColdFusion.Log.info

Description
Displays an information-level message in a log window.

Function syntax
ColdFusion.Log.info(message [, category])
ColdFusion.Log.info function

**See also**
ColdFusion.Log.debug, ColdFusion.Log.dump, ColdFusion.Log.error, Logging information in the Developing ColdFusion Applications

**History**
ColdFusion 8: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The text message to display in the log window. The log message can include HTML markup and JavaScript variables.</td>
</tr>
<tr>
<td>category</td>
<td>A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is global.</td>
</tr>
</tbody>
</table>

**Returns**
This function does not return a value.

**Usage**
If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

**Example**

**ColdFusion.Map.addEvent**

**Description**
Executes a custom JavaScript function to enable event handling in a map.

**Function syntax**
ColdFusion.Map.addEvent(name, event, listener, scopeObject)

**See also**

**History**
ColdFusion 9: Added this function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the map.</td>
</tr>
<tr>
<td>event</td>
<td>The event to handle, for example click, dblclick, singleLeftClick and mapTypeChange. For more events, refer to the Events section in the Google Maps API Reference documentation.</td>
</tr>
<tr>
<td>listener</td>
<td>The function that is called when the event is fired.</td>
</tr>
<tr>
<td>scopeObject</td>
<td>A JavaScript object that is set in the this scope.</td>
</tr>
</tbody>
</table>

Usage

This function does not return a value.

Example

This is an example of the Map.addmarker function. Click the HTML button labeled "Add marker" to set the marker to the specified Address.</h3>

```
<script>
  var markerObj={
    address: '201 S. Division St. Suite 500 Ann Arbor, MI 48104' |
  function addmarker(){
    ColdFusion.Map.addMarker('mapID', markerObj);
  }
</script>
<h3>MAP 1</h3>
<cfform name="map01">
  <cfinput type="button" value="Add marker" name="markerbutton"
     onclick="javascript:addmarker();">
</cfform>
<cfmap name="mapID" centerlatitude=42.261 centerlongitude=-87.717 displayscale=true doubleclickzoom="true" overview=true scrollwheelzoom=true tips="My Map" zoomlevel="4">
</cfmap>

ColdFusion.Map.addMarker

Description

Adds a marker to the map.

Function syntax

ColdFusion.Map.addMarker(name, markerObj)

See also

ColdFusion 10 CFML Reference

Ajax JavaScript Functions

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmap tag.</td>
</tr>
<tr>
<td>markerObj</td>
<td>Specifies the marker object for a given address. The following are the associated properties: latitude, longitude, address, title, markercolor, markericon, address, markerwindowcontent, and showmarkerwindow</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Example
<h3>This is an example of the Map.addmarker function. Click the HTML button labeled "Add marker" to set the marker to the specified Address.</h3>
<script>
var markerObj={
    address: '201 S. Division St. Suite 500 Ann Arbor, MI 48104'
};
function addmarker(){
    ColdFusion.Map.addMarker('mapID', markerObj);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="Add marker" name="markerbutton" onclick="javascript:addmarker();"/>
</cfform>
<cfmap name="mapID"
centerlatitude=42.261
centerlongitude=-87.717
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map" zoomlevel="4">
</cfmap>

ColdFusion.Map.getLatitudeLongitude

Description
Gets the latitude/longitude coordinates for a given address.

Function syntax
ColdFusion.Map.getLatitudeLongitude("address", "callBack")

See also
**History**
ColdFusion 9: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>Specifies the value in the <code>address</code> attribute of the <code>cfmap</code> tag.</td>
</tr>
<tr>
<td>callBack</td>
<td>The callback function that runs after the longitude/latitude values are successfully located.</td>
</tr>
</tbody>
</table>

**Returns**
This function returns a callback function that gets the latitude and longitude values of the specified address.

**Example**
This is an example of the `Map.getLatitudeLongitude` function. Click the HTML button labeled "GetLatitude-Longitude" to get the latitude and longitude of Ann Arbor, MI.

```javascript
function getLongitudeLatitude()
{
    ColdFusion.Map.getLatitudeLongitude('201 S. Division St. Suite 500 Ann Arbor, MI 48104',
callbackHandler);
}
function callbackHandler(result)
{
    alert("The latitude-longitude of Ann Arbor,MI is: "+result);
}
</script>

<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="GetLatitude-Longitude" name="buttn03"
onclick="javascript:getLongitudeLatitude()">
</cfform>
<cfmap name="mapID" centerlatitude= 42
centerlongitude=-87
doubleclickzoom="true"
overview=true
scrollwheelzoom=true tips="My Map" zoomlevel="4">
</cfmap>

---

**ColdFusion.Map.getMapObject**

**Description**
Gets the Google map component. You can manipulate the map using supported Google Map APIs.

**Function syntax**
`ColdFusion.Map.getMapObject("name")`

**See also**
History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the <code>name</code> attribute of the <code>cfmap</code> tag.</td>
</tr>
</tbody>
</table>

Returns
This function returns the Google map component. The map type can be `map`, `satellite`, or `hybrid`.

Example
<h3>This is an example of the Map.getmapObject function. Click the HTML button labeled "GetMap" to get the map object and set the center to Palo Alto.</h3>

```javascript
function getMapObject()
{
    var mapObj = ColdFusion.Map.getMapObject('mapID');
    mapObj.setCenter(new GLatLng(37.4419, -122.1419), 13);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
    <cfinput type="button" value="getMapObject and setCenter" name="htmlbutton"
onclick="javascript:getMapObject()"/>
</cfform>
<cfmap name="mapID" centerAddress='201 S. Division St. Suite 500 Ann Arbor, MI 48104'
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map"
zoomlevel="4">
</cfmap>

ColdFusion.Map.hide

Description
If displayed, hides the map.

Function syntax
`ColdFusion.Map.hide(Id)`

Parameters
- `Id`: Name of the map.

Example
See example in `ColdFusion.Map.show`. 
ColdFusion.Map.refresh

Description
Reloads the map.

Function syntax
ColdFusion.Map.refresh (Id)

Parameters
• Id: Name of the map.

Usage
If the map is embedded within spry collapsible panels or divs that are hidden on display, that is the map container is displayed while the actual map is hidden, use this function to force the map to display.

Example
<cfmap
   width="500"
   height="200"
   zoomlevel="12"
   name="mainMap"
   markercolor="333444"
   showscale="false"
   typecontrol="none"
   showcentermarker="true"
   centeraddress="The Key Learning centre, Oxford, UK"
>
</cfmap>
</div>
<script type="text/javascript">
var myTabClick = function()
{
   !cpanel.isOpen() ? cpanel.open() : cpanel.close();
   cpanel.focus();
   ColdFusion.Map.refresh('mainMap');
}
var cpanel = new Spry.Widget.CollapsiblePanel("cp", {contentIsOpen:false});
cpanel.onTabClick = myTabClick;
</script>
ColdFusion.Map.setCenter

Description
Sets the center of map to the address that you specify.

Function syntax
ColdFusion.Map.setCenter("name", centerConfigObject)

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmap tag.</td>
</tr>
<tr>
<td>centerConfigObject</td>
<td>The Center Address object. The value of this object can either be the longitude/latitude value or the address property.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.
Example 1
<h3>This is an example of the Map.setCenter function using latitude-longitude and address values</h3>
<code>
<script>
var centerLongLat={
  latitude: 71.094224,
  longitude: 42.339641
};
var center={
  address: '345 Park Avenue, san jose, CA 95110-2704, USA'
};
function setcenter()
{
  ColdFusion.Map.setCenter('mapID', centerLongLat);
}
function setcenterlatlong()
{
  ColdFusion.Map.setCenter('mapID', center);
}
</script>
<h3>MAP 1</h3>
<cfform name="mapID">
  Click this button to set the center using Latitude and Longitude.
  <cfinput type="button" value="setCenter using lattitude-longitude"
    name="buttn01" onclick="javascript:setcenterlatlong();">
  Click this button to set the center using Address.
  <cfinput type="button" value="setCenter using Address"
    name="buttn01" onclick="javascript:setcenter();">
</cfform>
<cfmap name="mapID" centerlatitude=71.094224
  centerlongitude=42.339641
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map"
zoomlevel="4">
</cfmap>

ColdFusion.Map.setZoomlevel

Description
Sets the zoom level of the map to the new value.

Function syntax
ColdFusion.Map.setZoomlevel("name", zoomLevelValue)

See also
ColdFusion.Map.addMarker, ColdFusion.Map.getLatitudeLongitude,
ColdFusion.Map.getMapObject, ColdFusion.Map.setCenter
History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmap tag.</td>
</tr>
<tr>
<td>zoomLevelValue</td>
<td>The value of the integer in the zoomlevel attribute of the cfmap tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example

```html
<h3>This is an example of the Map.setzoomlevel function. Click the Set Zoom Level button to set the zoom level to 6.</h3>
<script>
function setZoom(zoomlevel)
{
    ColdFusion.Map.setZoomLevel('mapID', zoomlevel);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="Set Zoom Level" name="buttn04" onclick="javascript:setZoom(6)">
</cfform>
<cfmap name="mapID" centerlatitude=42.094224 centerlongitude=72.339641 displayscale=true doubleclickzoom="true" overview=true scrollwheelzoom=true tips="My Map" zoomlevel="4" >
</cfmap>
```

**ColdFusion.Map.show**

Description
Shows the map if it is hidden.

Function syntax

```
ColdFusion.Map.show(Id)
```

Parameters

- Id: Name of the map.
Example
<script>
function showMap(mapId)
{
    ColdFusion.Map.show(mapId);
}

function hideMap(mapId)
{
    ColdFusion.Map.hide(mapId);
}
</script>
<a href="##" id="a1" onclick="return showMap('mainMap')">Show Map</a> | <a href="##" id="a1" onclick="return hideMap('mainMap')">Hide Map</a>
<cfmap
    zoomlevel = "12"
    name = "mainMap"
    showcentermarker = "true"
    centeraddress = "The Key Learning centre, Oxford, UK"
    title="Venue Address"
    hideborder=false
    collapsible=true
    initShow=false/>

**ColdFusion.MediaPlayer.getPlayer**

**Description**
Returns the player object that is used to invoke Strobe media player JavaScript API.

**Function syntax**
ColdFusion.MediaPlayer.getPlayer("Name")

**See also**
ColdFusion.Mediaplayer.resize, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setSource, ColdFusion.Mediaplayer.setVolume,
ColdFusion.Mediaplayer.startPlay, ColdFusion.Mediaplayer.getType,
ColdFusion.Mediaplayer.stopPlay

**History**
ColdFusion 10: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
</tbody>
</table>

**Example**
See the example for Dynamic streaming.
ColdFusion.MediaPlayer.getType

**Description**

Used to get the current playback type, if Flash or HTML player.

**Function syntax**

ColdFusion.MediaPlayer.getType("name")

**See also**

**History**

ColdFusion 10: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the <code>name</code> attribute of the <code>cfmediaplayer</code> tag.</td>
</tr>
</tbody>
</table>

**Returns**

This function returns the playback type as Flash or HTML 5.

**Example**

```html
<!DOCTYPE html>
<html>
<head>
    <script type="text/javascript">
        function getPlayback(player)
        {
            alert(ColdFusion.MediaPlayer.getType("player"));
        }
    </script>
</head>
<body style="background:#">
    <input name = "Source" value="Type" type="button" onClick="getPlayback('player')">
</body>
<cfmediaplayer
    fullScreenControl="yes"
    name="player"
    width=800
    height=500
>
    <source src="/videos/cathy2_HD.mp4" type="video/mp4" />
    <source src="/videos/gizmo.ogv" type="video/ogg" />
</cfmediaplayer>
</html>
```
ColdFusion.Mediaplayer.logError

Description
Lets you show custom error message on the media player, if an error occurs during playback.

Function syntax
ColdFusion.Mediaplayer.logError("Name", "Error")

See also
ColdFusion.Mediaplayer.resize, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setSource, ColdFusion.Mediaplayer.setVolume,
ColdFusion.Mediaplayer.startPlay, ColdFusion.Mediaplayer.getType,
ColdFusion.Mediaplayer.stopPlay

History
ColdFusion 10: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
<tr>
<td>Error</td>
<td>The custom error message that you want to display.</td>
</tr>
</tbody>
</table>

Example
See the example for "ColdFusion.Mediaplayer.getType" on page 1466.

ColdFusion.Mediaplayer.resize

Description
Changes the current size of the media player.

Function syntax
ColdFusion.Mediaplayer.resize("name", "height", "width")

See also
ColdFusion.Mediaplayer.setMute, ColdFusion.Mediaplayer.setSource,
ColdFusion.Mediaplayer.setVolume, ColdFusion.Mediaplayer.startPlay,
ColdFusion.Mediaplayer.stopPlay

History
ColdFusion 9: Added this function
Ajax JavaScript Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the <code>name</code> attribute of the <code>cfmediaplayer</code> tag.</td>
</tr>
<tr>
<td>height</td>
<td>The height (in pixels) to set for the media player. The height is 360 pixels, by default.</td>
</tr>
<tr>
<td>width</td>
<td>The width (in pixels) to set for the media player. The width is 480 pixels, by default.</td>
</tr>
</tbody>
</table>

Returns

This function does not return any value.

Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - `video.flv` in the location `web_root\xyz\`.

```html
<h3>This is an example of the Mediaplayer.resize function. Clicking the Resize Mediaplayer button-resizes the media player component.</h3>
<script language="JavaScript" type="text/javascript">
function onResize() {
    ColdFusion.Mediaplayer.resize('Myvideo', 500, 800);
};
</script>
<br/>
<form>
<input type="button" name="resize" value="Resize Mediaplayer" onClick="onResize()">
</form>
<br/>
<cfmediaplayer name="Myvideo" source="\xyz\video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>
```

**ColdFusion.Mediaplayer.setTitle**

**Description**

Assigns a title for the media player on the top left corner.

**Function syntax**

`ColdFusion.Mediaplayer.setTitle("name", "title")`

**See also**

**History**

ColdFusion 10: Added this function

Last updated 7/9/2012
Ajax JavaScript Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
<tr>
<td>title</td>
<td>Specifies the title to be displayed at the top left corner of the media player.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example
This is an example of the Mediaplayer.setTitle function. Clicking the Resize Mediaplayer button resizes the media player component.

```html
<script language="JavaScript" type="text/javascript">
function assignTitle() {
    ColdFusion.Mediaplayer.setTitle('Myvideo', 'Video');
};
</script>
<form>
<input type="button" name="resize" value="Resize Mediaplayer" onClick="assignTitle()">
</form>
<cfmediaplayer name="Myvideo" source="\xyz\video.flv" width=500 height=400 align="middle" quality="high" fullscreencontrol="true"/>
```

ColdFusion.Mediaplayer.setMute

Description
Mutes or unmutes the sound of the media player.

Function syntax
ColdFusion.Mediaplayer.setMute("name", mute)

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
<tr>
<td>mute</td>
<td>A Boolean value specifying whether to mute the sound (true), or to turn off the mute (false).</td>
</tr>
</tbody>
</table>
Ajax JavaScript Functions

Returns
This function does not return any value.

Example
In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location web_root\xyz\.

```<h3>This is an example of the Mediaplayer.setmute function. Clicking the Mute button mutes the media player.</h3>
<cfmediaplayer name="Myvideo" source="/xyz/video.flv" width=500 height=400 align="middle" quality="high" fullscreenc Control="true"/>
<script language="JavaScript" type="text/javascript">
function onMute() {
    ColdFusion.Mediaplayer.setMute('Myvideo', true);
}
</script>
<form>
<input type="button" name="mute" value="Mute" onClick="onMute()">
</form>
```

ColdFusion.Mediaplayer.setSource

Description
Sets the URL of the FLV file. The URL can point to a location on the ColdFusion server or any other server.

Function syntax
ColdFusion.Mediaplayer.setSource("name", newURL)

See also
ColdFusion.Mediaplayer.setMute, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setVolume, ColdFusion.Mediaplayer.startPlay,
ColdFusion.Mediaplayer.stopPlay

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
<tr>
<td>newURL</td>
<td>The URL to the FLV file. This can be a URL relative to the current page. You can store the FLV file on the ColdFusion server or any other streaming server.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.
Example
In this example, the source of the FLV file is changed from video.flv to newvideo.flv. The media player then plays the newvideo.flv file.

```
<h3>This is an example of the Mediaplayer.setsource function. Clicking the Set Source button changes the video playing in the media player.</h3>

<script language="JavaScript" type="text/javascript">
function setSource()
{
    ColdFusion.Mediaplayer.setSource('Myvideo',"/xyz/newvideo.flv");
};
</script>
<form>
<input type="button" name="setSource" value="Set Source" onClick="setSource()">
</form>
<cfmediaplayer name="Myvideo"
source="/xyz/video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>

ColdFusion.Mediaplayer.setVolume

Description
Sets the volume of sound of the media player.

Function syntax
ColdFusion.Mediaplayer.setVolume("name", "volume")

See also
ColdFusion.Mediaplayer.resize, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setSource, ColdFusion.Mediaplayer.startPlay,
ColdFusion.Mediaplayer.stopPlay

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
<tr>
<td>volume</td>
<td>The value of the volume. It can take any value from 0.0 through 1.0.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.
Ajax JavaScript Functions

Example
In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location `web_root\xyz`.

```javascript
function setVol() {
    ColdFusion.Mediaplayer.setVolume('Myvideo', 1.0);
}
</script>
<br>
<form>
<input type="button" name="setVolume" value="Set Volume" onClick="setVol()">
</form>
<cfmediaplayer name="Myvideo" source="\xyz\video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>

ColdFusion.Mediaplayer.startPlay

Description
Plays the FLV file.

Function syntax
ColdFusion.Mediaplayer.startPlay("name")

See also
ColdFusion.Mediaplayer.resize, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setSource, ColdFusion.Mediaplayer.setVolume,
ColdFusion.Mediaplayer.stopPlay

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example
In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location `web_root\xyz`.
ColdFusion.Mediaplayer.startPlay

Description
Stops playing the FLV file.

Function syntax
ColdFusion.Mediaplayer.stopPlay("name")

See also
ColdFusion.Mediaplayer.resize, ColdFusion.Mediaplayer.setMute,
ColdFusion.Mediaplayer.setSource, ColdFusion.Mediaplayer.setVolume,
ColdFusion.Mediaplayer.startPlay

History
ColdFusion 9: Added this function

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute of the cfmediaplayer tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example
In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location web_root\xyz\.
This is an example of the Mediaplayer.stopplay function. Clicking the Stop Play button stops playing the video.

```html
<script language="JavaScript" type="text/javascript">
function onStop()
{
  ColdFusion.Media player.stopPlay('Myvideo');
}
</script>
</h3>
<br>
<form>
<input type="button" name="stopPlay" value="Stop Play" onClick="onStop()">
</form>
<cfmediaplayer name="Myvideo" source="/xyz/video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>

ColdFusion.MessageBox.create

Description
Creates a ColdFusion message box. This function is equivalent to the cfmessagebox tag.

Function syntax
ColdFusion.MessageBox.create(name, type, title, message, callbackhandler [, configuration])

See also
ColdFusion.MessageBox.isMessageBoxDefined, ColdFusion.MessageBox.getMessageBoxObject,
ColdFusion.MessageBox.update, ColdFusion.MessageBox.updateMessage,
ColdFusion.MessageBox.updateTitle, ColdFusion.MessageBox.show

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box. This attribute is required to show and update the message box. The message box name must be unique on the page.</td>
</tr>
<tr>
<td>type</td>
<td>The control type. Must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• alert - A message with a single OK button.</td>
</tr>
<tr>
<td></td>
<td>• confirm - A message box with two buttons YES and NO or three buttons YES, NO, and CANCEL.</td>
</tr>
<tr>
<td></td>
<td>• prompt - A message box with a single-line or multiline text input area and OK and CANCEL buttons.</td>
</tr>
<tr>
<td>title</td>
<td>The text to display on the message box title bar.</td>
</tr>
<tr>
<td>message</td>
<td>The text to display inside the message box.</td>
</tr>
<tr>
<td>callbackhandler</td>
<td>The function that the control calls when a user clicks one of the buttons.</td>
</tr>
<tr>
<td>configuration</td>
<td>An object containing message box configuration parameters. For details, see &quot;Usage&quot;.</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Returns
This function does not return a value.

Usage
This function is equivalent to the `cfmessagebox` tag.

If you do not also use a `cfmessagebox` tag on a page that calls this function, specify a `cfajaximport` tag on the page and specify `cfmessagebox` in the `tags` attribute. Doing so ensures that the page includes the necessary JavaScript to create the message box. For example, use the following line if you do not have to import the JavaScript for any other ColdFusion Ajax features:

```
<cfajaximport tags="cfmessagebox">
```

The `configuration` parameter defines the message box characteristics; it can have any or all the following entries:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodystyle</td>
<td></td>
<td>A CSS style specification for the body of the message box. Generally, you use this attribute to set color and font styles.</td>
</tr>
<tr>
<td>buttonstyle</td>
<td>yes</td>
<td>Applies to the control type <code>confirm</code>. The buttons to display on the message box:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• yesno: displays the buttons Yes and No</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• yesnocancel: displays the buttons Yes, No, and Cancel</td>
</tr>
<tr>
<td>icon</td>
<td></td>
<td>Specifies the following CSS classes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• error: Provides the error icon. You can use this icon when displaying error messages.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• info: Provides the info icon. You can use this icon when displaying any information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• question: Provides the question icon. You can use this icon in a confirmation message box that prompts a user response.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• warning: Provides the warning icon. You can use this icon when displaying a warning message.</td>
</tr>
<tr>
<td>labelcancel</td>
<td>Cancel</td>
<td>The text to put on the cancel button of a prompt message box.</td>
</tr>
<tr>
<td>labelok</td>
<td>OK</td>
<td>The text to put on an alert button and prompt message box OK button.</td>
</tr>
<tr>
<td>labelno</td>
<td>No</td>
<td>The text to put on the button used for a negative response in a confirm message box.</td>
</tr>
<tr>
<td>labelyes</td>
<td>Yes</td>
<td>The text to put on the button used for a positive response a confirm message box.</td>
</tr>
<tr>
<td>modal</td>
<td>yes</td>
<td>A Boolean value that specifies if the message box is a modal window:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• no</td>
</tr>
<tr>
<td>multiline</td>
<td>false</td>
<td>Valid only for prompt type message boxes. A Boolean value specifying whether the prompt input text box has a single or multiple lines for text input.</td>
</tr>
<tr>
<td>width</td>
<td></td>
<td>Width of the message box in pixels.</td>
</tr>
<tr>
<td>x</td>
<td></td>
<td>The X (horizontal) coordinate of the upper-left corner of the message box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ColdFusion ignores this attribute if you do not set the y attribute.</td>
</tr>
<tr>
<td>y</td>
<td></td>
<td>The Y (vertical) coordinate of the upper-left corner of the message box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ColdFusion ignores this attribute if you do not set the x attribute.</td>
</tr>
</tbody>
</table>
Note: Entry names in the configuration object must be all-lowercase.

Example
The following minimal CFML application creates a message box of type confirmation.

```coldfusion
<cfajaximport tags="cfmessagebox">
<cfform name="test">
   <cfinput type="button" name="x" value="Create Message Box"
      onClick="ColdFusion.MessageBox.create('Messagebox1', 'confirm','Confirm',
         'Do you want to save the file?',
         onfinish,
         {width:200, modal:false})">
</cfform>
<script language="JavaScript" type="text/javascript">
   function onfinish()
   {
      alert('Button clicked');
   }
</script>
```

ColdFusion.MessageBox.show

Description
Used to display a ColdFusion message box.

Function syntax
ColdFusion.MessageBox.show(name)

See also
ColdFusion.MessageBox.isMessageBoxDefined, ColdFusion.MessageBox.getMessageBoxObject,
ColdFusion.MessageBox.update, ColdFusion.MessageBox.updateMessage,
ColdFusion.MessageBox.updateTitle,ColdFusion.MessageBox.create

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the message box that you want to display.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
You can create a messagebox using the cfmessage tag or the JavaScript function
ColdFusion.MessageBox.create. But to show it, you must use this function.
Example
<cfajaximport tags="cfmessagebox,cfform">
  <cfform name="ajax">
    <br>
    <input type="button" name="showMessageBox" value="Show Message Box"
      onclick="ColdFusion.MessageBox.create('mb','Alert','ALERT','Sample Alert!');ColdFusion.MessageBox.show('mb');">
  </cfform>
</cfajaximport>

ColdFusion.MessageBox.getMessageBoxObject

Description
Gets the underlying Ext JS - JavaScript Library object for the specified HTML cfmessagebox control.

Function syntax
ColdFusion.MessageBox.getMessageBoxObject(name)

See also
ColdFusion.MessageBox.create, ColdFusion.MessageBox.isMessageBoxDefined,
ColdFusion.MessageBox.update, ColdFusion.MessageBox.updateMessage,
ColdFusion.MessageBox.updateTitle

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box object.</td>
</tr>
</tbody>
</table>

Returns
A JavaScript object.

Usage
Use this function to get the JavaScript object that contains all the defined properties.

ColdFusion.MessageBox.isMessageBoxDefined

Description
Checks if a message box is defined.

Function syntax
ColdFusion.MessageBox.isMessageBoxDefined(name)
See also
ColdFusion.MessageBox.create, ColdFusion.MessageBox.getMessageBoxObject,
ColdFusion.MessageBox.update, ColdFusion.MessageBox.updateMessage,
ColdFusion.MessageBox.updateTitle

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box object.</td>
</tr>
</tbody>
</table>

Returns
A Boolean value, that is, true or false.

Usage
Use this function to check if the message box is defined for a specific name.

ColdFusion.MessageBox.update

Description
Updates the ColdFusion message box properties. This JavaScript function lets you update all the message box properties except name and type.

Function syntax
ColdFusion.MessageBox.update(name, configuration)

See also
ColdFusion.MessageBox.create, ColdFusion.MessageBox.getMessageBoxObject,
ColdFusion.MessageBox.isMessageBoxDefined, ColdFusion.MessageBox.updateMessage,
ColdFusion.MessageBox.updateTitle

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box.</td>
</tr>
<tr>
<td>configuration</td>
<td>An object containing message box configuration parameters. For details, see &quot;Usage&quot;.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.
Usage
This function is used to update a set of message box properties. For example, you can update the width, message, and title of the message box using the `configuration` parameter.

The `configuration` parameter defines the message box characteristics; it can have any or all the following entries:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bodystyle</td>
<td>A CSS style specification for the body of the message box. Generally, you use this attribute to set color and font styles.</td>
</tr>
</tbody>
</table>
| buttontype | Applies to the control type `confirm`. The buttons to display on the message box:  
  - yesno: displays the buttons Yes and No  
  - yesnocancel: displays the buttons Yes, No, and Cancel |
| callbackhandler | The function that the control calls when a user clicks one of the buttons. For more information see Usage. |
| icon      | Specifies the following CSS classes:  
  - error: Provides the error icon. You can use this icon when displaying error messages.  
  - info: Provides the info icon. You can use this icon when displaying any information.  
  - question: Provides the question icon. You can use this icon in a confirmation message box that prompts a user response.  
  - warning: Provides the warning icon. You can use this icon when displaying a warning message. |
| labelcancel | The text to put on the cancel button of a prompt message box. |
| labelok   | The text to put on an alert button and prompt message box OK button. |
| labelno   | The text to put on the button used for a negative response in a confirm message box. |
| labelyes  | The text to put on the button used for a positive response in a confirm message box. |
| modal     | A Boolean value that specifies if the message box is a modal window:  
  - yes  
  - no |
| message   | The text to display inside the message box. |
| multiline | Valid only for prompt type message boxes. A Boolean value specifying whether the prompt input text box has a single or multiple lines for text input. |
| title     | The title for the message box. If you do not specify a title, ColdFusion assigns the control type value as the default title. |
| width     | Width of the message box in pixels. |
| x         | The X (horizontal) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the y attribute. |
| y         | The Y (vertical) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the x attribute. |

**Note:** *Entry names in the configuration object must be all-lowercase.*
Example

The following minimal CFML application updates a message box.

```coldfusion
<cfajaximport tags="cfmessagebox">
<cfform name="test">
  <cfinput type="button" name="x" value="Update Message Box"
            onClick="ColdFusion.MessageBox.update('Messagebox1',
                                                    {width:400, modal:false, x:200, y:300, labelyes:'yes'})">
</cfform>
```

ColdFusion.MessageBox.updateMessage

Description

Updates the message property of the ColdFusion message box component.

Function syntax

ColdFusion.MessageBox.updateMessage(name, newmessage)

See also

ColdFusion.MessageBox.create, ColdFusion.MessageBox.getMessageBoxObject, ColdFusion.MessageBox.isMessageBoxDefined, ColdFusion.MessageBox.update, ColdFusion.MessageBox.updateTitle

History

ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box object.</td>
</tr>
<tr>
<td>newmessage</td>
<td>Overwrites an existing message.</td>
</tr>
</tbody>
</table>

Returns

This function does not return a value.

Usage

Use this function to update or change the message property of the message box.

ColdFusion.MessageBox.updateTitle

Description

Updates the title property of the ColdFusion message box component.

Function syntax

ColdFusion.MessageBox.updateTitle(name, newtitle)
See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the message box object.</td>
</tr>
<tr>
<td>newmessage</td>
<td>Overwrites an existing title.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
Use this function to update or change the title property of the message box.

ColdFusion.navigate

Description
Displays the output of a link target in an Ajax cfdiv, cflayoutarea, cfpod, or cfwindow container. When the browser follows a link that is populated by this function, the link does not replace the current page. Instead, it populates the control specified by the container attribute.

Function syntax
ColdFusion.navigate(URL [, container, callbackhandler, errorHandler, httpMethod, formId])

See also
AjaxLink, cfajaximport, ColdFusion.Ajax.submitForm, Control container contents in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>The URL of the link.</td>
</tr>
<tr>
<td>container</td>
<td>The name attribute value of the control in which to display the link output. The control must be a container control such as cfdiv, cflayoutarea, cfpod, or cfwindow. If you omit this argument, the link is treated as a normal URL and the entire page is refreshed.</td>
</tr>
<tr>
<td>callbackhandler</td>
<td>The name of a JavaScript function to call after the target has been displayed.</td>
</tr>
</tbody>
</table>
Returns
This function does not return a value.

Usage
If the page that calls this function does not have any ColdFusion AJAX-based controls, you must use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The `callbackhandler` parameter can be useful for changing the display after the contents has been displayed. For example, before you make the `ColdFusion.navigate` call you might make a pod's title bar italic to indicate loading; you could then use the `callbackhandler` function to switch it back to normal or make it bold once navigate completes. Similarly, you could use a `callbackhandler` to update the page number in a book reader.

The `FormID` attribute lets you specify a form to submit to the specified URL. You can use the `ColdFusion.Navigate` function with this attribute to submit form data asynchronously from outside the form, for example, when the user clicks a menu item, and to direct the returned results to a specific container control.

Example
When the user clicks the link in window 1, the `ColdFusion.navigate` function replaces the text in window 2 with the contents of `windowsrc.cfm`, and then calls the `myCallback` callback handler, which changes the innerHTML of the callback div region.

The main application page looks as follows:

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorHandler</td>
<td>The name of a JavaScript function to call if an error occurs when this function executes. The function can take two parameters: an HTTP error code, and an error message.</td>
</tr>
<tr>
<td>formId</td>
<td>The ID or name attribute of a form to submit to the URL.</td>
</tr>
<tr>
<td>httpMethod</td>
<td>The HTTP method to use when navigating to the URL:</td>
</tr>
<tr>
<td></td>
<td>- GET (the default)</td>
</tr>
<tr>
<td></td>
<td>- POST</td>
</tr>
</tbody>
</table>

---
ColdFusion.ProgressBar.getProgressBarObject

Description
Gets the progress bar object.

Function syntax
ColdFusion.ProgressBar.getProgressBarObject(name)

See also
ColdFusion.ProgressBar.start, ColdFusion.ProgressBar.stop

History
ColdFusion 9: Added this function
**ColdFusion.ProgressBar.hide**

**Description**
Hides the progress bar if it is displayed.

**Function syntax**
ColdFusion.ProgressBar.hide(progressBarId)

**See also**
ColdFusion.ProgressBar.show, ColdFusion.ProgressBar.update

**History**
ColdFusion 9: Added this function

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>progressBarId</td>
<td>Name of the progress bar object. This must be a valid ColdFusion identifier.</td>
</tr>
</tbody>
</table>

**Returns**
This function does not return a value.

**Usage**
This function lets you hide the progress bar if it is displayed.

You display the progressbar using the function ColdFusion.ProgressBar.show or by setting the attribute autodisplay to true in the tag cfprogressbar.

The following example shows how to use this function:

```text
<cfprogressbar name="pBar" autodisplay="true">
<cfinput type="button"
    onClick="ColdFusion.ProgressBar.hide('pBar')">
```
ColdFusion.ProgressBar.reset

Description
Resets the progress status and messages.

Function syntax
ColdFusion.ProgressBar.reset(progressBarId)

See also
ColdFusion.ProgressBar.start, ColdFusion.ProgressBar.stop

History
ColdFusion 9: Added this function

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>progressBarId</td>
<td>Name of the progress bar object. This must be a valid ColdFusion identifier.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
Resets the progress on a progress bar as shown in the following example:

```html
<cfform>
<cfprogressbar name="pBar" width="500"/>
<cfinput type="button" name="pBtn" onClick="ColdFusion.ProgressBar.reset('pBar')">
</cfform>
```

ColdFusion.ProgressBar.show

Description
Shows the progress bar if it is hidden.

Function syntax
ColdFusion.ProgressBar.show(progressBarId)

See also
ColdFusion.ProgressBar.hide, ColdFusion.ProgressBar.update

History
ColdFusion 9: Added this function
Ajax JavaScript Functions

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>progressBarId</td>
<td>Name of the progress bar object. This must be a valid ColdFusion identifier.</td>
</tr>
</tbody>
</table>

Returns

This function does not return a value.

Usage

This function lets you display the progress bar if it is hidden.

You hide the progress bar using the function ColdFusion.ProgressBar.hide or by setting the attribute autodisplay to false in the cfprogressbar tag.

The following example shows how to use this function:

```html
<cfprogressbar name="pBar" autodisplay="false">
  <cfinput type="button"
           onclick="ColdFusion.ProgressBar.show('pBar')">
</cfprogressbar>
```

**ColdFusion.ProgressBar.start**

Description

Starts the underlying Ext JS - JavaScript Library progress bar object.

Function syntax

ColdFusion.ProgressBar.start(name)

See also

ColdFusion.ProgressBar.getProgressBarObject, ColdFusion.ProgressBar.stop

History

ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the progress bar object.</td>
</tr>
</tbody>
</table>

Returns

This function does not return a value.

Usage

The cfprogressbar tag creates the HTML markup; at runtime, you use this function to initiate the progress bar object. On initialization, ColdFusion calls the underlying CFC, which is defined using a bind expression, at specified intervals. The CFC returns the progress status, which is passed to the underlying Ext progress bar object to update the progress bar value.
The progress status object that the CFC returns must have STATUS and MESSAGE properties. The STATUS property has a numeric value from 0.0 to 1.0.

### ColdFusion.ProgressBar.stop

**Description**
Stops the underlying progress bar object that is running.

**Function syntax**
```
ColdFusion.ProgressBar.stop(name, calloncomplete)
```

**See also**
- ColdFusion.ProgressBar.getProgressBarObject
- ColdFusion.ProgressBar.start

**History**
ColdFusion 9: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the progress bar object.</td>
</tr>
<tr>
<td>calloncomplete</td>
<td>A Boolean value that specifies whether to call oncomplete function:</td>
</tr>
<tr>
<td></td>
<td>* true</td>
</tr>
<tr>
<td></td>
<td>* false</td>
</tr>
</tbody>
</table>

The default value is true.

**Returns**
This function does not return a value.

**Usage**
You call this function to stop the progress bar object.

### ColdFusion.ProgressBar.update

**Description**
Updates attribute values.

**Function syntax**
```
ColdFusion.ProgressBar.update(progressBarId, config)
```

**See also**
- ColdFusion.ProgressBar.hide
- ColdFusion.ProgressBar.show
ColdFusion 10 CFML Reference

Ajax JavaScript Functions

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>progressBarId</td>
<td>Name of the progress bar object. This must be a valid ColdFusion identifier.</td>
</tr>
<tr>
<td>configObject</td>
<td>An object containing configuration parameters, interval, duration, and oncomplete.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
Updates any of the attribute values duration, interval, or oncomplete as shown in the following example:

```html
<cfprogressbar name="pBar" autodisplay="false">
<cfinput type="button"
   onClick="ColdFusion.ProgressBar.update('pBar', {interval:6000, duration:10000, oncomplete:newoncomplete})">
</cfprogressbar>
```

### ColdFusion.ProgressBar.updatestatus

Description
Lets you manually update the status and message of the progress bar.

Function syntax

- `ColdFusion.ProgressBar.updatestatus(progressBarId, status, message)`

See also

- `ColdFusion.ProgressBar.update`, `ColdFusion.ProgressBar.reset`

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>progressBarId</td>
<td>Name of the progress bar object. This must be a valid ColdFusion identifier.</td>
</tr>
<tr>
<td>message</td>
<td>Text to be displayed in the progress bar.</td>
</tr>
<tr>
<td>status</td>
<td>Progress status.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.
Usage
This function helps you to manually set the message and status in the progress bar. For instance, in the case of file upload, you can manually control the progress using this function.

The following snippet illustrates how to use the function:

```coldfusion
cfform
<cfprogressbar name="pBar" width="500"/>
<cfinput type="button" name="pBtn" onClick="ColdFusion.ProgressBar.updateStatus('pBar',0.5,'50%')"> </cfform>
```

ColdFusion.RichText.getEditorObject

Description
Returns the FCKEditor instance that underlies an existing textarea control’s rich text editor.

Function syntax
`object = ColdFusion.RichText.getEditorObject(textareaName)`

See also
ColdFusion.ProgressBar.update, ColdFusion.ProgressBar.reset

History
ColdFusion 8 update 1: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>textareaName</td>
<td>The value of the name attribute of the textarea tag that specifies a rich text editor.</td>
</tr>
</tbody>
</table>

Returns
An object.

Usage
This function returns an object that provides access to the operations of the internal FCKEditor.

ColdFusion.RichText.onComplete

Description
When a rich text editor instance completes initializing, ColdFusion calls this function and passes it the FCKEditor instance that underlies the rich text editor.

Function syntax
`ColdFusion.RichText.onComplete(editorInstance)`
See also
ColdFusion.ProgressBar.update, ColdFusion.ProgressBar.reset

History
ColdFusion 8 update 1: Added this function

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>editorInstance</td>
<td>the FCKEditor instance that underlies the rich text editor.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
When a rich text editor instance completes initializing, ColdFusion calls this function and passes it the FCKEditor instance that underlies the rich text editor. The function can then perform any needed post-initialization operations.

Examples
```html
<html>
  <head>
    <script type="text/javascript">
      //User defines this function to get control once the rich text editor
      //is done with its initialization
      ColdFusion.RichText.OnComplete = function(editorInstance)
      {
        alert("on complete called");
        alert("editor instance = " + editorInstance);
      }
    </script>
  </head>
  <body>
    <cfform>
      <cftextarea richtext = true name="richtext1">
      </cfform>
    </body>
  </html>
```

ColdFusion.setGlobalErrorHandler

Description
Specifies a function that gets called, in place of the ColdFusion Ajax default error handler, if an error occurs when using a ColdFusion Ajax feature.

Function syntax
ColdFusion.setGlobalErrorHandler(functionName)

History
ColdFusion 8: Added this function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>functionName</td>
<td>The name of the JavaScript function to execute when there is an error in ColdFusion Ajax code, such as a binding error. This function must take a single argument, the error message string.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
If the page that calls this function does not have any ColdFusion AJAX-based controls, use a `<cfajaximport>` tag on the page to ensure that the page includes the JavaScript definition for this function.

The global error handler displays information about errors that occur in ColdFusion Ajax features. The default global error handler displays an alert with the error message. You can use this function to create a custom global error handler, for example, to display a custom error window with additional information about your application.

**ColdFusion.Slider.disable**

Description
Disables the slider control.

Function syntax
`ColdFusion.Slider.disable(name)`

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the <code>name</code> attribute in the <code>cfslider</code> tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.
Example
<h3>This is an example of the Slider.disable function. Click the Disable Slider button to disable the slider.</h3>
<example>
<script language="JavaScript" type="text/javascript">
function disable(){
    ColdFusion.Slider.disable('sliderID');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200" increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Disable Slider" onclick="disable()">
</cfform>
</example>

ColdFusion.Slider.enable

Description
Enables the slider control.

Function syntax
ColdFusion.Slider.enable(name)

See also
ColdFusion.Slider.disable, ColdFusion.Slider.getValue, ColdFusion.Slider.getSliderObject,
ColdFusion.Slider.hide, ColdFusion.Slider.show, ColdFusion.Slider.setValue

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute in the cfslider tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.
Example

This is an example of the Slider.enable function. Click the Enable Slider button to enable the slider.<h3>

```html
<script language="JavaScript" type="text/javascript">
  function onload()
  {
    ColdFusion.Slider.disable('sliderID');
  }
  function enable()
  {
    ColdFusion.Slider.enable('sliderID');
  }
</script>

<br>

<cfform name="form01">
  <br/>
  <cfslider name="sliderID" format="HTML" body onLoad="onload()"
  vertical="false" width="350"
  value="100" min="0" max="200"
  increment="10" tip="true"/>
  <cfinput type="button" name="htmlbutton" value="Enable Slider" onclick="enable()">
</cfform>
```

### ColdFusion.Slider.getValue

**Description**

Gets the numeric value of the slider control.

**Function syntax**

`ColdFusion.Slider.getValue(name)`

**See also**

**History**

ColdFusion 9: Added this function

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute in the cfslider tag.</td>
</tr>
</tbody>
</table>

**Returns**

This function returns a numeric value.
Example

This is an example of the Slider.getvalue function. Click the Get Value button to get the value of the slider.<h3>

<script language="JavaScript" type="text/javascript">
function getvalue(){
  alert("The slider is currently at: "+ColdFusion.Slider.getValue('sliderID'));
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200" increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Get Value" onclick="getvalue()">
</cfform>

ColdFusion.Slider.getSliderObject

Description

Gets the underlying Ext JavaScript slider control.

Function syntax

ColdFusion.Slider.getSliderObject(name)

See also

History

ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute in the cfslider tag.</td>
</tr>
</tbody>
</table>

Returns

This function returns the underlying Ext JavaScript slider control.

ColdFusion.Slider.hide

Description

Hides the slider control.
Function syntax
ColdFusion.Slider.hide(name)

See also

History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute in the cfslider tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example
<h3>This is an example of the Slider.hide function. Click the Hide button to hide the slider.</h3>
<script language="JavaScript" type="text/javascript">
function hide(){
    ColdFusion.Slider.hide('sliderID');
}
</script>
<br/>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML" vertical="false" width="350" value="100" min="0" max="200" increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton" value="Hide" onclick="hide()" value="Hide" on click="hide()">
</cfform>

ColdFusion.Slider.show

Description
Shows the slider control.

Function syntax
ColdFusion.Slider.show(name)

See also
History
ColdFusion 9: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the name attribute in the cfslider tag.</td>
</tr>
</tbody>
</table>

Returns
This function does not return any value.

Example
<h3>This is an example of the Slider.show function. Click the Show Slider button to show the slider.</h3>

```javascript
function onload(){
    ColdFusion.Slider.hide('sliderID');
}

function show(){
    ColdFusion.Slider.show('sliderID');
}
</script>
<br>
<cfform name="form01">
    <cfinput type="button" name="htmlbutton" value="Show Slider" onclick="show()">
</cfform>
```

ColdFusion.Slider.setValue

Description
Sets the numeric value of the slider control.

Function syntax
ColdFusion.Slider.setValue(name, newValue)

See also

History
ColdFusion 9: Added this function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the value of the <code>name</code> attribute of the <code>cfmediaplayer</code> tag.</td>
</tr>
<tr>
<td>newValue</td>
<td>The numeric value of the slider control.</td>
</tr>
</tbody>
</table>

Returns

This function does not return any value.

Example

```html
<h3>This is an example of the Slider.setValue function. Click the Set Value button to set the pointer to a new value, 150.</h3>
    <script language="JavaScript" type="text/javascript">
    function setValue()
    ColdFusion.Slider.setValue('sliderID', '150');
    </script>
    <br>
    <cfform name="form01">
    <br/>
    <cfslider name="sliderID" format="HTML"
    vertical="false" width="350"
    value="100" min="0" max="200"
    increment="10" tip="true"/>
    <cfinput type="button" name="htmlbutton"
    value="Set Value" onclick="setValue()">
    </cfform>
```

ColdFusion.Tree.getTreeObject

Description

Gets the underlying object for the specified HTML tree.

Function syntax

ColdFusion.Tree.getTreeObject(name)

See also

cftree, cfajaximport, ColdFusion.Tree.refresh, Using HTML trees in the Developing ColdFusion Applications

History

ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the <code>name</code> attribute of the <code>cftree</code> tag for which you want the object.</td>
</tr>
</tbody>
</table>
Returns
An object of type YAHOO.widget.TreeView.

Usage
Use this function to get the Yahoo User Interface Library YAHOO.widget.TreeView object that underlies the HTML cftree control. You can then use the raw object to modify the displayed tree. For documentation on the objects and how to manage them, see the Yahoo toolkit documentation.

ColdFusion.Tree.refresh

Description
Refreshes an HTML tree and updates it with the latest values of all items.

Function syntax
ColdFusion.Tree.refresh(name)

See also
cftree, cfajaximport, ColdFusion.Tree.getTreeObject, Using HTML trees in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the cftree tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type YAHOO.widget.TreeView.

Usage
Use this function to manually update the tree. If you populate the tree by using a bind expression, the refresh call causes the bind expression to be re-evaluated and repopulates the tree root nodes. Use this function any time you must get the latest data from the server independent of an event that triggers the cftree bind expression, for example, use this function to periodically refresh a file/folder tree to represent the status of the server.

ColdFusion.Window.create

Description
Creates a ColdFusion pop-up window. This function is equivalent to the cfwindow tag.

Function syntax
ColdFusion.Window.create(name, title, URL [, configuration])
See also
cfwindow, ColdFusion.Window.getWindowObject, ColdFusion.Window.hide, ColdFusion.Window.onHide, ColdFusion.Window.onShow, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the window. This attribute is required to interact with the window, including to dynamically show or hide it. If a window with the specified name exists, the function shows that window, and ignores the remaining parameters; otherwise, the name must be unique on the page.</td>
</tr>
<tr>
<td>title</td>
<td>The text to display on the window title bar. You can use HTML mark-up to control the title appearance.</td>
</tr>
<tr>
<td>URL</td>
<td>The URL from which to get the window body contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page. <strong>Note</strong>: If the page specified in this attribute contains tags that use ColdFusion Ajax features, such as the cfform, cfgrid, and cfpod tags, identify the tags in a cfajaximport tag on the page that includes this function. For more information, see cfajaximport.</td>
</tr>
<tr>
<td>configuration</td>
<td>An object containing window configuration parameters. For details, see &quot;Usage&quot;.</td>
</tr>
<tr>
<td>refreshonshow</td>
<td>The default value is false.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function is equivalent to the cfwindow tag.

If you do not also use a cfwindow tag on a page that calls this function, specify a cfajaximport tag on the page and specify cfwindow in the tags attribute. Doing so ensures that the page includes the necessary JavaScript to create the window. For example, use the following line if you do not have to import the JavaScript for any other ColdFusion Ajax features:

```html
<cfajaximport tags="cfwindow">
```

The configuration parameter defines the window characteristics; it can have any or all the following entries:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callbackhandler</td>
<td></td>
<td>A function that is called when the window body loads. This function must not take any arguments.</td>
</tr>
</tbody>
</table>
| center      | false   | A Boolean value that specifies whether to center the window over the browser window.  
* If true, ColdFusion ignores the x and y attribute values.  
* If false, and you do not specify x and y attributes, ColdFusion centers the window. |
| closable    | true    | A Boolean value that specifies whether the user can close the window. If true, the window has an X close icon. |
| draggable   | true    | A Boolean value that specifies whether the user can drag the window. To drag the window, click the mouse on the title bar and hold the button down while dragging. If the window does not have a title, users cannot drag it. |
Note: Entry names in the configuration object must be all-lowercase.

**Example**

The following minimal CFML application creates a window and gets the window contents from the hello1.cfm file.

```cfml
<cfajaximport tags="cfwindow">
<cfform name="test">
    <cfinput type="button" name="x" value="Create Window"
        onclick="ColdFusion.Window.create('Window1', 'This is a CF window',
            'http://localhost:8500/My_stuff/AjaxUI/Book/hello1.cfm',
            {x:100,y:100,height:300,width:400,modal:false,closable:false,
                draggable:true,resizeable:true,center:true,initshow:true,
                minheight:200,minwidth:200 })"></cfform>
```

The hello1.cfm file can be as simple as the following line:

```
Hello from hello1.cfm
```
**ColdFusion.Window.getWindowObject**

Description
Gets the underlying object for the specified window.

Function syntax
ColdFusion.Window.getWindowObject (name)

See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window onHide, ColdFusion.Window.onShow, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the cfwindow tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type Ext.BasicDialog.

Usage
Use this function to get the Ext JavaScript Library Ext.BasicDialog object that underlies the HTML cfwindow control. You can then use the raw object to modify the displayed window. For documentation on the objects and how to manage them, see the Ext JavaScript library documentation.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the name attribute of the cfwindow tag for which you want the object.</td>
</tr>
</tbody>
</table>

Returns
An object of type Ext.BasicDialog.

Usage
Use this function to get the Ext JavaScript Library Ext.BasicDialog object that underlies the HTML cfwindow control. You can then use the raw object to modify the displayed window. For documentation on the objects and how to manage them, see the Ext JavaScript library documentation.

ColdFusion.Window.destroy

Description
Destroys a window instance

Function syntax
ColdFusion.Window.destroy(windowName[, destroyElement])

See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window.getWindowObject, ColdFusion.Window.onHide, ColdFusion.Window.onShow, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8 update 1: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>windowName</td>
<td>The name of the window to destroy</td>
</tr>
<tr>
<td>destroyElement</td>
<td>A Boolean value specifying whether the HTML element associated with the window should also be destroyed. The default value is false.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
Use this function to destroy a window instance.
ColdFusion.Window.hide

Description
Hides a window that is currently displayed.

Function syntax
ColdFusion.Window.hide(name)

See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window.getWindowObject, ColdFusion.Window.onHide, ColdFusion.Window.onShow, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name attribute of the window to hide.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This tag has no effect if the window is already hidden.

Example
The following code lets you show and hide a window by clicking buttons:

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>

<cfwindow name="testWindow" initshow=true title="test window" closable=true>
  Window contents
</cfwindow>

<cfform>
  <cfinput name="hidebutton" type="button" value="Hide Window"
           onclick="javascript:ColdFusion.Window.hide('testWindow');"/>
  <cfinput name="showbutton" type="button" value="Show Window"
           onclick="javascript:ColdFusion.Window.show('testWindow');"/>
</cfform>
</body>
</html>
```
ColdFusion.Window.onHide

Description
Specifies a function to run each time a specific window hides.

Function syntax
ColdFusion.Window.onHide(windowName, handler)

See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window.getWindowObject, ColdFusion.Window.hide, ColdFusion.Window.onShow, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>windowName</td>
<td>The name of the window. The handler function runs whenever this window hides.</td>
</tr>
<tr>
<td>handler</td>
<td>The JavaScript function to run when the window hides.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
The function specified in the handler parameter can optionally take one parameter, which contains the window name.

Example
The following example uses the ColdFusion.Window.onHide function to display an alert with information about the window when you click a button that hides the window:
ColdFusion.Window.onShow

Description
Specifies a function to run each time a specific window shows, including when you create a window and specify an initShow attribute or configuration entry value of true.

Function syntax
ColdFusion.Window.onShow(windowName, handler)

See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window.getWindowObject, ColdFusion.Window.onHide, ColdFusion.Window.hide, ColdFusion.Window.show, ColdFusion.Tree.getTreeObject, Using pop-up windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>windowName</td>
<td>The name of the window. The handler function runs whenever this window shows.</td>
</tr>
<tr>
<td>handler</td>
<td>The JavaScript function to run when the window shows.</td>
</tr>
</tbody>
</table>
Returns
This function does not return a value.

Usage
The function specified in the handler parameter can optionally take one parameter, which contains the window name.

One use for this function is to fetch window data only when the window shows. You could use a cfajaxproxy tag to create a JavaScript proxy for a CFC function that provides the data, and then a ColdFusion.Window.onShow function to specify a function that calls the proxy function and updates the window contents with the new data.

Example
The following example uses the ColdFusion.Window.onShow function to display an alert with information about the window when you click a button that shows the window:

```html
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
    <script language="javascript">
        function onshow(name) {
            alert("window shown = " + name);
        }

        function test() {
            ColdFusion.Window.onShow("testWindow", onshow);
            ColdFusion.Window.show("testWindow");
        }
    </script>
</head>
<body>

    <cfwindow name="testWindow" initshow=false title="test window"
        closable=true>
        Window contents
    </cfwindow>

    <cfform>
        <cfinput name="button" value="show Window" onclick="javascript:test()" type="button"/>
    </cfform>
</body>
</html>
```

**ColdFusion.Window.show**

Description
Shows a window that is currently hidden.

Function syntax
ColdFusion.Window.show(name)
See also
cfwindow, ColdFusion.Window.create, ColdFusion.Window.getWindowObject, ColdFusion.Window.hide,
ColdFusion.Window.onHide, ColdFusion.Window.onShow, ColdFusion.Tree.getTreeObject, Using pop-up
windows in the Developing ColdFusion Applications

History
ColdFusion 8: Added this function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name attribute of the window to show.</td>
</tr>
</tbody>
</table>

Returns
This function does not return a value.

Usage
This function shows a window that you created with an initShow attribute or parameter value of false, or that you
hid by calling the ColdFusion.Window.hide function. It does not show a window that a user closed by clicking the X
icon on the title bar.

This function has no effect if the window is already shown.

Example
See the example at ColdFusion.Window.hide

JavaScript Functions in ColdFusion 9 Update 1

The following are the Ajax JavaScript functions added in this release:

ColdFusion.Autosuggest.getAutosuggestObject

Description
Lets you access underlying YUI AutoComplete object thereby providing fine-grained control over the object, for
example attaching an event.

Returns
The underlying AutoComplete object.

Function syntax
ColdFusion.Autosuggest.getAutosuggestObject (Id)

Parameters
• id: Name of the auto-suggest object.
Example
<html>
  <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
  "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
  <head>
    <cfajaximport tags="cfinput-autosuggest">
    <script>
      var init = function()
      {
        autosuggestobj = ColdFusion.Autosuggest.get AutosuggestObject('state');
        autosuggestobj.itemSelectEvent.subscribe(foo);
      }
      var foo = function(event,args)
      {
        var msg = "";
        msg = msg + "Event: " + event + "\n\n";
        msg = msg + "Selected Item: " + args[2] + "\n\n";
        msg = msg + "Index: " + args[1].nItemIndex + "\n\n";
        alert(msg);
      }
      var getStates = function()
      {
        return
        ["California","Connecticut","Colorado","Illinois","Alabama","Iowa","Utah","Alaska"];
      };
      </script>
    </head>
    <body>
      <h3>Attaching an event handler to the autosuggest object</h3>
      <cfform name="mycfform" method="post">
        State:
        <cfinput type="text" name="state" autosuggest="javascript:getStates({cfautosuggestvalue})"
          autosuggestMinLength=1 autosuggestBindDelay=1>
        </cfinput>
        <cfset ajaxOnLoad("init")>
      </cfform>
    </body>
  </html>

ColdFusion.Layout.disableSourceBind

Description
Disables the source bind.

Function syntax
ColdFusion.Layout.disableSourceBind(Id)

Parameters
- Id: Name of the layout area.
Usage
Assume that you are using Coldfusion.navigate to populate content into tab or accordion panels. You can have instances where content comes from the source bind call if the source attribute is defined for cflayoutarea (and is not from ColdFusion.navigate).

In such instances, you might disable the source bind to get content using Coldfusion.navigate.

Example
layout.cfm uses the templates Tab1_Src.cfm, Tab2_Src.cfm, and Tab3_Src.cfm. If you run layout.cfm, you notice that clicking

- navigate populates content of tab2_src.cfm instead of navigate.cfm
- Disable Source bind ensures that the content of navigate.cfm is populated in tab2_src
- Enable Source Bind and then clicking tab2_src would again populate the content of tab2_src

Tab1_Src.cfm
<br><cfdump var="#CGI#" keys="15" label="[CGI scope]">\n
Tab2_Src.cfm
<br><cfdump var="#server#" label="[Server scope]">\n
Tab3_Src.cfm
<br><cfdump var="#server.coldfusion#" label="[Showing key coldfusion in server scope]">\n
Tab4_Src.cfm
<br><cfdump var="#server.os#" label="[Showing key OS in server scope]">\n
layout.cfm
<br>
<script>
var navigateToTab = function(layoutId,tabId){
    alert("Navigating to " + tabId);
    ColdFusion.Layout.selectTab(layoutId,tabId);
    ColdFusion.navigate('navigate.cfm',tabId);
}

var disableBind = function(tabId){
    alert("Disabling binding on source for " + tabId);
    ColdFusion.Layout.disableSourceBind(tabId);
}

var enableBind = function(tabId){
    alert("Enabling binding on source for " + tabId);
    ColdFusion.Layout.enableSourceBind(tabId);
}

</script>
<cflayout type="tab" name="layout1">
    <cflayoutarea
        name = "tab1"
        overflow = "auto"
        refreshonactivate = "yes"
        title = "Tab 1"
        source = "tab1_src.cfm"/>
    <cflayoutarea
        name = "tab2"
        overflow = "auto"
        refreshonactivate = "yes"
        title = "Tab 2"
        source = "tab2_src.cfm"/>
</cflayout>

Last updated 7/9/2012
ColdFusion.Layout.enableSourceBind

Description
If disabled, enables the source bind.

Function syntax
ColdFusion.Layout.enableSourceBind(Id)

Parameters
• Id: Name of the layout area.

Usage
See usage in ColdFusion.Layout.disableSourceBind.

Example
See example in ColdFusion.Layout.disableSourceBind.

ColdFusion.FileUpload.getSelectedFiles

Description
Returns an array of objects containing the filename and size of the files selected for upload. The file size is returned in bytes.

The function also returns file upload status as YES|NO|Error.

Function syntax
ColdFusion.FileUpload.getSelectedFiles(Id)
Parameters

- **id**: Name of the cffileupload control.

Usage

In a real life scenario, you normally use the uploader with other controls. For example, a form with three fields: name, email, and uploader. Assume that you upload the files, but forget to click Submit or you select the files, submit the form, but forget to click Upload.

You can use this function to inform the user that there are files that have been selected for upload and provide the following details:

- **FILENAME**: Name of the file selected for upload.
- **SIZE**: Size of the file in bytes.
- **STATUS**: YES|NO|Error; YES indicates a successful upload, NO indicates that the upload is yet to occur, and Error indicates that an exception has occurred during the upload operation.

Example

The following example illustrates a scenario where the user clicks Submit and is informed about the files selected for upload:

```html
<html>
<head>
<script language="javascript">
    var formatNumber = function(num){
        if(num < 1024) return num + "  bytes";
        if(num < (1024 * 1024)) return (num/1024).toFixed(2) + " KB";
        if(num < (1024 * 1024 * 1024)) return (num/(1024 * 1024)).toFixed(2) + " MB";
        return (num/(1024 * 1024 * 1024)).toFixed(2) + " GB";
    }
    var getSelectedList = function(id){
        var files = ColdFusion.FileUpload.getSelectedFiles(id);
        var fileslist = "";
        if(files.length)
            fileslist = "You have selected The following files for upload: \n\n";
        for(var i=0;i < files.length; i++){
            fileslist = fileslist + files[i].FILENAME + "  (" + formatNumber(files[i].SIZE) + ")"
            if(i != files.length-1)
                fileslist = fileslist + "\r\n";
        }
        if(files.length)
        { alert(fileslist);
```
Coldfusion.fileUpload.setUrl

Description
Used to set URL for the fileupload control dynamically.

Returns
Nothing

Function syntax
ColdFusion.fileUpload.setUrl(id, url)

Parameters
- id: Name of upload control.
- url: URL can be an absolute URL, relative URL, or fully qualified URL.
Example

```javascript
<script language="javascript">
  var uploadDone = function(result){
    alert("File uploaded");
  }

  var setUploadUrl = function(id)
  {
    var selectedFiles = ColdFusion.FileUpload.getSelectedFiles(id);
    var uploadUrl = "/manual/ajaxui/cffileupload/setUrl/includes/_uploadall.cfm";
    alert("Upload URL : " + uploadUrl);
    if(selectedFiles.length){
      ColdFusion.FileUpload.setURL(id,uploadUrl);
      ColdFusion.FileUpload.startUpload(id);
    }
  }

  var callbackhandler = function(obj)
  {
    var fileName = obj["FILENAME"];  
    var status = obj["STATUS"];  
    var message = obj["MESSAGE"];  
    var msg = "In callbackhandler()" + "\n\n" +
              "FILENAME: " + fileName + "\n\n" +
              "STATUS: " + status + "\n\n" +
              "MESSAGE: " + message
    alert(msg);
  }

  var errorhandler = function()
  {
    alert("In errorhandler()");
  }

  var uploadcompleted = function()
  {
    alert("All files have been uploaded successfully");
  }
</script>

<cfform name="frmUpload">
  <br>
  <cffileupload name="uploader" hideuploadbutton="true" onComplete="uploadDone"
onError="errorhandler" onUploadComplete="uploadcompleted">
    <br>
    <cfinput type="button" name="submit" value="Click to set URL and Upload Files" onClick="setUploadUrl('uploader')">
  </cfform>

ColdFusion.grid.getSelectedRows

Description
Used to fetch data for the selected rows in the grid.

Returns
An array of objects that contains row data.
**Function syntax**

ColdFusion.grid.getSelectedRows(id)

**Parameters**

- **Id**: Name of the grid defined using `cfgrid`.

**See also**

FileUpload

**Usage**

See the example in `ColdFusion.grid.clearSelectedRows`.

**Example**

See the example in `ColdFusion.grid.clearSelectedRows`.

---

**ColdFusion.grid.clearSelectedRows**

**Description**

Used to clear the selected rows in the grid.

**Returns**

Nothing

**Function syntax**

ColdFusion.grid.clearSelectedRows(id)

**Parameters**

- **Id**: Name of the grid defined using `cfgrid`.

**Usage**

See the following example.

**Example**

Employee.cfm
<html>
<head>
  <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
  "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
  <cfajaxproxy cfc="emp" jsc classname="emputils">
  <script language="javascript">
    var emp = new emputils();
    var deleteAllSelectedRows = function(grid)
    {
      emp.setHTTPMethod("POST");
      emp.deleteEmployees(getAllSelectedRows(grid,false));
      ColdFusion.Grid.refresh(grid);
    }
    var getAllSelectedRows = function(grid,showalert)
    {
      obj = ColdFusion.Grid.getSelectedRows(grid);
      jsonbj = ColdFusion.JSON.encode(obj);
      if(showalert)
        alert(jsonbj);
      return obj;
    }
    var clearAllSelectedRows = function(grid)
    {
      ColdFusion.Grid.clearSelectedRows(grid);
    }
  </script>
</head>
<body>
<cfform>
  <cfgrid
    format="html"
    name="empListing"
    selectmode="edit"
    bind="cfc:emp.getEmployees({cfgridpage},{cfgridpagesize},{cfgridsortcolumn},{cfgridsortdirection})"
    onchange="cfc:emp.editEmployees({cfgridaction},{cfgridrow},{cfgridchanged})"
    autowidth="true"
    multrowselect="true"
    delete="true"
</html>
Employee.cfc
<cfcomponent>
<cfscript>
empQuery = new query(name="emps", datasource="cfdocexamples");
remote any function
getEmployees(page, pageSize, gridsortcolumn="EMP_ID", gridsortdirection="ASC", empName)
{
    var orderBy = "EMP_ID";
    var mysql = "SELECT Emp_ID, FirstName, LastName, Email FROM Employees";
    if(isdefined("arguments.empName") and trim(arguments.empName) neq "") {
        mysql = mysql & " WHERE " & "firstname = '#arguments.empName#'";
    }
    if(arguments.gridsortcolumn eq "") {
        mysql = mysql & " ORDER BY " & orderBy;
    }
    mysql = mysql & " " & gridsortdirection;
    return QueryConvertForGrid(empQuery.execute(sql=mysql).getResult(), page, pageSize);
}
remote void function editEmployees(gridaction, gridrow, gridchanged)
{
    switch(gridaction)
    {
        case "I":
        {
            var eFName = gridrow["FIRSTNAME"];  
            var eLName = gridrow["LASTNAME"];  
            var eDept = gridrow["DEPARTMENT"];  
            var eEmail = gridrow["EMAIL"];  
            var insertSql = "insert into Employees(FirstName,LastName,Department,Email) values ('" & eFName & ",'" & eLName & ",'" & eDept & ",'" & eEmail & ")");
            empQuery.execute(sql=insertSql);
            break;
        }
    }
</cfscript>
</cfcomponent>
In this example, setting `multirowselect=true` enables performing of batch operations on grid data, such as deleting multiple records.

In the `deleteEmployees` functions, two lines have been commented out to prevent accidental deletion of data (since it is a batch operation). To see deletion, uncomment the code.

The form has a `deleteAllSelectedRows` button that illustrates how records can be deleted externally. That is, without using the delete button built in to the grid. The same approach can be used to perform other batch operations such as moving multiple files to another folder or batch updates.

*Note:* Set the `httpMethod` to `POST` on the Proxy object carefully to avoid "request URI too large" errors as shown in the `deleteAllSelectedRows` method in `Employee.cfm`.

**ColdFusion.Map/show**

**Description**
Shows the map if it is hidden.

**Function syntax**
`ColdFusion.Map/show(Id)`
Parameters

- id: Name of the map.

Example

```xml
<cfmap
    zoomlevel = "12"
    name = "mainMap"
    showcentermarker= "true"
    centeraddress = "The Key Learning centre, Oxford, UK"
    title="Venue Address"
    hideborder=false
    collapsible=true
    initShow=false/>
```

---

**ColdFusion.Map.hide**

**Description**

If displayed, hides the map.

**Function syntax**

```
ColdFusion.Map.hide(Id)
```

**Parameters**

- id: Name of the map.

**Example**

See example in ColdFusion.Map.show

---

**ColdFusion.Map.refresh**

**Description**

Reloads the map.

**Function syntax**

```
ColdFusion.Map.refresh (Id)
```
Parameters

- id: Name of the map.

Usage

If the map is embedded within spry collapsible panels or divs that are hidden on display, that is the map container is displayed while the actual map is hidden, use this function to force the map to display.

Example

```html
<script type="text/javascript" src="/CFIDE/scripts/ajax/spry/includes_minified/SpryCollapsiblePanel.js"></script>
<link type="text/css" href="/CFIDE/scripts/ajax/spry/widgets/collapsiblepanel/SpryCollapsiblePanel.css" rel="stylesheet"></link>
<div id="cp" class="CollapsiblePanel" style="width:500px;">
  <div class="CollapsiblePanelTab" tabindex="0" onclick="javascript:ColdFusion.Map.refresh('mainMap');">SHOW MAP</div>
  <div class="CollapsiblePanelContent">
    <cfmap width="500"
          height="200"
          zoomlevel="12"
          name="mainMap"
          markerColor="333444"
          showScale="false"
          typeControl="none"
          showCenterMarker="true"
          centerAddress="The Key Learning centre, Oxford, UK"/>
  </cfmap>
</div>
</div>
<script type="text/javascript">
  var myTabClick = function() {
    !cpanel.isOpen() ? cpanel.open() : cpanel.close();
    cpanel.focus();
    ColdFusion.Map.refresh('mainMap');
  }
  var cpanel = new Spry.Widget.CollapsiblePanel("cp", {contentIsOpen:false});
  cpanel.onTabClick = myTabClick;
</script>

ColdFusion.Grid.getTopToolbar

Description

Gets the top toolbar that can be used to add a control, for example icon or button.

Function syntax

ColdFusion.getTopToolbar(Id)

Parameters

- id: Name of the grid.
Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.getBottomToolbar

Description
Gets bottom toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.getBottomToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.showTopToolbar

Description
Displays the top toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.showTopToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.hideTopToolbar

Description
Hides the top toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.hideTopToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.
ColdFusion.Grid.showBottomToolbar

Description
Shows bottom toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.showBottomToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.hideBottomToolbar

Description
Hides the bottom toolbar that can be used to add a control, for example icon or button.

Function syntax
ColdFusion.Grid.hideBottomToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

ColdFusion.Grid.refreshTopToolbar

Description
Refreshes the top toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function ColdFusion.Grid.showTopToolbar.

Function syntax
ColdFusion.Grid.refreshTopToolbar(Id)

Parameters
• Id: Name of the grid.

Example
See example in ColdFusion.Grid.refreshBottomToolbar.

Last updated 7/9/2012
ColdFusion.Grid.refreshBottomToolbar

Description
Refreshes the bottom toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function ColdFusion.Grid.showBottomToolbar.

Function syntax
ColdFusion.Grid.refreshBottomToolbar(Id)

Parameters
- Id: Name of the grid control.

Example
grid.cfc
<cfcomponent>
  <cfscript>
    remote any function
    getEmployees(page,pageSize,gridsortcolumn="EMP_ID",gridsortdirection="ASC"){
      var startRow = (page-1)*pageSize;
      var endRow = page*pageSize;

      if(!isdefined("arguments.gridsortcolumn") or
      isdefined("arguments.gridsortcolumn") and trim(arguments.gridsortcolumn) eq "")
        gridsortcolumn = "EMP_ID";
      if(!isdefined("arguments.gridsortdirection") or
      isdefined("arguments.gridsortdirection") and arguments.gridsortdirection eq "")
        gridsortdirection = "ASC";
      var mysql = "SELECT Emp_ID, FirstName,  EMail, Department FROM Employees";
      if(isdefined("arguments.gridsortcolumn") and arguments.gridsortcolumn neq "")
        mysql = mysql & " ORDER BY " & gridsortcolumn;
      if(isdefined("arguments.gridsortdirection") and arguments.gridsortdirection neq "")
        mysql = mysql & " & gridsortdirection ;
      rs1 = new query(name="team", datasource="cfdocexamples", sql=mysql).execute();
      return QueryConvertForGrid(rs1.getResult(), page, pageSize);
    }
    remote any function editEmployees(gridaction,gridrow,gridchanged){
      writelog("edit employee info");
    }
  </cfscript>
</cfcomponent>

Chapter 6: Script Functions Implemented as CFCs

Script functions were added in ColdFusion 9. They are implemented as ColdFusion Components. These functions extend the usage of the tags `cfmail`, `cfpdf`, `cfquery`, `cfhttp`, `cfstoredproc`, and `cfftp` to CFScript.

More Help topics
“Script functions implemented as CFCs in ColdFusion 9 Update 1” on page 1547

Accessing the functions

Script functions are available in the following location: `cf_root\CustomTags\com\adobe\coldfusion`.

Ensure that you do not delete the default custom tag mapping listed in the ColdFusion Administrator (Extensions > Custom Tag Paths > Custom tag mappings).

Script functions work if they are either in the default location or web root. If you have the functions in any other location, add a `/com` mapping in the ColdFusion Administrator that points to the new location (for example `C:\com`).

Note: Values of the attributes set in a service action, for example, `mail.send(body="test mail")` are transient in nature. They are not accessible after the action completes. Accessing the attributes using implicit getters results in error whereas any attributes set using either implicit setters or the `init` method call are retained and can be accessed using implicit getters.

Function summary

The following table lists the script functions and the equivalent ColdFusion tag.

<table>
<thead>
<tr>
<th>Function</th>
<th>Equivalent ColdFusion Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td><code>cfftp</code></td>
</tr>
<tr>
<td>http</td>
<td><code>cfhttp</code></td>
</tr>
<tr>
<td>mail</td>
<td><code>cfmail</code></td>
</tr>

All attributes supported by the tag cfftp can be used as attribute-value pairs. For example,

```cfftp
<cfftp userName="myUserName">
```
can be used as

```cfftp
ftpService.setUserName("myUserName");
```

For details, see the Attributes section for the cfftp tag.

History

ColdFusion 9: Added this function.

Methods

The following FTP actions are available as methods. All methods have similar arguments and syntax.

<table>
<thead>
<tr>
<th>open</th>
<th>close</th>
<th>quote</th>
<th>site</th>
</tr>
</thead>
<tbody>
<tr>
<td>allo</td>
<td>acct</td>
<td>changeDir</td>
<td>createDir</td>
</tr>
<tr>
<td>listDir</td>
<td>removeDir</td>
<td>getFile</td>
<td>putFile</td>
</tr>
<tr>
<td>rename</td>
<td>remove</td>
<td>getCurrentDir</td>
<td>getCurrentUrl</td>
</tr>
<tr>
<td>existDir</td>
<td>existsFile</td>
<td>exists</td>
<td></td>
</tr>
</tbody>
</table>

Description

All methods correspond to the FTP actions supported by the tag cfftp. For details of each method, refer to the relevant section for the tag cfftp.

<td><code>ftpService.clear()</code></td>
</tr>
</tbody>
</table>

### Usage

This function corresponds to the `cfftp` tag. For details, see the Usage section for the tag `cfftp`. 
Example

```
<cfscript>
    /* Create a new ftp Service*/
    ftpService = new ftp();
    /* Set attributes using implicit setters */
    ftpService.setUsername("myUsername");
    ftpService.setPassword("myPassword");
    ftpService.setServer("myFtpServer");
    ftpService.setStopOnError("true");
    ftpService.setConnection("conn");
    /* Open connection to ftp server */
    WriteOutput("<h4>Open a connection</h4>");
    result = ftpService.open();
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br/></p>";)
    /* Get current directory */
    WriteOutput("<h4>Get current directory</h4>");
    result = ftpService.getCurrentDir();
    WriteOutput("<p>Current Directory: " & result.getPrefix().returnvalue & "<br/></p>";)
    /* List contents of the current directory */
    WriteOutput("<h4>List directory contents</h4>");
    displayListing(result.getResult());
    /* Move a file to the ftp server */
    WriteOutput("<h4>Move File to Remote Server</h4>");
    lFile = "C:\temp\artifacts.xml";
    rFile = "artifacts.xml";
    result = ftpService.putFile(transferMode="binary", localfile=lFile, remoteFile=rFile);
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br/></p>";)
    /* Close connection to the ftp server */
    WriteOutput("<h4>Close the connection</h4>");
    ftpService.close(connection="conn");
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br/></p>";)
</cfscript>
```

```
<cffunction name="displayListing" hint="display ftp files">
    <cfargument name="filesToList" required="true">
    <cftable query = "filesToList" HTMLTable = "Yes" colHeaders = "Yes" border="1" maxrows="10">
        <cfcol header = "<b>Name</b>" text = "#name#"/>
        <cfcol header = "<b>Path</b>" text = "#path#"/>
        <cfcol header = "<b>URL</b>" text = "#url#"/>
        <cfcol header = "<b>Length</b>" text = "#length#"/>
        <cfcol header = "<b>LastModified</b>" text = "#DateFormat(lastmodified)#"/>
        <cfcol header = "<b>IsDirectory</b>" text = "#isdirectory#"/>
    </cftable>
</cffunction>
```

http

Description

Used in CFScript to generate an HTTP request and handle the response from the server.
Syntax

<table>

Script Functions Implemented as CFCs

### Usage

This function corresponds to the `cfhttp` tag. For usage details, see the Usage section for `cfhttp` in the CFML Reference.

### Example

<!--- Get Video --->

```cfscript
/* youtube upload url */
youtubeUploadURL = "http://uploads.gdata.youtube.com/feeds/api/users/default/uploads";
/* video to upload */
videoName = ExpandPath('./hello.wmv');
videoFileName = "hello.wmv";
/* set user account data */
clientKey = "enter client key from google";
devKey = "enter client key from google";
/* create new http service */
httpService = new http();
/* set attributes using implicit setters */
httpService.setMethod("post");
httpService.setCharSet("utf-8");
httpService.setUrl("https://www.google.com/accounts/ClientLogin");
/* add httpparams using addParam() */
httpService.addParam(type="formfield", name="accountType", value="HOSTED OR GOOGLE");
httpService.addParam(type="formfield", name="Email", value="enter gmail id");
httpService.addParam(type="formfield", name="Passwd", value="enter password");
httpService.addParam(type="formfield", name="service", value="youtube");
httpService.addParam(type="formfield", name="source", value="youtubecode");
/* make the http call to the URL using send() */
result = httpService.send().getPrefix();
/* process the filecontent returned */
content = listToArray(result.filecontent, chr(10));
for(i=1; i <= arrayLen(content); i++)
{
    item = content[i];
    authdata[listFirst(item, ")")] = listRest(item, "=");
}
</cfscript>

<!--- Create ATOM XML and save to a file to be sent with video --->

```
<media:title type="plain">WithOutQuotes</media:title>
<media:description type="plain">Test Description</media:description>
<media:keywords>yourvideo</media:keywords>
</media:group>
</entry>
</cfoutput>
</cfsavecontent>
<cfscript>
    tmpfile = expandPath("./meta.xml");
    FileWrite(tmpfile,trim(meta));
    /* use the httpService created above */
    httpService.setUrl("http://uploads.gdata.youtube.com/feeds/api/users/default/uploads");
    httpService.setTimeOut(450);
    httpService.setMultipartType("related");
    /* clear params first */
    httpService.clearParams();
    /* add httpparams using addParam() */
    httpService.addParam(type="header",name="Authorization", value="GoogleLogin auth=#authdata.auth#");
    httpService.addParam(type="header",name="X-GData-Client", value="#variables.clientkey#");
    httpService.addParam(type="header",name="X-GData-Key", value="key=#variables.devkey#");
    httpService.addParam(type="header",name="Slug",value="#videoFileName#");
    httpService.addParam(type="file",name="API_XML_Request",file="#tmpfile ",mimetype="application/atom+xml");
    httpService.addParam(type="file",name="file",file="#videoName ",mimetype="video/*");
    /* make the http call to the URL using send() */
    result = httpService.send().getPrefix();
    if(result.statuscode contains "201")
    {
        WriteOutput("Your video has been successfully uploaded to YouTube");
    }
    else
    {
        WriteOutput("There was a problem uploading the video. Status code returned was " & result.statuscode);
    }
</cfscript>

mail

Description
Used to sends an e-mail message, that optionally contains query output, using an SMTP server.
**Syntax**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new mail()</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>createObject(&quot;component&quot;, &quot;mail&quot;)</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>Any one of the following:</td>
</tr>
<tr>
<td></td>
<td>• mailService.new mail(attribute-value_pair)</td>
</tr>
<tr>
<td></td>
<td>• mailService.setAttributes(attribute-value_pair)</td>
</tr>
<tr>
<td></td>
<td>• mailService.setAttributeName(attribute_value)</td>
</tr>
<tr>
<td></td>
<td>• mailService.send(attribute-value_pair)</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>mailService.send(attribute-value_pair)</td>
</tr>
</tbody>
</table>

**Properties**

from to subject bcc
cc charset debug failto
group groupcasesensitive mailerid maxrows
mimeattach password port priority
query replyto server spoolenable
startrow timeout type username
useSSL useTLS wraptexx remove

All attributes supported by the tag `cfmail` can be used as attribute-value pairs. For example,

```cfml
<cfmail from="#form.mailFrom#">
```

can be used as

```cfml
mailerService.setFrom(form.mailFrom);
```

Usage
This function corresponds to the tag cfmail. For usage details, see the Usage section for cfmail.

Example
Sending mail in cfscript
<pre>
<cfscript>
/* create mailer service */
mailerService = new mail();
if(IsDefined("form.mailto"))
{
    if(form.mailto is not "" AND form.mailfrom is not "" AND form.Subject is not "" and
form.attachment is not ")
    {
        savecontent variable="mailBody"{
            WriteOutput("This message was sent by an automatic mailer built with cfmail:= = = =
= = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = = 
=" & "<br><br>" & form.body);
        }
        /* set mail attributes using implicit setters provided */
mailerService.setTo(form.mailto);
mailerService.setFrom(form.mailFrom);
mailerService.setSubject(form.subject);
mailerService.setType("html");
/* add mailparams */
mailerService.addParam(file=expandpath(form.attachment),type="text/plain",remove=false);
/* send mail using send(). Attribute values specified in an end action like "send" will
not persist after the action is performed */
mailerService.send(body=mailBody);
writeoutput("<h3>Thank you</h3>" & "<p>Thank you, " & mailfrom & "<br>" & "Your
message, " & subject & ", has been sent to " & mailto & "</p>");
}
</cfscript>
</pre>
<table>

<td>Executing the service action</td>
<td>pdfService.action_method(attribute-value pair)</td>
</tr>
</tbody>
</table>

**Properties**

<table>
<thead>
<tr>
<th>addQuads</th>
<th>algo</th>
<th>align</th>
<th>ascending</th>
</tr>
</thead>
</table>

Last updated 7/9/2012
All attributes supported by the tag \texttt{cfpdf} can be used as attribute-value pairs. For example,

\begin{verbatim}
<cfpdf action="getInfo" source="myBook.pdf" name="PDFInfo">
\end{verbatim}

can be used as

\begin{verbatim}
pdfInfo = pdfService.getInfo(source="myBook.pdf", name="pdfinfo");
\end{verbatim}

For details, see the Attributes section for the \texttt{cfpdf} tag.

\textbf{Methods}

\begin{itemize}
\item \texttt{addParam}
\end{itemize}

\begin{table}[h]
\centering
\begin{tabular}{|l|p{0.7\textwidth}|}
\hline
\textbf{Description} & Used in CFScript to add \texttt{cfpdfparam} tags. Applicable only to \texttt{action="merge"}. \\
\hline
\textbf{Returns} & Nothing \\
\hline
\textbf{Syntax} & pdfService.addParam(attribute-value pair) \\
\hline
\textbf{Arguments} & All attributes supported by the \texttt{cfpdfparam} tag can be used as attribute-value pairs. \\
\hline
\end{tabular}
\end{table}

\item The following PDF actions are available as methods. All these methods have similar arguments and syntax.

\begin{verbatim}
addWatermark removeWatermark deletePages getPDFInfo
setPDFInfo merge processDDX protect
read write thumbnail transform
optimize extractImage extractText addHeader
addFooter removeFooter
\end{verbatim}

\textbf{Note:} In the list, \texttt{setPDFInfo} and \texttt{getPDFInfo} do not have identical actions in \texttt{cfpdf}. \texttt{cfpdf action="setinfo"} and \texttt{cfpdf action="getinfo"} represent them respectively.

\begin{table}[h]
\centering
\begin{tabular}{|l|p{0.7\textwidth}|}
\hline
\textbf{Description} & All methods correspond to the PDF actions specified for the tag \texttt{cfpdf}. For details of each method, refer to the corresponding section for \texttt{cfpdf}. \\
\hline
\end{tabular}
\end{table}
Returns

Depends on the action. If the name attribute is specified, the result of the pdf operation is returned. Else, an empty string.

For example, the following code returns a structure containing the pdf information for "book.pdf":

```plaintext
pdfinfo = pdfService.getPDFInfo(source="book.pdf",name="var")
```

PDF manipulation is done using the cfpdf tag. This is why, you must specify the name attribute.

Accessing "var" directly does not work since "var" does not exist in the page variables scope.

History
ColdFusion 9: Added this function.

Usage
This function corresponds to the cfpdf tag. For usage details, refer to the Usage section for cfpdf.

Example
<h3>PDF Thumbnail</h3>
<cfscript>
// Create a variable for the name of the PDF document.
mypdf = "book";
thumbnailsDirectory = ExpandPath( "." ) & \"\" & "#mypdf#_thumbnails";
// create new PDF service
pdfService = new pdf();
// set attributes using implicit setters
pdfService.setSource(expandpath('./#mypdf#.pdf'));
// Use the getPdfInfo action to retrieve the total page count for the PDF document.
PDFInfo = pdfService.getPdfInfo(name="pdfinfo");
pageCount = PDFInfo.TotalPages;
WriteOutput("pageCount=
 pageCount");
// Generate a thumbnail image for each page in the PDF source document,
// create a directory (if it does not exist) in the web root that is
// a concatenation of the PDF source name and the word "thumbnails", and
// save the thumbnail images in that directory.
pdfService.thumbnail(destination=thumbnailsDirectory, scale=60, overwrite=true);
// Loop through the images in the thumbnail directory and generate a link
// from each image to the corresponding page in the PDF document.
for(i="1"; i lte pageCount; i++)
{
    // Click the thumbnail image to navigate to the page in the PDF document.
    WriteOutput("<a href='#mypdf#.pdf?page=#i#' target='_blank'><img src='#mypdf#_thumbnails/#mypdf#_page_#i#.jpg'></a>");
}
</cfscript>

query

Description
Used to execute a query passing SQL statements to a data source using CFScript.
Syntax

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new query()</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>createObject(&quot;component&quot;, &quot;query&quot;)</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>Any one of the following:</td>
</tr>
<tr>
<td></td>
<td>* queryService=new query(attribute-value_pair)</td>
</tr>
<tr>
<td></td>
<td>* queryService.setAttributes(attribute-value_pair)</td>
</tr>
<tr>
<td></td>
<td>* queryService.setAttributeName(attribute_value)</td>
</tr>
<tr>
<td></td>
<td>* queryService.execute(attribute-value_pair)</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>queryService.execute(attribute-value_pair)</td>
</tr>
</tbody>
</table>

Properties

<table>
<thead>
<tr>
<th>name</th>
<th>blockfactor</th>
<th>cachedafter</th>
<th>cachedwithin</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSource</td>
<td>dbtype</td>
<td>result</td>
<td>maxRows</td>
</tr>
<tr>
<td>password</td>
<td>sql</td>
<td>timeout</td>
<td>username</td>
</tr>
</tbody>
</table>

All attributes supported by the tag `cfquery` can be used as attribute-value pairs. For example,

```cfml
<cfquery Name="myName"> </cfquery>
```

can be used as

```cfml```
queryService.setName("myName");
```cfml```

Methods

- `addParam`

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
<th>Arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used in CFScript to add <code>cfqueryparam</code> tags to:</td>
<td><code>serviceName.addParam(attribute-value_pair)</code></td>
<td>All attributes supported by <code>cfqueryparam</code> tag can be used as attribute-value pairs.</td>
</tr>
<tr>
<td>* Verify the data type of a query parameter</td>
<td></td>
<td></td>
</tr>
<tr>
<td>* For DBMSs that support bind variables, to enable ColdFusion to use bind variables in the SQL statement</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- `execute`

<table>
<thead>
<tr>
<th>Description</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used to execute SQL statements.</td>
<td></td>
</tr>
</tbody>
</table>
Returns
A component with the following properties set:

- Result: For SQL queries that return a result set, for example, a `SELECT` SQL query.
- Prefix: Equivalent to the result attribute for the `cfquery` tag.

Syntax
`queryService.execute(attribute-value pair)`

Arguments
All attributes supported by the `cfquery` tag.

• **setAttributes**

Description
Sets attributes for the `query` function.

Returns
Nothing

Syntax
`queryService.setAttributes (attribute-value pair)`

Arguments
All attributes supported by the `cfquery` tag.

• **getAttributes**

Description
Gets attributes that were set for the `query` function.

Returns
Returns a struct with all or some of the attribute values.

Syntax
`queryService.getAttributes (attributelist)`

Arguments
A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

• **clearAttributes**

Description
Removes all attributes added for the `query` function.

Returns
Nothing

Syntax
`queryService.clearAttributes(attribute_list)`

Arguments
A comma-separated list of attributes.

• **clearParams**

Description
Removes queryparams that were added using the `addParam` method.

Returns
Nothing

Syntax
`queryService.clearParams()`

Arguments
None

• **clear**

Description
Removes all attributes and queryparams that were added using the `addParam` method.

Returns
Nothing

Syntax
`queryService.clear()`

Arguments
None

Usage
This function corresponds to the `cfquery` tag. For usage information, see Usage details for `cfquery`.

Last updated 7/9/2012
Example
<cfscript>
    /*
    This example shows how to create a query service in cfscript, set/get attributes using implicit setters/getters, and also how to execute the query and access the resultset
    */
    param MaxRows="10";
    param StartRow="1";
    /*
    Query database for information if cached database information has not been updated in the last six hours; otherwise, use cached data.
    */
    /* create a query service */
    queryService = new query();
    /* set properties using implicit setters */
    queryService.setDatasource("cfdocexamples");
    queryService.setName("GetParks");
    queryService.setcachedwithin(CreateTimeSpan(0, 6, 0, 0));
    /* Add sql queryparams using named and positional notation */
    queryService.addParam(name="state",value="MD",cfsqltype="cf_sql_varchar");
    queryService.addParam(value="National Capital Region",cfsqltype="cf_sql_varchar");
    /* invoke execute() on the query object to execute the query and return a component with properties result and prefix (which can be accessed as implicit getters) */
    result = queryService.execute(sql="SELECT PARKNAME, REGION, STATE FROM Parks WHERE STATE = :state and REGION = ? ORDER BY ParkName, State ");
    GetParks = result.getResult();
    /* getPrefix() returns information like recordcount,sql etc (typically whatever one gets if one uses the result attribute of the cfquery tag */
    metaInfo = result.getPrefix();
</cfscript>
<cfoutput>
    <h4>Found #metaInfo.recordcount# records for '#metaInfo.sqlparameters[2]#' in the state '#metaInfo.sqlparameters[1]#' </h4>
</cfoutput>
<!--- Build HTML table to display query. -------------------------> 
<table cellpadding="1" cellspacing="1">
    <tr><td bgcolor="f0f0f0"></td></tr>
    <tr>
        <td bgcolor="f0f0f0"></td>
        <td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td></tr>
    <!-- Output the query and define the startrow and maxrows parameters. 
Use the query variable CurrentCount to keep track of the row you are displaying. --------> 
<cfoutput query="GetParks" startrow="#StartRow#" maxrows="#MaxRows#"> 
    <tr>
        <td bgcolor="f0f0f0"></td>
        <td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td><td bgcolor="f0f0f0"></td>
    </tr>
</cfoutput>
<b>#GetParks.CurrentRow#</b>
</td>
<td valign="top">
<font size="-1">#ParkName#</font>
</td>
<td valign="top">
<font size="-1">#Region#</font>
</td>
<td valign="top">
<font size="-1">#State#</font>
</td>
</tr>
</cfoutput>
<!--- If the total number of records is less than or equal to the total number of rows, then offer a link to the same page, with the startrow value incremented by maxrows (in the case of this example, incremented by 10). --------->
<tr>
<td colspan="4">
<cfif (StartRow + MaxRows) LTE GetParks.RecordCount>
<cfoutput><a href="#CGI.SCRIPT_NAME#?startrow=#Evaluate(StartRow + MaxRows)#">See next #MaxRows# rows</a></cfoutput>
</cfif>
</td>
</tr>

stored<em>proc</em>

**Description**
Used to execute a stored procedure in a server database using CFScript. It specifies database connection information and identifies the stored procedure.

**Syntax**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new storedProc()</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>createObject(&quot;component&quot;, &quot;storedproc&quot;)</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>Any one of the following:</td>
</tr>
<tr>
<td></td>
<td>* storedProcService=new storedproc(&lt;em&gt;attribute-value_pair&lt;/em&gt;)</td>
</tr>
<tr>
<td></td>
<td>* storedProcService.setAttributes(&lt;em&gt;attribute-value_pair&lt;/em&gt;)</td>
</tr>
<tr>
<td></td>
<td>* storedProcService.setAttributeName(&lt;em&gt;attribute_value&lt;/em&gt;)</td>
</tr>
<tr>
<td></td>
<td>* storedProcService.execute(&lt;em&gt;attribute-value_pair&lt;/em&gt;)</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>storedProcService.execute(&lt;em&gt;attribute-value_pair&lt;/em&gt;)</td>
</tr>
</tbody>
</table>

**Properties**

<table>
<thead>
<tr>
<th>datasource</th>
<th>procedure</th>
<th>debug</th>
<th>cachedafter</th>
</tr>
</thead>
<tbody>
<tr>
<td>cachedwithin</td>
<td>blockfactor</td>
<td>password</td>
<td>result</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
All attributes supported by the tag cfstoredproc are supported as attribute-value pairs. For example,
<cfstoredproc procedure= "sp_proc”>
can be used as
spService.setProcedure("sp_proc");
For details of the cfstoredproc tag attributes, see the Attributes section for cfstoredproc.

**Usage**

This function corresponds to the cfstoredproc tag. For usage details, refer to the Usage section for cfstoredproc.
Example

```cfscript>
//If submitting a new book, insert the record and display confirmation
if(isDefined("form.title"))
{
    //create a new storedproc service
    spService = new storedproc();
    //set attributes using implicit setters
    spService.setDatasource("books");
    spService.setProcedure("Insert_Book");
    //add proccparams using addParam
    spService.addParam(cfsqltype="cf_sql_varchar", type="in", value=form.title);
    spService.addParam(cfsqltype="cf_sql_numeric", type="in", value=form.price);
    spService.addParam(cfsqltype="cf_sql_date", type="in", value=form.publishDate);
    spService.addParam(cfsqltype="cf_sql_numeric", type="out", variable="bookId");
    //add procresult using addProcResult
    spService.addProcResult(name="rs1", resultSet=1);
    //execute the stored procedure
    result = spService.execute();
    //getprocOutVariables() returns any OUT or INOUT variables added using addParams()
    bookId = result.getprocOutVariables().bookId;
    //getProcResultSets() returns resultsets added using addProcResult()
    listOfBooks = result.getProcResultSets().rs1;
    WriteOutput("<h3>List of Books</h3>");
    writeDump(listOfBooks);
    //output data
    WriteOutput("<h3>" & "" & form.title & "" & " inserted into database. The ID is " & bookId & "." & ");
}
</cfscript>
```

```cfform action="#CGI.SCRIPT_NAME#" method="post">
    <h3>Insert a new book</h3>
    <table>
        <tr>
            <td>Title:</td>
            <td><cfinput type="text" size="20" required="yes" name="title"/></td>
        </tr>
        <tr>
            <td>Price:</td>
            <td><cfinput type="text" size="20" required="yes" name="price" validate="float" /></td>
        </tr>
        <tr>
            <td>Publish Date:</td>
            <td><cfinput type="datefield" name="publishdate" mask="mm/dd/yyyy" size="20" /></td>
        </tr>
    </table>
    <input type="submit" value="Insert Book"/>
</cfform>

</tbody>
</table>

**dbinfo**

Description
Used in CFScript to retrieve information about a data source such as database details, tables, queries, procedures, foreign keys, indexes, and version information about the database, driver, and JDBC.

Syntax

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new dbinfo();</td>
</tr>
<tr>
<td></td>
<td>or createObject(&quot;component&quot;, &quot;dbinfo&quot;);</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>dbinfoService.action_method(attribute-value_pair);</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>See Initializing the attributes.</td>
</tr>
<tr>
<td>Getting the CFC properties</td>
<td>See Getting the CFC Properties.</td>
</tr>
<tr>
<td>Working with the data returned</td>
<td>data=dbinfoService.action_method(attribute-value_pair); writedump(data);</td>
</tr>
</tbody>
</table>

Properties

datasource dbname name password pattern table username

All attributes supported by the tag cfdbinfo can be used as attribute-value pairs. For example,

<cfdbinfo userName="myUserName"> can be used as

dbinfoService.setUserName("myUserName");

For details, see the Attributes section for the cfdbinfo tag.
See also
Function summary

History
ColdFusion 9.0.1: Added this function.

Methods
The following dbinfo types are available as methods. All methods have similar arguments and syntax.

<table>
<thead>
<tr>
<th>dbnames</th>
<th>tables</th>
<th>columns</th>
<th>version</th>
</tr>
</thead>
<tbody>
<tr>
<td>procedures</td>
<td>foriegnkeys</td>
<td>index</td>
<td></td>
</tr>
</tbody>
</table>

**Description**

All methods correspond to the type of information supported by the tag `cfdbinfo`. For details of each method, see the relevant section for the tag `cfdbinfo` in ColdFusion 9 CFML Reference.

**Returns**

All methods return a query object.

**Syntax**

```
dbinfoService.methodName(attribute-value pair);
```

**Arguments**

All attributes supported by the tag `cfdbinfo`.

- `setAttributes`, `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, `clearProperties`, and `clearProperties`. For details, see Methods common to all functions.

Usage

This function corresponds to the tag `cfdbinfo`. For details, see the Usage section for the tag `cfdbinfo`.

Example

```
<cfscript>

d = new dbinfo(datasource= " cfartgallery ").dbnames(datasource= "ajax");
  writedump(d);
  d = new dbinfo(datasource= " ajax").dbnames();
  writedump(d);
</cfscript>
```

imap

**Description**

Used in CFScript to query an IMAP server to retrieve and manage mails within multiple folders.

**Syntax**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new imap();</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>createObject(&quot;component&quot;, &quot;imap&quot;);</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>See Initializing the attributes.</td>
</tr>
</tbody>
</table>
Properties

<table>
<thead>
<tr>
<th>attribute</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentpath</td>
<td>connection</td>
</tr>
<tr>
<td>maxrows</td>
<td>messagenumber</td>
</tr>
<tr>
<td>password</td>
<td>port</td>
</tr>
<tr>
<td>server</td>
<td>startrow</td>
</tr>
<tr>
<td>uid</td>
<td>username</td>
</tr>
<tr>
<td>generateuniquefilenames</td>
<td>name</td>
</tr>
<tr>
<td>newfolder</td>
<td>secure</td>
</tr>
<tr>
<td>recurse</td>
<td>stoponerror</td>
</tr>
<tr>
<td>timeout</td>
<td></td>
</tr>
</tbody>
</table>

All attributes supported by the tag `cfimap` can be used as attribute-value pairs. For example,

```cfimap action="open" connection = "myconnection"```

can be used as

```pl
imapService = new imap(server = "myimapserver", username = "myusername", password = "mypassword", port = "myport", secure = "yes");
imapService.open();
```

**Note:** If connection properties such as `server`, `username`, `password`, `port`, and `secure` are specified either during initialization or when open method is called, a connection is created implicitly. Therefore, you need not specify the properties for further actions. If sandbox security is turned on, the directory referred to by the property `attachmentPath` must be given the required permission. By default, the temp directory is used.

For details of the attributes, see the Attributes section for the tag `cfimap`.

**Function summary**

**History**

ColdFusion 9.0.1: Added this function.

**Methods**

The following `imap` actions are available as methods. All methods have similar arguments and syntax.

```
getAll  delete   open   close
markRead createFolder deleteFolder renameFolder
listAllFolders  moveMail  getHeaderOnly
```

<table>
<thead>
<tr>
<th>Description</th>
<th>All methods correspond to the type of information supported by the tag <code>cfimap</code>. For details of each method, see the relevant section of <code>cfimap</code> in the ColdFusion 9 CFML Reference.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>A query object for methods <code>getAll</code>, <code>getHeaderOnly</code>, and <code>listAllFolders</code>. Else, nothing.</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>imapService.methodName(attribute-value pair)</code>;</td>
</tr>
<tr>
<td>Arguments</td>
<td>All attributes supported by the tag <code>cfimap</code>.</td>
</tr>
</tbody>
</table>
• setAttributes, getAttributes, clearAttributes, clear, setProperties, getProperties, and clearProperties. For details, see Methods common to all functions.

Usage
This function corresponds to the tag cfimap. See the Usage section for cfimap in the ColdFusion 9 CFML Reference for details.

Example
<cfscript>
  m = new imap();
  m.setAttributes(server="#REQUEST.server#", username="#REQUEST.username#", password="#REQUEST.password#", secure="#REQUEST.secure#",
                  connection="#REQUEST.connectionname#", stoponerror="#REQUEST.stoponerror#" );
  m.open();
  master = m.getAll(connection = "#REQUEST.connectionname#", name = "queryname", stoponerror = "#REQUEST.stoponerror#" );
  writedump(master);
</cfscript>

pop

Description
Used in CFScript to retrieve or delete e-mail messages from a POP mail server.

Syntax

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new pop();</td>
</tr>
<tr>
<td></td>
<td>or createObject(&quot;component&quot;, &quot;pop&quot;);</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>See Initializing the attributes.</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>popService.action_method(attribute-value_pair);</td>
</tr>
<tr>
<td>Getting the CFC properties</td>
<td>See Getting the CFC Properties.</td>
</tr>
<tr>
<td>Working with data returned</td>
<td>popresult = popService.action_method(attribute-value pair), where popresult is a query object if the action_method is getAll or getHeaderOnly. For any other method, nothing is returned.</td>
</tr>
</tbody>
</table>

Properties

<table>
<thead>
<tr>
<th>server</th>
<th>generateUniqueFilenames</th>
<th>maxRows</th>
<th>attachmentPath</th>
<th>debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>port</td>
<td>messageNumber</td>
<td>name</td>
<td>startRow</td>
</tr>
<tr>
<td>uid</td>
<td>username</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All attributes supported by the tag cfpop can be used as attribute-value pairs. For example,

<cfpop server = "#form.popserver#" * action = "getHeaderOnly" name = "GetHeaders">
can be used as

```coldfusion
popHeaders = popService.getHeaderOnly(server="#form.popserver#);
```

**Note:** *name is a required attribute in cfpop, but not in CFScript.*

**See also**
- Function summary

**History**
ColdFusion 9.0.1: Added this function.

**Methods**
The following pop actions are available as methods. All methods have similar arguments and syntax.

<table>
<thead>
<tr>
<th>getHeaderOnly</th>
<th>getAll</th>
<th>delete</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>All methods correspond to the type of information supported by the tag cfpop. For details of each method, see the relevant section of cfpop in the ColdFusion 9 CFML Reference.</td>
<td></td>
</tr>
<tr>
<td><strong>Returns</strong></td>
<td>All methods except delete returns a query object.</td>
<td></td>
</tr>
<tr>
<td><strong>Syntax</strong></td>
<td>popService.methodName(attribute-value pair)</td>
<td></td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>All attributes supported by the tag cfpop.</td>
<td></td>
</tr>
</tbody>
</table>

- setAttributes, getAttributes, clearAttributes, clear, setProperties, getProperties, and clearProperties. For details, see **Methods common to all functions**.

**Usage**
This function corresponds to the tag cfpop. For usage details, see the Usage section for cfpop.

**Example**

```coldfusion
p = createObject("component","pop");
p.setAttributes(server="#popServer#",username="failoveruser",password="#popPassword#");
r = p.GetAll(name="results",maxRows = "2");
writeoutput("getAll Passed<br>");

r = p.GetAll(messageNumber = "2");
writeoutput(#r.FROM# & "<br>");

r = p.getHeaderOnly(messageNumber = "1");
writeoutput(#r.subject# & "<br>");
```

```
ldap

Description
Used in CFScript to provide an interface to a Lightweight Directory Access Protocol (LDAP) directory server, such as the Netscape Directory Server.

Syntax

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new ldap();</td>
</tr>
<tr>
<td>or</td>
<td>createObject(&quot;component&quot;, &quot;ldap&quot;);</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>See Initializing the attributes.</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>ldapService.\texttt{action_method}(\texttt{attribute_value_pair});</td>
</tr>
<tr>
<td>Getting the CFC properties</td>
<td>See Getting the CFC Properties.</td>
</tr>
<tr>
<td>Working with data</td>
<td>ldapresult = ldapService.query(\texttt{attribute_value_pair});</td>
</tr>
</tbody>
</table>

For other methods, nothing is returned.

Properties

- server
- attributes
- delimiter
- dn
- filter
- maxRows
- modifyType
- name
- password
- port
- rebind
- referral
- returnAsBinary
- scope
- secure
- separator
- sort
- sortcontrol
- start
- startRow
- timeout
- userName

All attributes supported by the tag \texttt{cfldap} can be used as attribute-value pairs. For example,

\begin{verbatim}
<cfldap action="add" server="ldap.uconn.edu"

can be used as

ldapService.add(server="ldap.uconn.edu");

For details, see the Attributes section for the tag \texttt{cfldap}.

Methods

The following ldap actions are available as methods. All methods have similar arguments and syntax.

query | add | modify | modifyDn

| Description | All methods correspond to the actions supported by the tag \texttt{cfldap}. For details of each method, see the relevant section of \texttt{cfldap} in the \texttt{ColdFusion 9 CFML Reference}. |
| Returns     | If method is query, returns a query object. Else, none. |
| Syntax      | ldapService.\texttt{methodName}(\texttt{attribute\_value\_pair}) |
| Arguments   | All attributes supported by the tag \texttt{cfldap}. |

- setAttributes. For details, see Methods common to all functions
• `getAttribute`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, and `clearProperties`. For details, see Methods common to all functions.

• `setLdapAttributes`

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets the property attributes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>ldapService.setLdapAttributes(attribute-value);</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>A string that contains the value of the property attributes.</td>
</tr>
</tbody>
</table>

• `getLdapAttributes`

<table>
<thead>
<tr>
<th>Description</th>
<th>Gets the property attributes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>A string that contains the value of the property attributes.</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>myattributes = ldapService.getLdapAttributes();</code></td>
</tr>
</tbody>
</table>

Function summary

History
ColdFusion 9.0.1: Added this function.

Usage
This function corresponds to the tag `cfldap`. For usage details, see the Usage section for `cfldap`. 
Example

```cfcscript
l = new ldap();
l.setLdapAttributes("objectclass=top, person, organizationalPerson, inetOrgPerson;cn=Joe Smith; sn=Smith; mail=spenella@allaire.com; telephonenumber=(617) 761 - 2128");
l.setUsername("uid=admin,ou=system");
l.setPassword("administrator");
l.setPort(port);
l.setServer(ldapserver);

l.setdn("ou=People+o=aribus.com,dc=example,dc=com");
1.add();

l.clearAttributes();result = l.query(name="apache",
 attributes="dn,cn,o,ou,c,mail,telephonenumber",
 start="dc=example,dc=com",
 scope="SUBTREE",
 filter="(&(cn=Joe Smith)(ou=people))");

writeoutput("Adding and Querying a LDAP entry : </b>" & "CN = " & result.CN & " DN = " & result.DN & "</br>");
l.clearAttributes();
l.delete(
 DN="ou=People+o=aribus.com,dc=example,dc=com",
);

</cfcscript>

feed

Description
Used in CFScript to read or create an RSS or Atom syndication feed. This service reads RSS versions 0.90, 0.91, 0.92, 0.93, 0.94, 1.0, and 2.0, and Atom 0.3 or 1.0. It can create RSS 2.0 or Atom 1.0 feeds.

Syntax

<table>
<thead>
<tr>
<th>Mode</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating the service</td>
<td>new feed()</td>
</tr>
<tr>
<td></td>
<td>or createObject(&quot;component&quot; &quot;feed&quot;)</td>
</tr>
<tr>
<td>Initializing the attributes</td>
<td>See Initializing the attributes.</td>
</tr>
<tr>
<td>Executing the service action</td>
<td>feedService.action_method(attribute-value_pair)</td>
</tr>
<tr>
<td>Getting the CFC properties</td>
<td>See Getting the CFC Properties.</td>
</tr>
<tr>
<td>Working with the data returned</td>
<td>feedresult = feedService.read(attribute-value_pair) where feedresult is a struct with the keys name, query, properties, and xmlvar.</td>
</tr>
<tr>
<td></td>
<td>feedresult = feedService.create(attribute-value_pair) where feedresult is a string that contains the xmlvar.</td>
</tr>
</tbody>
</table>
Properties

All attributes supported by the tag cffeed can be used as attribute-value pairs. For example,

```xml
<cffeed action="read" source="http://googleblog.blogspot.com/atom.xml" query="feedQuery" properties="feedMetadata">
```

can be used as

```cfm
feedservice.read(source="http://googleblog.blogspot.com/atom.xml", query="feedQuery", properties="feedMetadata");
```

Function summary

History

ColdFusion 9.0.1: Added this function.

Methods

- `create`

<table>
<thead>
<tr>
<th>Description</th>
<th>Creates an RSS 2.0 or Atom 1.0 feed XML document and saves it in a variable, writes it to a file, or both.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>String representing the xmlvar</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>feedservice.create (attribute-value pair);</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>All attributes supported by the tag cffeed.</td>
</tr>
</tbody>
</table>

- `read`

<table>
<thead>
<tr>
<th>Description</th>
<th>Parses an RSS or Atom feed from a URL or an XML file and saves it in a structure or query. You can also get feed metadata in a separate structure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Struct with the following keys:</td>
</tr>
<tr>
<td></td>
<td>• name</td>
</tr>
<tr>
<td></td>
<td>• query</td>
</tr>
<tr>
<td></td>
<td>• properties</td>
</tr>
<tr>
<td></td>
<td>• xmlvar</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>feedservice.read (attribute-value pair);</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>All attributes supported by the tag cffeed.</td>
</tr>
</tbody>
</table>

- setAttributes, getAttributes, clearAttributes, clear, setProperties, getProperties, and clearProperties. For details, see Methods common to all functions.
- `getFeedProperties`
**setFeedProperties**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the value of the property <code>properties</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Structural or error (if property is not set)</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>feedService.getFeedProperties()</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>None</td>
</tr>
</tbody>
</table>

Usage

This service corresponds to the tag `cffeed`. For usage, see Usage section for `cffeed`.

Example

```cfs
<cfscript>
  f = new feed();
  r = f.read(source=feedpath);
  writeoutput("Name : " & r.name.title & "\n");
  writeoutput("Properties : " & r.properties.version & "\n");
  writeoutput("Query : " & r.query.recordcount & "\n");
  writeoutput("XMLVar : " & r.xmlvar.length() & "\n");
</cfscript>
```

**Methods common to all functions**

The following methods are common to all script functions:

- **setAttributes**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets attributes for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.setAttributes (attribute-value pair);</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>All attributes supported by the equivalent tag.</td>
</tr>
</tbody>
</table>

- **getAttributes**

<table>
<thead>
<tr>
<th>Description</th>
<th>Gets the attributes set for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns a struct with all or some attribute values.</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.getAttributes (attributelist);</code></td>
</tr>
<tr>
<td>Arguments</td>
<td>A comma-separated list of attributes. If no list is specified, all defined attributes are returned.</td>
</tr>
</tbody>
</table>

- **clearAttributes**
Script Functions Implemented as CFCs

### clear

<table>
<thead>
<tr>
<th>Description</th>
<th>Removes all attributes added for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.clearAttributes(attribute_list)</code>;</td>
</tr>
<tr>
<td>Arguments</td>
<td>A comma-separated list of attributes.</td>
</tr>
</tbody>
</table>

### clearProperties

<table>
<thead>
<tr>
<th>Description</th>
<th>Removes all properties added for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.clearProperties(attribute_list)</code>;</td>
</tr>
<tr>
<td>Arguments</td>
<td>If nothing is specified, all properties are cleared.</td>
</tr>
</tbody>
</table>

### setProperties

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets properties for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Nothing</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.setProperties(attribute-value_pair)</code>;</td>
</tr>
<tr>
<td>Arguments</td>
<td>All attributes supported by the equivalent tag.</td>
</tr>
</tbody>
</table>

### getProperties

<table>
<thead>
<tr>
<th>Description</th>
<th>Gets the properties set for the function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns</td>
<td>Returns a struct with all or some attribute values.</td>
</tr>
<tr>
<td>Syntax</td>
<td><code>service_name.getProperties(attribute_list)</code>;</td>
</tr>
<tr>
<td>Arguments</td>
<td>A comma-separated list of attributes. If no list is specified, all defined attributes are returned.</td>
</tr>
</tbody>
</table>

### Initializing the attributes

You can initialize the attributes using one of the following ways:

- `service_name=new dbinfo(attribute-value_pair)`
- `service_name=new dbinfo().init(attribute-value_pair)`
- `service_name.setAttributes(attribute-value_pair)`
- `service_name.setAttributeName(attribute_value)`
- `service_name.action_method(attribute-value_pair)`
Script Functions Implemented as CFCs

- `service_name.setProperties (attribute_value)`

### Getting the CFC Properties

Get the CFC properties using one of the following ways:

- `service_name.getAttributeName(attributeList)`
- `service_name.getProperties (attributeList)`
- `service_name.getAttributes(attributeList)`
Chapter 7: ColdFusion Flash Form Style Reference

You can specify styles in ColdFusion forms tags when you display the form or form element in Flash format.

Note: The column labeled Inh indicates whether a style is inherited by child controls, such as the form controls in a vbox.

Styles valid for all controls

The following styles are valid for all ColdFusion Flash format form tags except for cfformitem tags with the following type attributes, which do not take style attributes:

- html
- space

These styles do not cause errors when used in all other tags. However, many styles do not have any effect when used in some tags.

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backgroundAlpha</td>
<td>N</td>
<td>Alpha (transparency) level of the SWF file or image defined by backgroundImage. Valid values range from 0 (transparent) to 100 (opaque). The default value is 100.</td>
</tr>
<tr>
<td>backgroundColor</td>
<td>Y</td>
<td>Format: color; background color of the control. Has no effect if specified in a cfform control tag, which uses the background-color style to control the color. Also ignored by cfform tags of type button, img, submit, radio, and checkbox, because they are filled with the button face or other graphics.</td>
</tr>
<tr>
<td>backgroundDisabledColor</td>
<td>Y</td>
<td>Format: color; background color of components when disabled. The default value is #EFEFEF (light gray).</td>
</tr>
<tr>
<td>backgroundSize</td>
<td>N</td>
<td>Scales the image specified by backgroundImage to different percentage sizes. By default, the value is auto, which maintains the original size of the image. A value of 100% stretches the image to fit the entire screen. Include the percent sign with the value.</td>
</tr>
<tr>
<td>barColor</td>
<td>Y</td>
<td>Format: color; color of the outer bar.</td>
</tr>
<tr>
<td>borderCapColor</td>
<td>Y</td>
<td>Format: color; outside left and outside right color for skins.</td>
</tr>
<tr>
<td>borderColor</td>
<td>Y</td>
<td>Format: color; black section of a three-dimensional border or the color section of a two-dimensional border.</td>
</tr>
<tr>
<td>borderSides</td>
<td>N</td>
<td>Bounding box sides. Only used when borderStyle=&quot;solid&quot;. Space-delimited string containing the sides of the border to show. Order is not important. The default value is &quot;left top right bottom&quot;.</td>
</tr>
<tr>
<td>borderStyle</td>
<td>Y</td>
<td>Bounding box style. The possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- inset (default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- none</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- outset</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- solid</td>
</tr>
<tr>
<td>borderThickness</td>
<td>N</td>
<td>Bounding box thickness. Only used when borderStyle=&quot;solid&quot;. The default value is 1.</td>
</tr>
<tr>
<td>Style</td>
<td>Inh</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>color</td>
<td>Y</td>
<td>Format: color; text color of a component’s label.</td>
</tr>
<tr>
<td>cornerRadius</td>
<td>N</td>
<td>Radius of component corners. The default value is 0.</td>
</tr>
<tr>
<td>disabledColor</td>
<td>Y</td>
<td>Format: color; color of the component if it is disabled.</td>
</tr>
<tr>
<td>dropShadow</td>
<td>N</td>
<td>Format: Boolean; controls the visibility of the component’s drop shadow. The default value is false. This style must be used with borderStyle=&quot;solid&quot;. For drop shadows to appear on containers, set backgroundColor or backgroundImage. Otherwise, since the default background of a container is transparent, the shadow appears behind the container.</td>
</tr>
<tr>
<td>errorColor</td>
<td>Y</td>
<td>Format: color; color of the error text.</td>
</tr>
<tr>
<td>fillColors</td>
<td>N</td>
<td>Format: color; colors used to tint the background of the control. Pass the same color for both values for “flat” looking control. The default value is ##E6EEEE,##FFFFFF.</td>
</tr>
<tr>
<td>fontFamily</td>
<td>Y</td>
<td>Comma-separated list of fonts to use, in descending order of desirability. You can use any font family name. If you specify a generic font name, it is converted to an appropriate device font. Flash can only use fonts that are installed on the client system.</td>
</tr>
<tr>
<td>fontSize</td>
<td>Y</td>
<td>Format: length; size of the text.</td>
</tr>
<tr>
<td>fontStyle</td>
<td>Y</td>
<td>Determines whether the text is italic. Recognized values are normal and italic. The default value is normal.</td>
</tr>
<tr>
<td>fontWeight</td>
<td>Y</td>
<td>Determines whether the text is bold. Recognized values are normal and bold. The default value is normal.</td>
</tr>
<tr>
<td>highlightColor</td>
<td>Y</td>
<td>Format: color; color of the control when it is in focus.</td>
</tr>
<tr>
<td>horizontalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the horizontal direction.</td>
</tr>
<tr>
<td>leading</td>
<td>N</td>
<td>Additional vertical space between lines of text. The default value is no leading.</td>
</tr>
<tr>
<td>marginLeft</td>
<td>N</td>
<td>Format: length; number of pixels between the container’s left border and its content area.</td>
</tr>
<tr>
<td>marginRight</td>
<td>N</td>
<td>Format: length; number of pixels between the container’s right border and its content area.</td>
</tr>
<tr>
<td>scrollTrackColor</td>
<td>Y</td>
<td>Format: color; scroll track for a scroll bar. The default value is ##EFEFEF (light gray).</td>
</tr>
<tr>
<td>selectedFillColors</td>
<td>N</td>
<td>Format: colors; two colors used to tint the background of the control when in its selected state. Pass the same color for both values for “flat” looking control. The default value is undefined, which means the colors are derived from themeColor.</td>
</tr>
<tr>
<td>textAlign</td>
<td>Y</td>
<td>Aligns text in a container. Recognized values are left, right, and center. The default value is right.</td>
</tr>
<tr>
<td>textDecoration</td>
<td>N</td>
<td>Determines whether the text is underlined or not. Recognized values are none and underline. The default value is none.</td>
</tr>
<tr>
<td>textIndent</td>
<td>Y</td>
<td>Format: length; offset of first line of text from the left side of the container. The default value is 0.</td>
</tr>
<tr>
<td>themeColor</td>
<td>Y</td>
<td>Format: color; background color of a component. The possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• haloGreen</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• haloBlue</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• haloOrange</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• haloSilver</td>
</tr>
<tr>
<td>verticalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the vertical direction.</td>
</tr>
</tbody>
</table>
Styles for cfform

The following styles apply to the `cfform` tag:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>background-color</td>
<td></td>
<td>Format: color; background color of the form.</td>
</tr>
<tr>
<td>indicatorGap</td>
<td>Y</td>
<td>Format: length; number of pixels between the label and child components. The default value is 14.</td>
</tr>
<tr>
<td>labelWidth</td>
<td>Y</td>
<td>Format: length; width of the form labels. The default value is the length of the longest label in the form.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>N</td>
<td>Format: length; number of pixels between the container's bottom border and its content area. The default value is 16.</td>
</tr>
<tr>
<td>marginTop</td>
<td>N</td>
<td>Format: length; number of pixels between the container's top border and its content area. The default value is 16.</td>
</tr>
<tr>
<td>verticalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the vertical direction. The default value is 8.</td>
</tr>
</tbody>
</table>

Styles for cfformgroup with horizontal or vertical type attributes

The following styles apply to the `cfformgroup` tag with `type` attributes `horizontal` or `vertical`:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizontalAlign</td>
<td>N</td>
<td>Horizontal alignment of children. Possible values are left, center, and right. The default value is left.</td>
</tr>
<tr>
<td>horizontalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the horizontal direction. The default value is 6.</td>
</tr>
<tr>
<td>indicatorGap</td>
<td>Y</td>
<td>Format: length; number of pixels between the label and child components. The default value is 14.</td>
</tr>
<tr>
<td>labelWidth</td>
<td>Y</td>
<td>Format: length; width of the form labels. The default value is the length of the longest label in the form.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>N</td>
<td>Format: length; number of pixels between the container's bottom border and its content area. The default value is 0.</td>
</tr>
<tr>
<td>marginTop</td>
<td>N</td>
<td>Format: length; number of pixels between the container's top border and its content area. The default value is 0.</td>
</tr>
<tr>
<td>verticalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the vertical direction. The default value is 6.</td>
</tr>
</tbody>
</table>

Styles for box-style cfformgroup elements

The following styles apply to the `cfformgroup` tag with the following `type` attributes. Some types have additional attributes, which are listed in the following sections.

- `hbox`
- `vbox`
- `hdividedbox`
- `vdividedbox`
- `panel`
The following additional styles apply to the `cfformgroup` tag with `type="hdividedbox"`, or `type="vdividedbox"`:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dividerAffordance</td>
<td>N</td>
<td>Format: length; width (hdividedbox) or height (vdividedbox) in pixels of the area of the divider that the user can select with the mouse pointer. The default value is 6.</td>
</tr>
<tr>
<td>dividerColor</td>
<td>Y</td>
<td>Format: color; color of the dividers in their up state. The default value is ##AAAAAA.</td>
</tr>
<tr>
<td>dividerThickness</td>
<td>N</td>
<td>Format: length; thickness in pixels of the dividers. The default value is 4.</td>
</tr>
</tbody>
</table>

The following additional styles apply to the `cfformgroup` tag with `type="panel"`:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cornerRadius</td>
<td>N</td>
<td>Format: length; radius of corners of the window frame. The default value is 8.</td>
</tr>
<tr>
<td>dropShadow</td>
<td>N</td>
<td>Boolean value specifying whether the panel has a drop shadow. The default value is true.</td>
</tr>
<tr>
<td>footerColors</td>
<td>Y</td>
<td>Format: color; comma-delimited list of two colors used to draw the footer (ControlBar) background. The first color is the top color. The second color is the bottom color. The default value is ##F4F5F7, ##E1E5EB.</td>
</tr>
<tr>
<td>headerColors</td>
<td>Y</td>
<td>Format: color; comma-delimited list of two colors used to draw the header. The first color is the top color. The second color is the bottom color. The default value is ##E1E5EB, ##F4F5F7.</td>
</tr>
<tr>
<td>headerHeight</td>
<td>N</td>
<td>Format: length; height of the header. The default value is 28.</td>
</tr>
<tr>
<td>panelBorderStyle</td>
<td>N</td>
<td>Border style for the bottom two corners of the container. The top two corners are always round. Possible values are default, which configures the container to have square corners, and roundedCorners, which defines rounded corners. To configure the top corners to be square, set cornerRadius to 0. The default value is default.</td>
</tr>
<tr>
<td>shadowDirection</td>
<td>N</td>
<td>Direction of drop shadow. Possible values are &quot;left&quot;, &quot;center&quot;, and &quot;right&quot;. The default value is &quot;center&quot;.</td>
</tr>
<tr>
<td>shadowDistance</td>
<td>N</td>
<td>Distance of drop shadow. Negative values move shadow above the panel. The default value is 2.</td>
</tr>
</tbody>
</table>
Styles for cfformgroup with accordion type attribute

The following styles apply to the cfformgroup tag with type="accordion":

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerHeight</td>
<td>N</td>
<td>Format: length; height of the accordion container buttons, in pixels. The default value is 22.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>N</td>
<td>Format: length; number of pixels between the container’s bottom border and its content area. The default value is -1.</td>
</tr>
<tr>
<td>marginTop</td>
<td>N</td>
<td>Format: length; number of pixels between the container’s top border and its content area. The default value is -1.</td>
</tr>
<tr>
<td>openDuration</td>
<td>N</td>
<td>Format: time; duration, in milliseconds, of the transition from one child panel to another. The default value is 250.</td>
</tr>
<tr>
<td>verticalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the vertical direction. The default value is -1.</td>
</tr>
</tbody>
</table>

Styles for cfformgroup with tabnavigator type attribute

The following styles apply to the cfformgroup tag with the type="tabnavigator":

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizontalAlign</td>
<td>N</td>
<td>Horizontal alignment of children. The default value is left. Possible values are left, center, and right. Because the preferred width of each tab in the tab navigator container is the size of the label text, use the tabWidth style to increase the width of the tab to a size larger than its preferred width to see different alignments.</td>
</tr>
<tr>
<td>horizontalGap</td>
<td>N</td>
<td>Format: length; number of pixels between children in the horizontal direction. The default value is 6.</td>
</tr>
<tr>
<td>tabHeight</td>
<td>N</td>
<td>Format: length; default tab height, in pixels. The default value is 22.</td>
</tr>
<tr>
<td>tabWidth</td>
<td>N</td>
<td>Format: length; width of the tabs, in pixels. If undefined, the default tab widths are automatically calculated from the label text. If the width of the container is smaller than the width of the label text, the labels are truncated. If a tab label is truncated, Flash displays a tooltip with the full label text when a user moves the mouse pointer over the tab. If you specify an explicit tab width, labels do not automatically shrink to fit if they do not fit in the available space.</td>
</tr>
</tbody>
</table>

Styles for cfformitem with hrule or vrule type attributes

The following styles apply to the formitem tag with type="hrule" or type="vrule":

Last updated 7/9/2012
Styles for cfinput with radio, checkbox, button, image, or submit type attributes

The following styles apply cfinput tags with the following type attribute values:

- button
- checkbox
- image
- radio
- submit

In some cases, a style applies only to the subset of these input types, as specified in the description.
Styles for cftextarea tag and cfinput with text, password, or hidden type attributes

The following style applies to the following tags and tag-attribute combinations:

- textarea
- cfinput type="hidden"
- cfinput type="password"
- cfinput type="text"

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disabledColor</td>
<td>Y</td>
<td>Format: color; disabled color of the Text Area.</td>
</tr>
</tbody>
</table>

Styles for cfselect with size attribute value of 1

The following styles apply to the cfselect tag when the size attribute is 1; that is, if the control displays one option at a time, with a drop-down list (also known as a combobox):

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternatingRowColors</td>
<td>Y</td>
<td>Format: comma delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors. Use only if you do not specify a backgroundColor style.</td>
</tr>
<tr>
<td>closeDuration</td>
<td>N</td>
<td>Time to close the drop-down list, in milliseconds. The default value is 250.</td>
</tr>
</tbody>
</table>
Styles for cfselect with size attribute value greater than 1

The following styles apply to the cfselect tag when the size attribute is greater than 1; that is, if the control is a list box that displays two or more options at a time:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternatingRowColors</td>
<td>Y</td>
<td>Type: comma-delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>N</td>
<td>Format: length; number of pixels between the bottom of the row and the bottom of the text in the row. The default value is 0.</td>
</tr>
<tr>
<td>marginTop</td>
<td>N</td>
<td>Format: length; number of pixels between the top of the row and the top of the text in the row. The default value is 0.</td>
</tr>
<tr>
<td>rollOverColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user rolls over an item. The default value is ##0EFFD6.</td>
</tr>
<tr>
<td>selectionColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user selects an item. The default value is ##0DFFC1.</td>
</tr>
<tr>
<td>selectionDuration</td>
<td>N</td>
<td>The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.</td>
</tr>
<tr>
<td>textRollOverColor</td>
<td>Y</td>
<td>Format: color; text color when the user moves the mouse pointer over the selection. The default value is #02B33C.</td>
</tr>
<tr>
<td>textSelectedColor</td>
<td>Y</td>
<td>Format: color; text color when selected. The default value is #005F33.</td>
</tr>
</tbody>
</table>

Styles for cfcalendar tag and cfinput with dateField type attribute

The following styles apply to the cfcalendar tag and dateField type of the cfinput tag:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerColors</td>
<td>Y</td>
<td>Format: color; colors of the band at the top of the DateChooser control. Specify two values, separated by a comma. For a solid band, use the same color for both values. The default value is #86B33C,#407FFF.</td>
</tr>
<tr>
<td>rollOverColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user moves the mouse pointer over the DateField. The default value is #E3FFD6.</td>
</tr>
<tr>
<td>selectionColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user selects the DateField. The default value is #CDFFC1.</td>
</tr>
<tr>
<td>todayColor</td>
<td>Y</td>
<td>Format: color; color of today’s date. The default value is #2B333C.</td>
</tr>
</tbody>
</table>
## Styles for the cfgrid tag

The following styles apply to the cfgrid tag:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizontalAlign</td>
<td>N</td>
<td>Horizontal alignment of children in the container. The default value is left. Possible values are left, center, and right.</td>
</tr>
<tr>
<td>horizontalGap</td>
<td>N</td>
<td>Number of pixels between children in the horizontal direction. The default value is 8.</td>
</tr>
<tr>
<td>marginBottom</td>
<td>N</td>
<td>Number of pixels between the container's bottom border and its content area. The default value is 0.</td>
</tr>
<tr>
<td>marginTop</td>
<td>N</td>
<td>Number of pixels between the container's top border and its content area. The default value is 0.</td>
</tr>
<tr>
<td>verticalAlign</td>
<td>N</td>
<td>Vertical alignment of children in the container. The default value is top. Possible values are top, middle, and bottom.</td>
</tr>
<tr>
<td>verticalGap</td>
<td>N</td>
<td>Number of pixels between children in the vertical direction. The default value is 8.</td>
</tr>
</tbody>
</table>

---

## Styles for the cftree tag

The following styles apply to the cftree tag:

<table>
<thead>
<tr>
<th>Style</th>
<th>Inh</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternatingRowColors</td>
<td>Y</td>
<td>Type: Array; colors for rows in an alternating pattern. Value can be an Array of two or more colors.</td>
</tr>
<tr>
<td>depthColors</td>
<td>Y</td>
<td>Type: Array; array of colors used in the Tree control, in descending order.</td>
</tr>
<tr>
<td>indentation</td>
<td>N</td>
<td>Indentation for each tree level, in pixels. The default value is 8.</td>
</tr>
<tr>
<td>openDuration</td>
<td>N</td>
<td>Format: time; length of an open or close transition, in milliseconds. The default value is 250.</td>
</tr>
<tr>
<td>rollOverColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user moves the mouse pointer over the link. The default value is ##E3FFD6.</td>
</tr>
<tr>
<td>selectionColor</td>
<td>Y</td>
<td>Format: color; color of the background when the user selects the link. The default value is ##CDFFC1.</td>
</tr>
<tr>
<td>selectionDuration</td>
<td>N</td>
<td>The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.</td>
</tr>
<tr>
<td>textRollOverColor</td>
<td>Y</td>
<td>Format: color; color of the text when the user moves the mouse pointer over the entry. The default value is ##02B33C.</td>
</tr>
<tr>
<td>textSelectedColor</td>
<td>Y</td>
<td>Format: color; color of the text when the user selects the entry. The default value is ##005F33.</td>
</tr>
</tbody>
</table>
Chapter 8: Application.CFC Reference

You implement methods in Application.cfc to handle ColdFusion application events and set variables in the CFC to configure application characteristics.

Application variables

The This scope for the Application.cfc contains several built-in variables, which correspond to the attributes that you set in the cfcapplication tag. You set the values of these variables in the CFC initialization code, before you define the CFC methods. You can access the variables in any method.

Note: Although Windows is case-insensitive, you must always start the Application.cfc filename with an uppercase A. Both application.cfc and Application.cfc are reserved words.

Note: If your application has an Application.cfc, and an Application.cfm or onRequestend.cfm page, ColdFusion ignores the CFM pages.

The following table briefly describes the variables that you can set to control the application behavior. For more details, see the cfcapplication tag.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>no name</td>
<td>The application name. If you do not set this variable, or set it to the empty string, your CFC applies to the unnamed application scope, which is the ColdFusion J2EE servlet context. For more information on unnamed scopes see Integrating JSP and servlets in a ColdFusion application in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>applicationTimeout</td>
<td>Administrator value</td>
<td>Life span, as a real number of days, of the application, including all Application scope variables. Use the CFML CreateTimeSpan function to generate this variable's value.</td>
</tr>
<tr>
<td>authcookie.disableupdate</td>
<td>False</td>
<td>Disable update of cfauthorization cookie using cfformcookie or cfheader tag</td>
</tr>
<tr>
<td>authcookie.timeout</td>
<td>-1</td>
<td>Auth Cookie age in days.</td>
</tr>
<tr>
<td>chartStyleDirectory</td>
<td>Administrator value</td>
<td>Application specific client side charting styles directory.</td>
</tr>
<tr>
<td>clientManagement</td>
<td>Administrator value</td>
<td>Whether the application supports Client scope variables.</td>
</tr>
<tr>
<td>clientStorage</td>
<td>Administrator value</td>
<td>Where Client variables are stored; can be cookie, registry, or the name of a data source.</td>
</tr>
<tr>
<td>customtagpaths</td>
<td>Administrator value</td>
<td>Contains ColdFusion custom tag paths. It is a comma delimited list with absolute path. To use this variable, select the Enable Per App Settings option in the Administrator Server &gt; Settings page. The settings that you define here take precedence over the custom tag paths defined in the Administrator Server Settings &gt; Mappings page for the current application.</td>
</tr>
<tr>
<td>googleMapKey</td>
<td>Administrator value</td>
<td>The Google Maps API key required to embed Google Maps in your web pages.</td>
</tr>
<tr>
<td>datasource</td>
<td>Administrator value</td>
<td>Name of the data source from which the query retrieves data.</td>
</tr>
<tr>
<td>loginStorage</td>
<td>cookie</td>
<td>Whether to store login information in the Cookie scope or the Session scope.</td>
</tr>
<tr>
<td>Variable</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mappings</td>
<td>Administrator value</td>
<td>A structure that contains ColdFusion mappings. Each element in the structure consists of a key and a value. The logical path is the key and the absolute path is the value. To use this variable, select the Enable Per App Settings option in the Administrator Server Settings &gt; Settings page. The mappings that you define here take precedence over the mappings defined in the Administrator Server Settings &gt; Mappings page for the current application.</td>
</tr>
<tr>
<td>sessioncookie.httponly</td>
<td>True</td>
<td>Specify whether session cookies have to be set as httponly or not. i.e. accessible only to Http requests</td>
</tr>
<tr>
<td>sessioncookie.secure</td>
<td>False</td>
<td>Specify whether session cookies have to be set as secure or not. i.e. returned on any type of connection or only secured (https) connections</td>
</tr>
<tr>
<td>sessioncookie.domain</td>
<td></td>
<td>Domain for which the cookie should be set. This should match exactly with the domain, with which application would be accessed</td>
</tr>
<tr>
<td>sessioncookie.timeout</td>
<td>30 years</td>
<td>Session Cookie age in days</td>
</tr>
<tr>
<td>sessioncookie.disableupdate</td>
<td>False</td>
<td>Disable update of cfid and cftoken cookie using cfcookie or cfheader tag</td>
</tr>
<tr>
<td>serverSideFormValidation</td>
<td>yes</td>
<td>Whether to enable validation on cfform fields when the form is submitted</td>
</tr>
<tr>
<td>sessionManagement</td>
<td>no</td>
<td>Whether the application supports Session scope variables.</td>
</tr>
<tr>
<td>sessionTimeout</td>
<td>Administrator value</td>
<td>Life span, as a real number of days, of the user session, including all Session variables. Use the CFML CreateTimeSpan function to generate this variable’s value.</td>
</tr>
<tr>
<td>setClientCookies</td>
<td>True</td>
<td>Whether to send CFID and CFTOKEN cookies to the client browser.</td>
</tr>
<tr>
<td>setDomainCookies</td>
<td>False</td>
<td>Whether to set CFID and CFTOKEN cookies for a domain (not just a host).</td>
</tr>
<tr>
<td>scriptProtect</td>
<td>Administrator value</td>
<td>Whether to protect variables from cross-site scripting attacks.</td>
</tr>
<tr>
<td>secureJSON</td>
<td>Administrator value</td>
<td>A Boolean value that specifies whether to add a security prefix in front of the value that a ColdFusion function returns in JSON-format in response to a remote call. The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to false). You can override this value in the cffunction tag. For more information see Improving security in the Developing ColdFusion Applications.</td>
</tr>
<tr>
<td>secureJSONPrefix</td>
<td>Administrator value</td>
<td>The security prefix to put in front of the value that a ColdFusion function returns in JSON-format in response to a remote call if the secureJSON setting is true. The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to //, the JavaScript comment character). For more information see Improving security in the Developing ColdFusion Applications.</td>
</tr>
</tbody>
</table>
Form fields with same name
Assume that the form fields have same name. In this case, ColdFusion converts the form fields as an array instead of a list. To do this, in the Application.cfc, specify the following: `this.sameformfieldsasarray = "true"`. The default value is `false`.

Enhancements made in ColdFusion 9.0.1
Application.cfc lets you specify data source authentication details for the data source. The data source settings can now be a string or a struct. When string, it is considered to be the data source name and authentication information is taken from the data source defined in the ColdFusion Administrator.

You can specify the authentication information using a struct value for data source. The following are the key names:

- **name**: data source name
- **username**: Username for the data source
- **password**: Password for the data source

Example

```cfml
<this.datasource={name='cfartgallery', username="user", password="passwd"}>
```
or

```cfml
<this.datasource="cfartgallery">
```
**Note:** The same convention is used for ORM default data source where you can specify the data source authentication information in the ormsettings.

The following application-specific attributes have been added for Amazon S3 integration:

- `accessKeyId`: ID for Amazon S3 account.
- `awsSecretKey`: Secret key for S3 account.
- `defaultLocation`: The default location of Amazon S3 bucket creation. A bucket on S3 storage can be in one of the following regions: US, EU, or US-WEST.

  The `defaultLocation` provided in the Application.cfc defines the default location for the bucket that you create. The default value is US.

**Example**

```cfs
<cfscript>
this.s3.accessKeyId = "key_ID";
this.s3.awsSecretKey = "secret_key";
this.s3.defaultLocation="location";
</cfscript>
```

### Application-specific In-memory file system

You can use in-memory file system specific to applications. This enables application isolation for your virtual file system. That is, the file created in the in-memory file system by one application will not be accessible to another application.

The settings can be specified in the Application.cfc as follows:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>this.inmemoryfilesystem.enabled</code></td>
<td>Set the value to <code>true</code> to enable in-memory file system for application.</td>
</tr>
<tr>
<td></td>
<td>This is the default setting.</td>
</tr>
<tr>
<td><code>this.inmemoryfilesystem.size</code></td>
<td>Specify the memory limit in MB for the in-memory file system.</td>
</tr>
<tr>
<td></td>
<td>You can also specify the value in the ColdFusion Administrator (Server Settings &gt; Settings &gt; Memory Limit per Application for In-Memory Virtual File System). The lesser value is considered.</td>
</tr>
</tbody>
</table>

### Method summary

The following table briefly describes the application event methods that you can implement in Application.CFC:

<table>
<thead>
<tr>
<th>Method name</th>
<th>Method runs when</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>onAbort</code></td>
<td>Runs when you execute the tag <code>cfabort</code></td>
</tr>
<tr>
<td><code>onApplicationEnd</code></td>
<td>The application ends: the application times out, or the server is stopped</td>
</tr>
<tr>
<td><code>onApplicationStart</code></td>
<td>The application first starts: the first request for a page is processed or the first CFC method is invoked by an event gateway instance, or a web services or Flash Remoting CFC.</td>
</tr>
<tr>
<td><code>onCFCRequest</code></td>
<td>HTTP or AMF calls are made to an application.</td>
</tr>
<tr>
<td><code>onError</code></td>
<td>An exception that is not caught by a try/catch block occurs.</td>
</tr>
</tbody>
</table>
All parameters to these methods are positional. You can use any names for these parameters.

When a request executes, ColdFusion runs the CFC methods in the following order:

1. `onApplicationStart` (if not run before for this application)
2. `onSessionStart` (if not run before for this session)
3. `onRequestStart`
4. `onRequest/onCFCRequest`
5. `onRequestEnd`

The `onApplicationEnd`, `onSessionEnd`, and `onError` CFCs are triggered by specific events.

### onAbort

**Description**
Runs when you execute the tag `cfabort`.

*Note: If `showError` attribute is specified in `cfabort`, `onError` method is executed instead of `onAbort`.*

*Note: When using `cfabort`, `cflocation`, or `cfcontent` tags, the `onAbort` method is invoked instead on `onRequestEnd`.*

**Returns**
Nothing

**Syntax**
```
<cffunction name="onAbort" returnType="boolean">
   <cfargument type="string" name="targetPage" required=true/>
   ...
   <cfreturn BooleanValue />
</cffunction>
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetPage</td>
<td>The path from the web root to the requested CFML page.</td>
</tr>
</tbody>
</table>
Example
Application.cfc

```
<cfcomponent>
  <cffunction name="onAbort"
    access="public"
    returnType="void"
    hint="Handles Aborted request">
    <cfargument type="String"
      name="targetPage"
      required=true/>
    <cfoutput> Target Page: #targetPage#</cfoutput>
    <!--- do stuff --->
  </cffunction>
</cfcomponent>

Test.cfm
<cfabort>
```

onApplicationEnd

Description
Runs when an application times out or the server is shutting down.

Syntax
```
<cffunction name="onApplicationEnd" returnType="void">
  <cfargument name="ApplicationScope" required=true/>
  ...
</cffunction>
```

See also
onApplicationStart, Method summary, Managing the application with Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ApplicationScope</td>
<td>The application scope.</td>
</tr>
</tbody>
</table>

Returns
This method does not return a value; do not use the `cfreturn` tag.

Usage
Use this method for any clean-up activities that your application requires when it shuts down, such as saving data in memory to a database, or to log the application end to a file. You cannot use this method to display data on a user page, because it is not associated with a request. The application ends, even if this method throws an exception.
If you call this method explicitly, ColdFusion does not end the application; it does execute the method code, but does not lock the Application scope while the method executes.

Use the ApplicationScope parameter to access the application scope; you cannot reference the scope directly; for example, use Arguments.ApplicationScope.myVariable, not Application.myVariable. This method can access the Server scope directly, but it does not have access to Session or Request scopes.

**Note:** The application times out only if it is inactive for the time-out period. Sessions do not end, and the onSessionEnd method is not called when an application ends. For more information, see onSessionEnd.

**Example**

```cf
<cffunction name="onApplicationEnd">
  <cfargument name="ApplicationScope" required=true/>
  <cflog file="#This.Name#" type="Information"
    text="Application #Arguments.ApplicationScope.applicationname# Ended" >
</cffunction>
```

**onApplicationStart**

**Description**
Runs when ColdFusion receives the first request for a page in the application.

**Syntax**

```cf
<cffunction name="onApplicationStart" returnType="boolean">
  ...
  <cfreturn Boolean>
</cffunction>
```

**See also**

onApplicationEnd, Method summary, Managing the application with Application.cfc in the Developing ColdFusion Applications

**Returns**
A Boolean value: True if the application startup code ran successfully; False, otherwise. You do not need to explicitly return a True value if you omit the cffunction tag returnType attribute.

**Usage**
Use this method for application initialization code; for example, use it to set Application scope variables, to determine whether a required data source or other resource is available, or to log the application start. You do not have to lock the Application scope if you set Application variables in this method, and you can reference Application scope variables as you normally do; for example, as Application.myVariable.

This method can access the requested page’s Variables scope only if the Application.cfc file includes an onRequest method that calls the page.

If you call this method explicitly, ColdFusion does not start the application; it does execute the method code, but does not lock the Application scope while the method executes.
If this method throws an uncaught exception or returns False, the application does not start and ColdFusion does not process any pages in the application. In this case, ColdFusion runs the `onApplicationStart` method the next time a user requests a page in the application.

**Example**
The following example tests for the availability of a database. If the database is not available it reports and logs the error, and does not start the application; if it is available, the method initializes two Application scope variables.

```cfml
<cffunction name="onApplicationStart">
  <cftry>
    <!--- Test whether the DB is accessible by selecting some data. --->
    <cfquery name="testDB" dataSource="cfdocexamples" maxrows="2">
      SELECT Emp_ID FROM employee
    </cfquery>
    <!--- If you get a database error, report an error to the user, log the error information, and do not start the application. --->
    <cfcatch type="database">
      <cfoutput>
        This application encountered an error<br>
        Please contact support.
      </cfoutput>
      <cflog file="#This.Name#" type="error"
        text="cfdocexamples DB not available. message: #cfcatch.message#
        Detail: #cfcatch.detail# Native Error: #cfcatch.NativeErrorCode#" >
      <cfreturn False>
    </cfcatch>
  </cftry>
  <cflog file="#This.Name#" type="Information" text="Application Started">
  <!--- You do not have to lock code in the onApplicationStart method that sets Application scope variables. --->
  <cfscript>
    Application.availableResources=0;
    Application.counter1=1;
  </cfscript>
  <cfreturn True>
</cffunction>
```

### onCFCRequest

**Description**
Intercepts any HTTP or AMF calls to an application based on CFC request.

**Syntax**
```cfml
<cffunction name="onCFCRequest" returnType="void">
  <cfargument type="string" name="cfcname">
  <cfargument type="string" name="method">
  <cfargument type="struct" name="args">
</cffunction>
```

**See also**
- [Method summary](#method-summary)
- Handling errors in Application.cfc in the *Developing ColdFusion Applications*
Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfcname</td>
<td>Fully qualified dotted path to the CFC.</td>
</tr>
<tr>
<td>method</td>
<td>The name of the method invoked.</td>
</tr>
<tr>
<td>args</td>
<td>The arguments (struct) with which the method is invoked.</td>
</tr>
</tbody>
</table>

Usage
Whereas onRequest handles only requests made to ColdFusion templates, this function controls Ajax, Web Service, and Flash Remoting requests.

Example
Create a folder onCFCRequest in your web root. Place test.cfc and Application.cfm in this directory and make an HTTP call to the CFC using the following URL:

http://localhost:8500/onCFCRequest/test.cfc?method=foo&arg1=1&arg2=2&arg3=3

When you run the URL, the method onCFCRequest is called and the function name foo is passed along with the arguments arg1, arg2, and arg3.

You can then invoke the test.cfc as shown in the following example:

<!--- Application.cfc --->
<cfcomponent>
  <cfset this.name = "oncfcRequest">
  <cffunction name="onCFCRequest">
    <cfargument type="string" name="cfcname" required=true>
    <cfargument type="string" name="method" required=true>
    <cfargument type="struct" name="args" required=true>
    <cflog text="oncfcRequest()">
    <cfdump var="#arguments#" output="console" format="text">
    <cfinvoke
      component = "arguments.cfcname"
      method = "arguments.method"
      returnVariable = "result"
      argumentCollection = "#arguments.args#">
      <cfdump var="#result#" output="console" format="text">
    </cffunction>
  </cffunction>
  <cffunction name="onRequest" output="yes" access="remote">
    <cfargument type="string" name="targetpage">
    <cflog text="onRequest()">
  </cffunction>
</cfcomponent>

<!--- test.cfc --->
<cfcomponent>
  <cffunction name="foo">
    <cfargument name="arg1" type="string" />
    <cfargument name="arg2" type="string" />
    <cfargument name="arg3" type="string" />
    <creturn arguments>
  </cffunction>
</cfcomponent>
onError

Description
Runs when an uncaught exception occurs in the application.

Syntax
<cffunction name="onError" returnType="void">
  <cfargument name="Exception" required=true/>
  <cfargument name="EventName" type="String" required=true/>
  ...
</cffunction>

See also
Method summary, Handling errors in Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exception</td>
<td>The ColdFusion Exception object. For information on the structure of this object, see the description of the cfcatch variable in the cfcatch description.</td>
</tr>
<tr>
<td>EventName</td>
<td>The name of the event handler that generated the exception. If the error occurs during request processing and you do not implement an onRequest method, EventName is the empty string.</td>
</tr>
</tbody>
</table>

Returns
This method does not return a value; do not use the cfreturn tag.

Usage
Use this method to handle errors in an application-specific manner. This method overrides any error handlers that you set in the ColdFusion Administrator or in cferror tags. It does not override try/catch blocks.

Whether the onError method can display output depends on where the error takes place, as follows:

- The onError method can display a message to the user if an error occurs during an onApplicationStart, onSessionStart, onRequestStart, onRequest, or onRequestEnd event method, or while processing a request.
- The onError method cannot display output to the user if the error occurs during an onApplicationEnd or onSessionEnd event method, because there is no available page context; however, it can log an error message.

If the onError event handler is triggered by a scope-specific event method, such as onSessionStart, the error prevents further processing at the level of that scope and any lower scopes. An onError event triggered by an onSessionStart method, for example, prevents further processing in the session, but not in the application.

If an exception occurs while processing the onError method, or if the onError method uses a cfthrow tag, the ColdFusion standard error handling mechanisms handle the exception. These mechanisms include: any error handlers specified by cferror tags in the Application.cfc initialization code, the site-wide error handler specified in the ColdFusion Administrator, and ColdFusion default error page. Therefore, you can use the onError method as a filter to handle selected errors, and use other ColdFusion error-handling techniques for the remaining errors.
Example
<cffunction name="onError">
  <cfargument name="Exception" required=true/>
  <cfargument type="String" name="EventName" required=true/>
  <!--- Log all errors. --->
  <cflog file="#This.Name#" type="error" text="Event Name: #Arguments.EventName#" >
  <cflog file="#This.Name#" type="error" text="Message: #Arguments.Exception.message#">
  <cflog file="#This.Name#" type="error"
    text="Root Cause Message: #Arguments.Exception.rootcause.message#">
  </cflog>
  <!--- Display an error message if there is a page context. --->
  <cfif NOT (Arguments.EventName IS "onSessionEnd") OR (Arguments.EventName IS "onApplicationEnd")>
    <cfoutput>
      <h2>An unexpected error occurred.</h2>
      <p>Please provide the following information to technical support:</p>
      <p>Error Event: #Arguments.EventName#/p>
      <p>Error details:<br>
      <cfdump var=#Arguments.Exception#></p>
    </cfoutput>
  </cfif>
</cffunction>

onMissingTemplate

Description
Runs when a request specifies a non-existent CFML page.

Syntax
<cffunction name="onMissingTemplate" returnType="boolean">
  <cfargument type="string" name="targetPage" required=true/>
  ...
  <cfreturn BooleanValue />
</cffunction>

See also
Method summary, Handling errors in Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetPage</td>
<td>The path from the web root to the requested CFML page.</td>
</tr>
</tbody>
</table>

Returns
A Boolean value. True or no return value specifies that the event has been processed. False specifies that the event was not processed.
Usage

ColdFusion invokes this method when it encounters a file not found condition, that is, when a URL specifies a CFML page that does not exist.

The `onMissingTemplate` function must return `true` to indicate that the event has been processed, or return `false` to indicate that the event has not been processed. If the function does not return a value, it is assumed to be `true`. If the function returns `false`, ColdFusion invokes the standard error handler. If an error occurs within the `onMissingTemplate` function, the error handler is not invoked. Therefore, you must use try/catch blocks in your missing template handler and, if the catch block cannot handle the error, it must set the function return value to `false` so the standard error handler can report the error.

If the `onMissingTemplate` function is invoked, the `onApplicationStart` and `onSessionStart` event handlers are first invoked, if appropriate, but the `onRequestStart`, `onRequest` and `onRequestEnd` handlers are not invoked, and processing of the request terminates when the `onMissingTemplate` handler returns.

All standard scopes, including the Application, Session, and Client scopes, are available in the `onMissingTemplate` function, if they are enabled.

To include the contents of a page in the `onMissingTemplate` function, use the `cfinclude` tag. Do not any other method to include or redirect other page content, including tags and functions such as `cflocation`, `GetPageContext().forward()`, and `GetPageContext().include()`.

Use the `This.welcomeFileList` variable to keep this function from executing if all of the following are true:

- Your web server uses a welcome file list with one or more CFML files (such as index.cfm), that it tries to access when a user enters a URL that ends with a directory name
- The web server sends a request for a CFML page on the welcome list to ColdFusion without first determining if the page exists.
- You want to allow users to browse web directories that do not have any files on the list.

For more information, see `welcomeFileList` in Application variables.
Example
<!--- The web.xml welcome-file-list includes index.cfm. 
To allow web browsing, specify index.cfm in This.welcomeFileList. --->
<cfset This.welcomeFileList="index.cfm">

<cffunction name="onMissingTemplate">
  <!--- Use a try block to catch errors. --->
  <cftry>
    <!--- Log all errors. --->
    <cflog type="error" text="Missing template: #Arguments.targetPage#"/>
    <!--- Display an error message. --->
    <cfoutput>
      <h3>#Arguments.targetPage# could not be found.</h3>
      <p>You requested a non-existent ColdFusion page.<br />
      Please check the URL.</p>
    </cfoutput>
    <cfreturn true />
  </cftry>
  <!--- If an error occurs, return false and the default error
      handler will run. --->
  <cfcatch>
    <cfreturn false />
  </cfcatch>
</cftry>
</cffunction>

onRequest

Description
Runs when a request starts, after the onRequestStart event handler. If you implement this method, it must explicitly call the requested page to process it.

Syntax
<cffunction name="onRequest" returnType="void">
  <cfargument name="targetPage" type="String" required=true/>
  ...
  <cfinclude template="#Arguments.targetPage#"/>
  ...
</cffunction>

See also
onRequestStart, onRequestEnd, Method summary, Managing requests in Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetPage</td>
<td>Path from the web root to the requested page.</td>
</tr>
</tbody>
</table>
Returns
This method does not return a value; do not use the cfreturn tag.

Usage
This event handler provides an optional request filter mechanism for CFML page requests (that is, .cfm pages requested using a browser). Use it to intercept requests to target pages and override the default behavior of running the requested pages. The following rules specify where and how you use the onRequest method.

- Implement this method only if the following are true:
  - The directory, and any subdirectories affected by this Application.cfc contain CFM files. The affected directory and subdirectories do not contain any CFC files that are intended to be accessed as web services, AJAX bind, using Flash Remoting, or using an event gateway.
  - You want to intercept the request and process it in a special way.
- If you do not implement this method, ColdFusion automatically calls the target page (or the CFC for a web service, Flash Remoting, or event gateway event).
- If you implement this method, it must explicitly call the target page, normally by using a cfinclude tag.
- Do not implement the onRequest method in any Application.cfc file that affects .cfc files that implement web services, process Flash Remoting or event gateway requests; ColdFusion does not execute the requests if you implement this method.
- Code in this method that precedes the call to the target page can perform the same functions as the onRequestStart method, and shares the Variables scope with the target page.
- Code in this method that follows the call to the target page can perform the same functions as the onRequestEnd method, and shares the Variables scope with the target page.
- If you implement this method, you can also implement the onRequestStart and onRequestEnd methods.

You can use this method to do preprocessing that is required for all requests. Typical uses include filtering and modifying request page contents (such as removing extraneous white space), or creating a switching mechanism that determines the exact page to display based on available parameters.

Example
<cffunction name="onRequest">
  <cfargument name="targetPage" type="String" required=true/>
  <cfset var content="">
  <cfsavecontent variable="content">
    <cfinclude template="#Arguments.targetPage#">
  </cfsavecontent>
  <cfoutput>
    #replace(content, "report", "MyCompany Quarterly Report", "all")#
  </cfoutput>
</cffunction>

onRequestEnd

Description
Runs at the end of a request, after all other CFML code.
Syntax
<cffunction name="onRequestEnd" returnType="void">
  <cfargument type="String" name="targetPage" required=true/>
  ...
</cffunction>

See also
onRequestStart, onRequest, Method summary, Managing requests in Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetPage</td>
<td>Path from the web root to the requested page.</td>
</tr>
</tbody>
</table>

Returns
This method does not return a value; do not use the cfreturn tag.

Usage
This method has the same purpose as the onRequestEnd.cfm page. (You cannot use an onRequestEnd.cfm page if you have an Application.cfc file for your application.) This method runs before the request terminates; therefore, it can access the page context, and can generate output.

This method can be useful for gathering performance metrics, or for displaying dynamic footer information.

This method can access the requested page's Variables scope only if the Application.cfc file includes an onRequest method that calls the page. You can use Request scope variables to share data with the requested page, even if the Application.cfc file does not have an onRequest method.

If you call this method explicitly, ColdFusion does not end the request, but does execute the method code.

Example
The following example displays one of two footer pages depending on whether the user has logged in:

The onRequestEnd method in Application.cfc contains the following code:

```coldfusion
<cffunction name="onRequestEnd">
  <cfargument type="String" name="targetPage" required=true/>
  <cfset theAuthuser=getauthuser()>
  <cfif theAuthUser NEQ ">
    <cfinclude template="authuserfooter.cfm">
  <cfelse>
    <cfinclude template="noauthuserfooter.cfm">
  </cfif>
</cffunction>
```

A simple authuserfooter.cfm page consists of the following code:

```coldfusion
<cfoutput>
  <h3>Thank you for shopping at our store, #theAuthUser#!</h3>
</cfoutput>
```

A simple noauthuserfooter.cfm page consists of the following code:
<cfoutput>
  <h3>Remember, only registered users get all our benefits!</h3>
</cfoutput>

To test this example, implement code for logging in a user, or try the example with and without the following line in the onRequestStart Application.cfc method:

<cfloginuser name="Robert Smith" password="secret" roles="customer">

## onRequestStart

### Description

Runs when a request starts.

### Syntax

```coldfusion
<cffunction name="onRequestStart" returnType="boolean">
  <cfargument type="String" name="targetPage" required=true/>
  ...
  <cfreturn Boolean>
</cffunction>
```

### See also

onRequest, onRequestEnd, Method summary, Managing requests in Application.cfc in the Developing ColdFusion Applications

### Parameters

ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetPage</td>
<td>Path from the web root to the requested page.</td>
</tr>
</tbody>
</table>

### Returns

A Boolean value. Return False to prevent ColdFusion from processing the request. You do not need to explicitly return a True value if you omit the cffunction tag returnType attribute.

### Usage

This method runs at the beginning of the request. It is useful for user authorization (login handling), and for request-specific variable initialization, such as gathering performance statistics.

If this method throws an exception (for example, if it uses the cfthrow tag), ColdFusion handles the error and does not process the request further.

If you call this method explicitly, ColdFusion does not start a request, but does execute the method code.

This method can access the requested page's Variables scope only if the Application.cfc file includes an onRequest method that calls the page. You can use Request scope variables to share data with the requested page even if Application.cfc does not have an onRequest method.
Example
This example uses the authentication code generated by the ColdFusion Dreamweaver Login wizard to ensure that the user is logged in. The wizard generates code that is appropriate for Application.cfm only. To use this code with the Application.CFC, delete the generated Application.CFM

```coldfusion
<cffunction name="onRequestStart">
  <cfargument name="requestname" required=true/>
  <!--- Authentication code, generated by the Dreamweaver Login wizard.--->
  <cfinclude template="mm_wizard_application_include.cfm">
  <!--- Regular maintenance is done late at night. During those hours, tell people to come back later, and do not process the request further. --->
  <cfscript>
    if ((Hour(now()) gt 1) and (Hour(now()) lt 3)) {
      WriteOutput("The system is undergoing periodic maintenance. Please return after 3:00 AM Eastern time.");
      return false;
    } else {
      this.start=now();
      return true;
    }
  </cfscript>
</cffunction>
```

onSessionEnd

Description
Runs when a session ends.

Syntax
```coldfusion
<cffunction name="onSessionEnd" returnType="void">
  <cfargument name="SessionScope" required=True/>
  <cfargument name="ApplicationScope" required=False/>
  ...
</cffunction>
```

See also
onSessionStart, Method summary
Managing sessions in Application.cfc in the Developing ColdFusion Applications

Parameters
ColdFusion passes the following parameters to the method:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionScope</td>
<td>The Session scope</td>
</tr>
<tr>
<td>ApplicationScope</td>
<td>The Application scope</td>
</tr>
</tbody>
</table>

Returns
This method does not return a value; do not use the `cfreturn` tag.
Usage
Use this method for any clean-up activities when the session ends. A session ends when the session is inactive for the session time-out period. You can, for example, save session-related data, such as shopping cart contents or whether the user has not completed an order, in a database, or do any other required processing based on the user’s status. You might also want to log the end of the session, or other session-related information, to a file for diagnostic use.

If you call this method explicitly, ColdFusion does not end the session; it does execute the method code, but does not lock the Session.

You cannot use this method to display data on a user page, because it is not associated with a request.

You can access shared scope variables as follows:

- Use the SessionScope parameter to access the Session scope. You cannot reference the Session scope directly; for example, use Arguments.SessionScope.myVariable, not Session.myVariable.

- You must use the ApplicationScope parameter to access the Application scope. You cannot reference the Application scope directly; for example, use Arguments.ApplicationScope.myVariable, not Application.myVariable. Use a named lock when you reference variables in the Application scope, as shown in the example.

- You can access the Server scope directly; for example, Server.myVariable.

- You cannot access the Request scope.

Sessions do not end, and the onSessionEnd method is not called when an application ends. The onSessionEnd does not execute if there is no active application, however.

Example
The following method decrements an Application scope session count variable and logs the session length.

```coldfusion
<cffunction name="onSessionEnd">
  <cfargument name = "SessionScope" required=true/>
  <cfargument name = "AppScope" required=true/>
  <cfset var sessionLength = TimeFormat(Now() - SessionScope.started, "H:mm:ss")>
  <cflock name="AppLock" timeout="5" type="Exclusive">
    <cfset Arguments.AppScope.sessions = Arguments.AppScope.sessions - 1>
  </cflock>
  <cflog file="#This.Name#" type="Information"
    text="Session #Arguments.SessionScope.sessionid# ended. Length: #sessionLength#
    Active sessions: #Arguments.AppScope.sessions#">
</cffunction>
```

**onSessionStart**

Description
Runs when a session starts.

Syntax
```coldfusion
<cffunction name="onSessionStart" returnType="void">
  ...
</cffunction>
```
See also
onSessionEnd, Method summary, Managing sessions in Application.cfc in the Developing ColdFusion Applications

Returns
This method does not return a value; do not use the cfreturn tag.

Usage
This method is useful for initializing Session scope data, such as a shopping cart, or setting session-specific Application scope variables, such as for tracking the number of active sessions. You need not lock the Session scope to set its variables using this method.

If you call this method explicitly, ColdFusion does not start a session; it does execute the method code, but does not lock the Session scope.

This method can access the requested page’s Variables scope only if the Application.cfc file includes an onRequest method that calls the page.

Example
The following onSessionStart example initializes some Session scope variables and increments an Application scope counter of active sessions.

```cfml
<cffunction name="onSessionStart">
  <cfscript>
    Session.started = now();
    Session.shoppingCart = StructNew();
    Session.shoppingCart.items = 0;
  </cfscript>
  <cflock scope="Application" timeout="5" type="Exclusive">
    <cfset Application.sessions = Application.sessions + 1>
  </cflock>
</cffunction>
```

onServerStart

ColdFusion now supports a CFC with an onServerStart method that runs only when the server starts. The onServerStart method takes no parameters, and is the only function in the CFC. The function is useful for application-independent tasks, such as instantiating the applications, configuring logging, or setting up the scheduler.

By default, ColdFusion looks for the onServerStart method in cf_webroot/Server.cfc. To specify a different filepath:

1. Launch ColdFusion Administrator.
2. Click ColdFusion Administrator Server Settings > Settings.
3. Specify the absolute filepath under the web root on the Settings page such as c:\Server.cfc. Alternatively, you can use a dot-delimited path under the web root, such as a.b.Server.

   **Note:** If you use an absolute path, the filename must end with .cfc. If you use a relative path or dotted path, do not end the name with the .cfc suffix.

You select an option on the Settings page to enable and disable the onServerStart method. By default, the method is disabled.
You can also specify a timeout limit (in seconds) for the onServerStart method. The timeout limit determines the duration for which the method would be allowed to run during server start up. This setting can be specified in server.cfc.

The onServerStart method can use most CFML features, but not any features that require full server start. For example, the method cannot use a cfhttp tag with a URL that specifies a location on the same server. You also cannot use Application or Request scope variables in the method.

By default, all errors, including any serverCFC errors, are logged in <ColdFusion_home>/WEB-INF/cfusion/logs directory for standalone and <appserver_root>/logs directory for J2EE configurations.

You can also specify a different location for logging by configuring the log directory setting in ColdFusion Administrator > Debugging and Logging > Logging Settings.

The server.log file contains server startup information. So, any server.CFC startup errors are logged in it, but for details about the error, you have to see the exception.log file. In addition, server startup information is logged in {appserver_root}/logs directory.

For WebSphere, it is logged in the SystemOut.log file.
Chapter 9: ColdFusion Event Gateway Reference

Java interfaces are available for building ColdFusion custom CFXs in Java.

*Note: The following CFML functions also apply to gateway application development:* GetGatewayHelper, SendGatewayMessage.

Gateway development interfaces and classes

The ColdFusion event gateway system is defined in the coldfusion.eventgateway package. Gateway developers implement two interfaces and use several classes, as follows:

More Help topics
“Gateway interface” on page 1588
“GatewayHelper interface” on page 1598
“GatewayServices class” on page 1598
“CFEvent class” on page 1602
“Logger class” on page 1615

Gateway interface

coldfusion.eventgateway.Gateway

Interface for implementing ColdFusion event gateways.

A class that implements this interface defines a ColdFusion event gateway type that you can use in ColdFusion applications. The class must implement the following methods:

<table>
<thead>
<tr>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatewayName([String id[, StringconfigFile]])</td>
<td>The gateway constructor.</td>
</tr>
<tr>
<td>String getGatewayID()</td>
<td>Returns the gateway ID.</td>
</tr>
<tr>
<td>GatewayHelper getHelper()</td>
<td>Returns an instance of the GatewayHelper class for this gateway type. instance, or null if the gateway does not have a GatewayHelper class.</td>
</tr>
<tr>
<td>int getStatus()</td>
<td>Gets the event gateway status.</td>
</tr>
<tr>
<td>String outgoingMessage(coldfusion.eventgateway.CFEvent cfmessage)</td>
<td>Handles a message sent by ColdFusion and processes it to send to a message receiver.</td>
</tr>
<tr>
<td>void restart()</td>
<td>Restarts a running event gateway.</td>
</tr>
</tbody>
</table>
Constructor

Description
Instantiates a gateway.

Category
Event Gateway Development

Syntax
public void gatewayName()
public void gatewayName(String id)
public void gatewayName(String id, String configFile)

See also
setGatewayID, Class constructor in the Developing ColdFusion Applications.

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The identifier for the gateway instance</td>
</tr>
<tr>
<td>configFile</td>
<td>The absolute path to the gateway configuration file.</td>
</tr>
</tbody>
</table>

Usage
If your gateway requires a configuration file, use the constructor with two parameters. Otherwise, you can use either the default constructor or the single parameter version; ColdFusion always uses the setGatewayID method to set the ID.

Example
The following example shows the two argument constructor implemented in the ColdFusion SocketGateway class:

```
void setCFCListeners(String[] listeners)
Identifies the CFCs that listen for incoming messages from the event gateway.

void setGatewayID(String id)
Sets the gateway ID that uniquely identifies the Gateway instance.

void start()
Starts the event gateway.

void stop()
Stops the event gateway.
```
public SocketGateway(String id, String configpath) {
    propsFilePath=configpath;
    try {
        FileInputStream propsFile = new FileInputStream(propsFilePath);
        properties.load(propsFile);
        propsFile.close();
        this.loadProperties();
    } catch (FileNotFoundException f) {
        // do nothing. use default value for port.
    } catch (IOException e) {
        e.printStackTrace();
    }
    gatewayID = id;
    gatewayService = GatewayServices.getGatewayServices();
}

getGatewayID

Description
Returns the gateway ID that identifies the Gateway instance.

Category
Event Gateway Development

Syntax
public String getGatewayID()

See also
setGatewayID, Providing Gateway class service and information routines in the Developing ColdFusion Applications.

Usage
This method returns a string value that is set by the setGatewayID method.

Example
The following example is the ColdFusion SocketGateway class getGatewayID method:

```java
public String getGatewayID() {
    return gatewayID;
}
```

getHelper

Description
Returns an instance of the gatewayHelper class, if any for the gateway type.
Category
Event Gateway Development

Syntax
public GatewayHelper getHelper()

See also
GatewayHelper interface; Providing Gateway class service and information routines in the Developing ColdFusion Applications.

Returns
A coldfusion.eventgateway.GatewayHelper class instance, or null if the gateway does not have a GatewayHelper class.

Usage
ColdFusion calls this method when a ColdFusion application calls the CFML GetGatewayHelper function. The application then uses the gatewayHelper object methods to call gateway-specific utility methods, such as instant message buddy management methods.

Example
The following example is the ColdFusion SocketGateway class getHelper method:

```java
public GatewayHelper getHelper()
{
    // SocketHelper class implements the GatewayHelper interface
    return new SocketHelper();
}
```

getStatus

Description
Returns the gateway status.

Category
Event Gateway Development

Syntax
public int getStatus()

See also
Providing Gateway class service and information routines in the Developing ColdFusion Applications

Returns
An integer status value. The Gateway interface defines the following status constants:

- STARTING
- RUNNING
- STOPPING
Example
The following example is the ColdFusion SocketGateway class `getStatus` method:

```java
public int getStatus()
{
    return status;
}
```

### outgoingMessage

**Description**
Sends a message from ColdFusion to a message receiver.

**Category**
Event Gateway Development

**Syntax**

```java
public String outgoingMessage(coldfusion.eventgateway.CFEvent message)
```

**See also**
Responding to a ColdFusion function or listener CFC in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>A <code>coldfusion.eventgateway.CFEvent</code> instance containing the message to be sent.</td>
</tr>
</tbody>
</table>

**Returns**
A gateway-specific string, such as a message ID or a status indicator.

**Usage**
This method handles a message sent by ColdFusion and processes it as needed by the gateway type to send a message to the (usually external) message receiver. ColdFusion calls this method when the listener method of a listener CFC returns a message or when a ColdFusion application calls the `SendGatewayMessage` function. ColdFusion passes the String returned by this method back as the return value of a CFML `SendGatewayMessage` function.

**Example**
The following example is the ColdFusion SocketGateway class `outgoingMessage` method:
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg) {
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null && message != null) {
        SocketServerThread st =
            ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID()));
        if (st != null)
            st.writeOutput(message);
        else {
            log.error("Cannot send outgoing message. OriginatorID '" +
                cfmsg.getOriginatorID() + "' is not a valid socket id.");
            retcode="failed";
        }
    }
    else if (data.get("OriginatorID") != null && message != null) {
        SocketServerThread st =
            ((SocketServerThread)socketRegistry.get(data.get("OriginatorID")));
        if (st != null)
            st.writeOutput(message);
        else {
            log.error("Cannot send outgoing message. OriginatorID '" +
                data.get("OriginatorID") + "' is not a valid socket id.");
            retcode="failed";
        }
    }
    else {
        log.error("Cannot send outgoing message. OriginatorID/MESSAGE is not
            available.");
        retcode="failed";
    }
    return retcode;
}

restart

Description
Stops a gateway if it is running and starts it up.

Category
Event Gateway Development

Syntax
public void restart()
See also
start, stop

Usage
In most cases, you implement this method as a call to the stop method followed by a start method, but you may be able to optimize the restart method based on the type of gateway.

Example
The following example is the ColdFusion SocketGateway class restart method:

```java
public void restart()
{
    stop();
    start();
}
```

**setCFCListeners**

**Description**
Sets the array of listener CFCs that the gateway sends messages to.

**Category**
Event Gateway Development

**Syntax**

```java
public void setCFCListeners(String[] listeners)
```

See also
Constructor, getGatewayID, setCFCPath, Providing Gateway class service and information routines in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listeners</td>
<td>Array of absolute file paths to CFCs to which the gateway forwards messages when it gets events.</td>
</tr>
</tbody>
</table>

**Usage**
When ColdFusion starts a gateway instance, it calls this method with the names in the instance's listener list in the ColdFusion Administrator. ColdFusion can also call this method if the ColdFusion Administrator listener list changes while the gateway is running.

**Example**
The following example is the ColdFusion SocketGateway class setCFCListeners method:
public void setCFCListeners(String[] listeners)  
{  
    ArrayList aListeners = new ArrayList();  
    for(int i = 0; i<listeners.length; i++)  
    {  
        aListeners.add(listeners[i]);  
    }  
    // Try not to pull the rug out from underneath a running message  
    synchronized (cfcListeners)  
    {  
        cfcListeners = aListeners;  
    }  
}

setGatewayID

Description
Sets the gateway ID that uniquely identifies the Gateway instance.

Category
Event Gateway Development

Syntax
public void setGatewayID(String id)

See also
Constructor, getGatewayID, Providing Gateway class service and information routines in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The identifier for this gateway instance.</td>
</tr>
</tbody>
</table>

Usage
This method sets a string value that is returned by the getGatewayID method. ColdFusion calls this method to set the gateway ID with the value specified in the gateway instance configuration in the ColdFusion Administrator before it starts the event gateway, even if the Gateway constructor also sets the ID.

Example
The following example is the ColdFusion SocketGateway class setGatewayID method:

```java
public void setGatewayID(String id)  
{  
    gatewayID = id;  
}  ```

Last updated 7/9/2012
start

Description
starts a gateway running.

Category
Event Gateway Development

Syntax
public void start()

See also
restart, stop, Starting, stopping, and restarting the event gateway in the Developing ColdFusion Applications

Usage
Start a gateway by performing any required initialization. This method starts any listener thread or threads that monitor the gateway's event source. The ColdFusion Administrator calls this function when it starts a gateway instance.

This method should update the status information that is returned by the getStatus method to indicate when the gateway is starting and when the gateway is running.

The ColdFusion Administrator Gateway Types page lets you specify a time-out for the gateway startup, and whether to kill the gateway on startup time-out. If you enable the kill option and the start method does not return in the time-out period, ColdFusion kills the thread that called this function.

Example
The following example is the ColdFusion SocketGateway class restart method:

```java
public void start()
{
    status = STARTING;
    listening=true;
    // Start up event generator thread
    Runnable r = new Runnable()
    {
        public void run()
        {
            socketServer();
        }
    }; Thread t = new Thread(r);
    t.start();
    status = RUNNING;
}
```
stop

Description
Stops a gateway if it is running.

Category
Event Gateway Development

Syntax
public void stop()

See also
restart, start, Starting, stopping, and restarting the event gateway in the Developing ColdFusion Applications

Usage
Stops a gateway by performing any required clean-up operations. This method stops any listener thread or threads that monitor the gateway’s event source and releases any other resources. The ColdFusion Administrator calls this function when it stops a gateway instance.

This method should update the status information that is returned by the getStatus method to indicate when the gateway is stopping and when the gateway is stopped.

Example
The following example is the ColdFusion SocketGateway class stop method:

```java
public void stop()
{
    status = STOPPING;
    listening=false;
    Enumeration e = socketRegistry.elements();
    while (e.hasMoreElements()) {
        try {
            ((SocketServerThread)e.nextElement()).socket.close();
        }
        catch (IOException e1) {
            e1.printStackTrace();
        }
    }
    if (serverSocket != null) {
        try {
            serverSocket.close();
        }
        catch (IOException e1) {
        } catch (IOException e1) {
            serverSocket = null;
        }
    }
    status = STOPPED;
}
```
GatewayHelper interface

coldfusion.eventgateway.GatewayHelper

ColdFusion includes a coldfusion.eventgateway.GatewayHelper Java marker interface, with no methods. Implement this interface to define a class that provides gateway-specific utility methods to the ColdFusion application or listener CFC. For example, an instant messaging event gateway might use a helper class to provide buddy list management methods to the application. The Gateway class must implement a `getHelper` method that returns the helper class, or null if you do not implement the interface.

For information on GatewayHelper classes, see GatewayHelper class.

GatewayServices class

coldfusion.eventgateway.GatewayServices

The Gateway class uses the coldfusion.eventgateway.GatewayServices class to interact with the ColdFusion event gateway services. This class has the following methods:

<table>
<thead>
<tr>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatewayServices <code>getGatewayServices()</code></td>
<td>Static method that returns the GatewayServices object.</td>
</tr>
<tr>
<td><code>boolean addEvent(CFEvent msg)</code></td>
<td>Sends a CFEvent instance to ColdFusion for dispatching to a listener CFC.</td>
</tr>
<tr>
<td><code>coldfusion.eventgateway.Logger </code>getLogger([[String logfile]])`</td>
<td>Returns a ColdFusion logger object that the event gateway can use to log information in a file.</td>
</tr>
<tr>
<td><code>int getMaxQueueSize()</code></td>
<td>Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion Administrator.</td>
</tr>
<tr>
<td><code>int getMaxQueueSize()</code></td>
<td>Returns the current size of the ColdFusion event queue that handles all messages for all gateways.</td>
</tr>
</tbody>
</table>

getGatewayServices

Description
Static method that returns the GatewayServices object. Gateway code can call this method at any time, if necessary.

Category
Event Gateway Development

Syntax
`GatewayServices getGatewayServices()`

See also
GatewayServices class in the Developing ColdFusion Applications

Returns
The GatewayServices object.
Usage
Gateway constructors can call this method to get a convenient reference to the GatewayServices class and its methods.

Example
The following Socket gateway constructor code sets the GatewayServices variable:

```java
public SocketGateway(String id)
{
    gatewayID = id;
    gatewayService = GatewayServices.getGatewayServices();
}
```

Calls to GatewayServices methods, such as the following, use the returned value.

```java
boolean sent = gatewayService.addEvent(event);
```

### addEvent

**Description**
Sends a CFEvent instance to ColdFusion for dispatching to a listener CFC.

**Category**
Event Gateway Development

**Syntax**

```java
boolean addEvent(CFEvent msg)
```

**See also**
`getMaxQueueSize`, `getMaxQueueSize`, Responding to incoming messages in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>The CFEvent object containing the message to be queued for delivery to the listener CFC.</td>
</tr>
</tbody>
</table>

**Returns**
True if the event was added to the gateway services queue for delivery, false, otherwise. Therefore, a true response does not indicate that the message was delivered.

**Usage**
The event gateway must use this method to send incoming messages to the application for processing.

**Example**
The following example from the ColdFusion SocketGateway code sends an event to all listener CFCs:
for (int i = 0; i < listeners.length; i++) {
    String path = listeners[i];
    CFEEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeout(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
    if (!sent)
        log.error("SocketGateway(" + gatewayID + ") Unable to put message on
        event queue. Message not sent from " + gatewayID + ", thread " +
        theKey + ". Message was " + theInput);
}

**getLogger**

**Description**
Returns a ColdFusion Logger object that the event gateway can use to log information in a file.

**Category**
Event Gateway Development

**Syntax**
coldfusion.eventgateway.Logger getLogger([String logfile])

**See also**
Logger class, Logging events and using log files in the *Developing ColdFusion Applications*

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logfile</td>
<td>The name, without an extension, of a log file in the ColdFusion logs directory. ColdFusion automatically appends a .log extension to the name. If the file does not exist, ColdFusion creates it when it logs the first message. By default, ColdFusion logs to the eventgateway.log file.</td>
</tr>
</tbody>
</table>

**Returns**
A ColdFusion logger object

**Usage**
The Logger class has five methods: debug, info, warn, error, and fatal, that correspond to the severity level that is set in the log message. Each method takes a message string, a Throwable class object, or both.

If you pass a Throwable object to these methods, ColdFusion writes the exception information in the exceptions.log file.
Example
The ColdFusion example DirectoryWatcherGateway includes the following line in the constructor to get a logger object:

```java
// We create our own log file, which will be named "watcher.log"
logger = gatewayService.getLogger("watcher");
```

The following code, from the start of the routine that loads information from the configuration file, uses this object to log the initialization.

```java
// Load the properties file to get our settings
protected void loadconfig() throws ServiceRuntimeException {
    // load config
    logger.info("DirectoryWatcher (" + gatewayID + ") Initializing
        DirectoryWatcher gateway with configuration file " + config);
```

getMaxQueueSize

Description
Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion Administrator.

Category
Event Gateway Development

Syntax
```java
int getMaxQueueSize()
```

See also
addEvent, getQueueSize

Returns
The integer maximum number of messages that the gateway services queue can hold.

Usage
If the queue length reaches this value, the addEvent method does not add its message to the processing queue. You can use this method and the getQueueSize method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

Example
The following example logs the queue size, maximum queue size, and other information if a gatewayService.addEvent method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)
boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
  logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
  gatewayType, gatewayID, ((path != null) ? path : "default"),
  Integer.ToString(gatewayService.getQueueSize()),
  Integer.ToString(gatewayService.getMaxQueueSize())));
}

**getQueueSize**

**Description**
Returns the current size of the ColdFusion event queue that handles all messages for all gateways.

**Category**
Event Gateway Development

**Syntax**
```java
int getQueueSize()
```

**See also**
addEvent, getMaxQueueSize

**Returns**
The integer number of messages in the gateway message queue that are waiting to be delivered to CFCs.

**Usage**
You can use this method and the `getMaxQueueSize` method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

**Example**
The following example logs the queue size, maximum queue size, and other information if a `gatewayService.addEvent` method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)

boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
  logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
  gatewayType, gatewayID, ((path != null) ? path : "default"),
  Integer.ToString(gatewayService.getQueueSize()),
  Integer.ToString(gatewayService.getMaxQueueSize())));
}

**CFEvent class**
coldfusion.gateway.CFEvent
The Gateway class sends and receives CFEvent instances to communicate with the ColdFusion listener CFC or application. The CFEvent instances correspond to CFML CFEvent structure that ColdFusion application listener CFC methods receive and contain the message structures that ColdFusion application code sends to the gateway.

- The Gateway notifies ColdFusion of a message by sending a CFEvent instance in GatewayServices.addEvent method.
- The Gateway receives a CFEvent instance when ColdFusion calls the gateway’s outgoingMessage method.

The CFEvent Class extends the java.util.Hashtable class and has the following methods:

<table>
<thead>
<tr>
<th>Methods</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFEvent(String gatewayID)</td>
<td>CFEvent constructor.</td>
</tr>
<tr>
<td>String getGatewayID()</td>
<td>Returns the gateway ID (set in the CFEvent constructor).</td>
</tr>
<tr>
<td>void setCFMethod(String method)</td>
<td>Sets or gets the name of the CFC method that receives an incoming message.</td>
</tr>
<tr>
<td>String getCFMethod()</td>
<td></td>
</tr>
<tr>
<td>void setCFPath(String path)</td>
<td>Sets or gets the path to the application listener CFC that processes the event.</td>
</tr>
<tr>
<td>String getCFPath()</td>
<td></td>
</tr>
<tr>
<td>void setCFTimeout(String seconds)</td>
<td>Sets or gets the time-out, in seconds, for the listener CFC to process the event request.</td>
</tr>
<tr>
<td>String getCFTimeout()</td>
<td></td>
</tr>
<tr>
<td>void setData(Map data)</td>
<td>Sets or gets the event data structure, which contains the message contents and any other gateway-specific information.</td>
</tr>
<tr>
<td>Map getData()</td>
<td></td>
</tr>
<tr>
<td>void setGatewayType(String type)</td>
<td>Sets or gets the event gateway type identifier, such as SMS.</td>
</tr>
<tr>
<td>String getGatewayType()</td>
<td></td>
</tr>
<tr>
<td>void setOriginatorID(String id)</td>
<td>Sets or gets the gateway- or protocol-specific Identity of the originator of a message.</td>
</tr>
<tr>
<td>String getOriginatorID()</td>
<td></td>
</tr>
</tbody>
</table>

**CFEvent**

**Description**
CFEvent constructor.

**Category**
Event Gateway Development

**Syntax**
CFEvent(String gatewayID)

**See also**
gatewayID, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayID</td>
<td>The ID of the gateway. This parameter indicates the source of the message and must be the value that is passed in the Gateway constructor or set using the Gateway setGatewayID method. The SMS gateway ID must be 21 characters or fewer.</td>
</tr>
</tbody>
</table>

Usage

This method creates a container for an event gateway message that you send to ColdFusion gateway services in a gatewayServices.addEvent method for delivery to a CFC listener method.

Example

The following example, based on code for the ColdFusion asynchronous CFML gateway, sends a message to the gateway has received to a CFC:

```java
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    // Get the data
    Map data = cfmsg.getData();
    boolean status = true;
    if (data != null)
    {
        // create an event
        CFEvent event = new coldfusion.eventgateway.CFEvent(gatewayID);
        // set the event field values
        event.setGatewayType("CFMLGateway");
        event.setOriginatorID("CFMLGateway");
        event.setData(data);
        // send it to the event service
        status = gatewayService.addEvent(event);
    }
    return new Boolean(status).ToString();
}
```

getCFCMethod

Description

Gets the name of the CFC method that processes the message.

Category

Event Gateway Development

Syntax

```java
String getCFCMethod()
```

See also

getCFCPath, getCFTimeout, setCFCMethod, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications
Returns
For incoming messages, the name of the method that gateway services call in the listener CFC, as set by the
`setCFCMethod` method. If `setCFCMethod` has not been called, returns null, and not `onIncomingMessage`, which
ColdFusion gateway services uses by default. Outgoing messages that are returned by a CFC in response to an
incoming message also have the CFC method name in this field if the gateway set the field on the incoming message.

Usage
Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to
multiple CFC Methods and must determine which method is responding.

getcFCPath

Description
Gets the path to the listener CFC that processes this message.

Category
Event Gateway Development

Syntax
```java
String getCFCTimeout()
```

See also
getcFCMethod, getCFCTimeout, setCFCPath, CFML CFEvent structure, CFEvent class in the Developing ColdFusion
Applications

Returns
An absolute path to the application listener CFC that processes the event, as set by the `setCFCPath` method. If the
`setCFCPath` method has not been called, returns null, not the path specified in the ColdFusion Administrator and
used by default by gateway services. Outgoing messages that are returned by a CFC in response to an incoming
message also have the CFC method name in this field if the gateway set the field on the incoming message.

Usage
Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to
multiple CFCs and must determine which CFC is responding.

getcFCCTimeout

Description
Gets the time-out, in seconds, for the listener CFC to process the event request.

Category
Event Gateway Development
Syntax
String getCFCTimeout()

See also
getCFCMethod, getCFCPath, setCFCTimeout, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

Returns
The listener CFC time-out, in seconds, as set by the setCFCTimeout method, or null.

Usage
Most gateways do not need to use this function.

When ColdFusion calls a listener CFC method to process the event, and the CFC does not process the event in the specified time-out period, ColdFusion terminates the request and logs an error in application.log file. By default ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion Administrator.

dataGet

Description
Returns the data Map that contains the message contents and other gateway-specific information.

Category
Event Gateway Development

Syntax
Map getData()

See also
setData, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

Returns
The event data structure, or null. This structure includes the message contents being passed by the gateway and any other gateway-specific information.

Usage
The contents of the data Map depends on the event gateway type. Typical fields include the message contents, originator ID, destination ID, and if a gateway (such as the ColdFusion SMS gateway) supports multiple commands, the command.

Note: The returned Map object has case-insensitive keys.

Example
The following outgoingMessage method from the SocketGateway example gateway gets the message contents from the CFEvent data field of an outgoing message. If the CFEvent object does not include an OriginatorID field, it also tries to get the originator ID from the data field.
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).
            writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).
            writeOutput(message);
    else { System.out.println("cannot send outgoing message. OriginatorID is not
            available.");
            retcode="failed"; 
    }
    return retcode;
}

getGatewayID

Description
Returns the gateway ID field of the CFEvent object.

Category
Event Gateway Development

Syntax
String getGatewayID(CFEvent event)

See also
cfevent, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

Returns
The gateway ID of the CFEvent object, or null.

Usage
Most gateways do not need to use this method. The gateway ID is set in the CFEvent constructor and normally corresponds to the gateway that is handling the event.

cgetGatewayType

Description
Returns the gateway type field of the CFEvent object.
Category
Event Gateway Development

Syntax

String getGatewayType()

See also

setGatewayType, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

Returns
The gateway type of the CFEvent object, or null.

Usage
Most gateways do not need to use this method.

getOriginatorID

Description
Identifies the originator of an incoming message. Some gateway types also use this field for the destination of an outgoing message.

Category
Event Gateway Development

Syntax

String getOriginatorID()

See also

setOriginatorID, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

Returns
The protocol-specific identifier of the message originator, or null.

Example

The outgoingMessage method of the SocketGateway example gateway uses the getOriginatorID method to determine the destination of an outgoing message. This way, a listener CFC that sends a response back to the originator does not have to explicitly set a destination in the return variable. If the field is empty, (as it is in messages sent by the CFML SendGatewayMessage function) the gateway tries to get the destination from the CFEvent data field.
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg) {
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).writeOutput(message);
    else {
        System.out.println("cannot send outgoing message. OriginatorID is not available.");
        retcode="failed";
    }
    return retcode;
}

setCFCMethod

Description
Sets the name of the CFC method that processes an incoming message.

Category
Event Gateway Development

Syntax
void setCFCMethod(String method)

See also
getCFCMethod, setCFCPath, setCFCTimeout, “CFML CFEvent structure” on page 1620, CFEvent class in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>The method in the listener CFC that ColdFusion calls to process this event. If you do not use this method in your gateway, ColdFusion invokes the onIncomingMessage method.</td>
</tr>
</tbody>
</table>

Usage
Gateways that use a single CFC listener method do not need to use this method if the listener CFC method is named onIncomingMessage. For the sake of consistency, Adobe recommends that any event gateway with a single listener not override this default.

A gateway, such as the ColdFusion XMPP gateway, that uses different listener methods for different message types uses this method to identify the destination method.
Example
The following example code comes from the ColdFusion XMPP gateway incoming message handler. It creates a CFEvent object and sets the method that handles tests based on the message type.

```java
CFEvent cfmsg = new CFEvent(gatewayID);
cfmsg.setOriginatorID(sender);
cfmsg.setGatewayType(gatewayType);
if (messageType == IMessage.IM) {
    // default for normal messages
    cfmsg.setCfcMethod(onIncomingMessageFunction);
} else if (messageType == IMessage.AUTH_REQUEST) {
    cfmsg.setCfcMethod(onAddBuddyRequestFunction);
    message = "Requesting authorization to add " + recipient + " to " + sender + " buddy list and view " + recipient + " presence.;"
} // Code snipped here for brevity.
```

setCFCPath

Description
Specifies the listener CFC that processes this event.

Category
Event Gateway Development

Syntax
```java
void setCFCPath(String path)
```

See also
`getCFCPath, setCFCMethod, setCFCTimeout`, CFEvent class in the *Developing ColdFusion Applications*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>An absolute path to the application listener CFC that processes the event. If you do not call this method in your gateway, ColdFusion uses the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion Administrator.</td>
</tr>
</tbody>
</table>

Usage
By default, ColdFusion delivers messages to the CFC in the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion Administrator.

If your application supports multiple listener CFCs, use this method to set each listener CFC and then call the `gatewayService.addEvent` method to send the event to the CFC.
Example
The following example code is based on the Socket gateway processInput method that takes input from the socket and sends it to the CFC listener methods. The listeners variable contains an array of listener CFCS and is set by the gateway's setCFCListeners method, which ColdFusion calls when it starts the gateway.

```java
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCFCMethod(cfcEntryPoint);
    event.setCFCTimeout(10);
    if (path != null)
        event.setCFCPath(path);boolean sent = gatewayService.addEvent(event);
}
```

**setCFCTimeout**

**Description**
Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request.

**Category**
Event Gateway Development

**Syntax**
void setCFCTimeout(String timeout)

**See also**
getCFCTimeout, setCFCMethod, setCFCPath, CFEvent class in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The CFC time-out period, in seconds.</td>
</tr>
</tbody>
</table>

**Usage**
When ColdFusion calls a listener CFC method to process the event, and the CFC does not return in the specified time-out period, ColdFusion terminates the request and logs an error in the application.log file.

If you do not use this method, ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion Administrator.

Use this method if your messages require a longer or shorter time-out period than standard ColdFusion HTML requests.
Example
The following example code is based on the Socket gateway processInput method that takes input from the socket and sends it to the CFC listener methods. It sets the CFC time-out to 10 seconds.

```java
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeOut(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
}
```

### setData

**Description**
Adds the gateway-specific data, including any message contents, as a Java Map to the CFEvent object

**Category**
Event Gateway Development

**Syntax**

```java
void setData(Map data)
```

**See also**

`getData`, CFML CFEvent structure, CFEvent class in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>The incoming message and any additional gateway-specific event data.</td>
</tr>
</tbody>
</table>

**Usage**

The number of fields and their contents depend on the event gateway type. The Map keys must be strings. Because ColdFusion is not case sensitive, it converts the Map passed in the `setData` method to a case insensitive Map. As a result, do not create entries in the data with names that differ only in case.

**Example**

The following code shows the routine from the example JMS gateway that handles incoming messages. It puts the JMS message ID and contents in a data HashMap, and uses it in the `setData` method:
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + '" to queue.");
    } else {
        log.error("Failed to add message '" + msgID + '" to queue.");
    }
}

setGatewayType

Description
Identifies the type of event gateway.

Category
Event Gateway Development

Syntax
void setGatewayType(String gatewayType)

See also
gatewayType, CFML CFEvent structure, CFEvent class in Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>A gateway type identifier.</td>
</tr>
</tbody>
</table>

Usage
For the sake of consistency, use the same name in this method and in the Type Name field when you add the event
gateway type in the ColdFusion Administrator. Gateway application CFCs that handle multiple gateway types, such as
those in an instant messaging application that handles multiple instant messaging providers, could use this field to
determine the protocol type and any gateway type-specific actions.

Example
The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the
gateway type to JMS:
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + '" to queue.");
    } else {
        log.error("Failed to add message '" + msgID + '" to queue.");
    }
}

setOriginatorID

Description
Identifies the originator of an incoming message.

Category
Event Gateway Development

Syntax
void setOriginatorID(String originatorID)

See also
getOriginatorID, CFML CFEvent structure, CFEvent class in Developing ColdFusion Applications

Parameters
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>originatorID</td>
<td>The gateway or protocol-specific ID of the message originator.</td>
</tr>
</tbody>
</table>

Example
The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the originator ID to the name of the JMS topic that the gateway handles:
```java
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + '" to queue.");
    } else {
        log.error("Failed to add message '" + msgID + '" to queue.");
    }
}
```

### Logger class

coldfusion.eventgateway.Logger

**Note:** This class is in the coldfusion.log package, not the coldfusion.eventgateway package, which contains all other event gateway-related interfaces and classes.

The Logger class logs messages to a file in the ColdFusion logs directory. (You set this directory on the ColdFusion Administrator Logging Settings page.) The coldfusion.eventgateway.GatewayServices.getLogger() method returns an instance of the Logger class. The Logger class has the following methods:

<table>
<thead>
<tr>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug</td>
<td>Writes a debugging message to the log file.</td>
</tr>
<tr>
<td>error</td>
<td>Writes an error message to the log file.</td>
</tr>
<tr>
<td>fatal</td>
<td>Writes a fatal error to the log file.</td>
</tr>
<tr>
<td>info</td>
<td>Writes an informational message to the log file.</td>
</tr>
<tr>
<td>warn</td>
<td>Writes a warning message to the log file.</td>
</tr>
</tbody>
</table>

### debug

**Description**

Writes a log entry with a debugging severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

**Category**

Event Gateway Development

**Syntax**

dbg(String message)
dbg(Throwable th)
dbg(String message, Throwable th)
See also error, fatal, info, warn, getLogger, Logging events and using log files in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to include in the log entry.</td>
</tr>
<tr>
<td>th</td>
<td>A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.</td>
</tr>
</tbody>
</table>

**Usage**

Use this method to send a debugging message to the ColdFusion logging subsystem.

By default, ColdFusion does not write debugging messages to the log file. To have debug messages appear in the log file, change the priority entry in cf_root\lib\neo-logging.xml (in the server configuration) or cf_root\WEB-INF\cfusion\lib\neo-logging.xml (in the J2EE configuration). Change the following entry:

```xml
<var name='priority'>
    <string>information</string>
</var>
```

to the following:

```xml
<var name='priority'>
    <string>debug</string>
</var>
```

With debug priority, ColdFusion writes messages with a severity of “debug” to the log file specified in the getLogger method that returned the Logger instance (or the default log file).

**Example**

The ColdFusion instant messaging gateways use the following line to log information about incoming administrative messages or errors only when debugging priority is on.

```java
// code to process incoming administrative messages or errors
logger.debug(gatewayType + "Gateway (" + gatewayID + ") admin message: " + msg.getMessage());
```

**error**

**Description**

Writes a log entry with an error severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

**Category**

Event Gateway Development

**Syntax**

```java
error(String message)
error(Throwable th)
error(String message, Throwable th)
```
See also debug, fatal, info, warn, getLogger, Logging events and using log files in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to include in the log entry.</td>
</tr>
<tr>
<td>th</td>
<td>A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.</td>
</tr>
</tbody>
</table>

Usage

Use this method to send an error message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “error” to the log file specified in the getLogger method that returned the Logger instance (or the default log file).

Example

The ColdFusion example SocketGateway class includes the following code in the outgoingMessage method. It writes an error message if the message's originator ID does not correspond to an open socket.

```java
SocketServerThread st = ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID()));
if(st != null)
    st.writeOutput(message);
else {
    log.error("Cannot send outgoing message. OriginatorID " +
            cfmsg.getOriginatorID() + " is not a valid socket id.");
    retcode="failed";
}
```

fatal

Description

Writes a log entry with a fatal severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

Category

Event Gateway Development

Syntax

- `fatal(String message)`
- `fatal(Throwable th)`
- `fatal(String message, Throwable th)`

See also debug, error, info, warn, getLogger, Logging events and using log files in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to include in the log entry.</td>
</tr>
<tr>
<td>th</td>
<td>A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.</td>
</tr>
</tbody>
</table>

Usage

Use this method to send a fatal error message to the ColdFusion logging subsystem. ColdFusion writes message with a severity of “fatal” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

info

Description

Writes a log entry with an information severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

Category

Event Gateway Development

Syntax

- `info(String message)`
- `info(Throwable th)`
- `info(String message, Throwable th)`

See also

`debug, error, fatal, warn, getLogger`, Logging events and using log files in the *Developing ColdFusion Applications*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to include in the log entry.</td>
</tr>
<tr>
<td>th</td>
<td>A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory. Not normally used with this method.</td>
</tr>
</tbody>
</table>

Usage

Use this method to send an informational message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “information” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

ColdFusion normally logs all information severity messages. So do not use this severity for debugging messages or for events that happen frequently.

Example

The ColdFusion example DirectoryWatcherGateway class includes the following line at the top of its `loadconfig` method that loads the gateway’s configuration file. It writes a message including the gateway ID and configuration file.
**logger.info**("DirectoryWatcher (" + gatewayID + ") Initializing
    DirectoryWatcher gateway with configuration file " + config");

**warn**

**Description**
Writes a log entry with a warning severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

**Category**
Event Gateway Development

**Syntax**

```java
warn(String message)
warn(Throwable th)
warn(String message, Throwable th)
```

**See also**
`debug`, `error`, `fatal`, `info`, `getLogger`, Logging events and using log files in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message to include in the log entry.</td>
</tr>
<tr>
<td>th</td>
<td>A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.</td>
</tr>
</tbody>
</table>

**Usage**
Use this method to send a warning message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “warning” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

**Example**
The ColdFusion example SocketWatcherGateway class includes the following code in its constructor to load a configuration file. If it cannot load the file, it converts the exception information to a string and logs a warning that includes the gateway ID, and the exception information. It also passes the exception to the `warn` method

```java
propsFilePath=configpath;
try {
    FileInputStream propsFile = new FileInputStream(propsFilePath);
    properties.load(propsFile);
    propsFile.close();
    this.loadProperties();
} catch (IOException e) {
    log.warn("SocketGateway(" + gatewayID + ") Unable to read configuration file
        " + propsFilePath + ": " + e.ToString() + ".Using default port.", e);
}
```

Last updated 7/9/2012
**CFML CFEvent structure**

The CFML listener CFC methods receive messages in the form of a CFEvent structure that corresponds to the [CFEvent class](#) that gateway developers use. This structure has the following fields. Some of the fields might not be used by all gateways. All fields contain text or numeric values except the Data field, which contains a structure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatewayId</td>
<td>The event gateway that sent the event or will handle the outgoing message. The value is the ID of an event gateway instance configured on the ColdFusion Administrator Gateways page. If the application calls the <code>SendGatewayMessage</code> function to respond to the event gateway, it uses this ID as the function’s first parameter.</td>
</tr>
<tr>
<td>Data</td>
<td>A structure containing the event data, including the message. The <strong>Data</strong> structure contents depend on the event gateway type. This field corresponds to the <code>SendGatewayMessage</code> function’s second parameter.</td>
</tr>
<tr>
<td>OriginatorID</td>
<td>The originator of the message. The value depends on the protocol or event gateway type. Some event gateways might require this value in response messages to identify the destination of the response. Identifies the sender of the message.</td>
</tr>
<tr>
<td>GatewayType</td>
<td>The type of event gateway, such as SMS. An application that can process messages from multiple event gateway types can use this field. This value is the gateway type name that is specified by the event Gateway class. It is not necessarily the same as the gateway type name in the ColdFusion Administrator.</td>
</tr>
<tr>
<td>CFCPath</td>
<td>The location of the listener CFC. The listener CFC does not need to use this field.</td>
</tr>
<tr>
<td>CFCMethod</td>
<td>The listener method that ColdFusion invokes to process the event. The listener CFC does not need to use this field.</td>
</tr>
<tr>
<td>CFCTimeout</td>
<td>The time-out, in seconds, for the listener CFC to process the event request. The listener CFC does not need to use this field.</td>
</tr>
</tbody>
</table>

**IM gateway methods and commands**

The XMPP and IBM Sametime gateways implement CFC methods to receive messages, use the gatewayHelper object methods to manage the gateway, and use outgoing message commands to send messages. The following sections describe these methods and commands:

**More Help topics**

“IM Gateway CFC incoming message methods” on page 1620

“IM gateway message sending commands” on page 1628

“IM Gateway GatewayHelper class methods” on page 1629

**IM Gateway CFC incoming message methods**

You write the following CFC methods to handle incoming messages from an XMPP or Lotus Sametime instant messaging gateway.

*Note:* The method names assume a default gateway configuration. ColdFusion lets you change the method names and disable event types in the gateway configuration file.
ColdFusion Event Gateway Reference

### onAddBuddyRequest

**Description**
Handles incoming requests for users to add the gateway user name as one of their buddies.

**Syntax**

```cfml
onAddBuddyRequest(CFEvent)
```

**See also**

`onIncomingMessage`, `onAddBuddyResponse`, `onBuddyStatus`, `onIMServerMessage`

**Parameters**
The method must take one parameter, a CFEvent structure with the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>Gateway type, either XMPP or SAMETIME</td>
</tr>
<tr>
<td>gatewayID</td>
<td>The ID of the gateway instance, as configured in ColdFusion Administrator</td>
</tr>
<tr>
<td>originatorID</td>
<td>The IM ID of the message originator</td>
</tr>
<tr>
<td>cfcMethod</td>
<td>This CFC method; by default, onAddBuddyRequest.</td>
</tr>
<tr>
<td>data.MESSAGE</td>
<td>The message that was sent with the request</td>
</tr>
<tr>
<td>data.SENDER</td>
<td>The sender’s ID; identical to the originatorID field value</td>
</tr>
<tr>
<td>data.RECIPIENT</td>
<td>The recipient’s ID, as specified in the gateway’s configuration file</td>
</tr>
<tr>
<td>data.TIMESTAMP</td>
<td>The date and time when the message was sent</td>
</tr>
</tbody>
</table>

**Returns**
The function can optionally return a value to send a response message. The return structure must contain the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>Gateway type, either XMPP or SAMETIME</td>
</tr>
<tr>
<td>gatewayID</td>
<td>The ID of the gateway instance, as configured in ColdFusion Administrator</td>
</tr>
<tr>
<td>originatorID</td>
<td>The IM ID of the message originator</td>
</tr>
<tr>
<td>cfcMethod</td>
<td>This CFC method; by default, onAddBuddyRequest.</td>
</tr>
<tr>
<td>data.MESSAGE</td>
<td>The message that was sent with the request</td>
</tr>
<tr>
<td>data.SENDER</td>
<td>The sender’s ID; identical to the originatorID field value</td>
</tr>
<tr>
<td>data.RECIPIENT</td>
<td>The recipient’s ID, as specified in the gateway’s configuration file</td>
</tr>
<tr>
<td>data.TIMESTAMP</td>
<td>The date and time when the message was sent</td>
</tr>
</tbody>
</table>
Example
The following example searches for the requested buddy’s name in a data source and, if it finds a unique entry, adds the buddy and updates the buddy’s status information in an Application scope buddyStatus structure. If it doesn’t find the name, it declines the buddy. If there are multiple entries for the buddy name in the database, it tells the gateway not to respond. It logs all actions.

```coldfusion
<cffunction name="onAddBuddyRequest"
    <cfargument name="CFEvent" type="struct" required="YES">
    <cfquery name="buddysearch" datasource="cfdocexamples">
        SELECT IM_ID
        FROM Employees
        WHERE IM_ID = '#CFEvent.Data.SENDER#'
    </cfquery>
    <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
        <cfscript>
            // If the name is in the DB once, accept; if it is missing, decline.
            // If it is in the DB multiple times, take no action.
            if (buddysearch.RecordCount IS 0) {
                action="decline";
                reason="Invalid ID";
            } else if (buddysearch.RecordCount IS 1) {
                action="accept";
                reason="Valid ID";
                // Add the buddy to the buddy status structure only if accepted.
                if (!StructKeyExists(Application, "buddyStatus")) {
                    Application.buddyStatus=StructNew();
                }
                if (!StructKeyExists(Application.buddyStatus, CFEvent.Data.SENDER)) {
                    Application.buddyStatus[CFEvent.Data.SENDER]=StructNew();
                }
                Application.buddyStatus[CFEvent.Data.SENDER].status= "Accepted Buddy Request";
                Application.buddyStatus[CFEvent.Data.SENDER].timeStamp=
            }
        </cfscript>
    </cflock>
</cffunction>
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• accept Accept the request to add you as a buddy. ColdFusion adds the user to the permit list of users that can get status information.</td>
</tr>
<tr>
<td></td>
<td>• decline Deny request to add you as a buddy. ColdFusion adds the user to the deny list of users that can get status information.</td>
</tr>
<tr>
<td></td>
<td>• noact Take no action. ColdFusion does not respond to the requestor.</td>
</tr>
<tr>
<td>buddyID</td>
<td>ID to which to send the message. Normally, the value of the CFEvent.data.SENDER field. Not used with the noact command.</td>
</tr>
<tr>
<td>reason</td>
<td>A text message describing the reason for the action. Not used with the noact command.</td>
</tr>
</tbody>
</table>
onAddBuddyResponse

Description
Handles incoming responses from other users to requests from the gateway to be added to their buddy lists. Also receives requests from buddies to have you remove them from your buddy list.

Syntax
onAddBuddyResponse(CFEvent)

See also
onIncomingMessage, onAddBuddyRequest, onBuddyStatus, onIMServerMessage

Parameters
The method must take one parameter, a CFEvent structure with the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>Gateway type, either XMPP or SAMETIME.</td>
</tr>
<tr>
<td>gatewayID</td>
<td>The ID of the gateway instance, as configured in ColdFusion Administrator.</td>
</tr>
<tr>
<td>originatorID</td>
<td>The IM ID of the message originator.</td>
</tr>
<tr>
<td>cfcMethod</td>
<td>This CFC method; by default, onAddBuddyResponse.</td>
</tr>
<tr>
<td>data.MESSAGE</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• accept The request was accepted.</td>
</tr>
<tr>
<td></td>
<td>• decline The request was declined, or the buddy is asking you to remove them from your list.</td>
</tr>
</tbody>
</table>
Returns
The function does not return a value.

Example
The following example adds the buddy’s status to the Application scope buddyStatus structure if the message sender accepted an add buddy request. It logs all responses.

```cfml
<cffunction name="onAddBuddyResponse">
  <cfargument name="CFEvent" type="struct" required="YES">
  <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
    <cfscript>
      //Do the following only if the buddy accepted the request.
      if (NOT StructKeyExists(Application, "buddyStatus")) {
        Application.buddyStatus=StructNew();
      }
      if (#CFEVENT.Data.MESSAGE# IS "accept") {
        //Create a new entry in the buddyStatus record for the buddy.
        if (NOT StructKeyExists(Application.buddyStatus, #CFEvent.Data.SENDER#)) {
          Application.buddyStatus[#CFEvent.Data.SENDER#]=StructNew();
        }
        //Set the buddy status information to indicate buddy was added.
        Application.buddyStatus[#CFEvent.Data.SENDER#].status= "Buddy accepted us";
        Application.buddyStatus[#CFEvent.Data.SENDER#].timeStamp= #CFEvent.Data.TIMESTAMP;  
        Application.buddyStatus[#CFEvent.Data.SENDER#].message= #CFEvent.Data.MESSAGE;
      }
    </cfscript>
  </cflock>
  <!--- Log the information for all responses. --->
  <cflog file="#CFEvent.GatewayID#Status" 
    text="onAddBuddyResponse; BUDDY: #CFEvent.Data.SENDER# RESPONSE: #CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>
```

**onBuddyStatus**

**Description**
Handles incoming messages indicating online status (presence) changes of users on the gateway’s buddy list.

**Syntax**
```
onBuddyStatus(CFEvent)
```
See also
onIncomingMessage, onAddBuddyRequest, onAddBuddyResponse, onIMServerMessage

Parameters
The method must take one parameter, a CFEvent structure with the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>Gateway type, either XMPP or SAMETIME.</td>
</tr>
<tr>
<td>gatewayID</td>
<td>The ID of the Gateway instance, as configured in ColdFusion Administrator.</td>
</tr>
<tr>
<td>originatorID</td>
<td>The IM ID (buddy name) of the message originator.</td>
</tr>
<tr>
<td>cfcMethod</td>
<td>This CFC method; by default, onIMServerMessage.</td>
</tr>
<tr>
<td>data.BUDDYNAME</td>
<td>The sender’s buddy name, or ID; identical to the originatorID.</td>
</tr>
<tr>
<td>data.BUDDYNICKNAME</td>
<td>The buddy’s display name or nickname.</td>
</tr>
<tr>
<td>data.BUDDYSTATUS</td>
<td>The buddy's status; one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ONLINE</td>
</tr>
<tr>
<td></td>
<td>• OFFLINE</td>
</tr>
<tr>
<td></td>
<td>• AWAY</td>
</tr>
<tr>
<td></td>
<td>• DO NOT DISTURB</td>
</tr>
<tr>
<td></td>
<td>• NOT AVAILABLE</td>
</tr>
<tr>
<td></td>
<td>• FREE TO CHAT</td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
<tr>
<td></td>
<td><strong>XMPP only</strong></td>
</tr>
<tr>
<td></td>
<td>• NOT AVAILABLE</td>
</tr>
<tr>
<td></td>
<td>• FREE TO CHAT</td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
<tr>
<td></td>
<td><strong>Sametime only</strong></td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
</tbody>
</table>

Use the `IMGatewayHelper.getCustomAwayMessage` method to get any custom message that the buddy sent when changing status.

| data.BUDDYGROUP   | The group that the buddy belongs to.                                       |
| data.RECIPIENT    | The recipient's ID, as specified in the gateway's configuration file.       |
| data.TIMESTAMP    | The date and time when the message was sent.                              |

Note: You configure the buddy’s nickname and group when you use the gatewayHelper object `addBuddy` method to add a buddy.

Returns
The function does not return a value.
Example
The following example keeps an Application scope structure up-to-date with a buddy’s status. It also uses the gatewayhelper object `getBuddyStatus` method to get the buddy’s custom away message, if any.

```cfml
<cffunction name="onBuddyStatus">
    <cfargument name="CFEvent" type="struct" required="YES">
    <!--- Get the gatewayhelper object and to get the info for this buddy. --->
    <!--- This is used to get the buddy’s custom away message. --->
    <cfset helper = getGatewayHelper("MYIM")>
    <cfset mybuddyinfo = helper.getBuddyInfo(CFEvent.Data.BUDDYNAME)>
    <cflog file="#CFEvent.GatewayID#Status" type="Information"
        text="in OnbuddyStatus, sender is #CFEvent.OriginatorID#">
    <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
        <cfscript>
            // Create the status structures if they don’t exist.
            if (NOT StructKeyExists(Application, "buddyStatus")) {
                Application.buddyStatus = StructNew();
            }
            if (NOT StructKeyExists(Application.buddyStatus,
                CFEvent.Data.BUDDYNAME)) {
                Application.buddyStatus[#CFEvent.Data.BUDDYNAME#] = StructNew();
            }
            // Save the buddy status, timestamp, and custom away message
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status =
                CFEvent.Data.BUDDYSTATUS;
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp =
                CFEvent.Data.TIMESTAMP;
            // The following assumes that the buddy is in only one group.
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].customAway =
                mybuddyinfo[1].BUDDYCUSTOMAWAYMESSAGE;
        </cfscript>
    </cflock>
    <!--- log the info, for debugging purposes only --->
    <cfset temp = Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status>
    <cflog file="#CFEvent.GatewayID#Status" type="Information" text="Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status is #temp#!">
    <cfset temp = Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp>
    <cflog file="#CFEvent.GatewayID#Status" type="Information" text="Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timestamp is #temp#!">
    </cffunction>
</cffunction>
```

### onIMServerMessage

**Description**
Handles incoming error and status messages from the IM server.

**Syntax**

```cfml
onIMServerMessage (CFEvent)
```
See also
onIncomingMessage, onAddBuddyRequest, onAddBuddyResponse, onBuddyStatus

Parameters
This method must take one parameter, a CFEvent structure with the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayType</td>
<td>Gateway type, either XMPP or SAMETIME</td>
</tr>
<tr>
<td>gatewayID</td>
<td>The ID of the gateway instance, as configured in ColdFusion Administrator</td>
</tr>
<tr>
<td>originatorID</td>
<td>The IM ID (buddy name) of the message originator</td>
</tr>
<tr>
<td>cfcMethod</td>
<td>This CFC method; by default, onIMServerMessage</td>
</tr>
<tr>
<td>data.MESSAGE</td>
<td>The message sent by the server</td>
</tr>
<tr>
<td>data.SENDER</td>
<td>The sender's ID; identical to the originatorID</td>
</tr>
<tr>
<td>data.RECIPIENT</td>
<td>The recipient's ID, as specified in the gateway’s configuration file</td>
</tr>
<tr>
<td>data.TIMESTAMP</td>
<td>The date and time when the message was sent</td>
</tr>
</tbody>
</table>

Example
The following example logs the sender, message, and a timestamp when an IM server sends an error or status message:

```cfc
<cffunction name="onIMServerMessage">
  <!--- This function just logs the message. --->
  <cfargument name="CFEvent" type="struct" required="YES">
  <cflog file="#CFEvent.GatewayID##Status"
    text="onIMServerMessage; SENDER: #CFEvent.OriginatorID#MESSAGE: #CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>
```

**onIncomingMessage**

Description
Handles incoming instant messages from other users. Optionally returns a response to the message sender.

Syntax
```cfc```
onIncomingMessage(CFEvent)
```

See also
onAddBuddyRequest, onAddBuddyResponse, onBuddyStatus, onIMServerMessage, Handling incoming messages in the *Developing ColdFusion Applications*

Parameters
The method must take one parameter, a CFEvent structure with the following fields:
Returns
The function can optionally return a value to send a response message. The return structure must contain the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Normally omitted. You can also specify submit.</td>
</tr>
<tr>
<td>buddyID</td>
<td>ID to which to send the message. Normally, the value of the input parameter's data.SENDER field.</td>
</tr>
<tr>
<td>message</td>
<td>The message contents.</td>
</tr>
</tbody>
</table>

Example
The following example shows a simple onIncomingMessage method that echoes a message back to the sender.

```
<cffunction name="onIncomingMessage">
  <cfargument name="CFEvent" type="struct" required="YES">
  <cfset input_mesg = CFEvent.data.MESSAGE>
  <cfset retValue = structNew()>
  <cfset retValue.command = "submit">
  <cfset retValue.buddyID = CFEvent.originatorID>
  <cfset retValue.message = "Message Received:" & input_mesg>
  <creturn retValue>
</cffunction>
```

IM gateway message sending commands

You use the SendGatewayMessage CFML function or the return value of a CFC listener method to send outgoing messages. The ColdFusion IM gateway accepts the following outgoing message commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>submit</td>
<td>(Default) Sends a normal message to another IM user.</td>
</tr>
</tbody>
</table>
The message structure that you return in the gateway listener CFC function or use as the second parameter in the CFML `SendGatewayMessage` function can have the following fields. The table lists the fields and the commands in which they are used, and describes the field’s use.

<table>
<thead>
<tr>
<th>Field</th>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buddyID</td>
<td>All</td>
<td>The destination user ID</td>
</tr>
<tr>
<td>command</td>
<td>All</td>
<td>The command; defaults to submit if omitted</td>
</tr>
<tr>
<td>message</td>
<td>submit</td>
<td>A text message to send to the destination user</td>
</tr>
<tr>
<td>reason</td>
<td>accept, decline</td>
<td>A text description of the reason for the action or other message to send to the add buddy requestor</td>
</tr>
</tbody>
</table>

In typical use, a ColdFusion application uses the accept, decline, and noact commands in the return value of the `onAddBuddyRequest` method, and uses the submit command (or no command, because submit is the default command) in `SendGatewayMessage` CFML functions and the return value of the `onIncomingMessage` CFC method.

**IM Gateway GatewayHelper class methods**

The GatewayHelper class returned by the CFML `GetGatewayHelper` function includes the following methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addBuddy</td>
<td>adds a buddy to the buddy list for the gateway user ID and asks to have the IM server send messages with the buddy’s online presence state to the gateway.</td>
</tr>
<tr>
<td>addDeny</td>
<td>getDenyList</td>
</tr>
<tr>
<td>addPermit</td>
<td>getPermitList</td>
</tr>
<tr>
<td>getBuddyInfo</td>
<td>getPermitMode</td>
</tr>
<tr>
<td>getBuddyList</td>
<td>getProtocolName</td>
</tr>
<tr>
<td>getCustomAwayMessage</td>
<td>getTemplateName</td>
</tr>
<tr>
<td>getDenyList</td>
<td>getName</td>
</tr>
<tr>
<td>getStatusAsString</td>
<td>getPermitMode</td>
</tr>
<tr>
<td>removeDeny</td>
<td>getPermitMode</td>
</tr>
<tr>
<td>removePermit</td>
<td>isOnline</td>
</tr>
<tr>
<td>removeBuddy</td>
<td>numberOfMessagesReceived</td>
</tr>
<tr>
<td>removePermit</td>
<td>setNickName</td>
</tr>
<tr>
<td>setStatus</td>
<td>numberOfMessagesSent</td>
</tr>
<tr>
<td>setPermitMode</td>
<td>setStatusMode</td>
</tr>
<tr>
<td>addBuddy</td>
<td>setCustomAwayMessage</td>
</tr>
<tr>
<td>addDeny</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>addPermit</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>getBuddyInfo</td>
<td>setCustomAwayMessage</td>
</tr>
<tr>
<td>getBuddyList</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>getCustomAwayMessage</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>getDenyList</td>
<td>setCustomAwayMessage</td>
</tr>
<tr>
<td>getStatusAsString</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>removeDeny</td>
<td>setCustomAwayMessage</td>
</tr>
<tr>
<td>removePermit</td>
<td>setPermitMode</td>
</tr>
<tr>
<td>removeBuddy</td>
<td>setCustomAwayMessage</td>
</tr>
</tbody>
</table>

**addBuddy**

**Description**

Adds a buddy to the buddy list for the gateway user ID and asks to have the IM server send messages with the buddy’s online presence state to the gateway.

**Syntax**

```plaintext
Boolean = addBuddy(name, nickname, group)
```
See also
getBuddyInfo, getBuddyList, removeBuddy, Using the GatewayHelper object in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person about whom you want to receive periodic status messages.</td>
</tr>
<tr>
<td>nickname</td>
<td>The nickname that the application can use to refer to the user.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group you wish to add the user to in your Buddy List. If the group specified does not exist, it will be created. If the group parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

Returns
True if the ID was added to the gateway's buddy list; False, otherwise.

Usage
This method adds the buddy to the buddy list for the gateway's ID and sends a subscription request (to automatically get presence information about the buddy's online status) to the remote buddy. It does not wait for a response from the buddy, so it returns True (and the gateway adds the buddy to the list) even if the buddy denies the subscription request. Use the listener CFC onAddBuddyResponse method to monitor the buddy's response. If the CFEvent.data.MESSAGE field value is decline, the listener method can call the gatewayHelper object removeBuddy method to remove the buddy from the buddy list.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

addDeny

Description
Tells the IM server to add the specified user to the deny list for the gateway's user ID. If the gateway's permit mode value is DENY_SOME, the specified user cannot receive messages on the gateway's presence state.

Syntax
 Boolean = addDeny(name, nickname, group)

See also
addPermit, getDenyList, getPermitList, getPermitMode, removeDeny, removePermit, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person about whom you want to deny access to status messages.</td>
</tr>
<tr>
<td>nickname</td>
<td>The nickname that the application can use to refer to the user. Can be the empty string.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group that you want to add the user to in your buddy list. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

Returns

True if the ID was added to the deny list; False, otherwise.

**Note:** If the XMPP server does not support permission management, this function always returns False.

Example

See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

---

addPermit

**Description**

Tells the IM server to add the specified user to the permit list for the gateway's user ID. If the gateway's permit mode is PERMIT_SOME, the specified user receive messages on the gateway's presence state.

**Syntax**

```java
Boolean = addPermit(name, nickname, group)
```

**See also**

addDeny, getDenyList, getPermitList, getPermitMode, removeDeny, removePermit, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person about whom you want to deny access to status messages.</td>
</tr>
<tr>
<td>nickname</td>
<td>The nickname that the application can use to refer to the user. Can be the empty string.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group you want to add the user to in your Buddy List. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

Returns

True if the ID was added to the permit list; false, otherwise.

**Note:** If the XMPP server does not support permission management, this function always returns False.

Example

See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.
getBuddyInfo

Description
Gets information about the specified user from the buddy list, deny list, and permit list.

Syntax
array = getBuddyInfo(name)

See also
addBuddy, getBuddyList, removeBuddy, Using the GatewayHelper object in the Developing ColdFusion Applications

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person about whom you want to get information.</td>
</tr>
</tbody>
</table>

Returns
An array of structures, with one structure for each information record found. The method finds one record for each group that the user belongs to in each of the lists (buddy, permit, deny) that contains the specified name. Each structure has the following fields. Some fields might not be meaningful for some IM protocols. If there is no information for a field, it is blank.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUDDYNAME</td>
<td>The user's unique ID.</td>
</tr>
<tr>
<td>BUDDYGROUP</td>
<td>The group to which the user belongs.</td>
</tr>
<tr>
<td>BUDDYNICKNAME</td>
<td>The nickname that you have assigned to the user.</td>
</tr>
<tr>
<td>BUDDYPROTOCOL</td>
<td>The instant messaging protocol. JABBER (for XMPP) or SAMETIME, or an empty string (if the server did not return a value).</td>
</tr>
</tbody>
</table>
Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods. For an example of using this method to get the buddy custom away message, see onBuddyStatus.

getBuddyList

Description
Gets the buddy list for the gateway’s user ID.
Syntax
array = getBuddyList()

See also
addBuddy, getBuddyInfo, removeBuddy, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
An array of IDs (buddy names) of the users on the gateway’s buddy list, a list of instant messaging IDs that this gateway normally communicates with.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

getCustomAwayMessage

Description
Returns the gateway’s custom away message if it has been set by the gatewayHelper object setStatus method.

Syntax
string = getCustomAwayMessage()

See also
getStatusAsString, getStatusTimeStamp, isOnline, setStatus, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
The gateway’s custom away message if it has been set by the GatewayHelper object setStatus method.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

getDenyList

Description
Returns the list of users that the IM server has been told not to send state information about the gateway, if the permit mode is set to DENY_SOME.

Syntax
array = getDenyList()

See also
addDeny, addPermit, getPermitList, getPermitMode, removeDeny, removePermit, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications
Returns
An array of IDs (buddy names) of the users on the gateway’s deny list, the list of IDs to which the IM server does not send presence status information.

*Note:* If the XMPP server does not support permission management, this function always returns False.

Example
See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

getName

Description
Returns the gateway’s user name.

Syntax
```plaintext
string = getName()
```

See also
**getName, getProtocolName, numberOfMessagesReceived, numberOfMessagesSent, setNickName, Using the GatewayHelper object in the Developing ColdFusion Applications**

Returns
The gateway’s user name, as specified in gateway configuration file.

Example
See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

getNickName

Description
Returns the gateway’s nickname (display name), if it has been set using the gatewayHelper object `setNickName` method.

Syntax
```plaintext
string = getNickName()
```

See also
**getName, getProtocolName, numberOfMessagesReceived, numberOfMessagesSent, setNickName, Using the GatewayHelper object in the Developing ColdFusion Applications**

Returns
The gateway’s nickname, if any; empty string, otherwise.

Example
See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.
getPermitList

Description
Returns the list of users that the IM server has been told to send state information about the gateway.

Syntax
array = getPermitList()

See also
addDeny, addPermit, getDenyList, getPermitMode, removeDeny, removePermit, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
An array of IDs (buddy names) of the users on the gateway's permit list, the list of IDs to which the IM server sends presence status information if the permit mode is set to PERMIT_SOME.

Note: If the XMPP server does not support permission management, this function always returns False.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

getPermitMode

Description
Gets the gateway’s permit mode from the IM server. The permit mode determines whether all users can get the gateway’s online state information, or whether the server uses a permit list or a deny list to control which users get state information.

Syntax
string = getPermitMode()

See also
addDeny, addPermit, getDenyList, getPermitList, removeDeny, removePermit, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
The gateway’s permit mode; one of the following values:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PERMIT_ALL</td>
<td>(Default) Permits all users to be aware of the gateway’s online presence and state.</td>
</tr>
<tr>
<td>PERMIT_SOME</td>
<td>Permits only users in the permit list to be aware of the gateway’s online presence and state.</td>
</tr>
<tr>
<td>DENY_SOME</td>
<td>Prevents the users in the deny list from being aware of the gateway’s online presence and state.</td>
</tr>
</tbody>
</table>

Note: If the XMPP server does not support permission management, this function always returns PERMIT_ALL.
Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**getProtocols**

**Description**
Gets the name of the gateway’s instant messaging protocol.

**Syntax**
```plaintext
string = getProtocols()
```

**See also**
getName, getNickName, numberOfMessagesReceived, numberOfMessagesSent, setNickName, Using the GatewayHelper object in the Developing ColdFusion Applications

**Returns**
The gateway’s protocol, as determined by the gateway type; one of the following values:

- JABBER (for XMPP)
- SAMETIME

**Example**
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**getStatusAsString**

**Description**
Gets the online status of the gateway as a text string.

**Syntax**
```plaintext
string = getStatusAsString()
```

**See also**
getCustomAwayMessage, getStatusTime, isOnline, setStatus, Using the GatewayHelper object in the Developing ColdFusion Applications

**Returns**
The gateway’s online status; one of the following:

- ONLINE
- OFFLINE
- AWAY
- DO NOT DISTURB
- XMPP only
NOT AVAILABLE
FREE TO CHAT
IDLE

Usage
The DO NOT DISTURB, NOT AVAILABLE, and FREE TO CHAT strings differ from the status values that you use in the setStatus method, which does not allow spaces in the status names.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

getStatusTimeStamp

Description
Gets the date and time that the gateway changed its online status.

Syntax

date-time object = getStatusTimeStamp()

See also
getCustomAwayMessage, getStatusAsString, isOnline, setStatus, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
The date and time that the gateway changed its online status, normally by calling the setStatus gatewayHelper object method.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

isOnline

Description
Determines whether the gateway is connected to the instant messaging server.

Syntax

Boolean = isOnline()

See also
getCustomAwayMessage, getStatusAsString, getStatusTimeStamp, setStatus, Using the GatewayHelper object in the Developing ColdFusion Applications
Returns
True, if the gateway is connected to the IM server; False, otherwise.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**numberOfMessagesReceived**

Description
Gets the number of messages received by the gateway since it was started.

Syntax
```plaintext
integer = numberOfMessagesReceived()
```

See also
getName, getNickName, getProtocolName, numberOfMessagesSent, setNickName, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
The number of messages received by the gateway since it was started.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**numberOfMessagesSent**

Description
Gets the number of messages sent by the gateway since it was started.

Syntax
```plaintext
integer = numberOfMessagesSent()
```

See also
gName, getNickName, getProtocolName, numberOfMessagesReceived, setNickName, Using the GatewayHelper object in the Developing ColdFusion Applications

Returns
The number of messages sent by the gateway since it was started.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.
**removeBuddy**

**Description**
Removes an ID from a group in the buddy list for the gateway and tells the IM server not to send the gateway messages with the buddy’s online presence state.

**Syntax**
```
Boolean = removeBuddy(name, group)
```

**See also**
`addBuddy, getBuddyInfo, getBuddyList, removeDeny, removePermit`, Using the GatewayHelper object in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person to remove from the buddy list.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

**Returns**
True if the ID was removed from the group; False, otherwise.

**Usage**
If the user is in multiple groups in your buddy list, you remove the buddy separately from each group. The IM server does not stop sending status updates until you remove the name from all groups.

**Example**
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**removeDeny**

**Description**
Removes an ID from a group in the deny list for the gateway. If the gateway’s permit mode is DENY_SOME, the specified user can receive messages on the gateway’s presence state.

**Syntax**
```
Boolean = removeDeny(name, group)
```

**See also**
`addDeny, addPermit, getDenyList, getPermitList, getPermitMode, removeBuddy, removePermit, setPermitMode`, Using the GatewayHelper object in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person to remove from the deny list.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

Returns
True if the ID was removed from the group; False, otherwise.

*Note: If the XMPP server does not support permission management, this function always returns False.*

Usage
If the user is in multiple groups in your deny list, you remove the user separately from each group. The IM server enables sending status updates if you remove the name any group.

Example
See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

---

**removePermit**

Description
Removes an ID from a group in the permit list for the gateway. If the gateway's permit mode is PERMIT_SOME, the specified user cannot receive messages on the gateway's presence state.

Syntax

```plaintext
Boolean = removePermit(name, group)
```

See also
*addDeny, addPermit, getDenyList, getPermitList, getPermitMode, removeBuddy, removeDeny, setPermitMode, Using the GatewayHelper object in the Developing ColdFusion Applications*

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The unique instant messaging user name for the person to remove from the permit list.</td>
</tr>
<tr>
<td>group</td>
<td>The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.</td>
</tr>
</tbody>
</table>

Returns
True if the ID was removed from the group; False, otherwise.

*Note: If the XMPP server does not support permission management, this function always returns False.*

Usage
If the user is in multiple groups in your permit list, you remove the user separately from each group. However, the IM server stops sending status updates when you remove the user from the first group.
Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**setNickName**

**Description**
Sets the gateway's nickname (display name).

**Syntax**
```
Boolean = setNickName(name)
```

**See also**
getName, getNickName, getProtocolName, numberOfMessagesReceived, numberOfMessagesSent, Using the GatewayHelper object in the Developing ColdFusion Applications

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The display name that you want to associate with this gateway. This name is not guaranteed to be unique for the protocol.</td>
</tr>
</tbody>
</table>

**Returns**
True if the nickname got set; false, otherwise.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**setPermitMode**

**Description**
Sets the gateway's permit mode on the IM server. The permit mode determines whether all users can get the gateway's online state information, or whether the server uses a permit list or a deny list to control which users get state information.

**Syntax**
```
Boolean = setPermitMode(permitMode)
```

**See also**
addDeny, addPermit, getDenyList, getPermitList, getPermitMode, removeDeny, removePermit, Using the GatewayHelper object in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>permitMode</td>
<td>The permission mode, one of the following:</td>
</tr>
<tr>
<td></td>
<td>• PERMIT_ALL  Permits all users to be aware of the gateway’s online presence and state. This is the default mode if you do not call this function.</td>
</tr>
<tr>
<td></td>
<td>• PERMIT_SOME Permits only users in the permit list to be aware of the gateway’s online presence and state.</td>
</tr>
<tr>
<td></td>
<td>• DENY_SOME  Prevents all users in the deny list from being aware of the gateway’s online presence and state.</td>
</tr>
</tbody>
</table>

Returns

True if the permit mode was set; False otherwise.

Note: If the XMPP server does not support permission management, this function returns False to all values except PERMIT_ALL.

Example

See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

setStatus

Description

Sets the online presence status of the gateway, including any custom away message.

Syntax

Boolean = setStatus(status, customAwayMsg)

See also

getCustomAwayMessage, getStatusAsString, getStatusTimeStamp, isOnline, Using the GatewayHelper object in the Developing ColdFusion Applications
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>The gateway’s online presence status; one of the following:</td>
</tr>
<tr>
<td></td>
<td>• ONLINE</td>
</tr>
<tr>
<td></td>
<td>• AWAY</td>
</tr>
<tr>
<td></td>
<td>• DND (Do Not Disturb)</td>
</tr>
<tr>
<td></td>
<td>• NA (Not Available)</td>
</tr>
<tr>
<td></td>
<td>• FREE_TO_CHAT</td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
<tr>
<td></td>
<td><strong>XMPP only</strong></td>
</tr>
<tr>
<td></td>
<td>• NA (Not Available)</td>
</tr>
<tr>
<td></td>
<td>• FREE_TO_CHAT</td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
<tr>
<td></td>
<td><strong>Sametime only:</strong></td>
</tr>
<tr>
<td></td>
<td>• IDLE</td>
</tr>
<tr>
<td>customAwayMsg</td>
<td>A text string containing a custom message for the status. Can be the empty string if you do not need a custom away message.</td>
</tr>
</tbody>
</table>

Returns
True, if the operation was successful; False. otherwise. Passing an invalid status for the protocol causes this method to return False.

Usage
Do not use the setStatus method to go offline. Although the method accepts a parameter of OFFLINE, the gateway immediately resets itself to be online. To set the gateway offline, stop the gateway instance in the ColdFusion Administrator, or use the stopGatewayInstance method in the CFIDE.adminapi.eventgateway CFC.

Example
See GatewayHelper example, in the Developing ColdFusion Applications, which uses all GatewayHelper class methods.

**SMS Gateway CFEvent structure and commands**

This section describes the detailed contents of the following structures that you use in the SMS Gateway listener CFCs and CFML SendGatewayMessage functions:

More Help topics
“SMS Gateway incoming message CFEvent structure” on page 1645
“SMS gateway message sending commands” on page 1646
**SMS Gateway incoming message CFEvent structure**

The SMS gateway puts the following information in a CFEvent instance that it sends to the CFC listener method:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OriginatorID</td>
<td>Contents of the PDU source_addr field, the address of the device that sent the message.</td>
</tr>
<tr>
<td>CfcMethod</td>
<td>Listener CFC method name. Value of the configuration file cfc-method entry, or onIncomingMessage if the configuration file does not have this entry.</td>
</tr>
<tr>
<td>Data.MESSAGEx</td>
<td>Contents of the short_message field of the PDU.</td>
</tr>
<tr>
<td>Data.sourceAddress</td>
<td>The address of the device that sent this message.</td>
</tr>
<tr>
<td>Data.destAddress</td>
<td>The address to which the message was sent; an address in the range specified by the gateway configuration file address-range setting.</td>
</tr>
<tr>
<td>Data.esmClass</td>
<td>Contents of the PDU esm_class field. Identifies the message type. A number in the range 0-255 representing a byte value, where bits 2-5 (0-indexed) indicate the message type, and therefore the contents of the data.MESSAGE field, as follows. (Reserved values are omitted.)</td>
</tr>
<tr>
<td></td>
<td>xx0000xx  Normal message</td>
</tr>
<tr>
<td></td>
<td>xx0001xx  SMSC delivery receipt</td>
</tr>
<tr>
<td></td>
<td>xx0010xx  SME Delivery Acknowledgement</td>
</tr>
<tr>
<td></td>
<td>xx0100xx  SME Manual/User Acknowledgement</td>
</tr>
<tr>
<td></td>
<td>xx0110xx  Conversation abort (Korean CDMA only)</td>
</tr>
<tr>
<td></td>
<td>xx1000xx  Intermediate Delivery Notification</td>
</tr>
<tr>
<td></td>
<td>For more information on this field, see the SMPP specification.</td>
</tr>
<tr>
<td>Data.protocol</td>
<td>Contents of the PDU protocol_id field. Meaningful for messages sent from GSM networks only. For more information, see the GSM 03.40 specification.</td>
</tr>
<tr>
<td>Data.priority</td>
<td>Contents of the PDU priority_flag field. A message priority level set by the originating SME, in the range 0-3; 0 is the lowest priority and 3 is the highest priority. The specific priority level meaning depends on the originating network. For more details, see the SMPP specification.</td>
</tr>
<tr>
<td>Data.registeredDelivery</td>
<td>Contents of the PDU registered_delivery field, indicating the type of delivery receipt or acknowledgement that the sender requested. A number in the range 0-32, representing the sum of the following values:</td>
</tr>
<tr>
<td></td>
<td>0: No SMS delivery receipt requested or</td>
</tr>
<tr>
<td></td>
<td>1: SMSC delivery receipt requested on delivery success or failure or</td>
</tr>
<tr>
<td></td>
<td>2: SMSC delivery receipt requested on delivery failure only Plus</td>
</tr>
<tr>
<td></td>
<td>0: No SME acknowledgement requested or</td>
</tr>
<tr>
<td></td>
<td>4: SME Delivery Acknowledgement requested or</td>
</tr>
<tr>
<td></td>
<td>8: SME Manual/User Acknowledgement requested or</td>
</tr>
<tr>
<td></td>
<td>12: Both Delivery and Manual/User Acknowledgements requested Plus</td>
</tr>
<tr>
<td></td>
<td>0: No Intermediate notification requested or</td>
</tr>
<tr>
<td></td>
<td>16: Intermediate notification requested</td>
</tr>
</tbody>
</table>
ColdFusion Event Gateway Reference

For more information on the meanings of some of these fields and how to handle incoming SMS messages an SMS gateway listener CFC method, see Handling incoming messages in the Developing ColdFusion Applications.

### SMS gateway message sending commands

ColdFusion applications that use gateways of the Short Message Service (SMS) type can send the following commands to the event gateway in an outgoing message:

#### More Help topics
- “submit command” on page 1646
- “submitMulti command” on page 1648
- “data command” on page 1649

#### submit command

To send a message to a single destination address in an SMPP SUBMIT_SM PDU, the structure that you used in the Data parameter of a SendGatewayMessage function or the return variable of the CFC listener method has the following fields. For more information about these fields, see the documentation for the SUBMIT_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at www.smsforum.net/.
Required fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>If present, the value must be submit. If you omit this field, the event gateway sends a submit message.</td>
</tr>
<tr>
<td>shortMessage</td>
<td>The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the shortMessage field, and some carriers might limit its size further. The messagePayload field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents.</td>
</tr>
<tr>
<td>destAddress</td>
<td>Required. The address to which to send the message.</td>
</tr>
<tr>
<td>sourceAddress</td>
<td>The address of this application. You can omit this field; the configuration file specifies the application address.</td>
</tr>
</tbody>
</table>

Optional fields

You can set default values for the following optional fields in the SMS event gateway configuration file. For information on the default values, see Configuring an SMS event gateway in the Developing ColdFusion Applications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>destAddress_npi</td>
<td>destAddress_ton</td>
</tr>
<tr>
<td>serviceType</td>
<td></td>
</tr>
</tbody>
</table>

The following optional fields do not have default values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>alertOnMsgDelivery</td>
<td>EsmClass</td>
</tr>
<tr>
<td>callbackNum</td>
<td>ItsReplyType</td>
</tr>
<tr>
<td>callbackNumAtag</td>
<td>ItsSessionInfo</td>
</tr>
<tr>
<td>callbackNumPresInd</td>
<td>LanguageIndicator</td>
</tr>
<tr>
<td>dataCoding</td>
<td>MoreMsgsToSend</td>
</tr>
<tr>
<td>DestAddrSubunit</td>
<td>MsMsgWaitFacilities</td>
</tr>
<tr>
<td>DestinationPort</td>
<td>MsValidity</td>
</tr>
<tr>
<td>DestSubaddress</td>
<td>NumberOfMessages</td>
</tr>
<tr>
<td>DisplayTime</td>
<td>PayloadType</td>
</tr>
<tr>
<td>scheduleDeliveryTime</td>
<td>registeredDelivery</td>
</tr>
<tr>
<td>validityPeriod</td>
<td></td>
</tr>
</tbody>
</table>

Example

The following example onIncomingMessage method of a listener CFC uses the submit command to echo incoming SMS messages to the message originator:

```cfc
<cffunction name="onIncomingMessage" output="no">
  <cfargument name="CFEvent" type="struct" required="yes">
  <!--- Create a return structure that contains the message. --->
  <cfset retValue = structNew()>
  <!--- Send the message back. --->
  <cfreturn retValue>
</cffunction>
```
submitMulti command

To send a single text message to multiple recipients using an SMPP SUBMIT_MULTI PDU, the Data parameter of a SendGatewayMessage function or the return variable of the CFC listener method usually has the following fields. For more information about these fields, see the documentation for the SUBMIT_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at www.smsforum.net/.

Required fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Must be submitMulti.</td>
</tr>
<tr>
<td>shortMessage or messagePayload</td>
<td>The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the shortMessage field, and some carriers might limit its size further. The messagePayload field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents.</td>
</tr>
<tr>
<td>destAddress</td>
<td>A ColdFusion array of destination addresses (required). You cannot specify individual TON and NPI values for these addresses; all must conform to a single setting.</td>
</tr>
<tr>
<td>sourceAddress</td>
<td>The address of this application. You can omit this field; the configuration file specifies the application address.</td>
</tr>
</tbody>
</table>

Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see Configuring an SMS event gateway in the Developing ColdFusion Applications.

<table>
<thead>
<tr>
<th>destAddress_npi</th>
<th>destAddress_ton</th>
<th>serviceType</th>
</tr>
</thead>
</table>

The following optional fields do not have default values:

<table>
<thead>
<tr>
<th>alertOnMsgDelivery</th>
<th>DisplayTime</th>
<th>protocolId</th>
<th>SmsSignal</th>
</tr>
</thead>
<tbody>
<tr>
<td>callbackNum</td>
<td>EsmClass</td>
<td>registeredDelivery</td>
<td>SourceAddrSubunit</td>
</tr>
<tr>
<td>callbackNumAtag</td>
<td>LanguageIndicator</td>
<td>replaceIfPresent</td>
<td>SourcePort</td>
</tr>
<tr>
<td>callbackNumPresInd</td>
<td>MsMsgWaitFacilities</td>
<td>SarMsgRefNum</td>
<td>SourceSubaddress</td>
</tr>
<tr>
<td>dataCoding</td>
<td>MsValidity</td>
<td>SarSegmentSeqnum</td>
<td>UserMessageReference</td>
</tr>
<tr>
<td>DestAddrSubunit</td>
<td>PayloadType</td>
<td>SarTotalSegments</td>
<td>validityPeriod</td>
</tr>
<tr>
<td>DestinationPort</td>
<td>priorityFlag</td>
<td>scheduleDeliveryTime</td>
<td></td>
</tr>
<tr>
<td>DestSubaddress</td>
<td>PrivacyIndicator</td>
<td>smDefaultMsgId</td>
<td></td>
</tr>
</tbody>
</table>
<cffunction name="onIncomingMessage" output="no">
<cfargument name="CFEvent" type="struct" required="yes">
<!--- Get the message. --->
<cfset data=cfevent.DATA>
<cfset message="#data.message#">
<!--- Create the return structure. --->
<cfset retValue = structNew()>
<cfset retValue.command = "submitmulti">
<cfset retValue.destAddresses=arraynew(1)>
<!--- One destination is incoming message originator; get the address from CFEvent originator ID. --->
<cfset retValue.destAddresses[1] = arguments.CFEvent.originatorid>
<cfset retValue.destAddresses[2] = "12345">
<cfset retValue.shortMessage = "echo: " & message>
<cfreturn retValue>
</cffunction>

data command

To send binary data to a single destination address in an SMPP DATA_SM PDU, the Data parameter of a SendGatewayMessage function or the return variable of the CFC listener method must have the following fields. For more information about these fields, see the documentation for the SUBMIT_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at www.smsforum.net/.

### Required fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Must be data.</td>
</tr>
<tr>
<td>messagePayload</td>
<td>The message data. To convert data to binary format, use the ColdFusion ToBinary function.</td>
</tr>
<tr>
<td>destAddress</td>
<td>The address to which to send the message.</td>
</tr>
<tr>
<td>sourceAddress</td>
<td>The address of this application. You can omit this field; the configuration file specifies the application address.</td>
</tr>
</tbody>
</table>

### Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see Configuring an SMS event gateway in the Developing ColdFusion Applications.

<table>
<thead>
<tr>
<th>destAddress_npi</th>
<th>destAddress_ton</th>
<th>serviceType</th>
</tr>
</thead>
</table>

The following optional fields do not have default values:

<table>
<thead>
<tr>
<th>alertOnMsgDelivery</th>
<th>DestTelematicsId</th>
<th>NetworkErrorCode</th>
<th>SetDpf</th>
</tr>
</thead>
<tbody>
<tr>
<td>callbackNum</td>
<td>DisplayTime</td>
<td>NumberOfMessages</td>
<td>SmsSignal</td>
</tr>
<tr>
<td>callbackNumAtag</td>
<td>EsmClass</td>
<td>PayloadType</td>
<td>SourceAddrSubunit</td>
</tr>
<tr>
<td>callbackNumPresInd</td>
<td>ItsReplyType</td>
<td>PrivacyIndicator</td>
<td>SourceBearerType</td>
</tr>
<tr>
<td>dataCoding</td>
<td>ItsSessionInfo</td>
<td>QosTimeToLive</td>
<td>SourceNetworkType</td>
</tr>
<tr>
<td>DestAddrSubunit</td>
<td>LanguageIndicator</td>
<td>ReceiptedMessageId</td>
<td>SourcePort</td>
</tr>
</tbody>
</table>
The following example `onIncomingMessage` method converts an incoming message to binary data, and sends the binary version of the message back to the originator address:

```cffunction name="onIncomingMessage" output="no">
  <cfargument name="CFEvent" type="struct" required="yes">
  <!--- Get the message --->
  <cfset data=CFEvent.DATA>
  <cfset message="#data.message#">
  <!--- Create the return structure --->
  <cfset retValue = structNew()>
  <cfset retValue.command = "data">
  <!--- Sending to incoming message originator; get value from CFEvent. --->
  <cfset retValue.destAddress = arguments.CFEvent.originatorid>
  <cfset retValue.messagePayload = tobinary(tobase64("echo: " & message))>
  <cfreturn retValue>
</cffunction>
```

---

### CFML event gateway `SendGatewayMessage` data parameter

The ColdFusion CFML gateway type enables you to invoke CFC methods asynchronously. The structure that you use in the `SendGatewayMessage` function `data` parameter can include two types of fields:

- Any number of fields can contain arbitrary contents for use in by the CFC.
- Several optional fields can configure how the gateway delivers the information to the CFC.

The CFML gateway looks for the following optional fields, and, if they exist, uses them to determine how it delivers the message. Do not use these field names for data that you send to your CFC method.

<table>
<thead>
<tr>
<th>Field</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfcpath</td>
<td>Overrides the CFC path specified in the ColdFusion Administrator. This field lets you use a single gateway configuration in the ColdFusion Administrator multiple CFCs. This field sets the CFEvent object CFCPath variable.</td>
</tr>
<tr>
<td>method</td>
<td>Specifies the name of the method to invoke in the CFC. The default method is <code>onIncomingMessage</code>. This field lets you use a single gateway configuration in the ColdFusion Administrator for a CFC that has several methods. This field sets the CFEvent object CFCMethod variable.</td>
</tr>
<tr>
<td>originatorID</td>
<td>Sets the originatorID field of the CFEvent object that ColdFusion delivers to the CFC. The default value is CFMLGateway.</td>
</tr>
<tr>
<td>timeout</td>
<td>Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request. The default value is the Timeout Request value set on the Server Settings page in the ColdFusion Administrator. Set this value if a request might validly take longer to process than the default time-out; for example, if the request involves a long processing time. This field sets the CFEvent object CFCTimeout variable.</td>
</tr>
</tbody>
</table>
Example
The following example consists of a CFML page that sends a message to a logevent method in the file logger.CFC. The CFML page specifies the CFC and method to call, and sets the OriginatorID.

```cfml
<h3>Sending an event using a generic CFML event gateway and specifying the CFC and method.</h3>
<cfscript>
status = False;
props = structNew();
props.cfcpath="C:\CFusionMX7\gateway\cfc\MyCFCs\logger.cfc";
props.method="logEvent";
props.OriginatorID=CGI.SCRIPT_NAME;
props.Message="Replace me with a variable with data to log";
props.file="GenericCFCtest";
props.type="warning";
status = SendGatewayMessage("DefaultCFC", props);
if (status IS True)
    WriteOutput('Event Message "#props.Message#" has been sent.');
</cfscript>

The CFC method uses the OriginatorID and the message, file, and type fields of the CFEvent parameter’s data field to specify the log file and message.

```cfcomponent```
```cfscript```
    if (NOT IsDefined("CFEvent.Data.file")) {
        CFEvent.Data.file=defaultEventLog;
    }
    if (NOT IsDefined("CFEvent.Data.type")) {
        CFEvent.Data.type="information";
    }
</cfscript>
```cflog```
    text="Message from #CFEvent.originatorID#: #CFEvent.Data.message#" 
    file="#CFEvent.data.file#" type="#CFEvent.Data.type#" 
</cflog>
```
```cffunction```
```cfargument```
</cffunction>
```
</cfcomponent>
```
Chapter 10: ColdFusion C++ CFX Reference

ColdFusion includes CFXAPI classes and methods for building ColdFusion extensions.

C++ class overview

The following table lists the CFXAPI classes and methods:

<table>
<thead>
<tr>
<th>Class</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCFXException class</td>
<td>CCFXException::GetError</td>
</tr>
<tr>
<td></td>
<td>CCFXException::GetDiagnostics</td>
</tr>
<tr>
<td>CCFXQuery class</td>
<td>CCFXQuery::AddRow</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::GetColumns</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::GetData</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::GetName</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::GetRowCount</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::SetData</td>
</tr>
<tr>
<td>CCFXRequest class</td>
<td>CCFXRequest::AddQuery</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::AttributeExists</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::CreateStringSet</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::Debug</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::GetAttribute</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::GetAttributeList</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::GetCustomData</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::GetQuery</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::ReThrowException</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::SetCustomData</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::SetVariable</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::ThrowException</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::Write</td>
</tr>
<tr>
<td></td>
<td>CCFXRequest::WriteDebug</td>
</tr>
<tr>
<td>CCFXStringSet class</td>
<td>CCFXStringSet::AddString</td>
</tr>
<tr>
<td></td>
<td>CCFXStringSet::GetCount</td>
</tr>
<tr>
<td></td>
<td>CCFXStringSet::GetIndexForString</td>
</tr>
<tr>
<td></td>
<td>CCFXStringSet::GetString</td>
</tr>
</tbody>
</table>
Deprecation class methods

The following CFX API classes and methods are deprecated. They do not work, and might cause an error, in later releases.

<table>
<thead>
<tr>
<th>Class</th>
<th>Deprecated member</th>
<th>Deprecated as of this ColdFusion release</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCFXQuery Class</td>
<td>CCFXQuery::SetQueryString</td>
<td>ColdFusion MX</td>
</tr>
<tr>
<td></td>
<td>CCFXQuery::SetTotalTime</td>
<td>ColdFusion MX</td>
</tr>
<tr>
<td>CCFXRequest Class</td>
<td>CCFXRequest::GetSetting</td>
<td>ColdFusion MX</td>
</tr>
</tbody>
</table>

CCFXException class

An abstract class that represents an exception thrown during processing of a ColdFusion Extension (CFX) procedure. The `CCFXRequest` class, `CCFXQuery` class, and `CCFXStringSet` class can throw exceptions of this type. Your ColdFusion Extension code must be written to handle exceptions of this type. For more information, see `CCFXRequest::ThrowException` and `CCFXRequest::ReThrowException`.

Class methods

<table>
<thead>
<tr>
<th>virtual LPCSTR GetError()</th>
<th>The <code>CCFXException::GetError</code> function returns a general error message.</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual LPCSTR GetDiagnostics()</td>
<td>The <code>CCFXException::GetDiagnostics</code> function returns detailed error information.</td>
</tr>
</tbody>
</table>

CCFXException::GetError

Description
Provides basic user output for exceptions that occur during processing.

CCFXException::GetDiagnostics

Description
Provides detailed user output for exception that occur during processing.

Example
This code block shows how GetError and GetDiagnostics work with ThrowException and ReThrowException.
// Write output back to the user here...
pRequest->Write( "Hello from CFX_FOO2!" ) ;
pRequest->ThrowException("User Error", "You goof'd..." );

// Output optional debug info
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Debug info..." );
}

// Catch ColdFusion exceptions & re-raise them
catch( CCFXException* e )
{
    // This is how you would pull the error information
    LPCSTR strError = e->GetError();
    LPCSTR strDiagnostic = e->GetDiagnostics();

    pRequest->ReThrowException( e );
}

// Catch ALL other exceptions and throw them as ColdFusion exceptions (DO NOT REMOVE! --
// this prevents the server from crashing in case of an unexpected exception)
catch( ... )
{
    pRequest->ThrowException(
        "Error occurred in tag CFX_FOO2",
        "Unexpected error occurred while processing tag." ) ;
}

**CCFXQuery class**

An abstract class that represents a query used or created by a ColdFusion Extension (CFX). Queries contain one or more columns of data that extend over a varying number of rows.

**Class methods**

<table>
<thead>
<tr>
<th>Method Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual int AddRow()</td>
<td><code>CCFXQuery::AddRow</code> adds a row to a query.</td>
</tr>
<tr>
<td>virtual CCFXStringSet* GetColumns</td>
<td><code>CCFXQuery::GetColumns</code> retrieves a list of a query's column names.</td>
</tr>
<tr>
<td>virtual LPCSTR GetData( int iRow, int iColumn )</td>
<td><code>CCFXQuery::GetData</code> retrieves a data element from a row and column of a query.</td>
</tr>
<tr>
<td>virtual LPCSTR GetName()</td>
<td><code>CCFXQuery::GetName</code> retrieves the name of a query.</td>
</tr>
<tr>
<td>virtual int GetRowCount()</td>
<td><code>CCFXQuery::GetRowCount</code> retrieves the number of rows in a query.</td>
</tr>
</tbody>
</table>
CCFXQuery::AddRow

Syntax

```cpp
int CCFXQuery::AddRow(void)
```

Description

Add a row to the query. Call this function to append a row to a query.

Returns

Returns the index of the row that was appended to a query.

Example

The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```cpp
// First row
int iRow;
iRow = pQuery->AddRow();
pQuery->SetData( iRow, iCity, "Minneapolis" );
pQuery->SetData( iRow, iState, "MN" );
pQuery->SetData( iRow, iZip, "55345" );

// Second row
iRow = pQuery->AddRow();
pQuery->SetData( iRow, iCity, "St. Paul" );
pQuery->SetData( iRow, iState, "MN" );
pQuery->SetData( iRow, iZip, "55105" );
```

CCFXQuery::GetColumns

Syntax

```cpp
CCFXStringSet* CCFXQuery::GetColumns(void)
```

Description

Retrieves a list of the column names contained in a query.

Returns

Returns an object of `CCFXStringSet` class that contains a list of the columns in the query. ColdFusion automatically frees the memory that is allocated for the returned string set, after the request is completed.

Example

The following example gets the list of columns, then iterates over the list, writing each column name back to the user:
// Get the list of columns from the query
CCFXStringSet* pColumns = pQuery->GetColumns();
int nNumColumns = pColumns->GetCount();

// Print the list of columns to the user
pRequest->Write( "Columns in query: " );
for( int i=1; i<=nNumColumns; i++ )
{
pRequest->Write( pColumns->GetString( i ) );
pRequest->Write( " " );
}

CCFXQuery::GetData

Syntax
LPCSTR CCFXQuery::GetData(int iRow, int iColumn)

Description
Gets a data element from a row and column of a query. Row and column indexes begin with 1. You can determine the number of rows in a query by calling CCFXQuery::GetRowCount. You can determine the number of columns in a query by retrieving the list of columns using CCFXQuery::GetColumns, and then calling CCFXStringSet::GetCount on the returned string set.

Returns
Returns the value of the requested data element.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iRow</td>
<td>Row to retrieve data from (1-based)</td>
</tr>
<tr>
<td>iColumn</td>
<td>Column to retrieve data from (1-based)</td>
</tr>
</tbody>
</table>

Example
The following example iterates over the elements of a query and writes the data in the query back to the user in a simple, space-delimited format:

```c++
int iRow, iCol;
int nNumCols = pQuery->GetColumns()->GetCount();
int nNumRows = pQuery->GetRowCount();
for ( iRow=1; iRow<=nNumRows; iRow++ )
{
    for ( iCol=1; iCol<=nNumCols; iCol++ )
    {
        pRequest->Write( pQuery->GetData( iRow, iCol ) );
pRequest->Write( " " );
    }
pRequest->Write( "<BR>" );
}
CCFXQuery::GetName

Syntax
LPCSTR CCFXQuery::GetName(void)

Description
Returns the name of a query.

Example
The following example retrieves the name of a query and writes it back to the user:

CCFXQuery* pQuery = pRequest->GetQuery() ;
pRequest->Write( "The query name is: " ) ;
pRequest->Write( pQuery->GetName() ) ;

CCFXQuery::GetRowCount

Syntax
int CCFXQuery::GetRowCount(void)

Description
Returns the number of rows contained in a query.

Example
The following example retrieves the number of rows in a query and writes it back to the user:

CCFXQuery* pQuery = pRequest->GetQuery() ;
char buffOutput[256] ;
wsprintf( buffOutput, "The number of rows in the query is %ld.\n", pQuery->GetRowCount() ) ;
pRequest->Write( buffOutput ) ;

CCFXQuery::SetData

Syntax
void CCFXQuery::SetData(int iRow, int iColumn, LPCSTR lpszData)

Description
Sets a data element within a row and column of a query. Row and column indexes begin with 1. Before calling SetData for a given row, call CCFXQuery::AddRow and use the return value as the row index for your call to SetData.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iRow</td>
<td>Row of data element to set (1-based)</td>
</tr>
<tr>
<td>iColumn</td>
<td>Column of data element to set (1-based)</td>
</tr>
<tr>
<td>lpszData</td>
<td>New value for data element</td>
</tr>
</tbody>
</table>

Last updated 7/9/2012
Example
The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```c++
// First row
int iRow;
iRow = pQuery->AddRow();
pQuery->SetData( iCity, iRow, "Minneapolis" );
pQuery->SetData( iState, iRow, "MN" );
pQuery->SetData( iZip, iRow, "55345" );

// Second row
iRow = pQuery->AddRow();
pQuery->SetData( iCity, iRow, "St. Paul" );
pQuery->SetData( iState, iRow, "MN" );
pQuery->SetData( iZip, iRow, "55105" );
```

CCFXRequest class

Abstract class that represents a request made to a ColdFusion Extension (CFX). An instance of this class is passed to the main function of your extension DLL. The class provides interfaces that can be used by the custom extension for the following actions:

- Reading and writing variables
- Returning output
- Creating and using queries
- Throwing exceptions

Class methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual BOOL AttributeExists( LPCSTR lpszName )</td>
<td>CCFXRequest::AttributeExists checks whether the attribute was passed to the tag.</td>
</tr>
<tr>
<td>virtual LPCSTR GetAttribute( LPCSTR lpszName )</td>
<td>CCFXRequest::GetAttribute gets the value of the passed attribute.</td>
</tr>
<tr>
<td>virtual CCFXStringSet* GetAttributeList()</td>
<td>CCFXRequest::GetAttributeList gets an array of attribute names passed to the tag.</td>
</tr>
<tr>
<td>virtual CCFXQuery* GetQuery()</td>
<td>CCFXRequest::GetQuery gets the query that was passed to the tag.</td>
</tr>
<tr>
<td>virtual LPCSTR GetSetting( LPCSTR lpszSettingName )</td>
<td>CCFXRequest::GetSetting This method is deprecated. It might not work, and might cause an error, in later releases.</td>
</tr>
<tr>
<td>virtual void Write( LPCSTR lpszOutput )</td>
<td>CCFXRequest::Write writes text output back to the user.</td>
</tr>
<tr>
<td>virtual void SetVariable( LPCSTR lpszName, LPCSTR lpszValue )</td>
<td>CCFXRequest::SetVariable sets a variable in the template that contains this tag.</td>
</tr>
<tr>
<td>virtual CCFXQuery* AddQuery( LPCSTR lpszName, CCFXStringSet* pColumns )</td>
<td>CCFXRequest::AddQuery adds a query to the template that contains this tag.</td>
</tr>
<tr>
<td>virtual BOOL Debug()</td>
<td>CCFXRequest::Debug checks whether the tag contains the Debug attribute.</td>
</tr>
<tr>
<td>virtual void WriteDebug( LPCSTR lpszOutput )</td>
<td>CCFXRequest::WriteDebug writes text output into the debug stream.</td>
</tr>
</tbody>
</table>
CCFXRequest::AddQuery

Syntax

CCFXQuery* CCFXRequest::AddQuery(LPCSTR lpszName, CCFXStringSet* pColumns)

Description

Adds a query to the calling template. The query can be accessed by CFML tags (for example, cfoutput or cftable) within the template. After calling AddQuery, the query is empty (it has 0 rows). To populate the query with data, call the CCFXQuery::AddRow and CCFXQuery::SetData functions.

Returns

Returns a pointer to the query that was added to the template (an object of class CCFXQuery). The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszName</td>
<td>Name of query to add to the template (must be unique)</td>
</tr>
<tr>
<td>pColumns</td>
<td>List of column names to be used in the query</td>
</tr>
</tbody>
</table>

Example

The following example adds a query named 'People' to the calling template. The query has two columns ('FirstName' and 'LastName') and two rows:
// Create a string set and add the column names to it
CCFXStringSet* pColumns = pRequest->CreateStringSet() ;
int iFirstName = pColumns->AddString( "FirstName" ) ;
int iLastName = pColumns->AddString( "LastName" ) ;

// Create a query that contains these columns
CCFXQuery* pQuery = pRequest->AddQuery( "People", pColumns ) ;

// Add data to the query
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "John" ) ;
pQuery->SetData( iRow, iLastName, "Smith" ) ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "Jane" ) ;
pQuery->SetData( iRow, iLastName, "Doe" ) ;

CCFXRequest::AttributeExists

Syntax
BOOL CCFXRequest::AttributeExists(LPCSTR lpszName)

Description
Checks whether the parameter was passed to the tag. Returns True if the parameter is available; False, otherwise.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszName</td>
<td>Name of the parameter to check (case insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example checks whether the user passed an attribute named DESTINATION to the tag, and throws an exception if the attribute was not passed:

```cpp
if ( pRequest->AttributeExists("DESTINATION") == FALSE )
{
    pRequest->ThrowException(
        "Missing DESTINATION parameter",
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly." ) ;
}
```

CCFXRequest::CreateStringSet

Syntax
CCFXStringSet* CCFXRequest::CreateStringSet(void)

Description
Allocates and returns an instance. Always use this function to create string sets, as opposed to directly using the new operator.
Returns
Returns an object of `CCFXStringSet` class. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed.

Example
The following example creates a string set and adds three strings to it:

```c
CCFXStringSet* pColors = pRequest->CreateStringSet() ;
pColors->AddString( "Red" ) ;
pColors->AddString( "Green" ) ;
pColors->AddString( "Blue" ) ;
```

`CCFXRequest::Debug`

Syntax

```c
BOOL CCFXRequest::Debug(void)
```

Description
Checks whether the tag contains the `Debug` attribute. Use this function to determine whether to write debug information for a request. For more information, see `CCFXRequest::WriteDebug`.

Returns
Returns True if the tag contains the `Debug` attribute; False, otherwise.

Example
The following example checks whether the `Debug` attribute is present, and if it is, it writes a brief debug message:

```c
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Top secret debug info" ) ;
}
```

`CCFXRequest::GetAttribute`

Syntax

```c
LPCSTR CCFXRequest::GetAttribute(LPCSTR lpszName)
```

Description
Retrieves the value of the passed attribute. Returns an empty string if the attribute does not exist. (To test whether an attribute was passed to the tag, use `CCFXRequest::AttributeExists`.)

Returns
Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszName</td>
<td>Name of the attribute to retrieve (case insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example retrieves an attribute named DESTINATION and writes its value back to the user:

```
LPCSTR lpszDestination = pRequest->GetAttribute("DESTINATION") ;
pRequest->Write( "The destination is: " ) ;
pRequest->Write( lpszDestination ) ;
```

**CCFXRequest::GetAttributeList**

Syntax
```
CCFXStringSet* CCFXRequest::GetAttributeList(void)
```

Description
Gets an array of attribute names passed to the tag. To get the value of one attribute, use `CCFXRequest::GetAttribute`.

Returns
Returns an object of class `CCFXStringSet` that contains a list of attributes passed to the tag. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed.

Example
The following example gets the list of attributes and iterates over the list, writing each attribute and its value back to the user.

```
LPCSTR lpszName, lpszValue ;
CCFXStringSet* pAttribs = pRequest->GetAttributeList() ;
int nNumAttribs = pAttribs->GetCount() ;
for( int i=1; i<=nNumAttribs; i++ )
{
    lpszName = pAttribs->GetString( i ) ;
    lpszValue = pRequest->GetAttribute( lpszName ) ;
    pRequest->Write( lpszName ) ;
    pRequest->Write( " = " ) ;
    pRequest->Write( lpszValue ) ;
    pRequest->Write( "<BR>" ) ;
}
```

**CCFXRequest::GetCustomData**

Syntax
```
LPVOID CCFXRequest::GetCustomData(void)
```

Parameter
lpszName
Name of the attribute to retrieve (case insensitive)
Description
Gets the custom (tag specific) data for the request. This method is typically used from within subroutines of a tag implementation to extract tag data from a request.

Returns
Returns a pointer to the custom data, or NULL if no custom data has been set during this request using CCFXRequest::SetCustomData.

Example
The following example retrieves a pointer to a request specific data structure of hypothetical type MYTAGDATA:

```c
void DoSomeGruntWork( CCFXRequest* pRequest )
{
    MYTAGDATA* pTagData =
        (MYTAGDATA*)pRequest->GetCustomData() ;

    ... remainder of procedure ...
}
```

CCFXRequest::GetQuery

Syntax
CCFXQuery* CCFXRequest::GetQuery(void)

Description
Retrieves a query that was passed to a tag. To pass a query to a custom tag, you use the QUERY attribute. Set the attribute to the name of a query (created using the cfquery tag or another custom tag). The QUERY attribute is optional and must be used only by tags that process an existing data set.

Returns
Returns an object of the CCFXQuery class that represents the query passed to the tag. If no query was passed to the tag, NULL is returned. The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

Example
The following example retrieves the query that was passed to the tag. If no query was passed, an exception is thrown:

```c
CCFXQuery* pQuery = pRequest->GetQuery() ;
if ( pQuery == NULL )
{
    pRequest->ThrowException(
        "Missing QUERY parameter",
        "You must pass a QUERY parameter in "
        "order for this tag to work correctly." ) ;
}
```

CCFXRequest::ReThrowException

Syntax
void CCFXRequest::ReThrowException(CCFXException* e)
Description
Rethrows an exception that has been caught within an extension procedure. This function is used to avoid having C++ exceptions that are thrown by DLL extension code propagate back into ColdFusion. Catch ALL C++ exceptions that occur in extension code, and either re-throw them (if they are of the **CCFXException** class) or create and throw a new exception pointer using **CCFXRequest::ThrowException**.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>e</td>
<td>A CCFXException that has been caught</td>
</tr>
</tbody>
</table>

Example
The following code demonstrates how to handle exceptions in ColdFusion Extension DLL procedures:

```cpp
try {
    ...Code that could throw an exception...
}
catch( CCFXException* e ) {
    ...Do appropriate resource cleanup here...
    // Re-throw the exception
    pRequest->ReThrowException( e ) ;
}
catch( ... ) {
    // Something nasty happened
    pRequest->ThrowException(
        "Unexpected error occurred in CFX tag", "" ) ;
}
```

**CCFXRequest::SetCustomData**

Syntax

```cpp
void CCFXRequest::SetCustomData(LPVOID lpvData)
```

Description
Sets custom (tag specific) data to carry with the request. Use this function to store request specific data to pass to procedures within your custom tag implementation.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpvData</td>
<td>Pointer to custom data</td>
</tr>
</tbody>
</table>

Example
The following example creates a request-specific data structure of hypothetical type MYTAGDATA and stores a pointer to the structure in the request for future use:
void ProcessTagRequest( CCFXRequest* pRequest )  
    try  
        {  
            MYTAGDATA tagData ;  
            pRequest->SetCustomData( (LPVOID)&tagData ) ;  

            ... remainder of procedure ...  
        }  

CCFXRequest::SetVariable  

Syntax  
void CCFXRequest::SetVariable(LPCSTR lpszName, LPCSTR lpszValue)  

Description  
Sets a variable in the calling template. If the variable name already exists in the template, its value is replaced. If it does not exist, a variable is created. The values of variables created using SetVariable can be accessed in the same manner as other template variables (for example, #MessageSent#).  

Parameters  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszName</td>
<td>Name of variable</td>
</tr>
<tr>
<td>lpszValue</td>
<td>Value of variable</td>
</tr>
</tbody>
</table>

Example  
The following example sets the value of a variable named 'MessageSent' based on the success of an operation performed by the custom tag:  

    BOOL bMessageSent;  
    ...attempt to send the message...  
    if ( bMessageSent == TRUE )  
        {  
            pRequest->SetVariable( "MessageSent", "Yes" ) ;  
        }  
    else  
        {  
            pRequest->SetVariable( "MessageSent", "No" ) ;  
        }  

CCFXRequest::ThrowException  

Syntax  
void CCFXRequest::ThrowException(LPCSTR lpszError, LPCSTR lpszDiagnostics)  

Description  
Throws an exception and ends processing of a request. Call this function when you encounter an error that does not allow you to continue processing the request. This function is almost always combined with the CCFXRequest::ReThrowException to protect against resource leaks in extension code.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszError</td>
<td>Short identifier for error</td>
</tr>
<tr>
<td>lpszDiagnostics</td>
<td>Error diagnostic information</td>
</tr>
</tbody>
</table>

Example
The following example throws an exception indicating that an unexpected error occurred while processing a request:

```c
char buffError[512] ;
wsprintf( buffError,
    "Unexpected Windows NT error number %ld 
    "occurred while processing request.", GetLastError() ) ;

pRequest->ThrowException( "Error occurred", buffError ) ;
```

CCFXRequest::Write

Syntax

```c
void CCFXRequest::Write(LPCSTR lpszOutput)
```

Description
Writes text output back to the user.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszOutput</td>
<td>Text to output</td>
</tr>
</tbody>
</table>

Example
The following example creates a buffer to hold an output string, fills the buffer with data, and writes the output back to the user:

```c
CHAR buffOutput[1024] ;
wsprintf( buffOutput, "The destination is: %s", pRequest->GetAttribute("DESTINATION") ) ;
pRequest->Write( buffOutput ) ;
```

CCFXRequest::WriteDebug

Syntax

```c
void CCFXRequest::WriteDebug(LPCSTR lpszOutput)
```

Description
Writes text output into the debug stream. The text is only displayed to the end user if the tag contains the `Debug` attribute. (For more information, see `CCFXRequest::Debug`.)
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszOutput</td>
<td>Text to output</td>
</tr>
</tbody>
</table>

Example
The following example checks whether the `Debug` attribute is present; if so, it writes a brief debug message:

```cpp
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Top secret debug info" ) ;
}
```

### CCFXStringSet class

Abstract class that represents a set of ordered strings. You can add strings to a set and retrieve them by a numeric index (index values for strings are 1-based). To create a string set, use `CCFXRequest::CreateStringSet`.

#### Class methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
</table>
| ```cpp
virtual int AddString( LPCSTR lpszString )
``` | `CCFXStringSet::AddString` adds a string to the end of a list. |
| ```cpp
virtual int GetCount()
``` | `CCFXStringSet::GetCount` gets the number of strings contained in a list. |
| ```cpp
virtual LPCSTR GetString( int iIndex )
``` | `CCFXStringSet::GetString` gets the string located at the passed index. |
| ```cpp
virtual int GetIndexForString( LPCSTR lpszString )
``` | `CCFXStringSet::GetIndexForString` gets the index for the passed string. |

#### CCFXStringSet::AddString

**Syntax**

```cpp
int CCFXStringSet::AddString( LPCSTR lpszString )
```

**Description**

Adds a string to the end of the list.

**Returns**

The index of the string that was added.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszString</td>
<td>String to add to the list</td>
</tr>
</tbody>
</table>
Example
The following example demonstrates adding three strings to a string set and saving the indexes of the items that are added:

```cpp
CCFXStringSet* pSet = pRequest->CreateStringSet();
int iRed = pSet->AddString( "Red" );
int iGreen = pSet->AddString( "Green" );
int iBlue = pSet->AddString( "Blue" );
```

**CCFXStringSet::GetCount**

**Syntax**

```cpp
int CCFXStringSet::GetCount(void)
```

**Description**

Gets the number of strings in a string set. The value can be used with CCFXStringSet::GetString to iterate over the strings in the set (recall that the index values for strings in the list begin at 1).

**Returns**

Returns the number of strings contained in the string set.

**Example**

The following example demonstrates using GetCount with CCFXStringSet::GetString to iterate over a string set and write the contents of the list back to the user:

```cpp
int nNumItems = pStringSet->GetCount();
for ( int i=1; i<=nNumItems; i++ )
{
    pRequest->Write( pStringSet->GetString( i ) );
    pRequest->Write( "<BR>" );
}
```

**CCFXStringSet::GetIndexForString**

**Syntax**

```cpp
int CCFXStringSet::GetIndexForString(LPCSTR lpszString)
```

**Description**

Searches for a passed string. The search is case-insensitive.

**Returns**

If the string is found, its index within the string set is returned. If it is not found, the constant **CFX_STRING_NOT_FOUND** is returned.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpszString</td>
<td>String to search for</td>
</tr>
</tbody>
</table>
Example
The following example demonstrates a search for a string and throwing an exception if it is not found:

```cpp
CCFXStringSet* pAttribs = pRequest->GetAttributeList() ;

    int iDestination = pAttribs->GetIndexForString("DESTINATION") ;
    if ( iDestination == CFX_STRING_NOT_FOUND )
    {
        pRequest->ThrowException(
            "DESTINATION attribute not found."
            "The DESTINATION attribute is required "
            "by this tag." ) ;
    }
```

CCFXStringSet::GetString

**Syntax**

LPCSTR CCFXStringSet::GetString(int iIndex)

**Description**
Retrieves the string located at the passed index (index values are 1-based).

**Returns**
Returns the string located at the passed index.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iIndex</td>
<td>Index of string to retrieve</td>
</tr>
</tbody>
</table>

**Example**

The following example demonstrates `GetString` with `CCFXStringSet::GetCount` to iterate over a string set and write the contents of a list back to the user:

```cpp
int nNumItems = pStringSet->GetCount() ;
    for ( int i=1; i<=nNumItems; i++ )
    {
        pRequest->Write( pStringSet->GetString( i ) ) ;
        pRequest->Write( "<BR>" ) ;
    }
```
Chapter 11: ColdFusion Java CFX Reference

ColdFusion includes Java interfaces for building ColdFusion custom CFXs in Java.

Class libraries overview

The following Java interfaces are available for building ColdFusion custom CFXs in Java:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom tag interface</td>
<td>processRequest</td>
</tr>
<tr>
<td>Query interface</td>
<td>addRow</td>
</tr>
<tr>
<td></td>
<td>getColumnInfo</td>
</tr>
<tr>
<td></td>
<td>getColumnNames</td>
</tr>
<tr>
<td></td>
<td>getData</td>
</tr>
<tr>
<td></td>
<td>getName</td>
</tr>
<tr>
<td></td>
<td>getRowCount</td>
</tr>
<tr>
<td></td>
<td>setData</td>
</tr>
<tr>
<td>Request interface</td>
<td>attributeExists</td>
</tr>
<tr>
<td></td>
<td>debug</td>
</tr>
<tr>
<td></td>
<td>getAttribute</td>
</tr>
<tr>
<td></td>
<td>getAttributeList</td>
</tr>
<tr>
<td></td>
<td>getIntAttribute</td>
</tr>
<tr>
<td></td>
<td>getQuery</td>
</tr>
<tr>
<td></td>
<td>getSetting</td>
</tr>
<tr>
<td>Response interface</td>
<td>addQuery</td>
</tr>
<tr>
<td></td>
<td>setVariable</td>
</tr>
<tr>
<td></td>
<td>write</td>
</tr>
<tr>
<td></td>
<td>writeDebug</td>
</tr>
</tbody>
</table>

Custom tag interface

public abstract interface CustomTag

Interface for implementing custom tags.

Classes that implement this interface can be specified in the CLASS attribute of the Java CFX tag. For example, in a class MyCustomTag, which implements this interface, the following CFML code calls the MyCustomTag.processRequest method:
<CFX_MyCustomTag>

Other attributes can be passed to the Java CFX tag. Their values are available using the Request object passed to the processRequest method.

Methods

<table>
<thead>
<tr>
<th>Returns</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td>processRequest(Request request, Response response)</td>
<td>Processes a request originating from the CFX_mycustomtag tag</td>
</tr>
</tbody>
</table>

processRequest

**Description**
Processes a request originating from the Java CFX tag.

**Category**
Custom tag interface

**Syntax**
public void processRequest(Request request, Response response)

**Throws**
Exception If an unexpected error occurs while processing the request.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Parameters (attributes, query, and so on.) for this request</td>
</tr>
<tr>
<td>response</td>
<td>Interface for generating response to request (output, variables, queries, and so on)</td>
</tr>
</tbody>
</table>

Query interface

public abstract interface Query

Interface to a query used or created by a custom tag. A query contains tabular data organized by named columns and rows.

Methods

<table>
<thead>
<tr>
<th>Returns</th>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>addRow()</td>
<td>Adds a row to the query</td>
</tr>
<tr>
<td>int</td>
<td>getColumnIndex(String name)</td>
<td>Gets the index of a column given its name</td>
</tr>
<tr>
<td>String[]</td>
<td>getColumns()</td>
<td>Gets a list of the column names in a query</td>
</tr>
<tr>
<td>String</td>
<td>getData(int iRow, int iCol)</td>
<td>Gets a data element from a row and column of a query</td>
</tr>
</tbody>
</table>
addRow

Description
Adds a row to a query. Call this method to append a row to a query.

Returns the index of the row that was appended to the query.

Category
Query interface

Syntax
public int addRow()

See also
setData, getData

Example
The following example demonstrates the addition of two rows to a query that has three columns, City, State, and Zip:

```java
// Define column indexes
int iCity = 1, iState = 2, iZip = 3;

// First row
int iRow = query.addRow();
query.setData(iRow, iCity, "Minneapolis");
query.setData(iRow, iState, "MN");
query.setData(iRow, iZip, "55345");
// Second row
iRow = query.addRow();
query.setData(iRow, iCity, "St. Paul");
query.setData(iRow, iState, "MN");
query.setData(iRow, iZip, "55105");
```

ggetColumnIndex

Description
Returns the index of the column, or 0 if no such column exists.

Category
Query interface

Syntax
public int getColumnIndex(String name)

Returns Method Description

<table>
<thead>
<tr>
<th>Returns</th>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>getName()</td>
<td>Gets the name of a query</td>
</tr>
<tr>
<td>int</td>
<td>getRowCount()</td>
<td>Gets the number of rows in a query</td>
</tr>
<tr>
<td>void</td>
<td>setData(int iRow, int iCol, String data)</td>
<td>Sets a data element in a row and column of a query</td>
</tr>
</tbody>
</table>
See also
getColumns, getData

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of column to get index of (lookup is case-insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example retrieves the index of the EMAIL column and uses it to output a list of the addresses contained in the column:

```java
// Get the index of the EMAIL column
int iEMail = query.getColumnIndex( "EMAIL" ) ;

// Iterate over the query and output list of addresses
int nRows = query.getRowCount() ;
for( int iRow = 1; iRow <= nRows; iRow++ )
{
    response.write( query.getData( iRow, iEMail ) + "<BR>" ) ;
}
```

getColumns

Description
Returns an array of strings containing the names of the columns in the query.

Category
Query interface

Syntax
`public String[] getColumns()`

Example
The following example retrieves the array of columns, then iterates over the list, writing each column name back to the user:

```java
String[] columns = query.getColumns() ;
int nNumColumns = columns.length ;

// Print the list of columns to the user
response.write( "Columns in query: " ) ;
for( int i=0; i<nNumColumns; i++ )
{
    response.write( columns[i] + " " ) ;
}
```
**getData**

**Description**
Retrieves a data element from a row and column of a query. Row and column indexes begin with 1. You can find the number of rows in a query by calling `getRowCount`. You can find the number of columns in a query by calling `getColumns`.

Returns the value of the requested data element.

**Category**
Query interface

**Syntax**
```java
public String getData(int iRow, int iCol)
```

**Throws**
`IndexOutOfBoundsException` if an invalid index is passed to the method.

**See also**
`setData`, `addRow`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iRow</td>
<td>Row to retrieve data from (1-based)</td>
</tr>
<tr>
<td>iCol</td>
<td>Column to retrieve data from (1-based)</td>
</tr>
</tbody>
</table>

**Example**
The following example iterates over the rows of a query and writes the data back to the user in a simple, space-delimited format:
```java
int iRow, iCol;
int nNumCols = query.getColumns().length;
int nNumRows = query.getRowCount();
for ( iRow = 1; iRow <= nNumRows; iRow++ )
{
    for ( iCol = 1; iCol <= nNumCols; iCol++ )
    {
        response.write( query.getData( iRow, iCol ) + " " ) ;
    }
    response.write( "<BR>" ) ;
}
```

**getName**

**Description**
Returns the name of a query.
Category
Query interface

Syntax
public String getName()

Example
The following example retrieves the name of a query and writes it back to the user:

```
Query query = request.getQuery() ;
    response.write( "The query name is: " + query.getName() ) ;
```

getRowCount

Description
Retrieves the number of rows in a query.

Returns the number of rows contained in a query.

Category
Query interface

Syntax
public int getRowCount()

Example
The following example retrieves the number of rows in a query and writes it back to the user:

```
Query query = request.getQuery() ;
    int rows = query.getRowCount() ;
    response.write( "The number of rows in the query is "
        + Integer.ToString(rows) ) ;
```

setData

Description
Sets a data element in a row and column of a query. Row and column indexes begin with 1. Before calling setData for a given row, call addRow and use the return value as the row index for your call to setData.

Category
Query interface

Syntax
public void setData(int iRow, int iCol, String data)

Throws
IndexOutOfBoundsException if an invalid index is passed to the method.
See also
getData, addRow

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iRow</td>
<td>Row of data element to set (1-based)</td>
</tr>
<tr>
<td>iCol</td>
<td>Column of data element to set (1-based)</td>
</tr>
<tr>
<td>data</td>
<td>New value for data element</td>
</tr>
</tbody>
</table>

Example
The following example demonstrates the addition of two rows to a query that has three columns, City, State, and Zip:

```java
// Define column indexes
int iCity = 1, iState = 2, iZip = 3;

// First row
int iRow = query.addRow();
query.setData(iRow, iCity, "Minneapolis");
query.setData(iRow, iState, "MN");
query.setData(iRow, iZip, "55345");

// Second row
iRow = query.addRow();
query.setData(iRow, iCity, "St. Paul");
query.setData(iRow, iState, "MN");
query.setData(iRow, iZip, "55105");
```

Request interface

```java
public abstract interface Request
```

Interface to a request made to a CustomTag. The interface includes methods for retrieving attributes passed to the tag (including queries) and reading global tag settings.

Methods

<table>
<thead>
<tr>
<th>Returns</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>attributeExists(String name)</td>
<td>Checks whether the attribute was passed to this tag.</td>
</tr>
<tr>
<td>boolean</td>
<td>debug()</td>
<td>Checks whether the tag contains the debug attribute.</td>
</tr>
<tr>
<td>String</td>
<td>getAttribute(String name)</td>
<td>Retrieves the value of the passed attribute.</td>
</tr>
<tr>
<td>String[]</td>
<td>getAttributeList()</td>
<td>Retrieves a list of attributes passed to the tag.</td>
</tr>
<tr>
<td>int</td>
<td>getIntAttribute(String name)</td>
<td>Retrieves the value of the passed attribute as an integer.</td>
</tr>
</tbody>
</table>
attributeExists

Description
Checks whether the attribute was passed to this tag.

Returns True if the attribute is available; otherwise returns False.

Category
Request interface

Syntax
public boolean attributeExists(String name)

See also
getAttribute, getAttributeList

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the attribute to check (case-insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example checks whether the user passed an attribute named DESTINATION to the tag; if not, it throws an exception:

```java
if ( ! request.attributeExists("DESTINATION") )
{
    throw new Exception("Missing DESTINATION parameter,
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly."");
}
```

default

Description
Checks whether the tag contains the debug attribute. Use this method to determine whether to write debug information for this request. For more information, see writeDebug.

Returns True if the tag contains the debug attribute; False, otherwise.
Category
Request interface

Syntax
public boolean debug()

See also
writeDebug

Example
The following example checks whether the debug attribute is present, and if so, it writes a brief debug message:

```java
if ( request.debug() )
{
    response.writeDebug( "debug info" ) ;
}
```

getAttribute

Description
Retrieves the value of a passed attribute. Returns an empty string if the attribute does not exist (use attributeExists to test whether an attribute was passed to the tag). Use getAttribute(String,String) to return a default value rather than an empty string.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.

Category
Request interface

Syntax
public String getAttribute(String name)

See also
attributeExists, getAttributeList, getIntAttribute

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The attribute to retrieve (case-insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example retrieves an attribute named DESTINATION and writes its value back to the user:

```java
String strDestination = request.getAttribute("DESTINATION") ;
response.write( "The destination is: " + strDestination ) ;
```
getAttributeList

Description
Retrieves a list of attributes passed to the tag. To retrieve the value of one attribute, use the getAttribute method.

Returns an array of strings containing the names of the attributes passed to the tag.

Category
Request interface

Syntax
public String[] getAttributeList()

See also
attributeExists

Example
The following example retrieves the list of attributes, then iterates over the list, writing each attribute and its value back to the user:

```java
String[] attribs = request.getAttributeList() ;
int nNumAttribs = attribs.length ;

for( int i = 0; i < nNumAttribs; i++ )
{
    String strName = attribs[i] ;
    String strValue = request.getAttribute( strName ) ;
    response.write( strName + "=" + strValue + "<BR>" ) ;
}
```

getIntAttribute

Description
Retrieves the value of the passed attribute as an integer. Returns -1 if the attribute does not exist. Use attributeExists to test whether an attribute was passed to the tag. Use getIntAttribute(String, int) to return a default value rather than throwing an exception or returning -1.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, -1 is returned.

Category
Request interface

Syntax
public int getIntAttribute(String name)

Throws
NumberFormatException if the attribute is not a valid number.

See also
attributeExists, getAttributeList
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The attribute to retrieve (case-insensitive)</td>
</tr>
</tbody>
</table>

Example
The following example retrieves an attribute named PORT and writes its value back to the user:

```java
int nPort = request.getIntAttribute("PORT") ;
if ( nPort != -1 )
    response.write( "The port is: " + String.valueOf(nPort) ) ;
```

getQuery

Description
Retrieves the query that was passed to this tag.

To pass a query to a custom tag, you use the query attribute. It should be set to the name of a query (created using the cfquery tag). The query attribute is optional and should be used only by tags that process an existing dataset.

Returns the Query that was passed to the tag. If no query was passed, returns null.

Category
Request interface

Syntax
```java
public Query getQuery()
```

Example
The following example retrieves a query that was passed to a tag. If no query was passed, an exception is thrown:

```java
Query query = request.getQuery() ;
if ( query == null )
{
    throw new Exception(
        "Missing QUERY parameter. " +
        "You must pass a QUERY parameter in "
        "order for this tag to work correctly." ) ;
}
```

getSetting

Description
Retrieves the value of a global custom tag setting. Custom tag settings are stored in the CustomTags section of the ColdFusion Registry key.

Returns the value of the custom tag setting. If no setting of that name exists, an empty string is returned.

Category
Request interface
Syntax
public String getSetting(String name)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the setting to retrieve (case-insensitive)</td>
</tr>
</tbody>
</table>

Usage
All custom tags implemented in Java share a registry key for storing settings. To avoid name conflicts, preface the names of settings with the name of your custom tag class. For example, the code below retrieves the value of a setting named `VerifyAddress` for a custom tag class named `MyCustomTag`:

```java
String strVerify = request.getSetting("MyCustomTag.VerifyAddress") ;
if ( Boolean.valueOf(strVerify) )
{
    // Do address verification...
}
```

Response interface

```java
public abstract interface Response
```

Interface to response generated from a custom tag. This interface includes methods for writing output, generating queries, and setting variables in the calling page.

Methods

<table>
<thead>
<tr>
<th>Returns</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>addQuery(String name, String[] columns)</td>
<td>Adds a query to the calling template.</td>
</tr>
<tr>
<td>void</td>
<td>setVariable(String name, String value)</td>
<td>Sets a variable in the calling template.</td>
</tr>
<tr>
<td>void</td>
<td>write(String output)</td>
<td>Outputs text back to the user.</td>
</tr>
<tr>
<td>void</td>
<td>writeDebug(String output)</td>
<td>Writes text output into the debug stream.</td>
</tr>
</tbody>
</table>

addQuery

Description
Adds a query to the calling template. The query can be accessed by CFML tags in the template. After calling `addQuery`, the query is empty (it has 0 rows). To populate the query with data, call the Query methods `addRow` and `setData`.

Returns the Query that was added to the template.

Category
Response interface
Syntax
public Query addQuery(String name, String[] columns)

Throws
IllegalArgumentException  If the name parameter is not a valid CFML variable name.

See also
addRow, setData

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the query to add to the template</td>
</tr>
<tr>
<td>columns</td>
<td>The column names to use in the query</td>
</tr>
</tbody>
</table>

Example
The following example adds a query named People to the calling template. The query has two columns (FirstName and LastName) and two rows:

```java
// Create string array with column names (also track columns indexes)
String[] columns = { "FirstName", "LastName" } ;
int iFirstName = 1, iLastName = 2 ;

// Create a query which contains these columns
Query query = response.addQuery( "People", columns ) ;

// Add data to the query
int iRow = query.addRow() ;
query.setData( iRow, iFirstName, "John" ) ;
query.setData( iRow, iLastName, "Smith" ) ;

iRow = query.addRow() ;
query.setData( iRow, iFirstName, "Jane" ) ;
query.setData( iRow, iLastName, "Doe" ) ;
```

setVariable

Description
Sets a variable in the calling template. If the variable name specified exists in the template, its value is replaced. If it does not exist, a new variable is created.

Category
Response interface

Syntax
public void setVariable(String name, String value)

Throws
IllegalArgumentException  If the name parameter is not a valid CFML variable name.
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the variable to set</td>
</tr>
<tr>
<td>value</td>
<td>The value to set the variable to</td>
</tr>
</tbody>
</table>

Example

For example, this code sets the value of a variable named `MessageSent` based on the success of an operation performed by the custom tag:

```java
boolean bMessageSent;

...attempt to send the message...

if ( bMessageSent == true )
{
    response.setVariable( "MessageSent", "Yes" );
}
else
{
    response.setVariable( "MessageSent", "No" );
}
```

write

Description

Outputs text back to the user.

Category

Response interface

Syntax

```java
public void write(String output)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>output</td>
<td>Text to output</td>
</tr>
</tbody>
</table>

Example

The following example outputs the value of the `DESTINATION` attribute:

```java
response.write( "DESTINATION = " +
    request.getAttribute("DESTINATION") ) ;
```
writeDebug

Description
Writes text output into the debug stream. This text is displayed to the end-user only if the tag contains the debug attribute (check for this attribute using the Request.debug method).

Category
Response interface

Syntax
public void writeDebug(String output)

See also
debug

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>output</td>
<td>The text to output</td>
</tr>
</tbody>
</table>

Example
The following example checks whether the debug attribute is present; if so, it writes a brief debug message:

```java
if ( request.debug() )
{
    response.writeDebug( "debug info" ) ;
}
```

Debugging classes reference

The constructors and methods supported by the DebugRequest, DebugResponse, and DebugQuery classes are as follows. These classes also support the other methods of the Request, Response, and Query interfaces, respectively.

DebugRequest

```java
// initialize a debug request with attributes
public DebugRequest( Hashtable attributes ) ;

// initialize a debug request with attributes and a query
public DebugRequest( Hashtable attributes, Query query ) ;

// initialize a debug request with attributes, a query, and settings
public DebugRequest( Hashtable attributes, Query query, Hashtable settings ) ;
```
DebugResponse

  // initialize a debug response
  public DebugResponse() {
  }

  // print the results of processing
  public void printResults() {
  }

DebugQuery

  // initialize a query with name and columns
  public DebugQuery(String name, String[] columns)
      throws IllegalArgumentException {
  }

  // initialize a query with name, columns, and data
  public DebugQuery(String name, String[] columns, String[][] data)
      throws IllegalArgumentException {
Chapter 12: WDDX JavaScript Objects

You use JavaScript objects and functions to use with WDDX in a ColdFusion application.

JavaScript object overview

These are the JavaScript objects and functions:

<table>
<thead>
<tr>
<th>Class</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>WddxSerializer object</td>
<td>serialize, serializeVariable, serializeValue, write</td>
</tr>
<tr>
<td>WddxRecordset object</td>
<td>addColumn, addRows, getField, getRowCount, setField, wddxSerialize</td>
</tr>
</tbody>
</table>

WDDX JavaScript objects are defined in the wddx.js file; this file is installed in the CFIDE/scripts directory.

To use these objects, you must put a JavaScript tag before the code that refers to the objects; for example:

```html
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
```

WddxSerializer object

The WddxSerializer object includes functions that serialize any JavaScript data structure. For more information on using this object, see Using WDDX in the Developing ColdFusion Applications.

Functions

The only function that developers typically call is `serialize`.

<table>
<thead>
<tr>
<th>Function syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object serialize (rootobj)</code></td>
<td>Creates a WDDX packet for a passed WddxRecordset instance.</td>
</tr>
<tr>
<td><code>object serializeVariable (name, obj)</code></td>
<td>Serializes a property of a structure. If an object is not a string, number, array, Boolean, or a date, WddxSerializer treats it as a structure.</td>
</tr>
<tr>
<td><code>object serializeValue (obj)</code></td>
<td>Recursively serializes eligible data in a passed instance.</td>
</tr>
<tr>
<td><code>object write (str)</code></td>
<td>Appends data to the serialized data stream.</td>
</tr>
</tbody>
</table>
serialize

Description
Creates a WDDX packet for a passed WddxRecordset instance.

Syntax
object.serialize( rootobj )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxSerializer object</td>
</tr>
<tr>
<td>rootobj</td>
<td>JavaScript data structure to serialize</td>
</tr>
</tbody>
</table>

Return value
Returns a serialized WDDX packet as a string if the function succeeds, or a null value if an error occurs.

Usage
Call this function to serialize the data in a WddxRecordset instance.

Example
This example shows a JavaScript function that you can call to serialize a WddxRecordset instance. It copies serialized data to a form field for display:

```javascript
function serializeData(data, formField)
{
  wddxSerializer = new WddxSerializer();
  wddxPacket = wddxSerializer.serialize(data);
  if (wddxPacket != null)
  {
    formField.value = wddxPacket;
  }
  else
  {
    alert("Couldn't serialize data");
  }
}
```

serializeVariable

Description
Serializes a property of a structure. If an object is not a string, number, array, Boolean, or date, WddxSerializer treats it as a structure.

Syntax
object.serializeVariable( name, obj )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of a WddxSerializer object</td>
</tr>
<tr>
<td>name</td>
<td>Property to serialize</td>
</tr>
<tr>
<td>obj</td>
<td>Instance name of the value to serialize</td>
</tr>
</tbody>
</table>

Return value
Returns a Boolean True if serialization was successful; False, otherwise.
This is an internal function; you do not typically call it.

Example
This example is from the WddxSerializer serializeValue function:

```javascript
// Some generic object; treat it as a structure
this.write("<struct>");
for (prop in obj)
{
  bSuccess = this.serializeVariable(prop, obj[prop]);
  if (! bSuccess)
  {
    break;
  }
}
this.write("</struct>");
```

serializeValue

Description
Recursively serializes eligible data in a passed instance. Eligible data includes:

- String
- Number
- Boolean
- Date
- Array
- Recordset
- Any JavaScript object
  This function serializes null values as empty strings.

Syntax

```javascript
object.serializeValue( obj )
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxSerializer object</td>
</tr>
<tr>
<td>obj</td>
<td>Instance name of the WddxRecordset object to serialize</td>
</tr>
</tbody>
</table>

Return value

Returns a Boolean True if `obj` was serialized successfully; False, otherwise.

Usage

This is an internal function; you do not typically call it.

Example

This example is from the WddxSerializer `serialize` function:

```javascript
... 
this.wddxPacket = "";
this.write("<wddxPacket version='1.0'><header/><data>");
bSuccess = this.serializeValue(rootObj);
this.write("</data></wddxPacket>");
if (bSuccess)
{
    return this.wddxPacket;
}
else
{
    return null;
}
... 
```

write

Description

Appends data to a serialized data stream.

Syntax

```javascript
object.write( str )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxSerializer object</td>
</tr>
<tr>
<td>str</td>
<td>String to be copied to the serialized data stream</td>
</tr>
</tbody>
</table>

Return value

Returns an updated serialized data stream as a String.

Usage

This is an internal function; you do not typically call it.
Example
This example is from the WddxSerializer `serializeValue` function:

```javascript
... else if (typeof(obj) == "number") {
  // Number value
  this.write("<number>" + obj + "</number>");
} else if (typeof(obj) == "boolean") {
  // Boolean value
  this.write("<boolean value='" + obj + "'/>");
}
...```

**WddxRecordset object**

Includes functions that you call as needed when constructing a WDDX record set. For more information on using this object, see Using WDDX in the *Developing ColdFusion Applications*.

**Functions**

<table>
<thead>
<tr>
<th>Function syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object.addColumn(name)</code></td>
<td>Adds a column to all rows in a WddxRecordset instance.</td>
</tr>
<tr>
<td><code>object.addRows(n)</code></td>
<td>Adds rows to all columns in a WddxRecordset instance.</td>
</tr>
<tr>
<td><code>object.dump(escapeStrings)</code></td>
<td>Displays WddxRecordset object data.</td>
</tr>
<tr>
<td><code>object.getField(row, col)</code></td>
<td>Returns the element in a row/column position.</td>
</tr>
<tr>
<td><code>object.getRowCount()</code></td>
<td>Indicates the number of rows in a WddxRecordset instance.</td>
</tr>
<tr>
<td><code>object.setField(row, col, value)</code></td>
<td>Sets the element in a row/column position.</td>
</tr>
<tr>
<td><code>object.wddxSerialize(serializer)</code></td>
<td>Serializes a record set.</td>
</tr>
</tbody>
</table>

**Returns**

HTML table of the WddxRecordset object data.

**Usage**

Convenient for debugging and testing record sets. The boolean parameter `escapeStrings` determines whether `<>& characters in string values are escaped as &lt;&gt;&amp; in HTML.
Example

<!-- Create a simple query -->
<cfquery name = "q" datasource ="cfdocexamples">
    SELECT Message_Id, Thread_id, Username, Posted
    FROM messages
</cfquery>

<!-- Load the wddx.js file, which includes the dump function -->
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
<script>
// Use WDDX to move from CFML data to JS
<cfwddx action="cfml2js" input="#q#" topLevelVariable="qj"> // Dump the record set
document.write(qj.dump(true));
</script>

addColumn

**Description**

Adds a column to all rows in a WddxRecordset instance.

**Syntax**

```javascript
object.addColumn( name )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxRecordset object</td>
</tr>
<tr>
<td>name</td>
<td>Name of the column to add</td>
</tr>
</tbody>
</table>

**Return value**

None.

**Usage**

Adds a column to every row of the WDDX record set. Initially the new column’s values are set to NULL.

**Example**

This example calls the `addColumn` function:

```javascript
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```
addRows

Description
Adds rows to all columns in a WddxRecordset instance.

Syntax

object.addRows( n )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxRecordset object</td>
</tr>
<tr>
<td>n</td>
<td>integer; number of rows to add</td>
</tr>
</tbody>
</table>

Return value
None.

Usage
This function adds the specified number of rows to every column of a WDDX record set. Initially, the row/column values are set to NULL.

Example
This example calls the addRows function:

```javascript
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

ggetField

Description
Returns the element in the specified row/column position.

Syntax

object.getField( row, col )
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxRecordset object</td>
</tr>
<tr>
<td>row</td>
<td>Integer; zero-based row number of the value to return</td>
</tr>
<tr>
<td>col</td>
<td>Integer or string; column of the value to be returned.</td>
</tr>
</tbody>
</table>

Return value

Returns the value in the specified row/column position.

Usage

Call this function to access a value in a WDDX record set.

Example

This example calls the `getField` function (the variable `r` is a reference to a WddxRecordset instance):

```javascript
for (row = 0; row < nRows; ++row) {
    o += "<tr>";
    for (i = 0; i < colNames.length; ++i) {
        o += "<td>" + r.getField(row, colNames[i]) + "</td>";
    }
    o += "</tr>";
}
```

getRowCount

Description

Indicates the number of rows in a WddxRecordset instance.

Syntax

```javascript
object.getRowCount( )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of a WddxRecordset object</td>
</tr>
</tbody>
</table>

Return value

Integer. Returns the number of rows in the WddxRecordset instance.

Usage

Call this function before a looping construct to determine the number of rows in a record set.

Example

This example calls the `getRowCount` function:
function dumpWddxRecordset(r) {
// Get row count
    nRows = r.getRowCount();
...
    for (row = 0; row < nRows; ++row) 
    ...

**setField**

**Description**
Sets the element in the specified row/column position.

**Syntax**

```javascript
object.setField( row, col, value )
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of a WddxRecordset object</td>
</tr>
<tr>
<td>row</td>
<td>Integer; row that contains the element to set</td>
</tr>
<tr>
<td>col</td>
<td>Integer or string; the column containing the element to set</td>
</tr>
<tr>
<td>value</td>
<td>Value to set</td>
</tr>
</tbody>
</table>

**Return value**

None.

**Usage**

Call this function to set a value in a WddxRecordset instance.

**Example**

This example calls the `setField` function:

```javascript
// Create a new recordset
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```
wddxSerialize

Description
Serializes a record set.

Syntax
object.wddxSerialize( serializer )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Instance name of the WddxRecordset object</td>
</tr>
<tr>
<td>serializer</td>
<td>WddxSerializer instance</td>
</tr>
</tbody>
</table>

Return value
Returns a Boolean True if serialization was successful; False, otherwise.

Usage
This is an internal function; you do not typically call it.

Example
This example is from the WddxSerializer serializeValue function:

```javascript
... 
else if (typeof(obj) == "object")
{
    if (obj == null)
    {
        // Null values become empty strings
        this.write("<string></string>");
    }
    else if (typeof(obj.wddxSerialize) == "function")
    {
        // Object knows how to serialize itself
        bSuccess = obj.wddxSerialize(this);
    }
    ... 
```
Chapter 13: ColdFusion ActionScript Functions

ColdFusion includes two server-side ActionScript functions, `CF.query` and `CF.http`, including specific syntax and methods.

**CF.query**

Description
Performs queries against ColdFusion data sources.

Return value
Returns a RecordSet object.

Syntax
```
CF.query({
    datasource:"data source name",
    sql:"SQL stmts",
    username:"username",
    password:"password",
    maxrows:number,
    timeout:milliseconds
});
```

Arguments

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Req/Opt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datasource</td>
<td>Required</td>
<td>Name of the data source from which the query retrieves data.</td>
</tr>
<tr>
<td>sql</td>
<td>Required</td>
<td>SQL statement.</td>
</tr>
<tr>
<td>username</td>
<td>Optional</td>
<td>Username. Overrides the username specified in the data source setup.</td>
</tr>
<tr>
<td>password</td>
<td>Optional</td>
<td>Password. Overrides the password specified in the data source setup.</td>
</tr>
<tr>
<td>maxrows</td>
<td>Optional</td>
<td>Maximum number of rows to return in the record set.</td>
</tr>
<tr>
<td>timeout</td>
<td>Optional</td>
<td>Maximum number of seconds for the query to execute before returning an error indicating that the query has timed out. Can only be used in named arguments.</td>
</tr>
</tbody>
</table>

Usage
You can code the `CF.query` function using named or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```
CF.query({
    datasource:"datasource",
    sql:"sql stmt",
    username:"username",
    password:"password",
    maxrows:"maxrows",
    timeout:"timeout"});
```
Note: The named argument style uses curly braces {} to surround the function arguments.

Positional argument style, which is a shorthand coding style, does not support all arguments. Use the following syntax to code the `CF.query` function using positional arguments:

```actionscript
CF.query(datasource, sql);
CF.query(datasource, sql, maxrows);
CF.query(datasource, sql, username, password);
CF.query(datasource, sql, username, password, maxrows);
```

Note: Do not use curly braces {} with positional arguments.

You can manipulate the record set returned by the `CF.query` function using methods in the RecordSet ActionScript class. The following are some of the methods available in the RecordSet class:

- `RecordSet.getColumnnames`
- `RecordSet.getLength`
- `RecordSet.getItemAt`
- `RecordSet.getItemId`
- `RecordSet.sortItemsBy`
- `RecordSet.getNumberAvailable`
- `RecordSet.filter`
- `RecordSet.sort`

For more information on using server-side ActionScript, see Using Server-Side ActionScript in the Developing ColdFusion Applications. For more detailed information about the RecordSet ActionScript class, see Using Flash Remoting.
Example

// Define a function to do a basic query
// Note use of positional arguments
function basicQuery()
{
    result = CF.query("myquery", "cust_data", "SELECT * from tblParks");
    return result;
}

// Example function declaration using named arguments
function basicQuery()
{
    result = CF.query({datasource:"cust_data", sql:"SELECT * from tblParks"});
    return result;
}

// Example of the CF.query function using maxrows argument
function basicQueryWithMaxRows()
{
    result = CF.query("cust_data", "SELECT * from tblParks", 25);
    return result;
}

// Example of the CF.query function with username and password
function basicQueryWithUser()
{
    result = CF.query("cust_data", "SELECT * from tblParks", "wsburroughs", "migrainel");
    return result;
}

CF.http

Description
Executes HTTP POST and GET operations on files. (POST operations upload MIME file types to a server, or post cookie, formfield, URL, file, or CGI variables directly to a server.)

Return value
Returns an object containing properties that you reference to access data.

Syntax
CF.http
{{
    method:"get or post",
    url:"URL",
    username:"username",
    password:"password",
    resolveurl:"yes or no",
    params:arrayvar,
    path:"path",
    file:"filename"
}}

Last updated 7/9/2012
### Arguments

<table>
<thead>
<tr>
<th>Arguments</th>
<th>Req/Opt</th>
<th>Description</th>
</tr>
</thead>
</table>
| method    | Required | One of two arguments:  
- get: downloads a text or binary file or creates a query from the contents of a text file.  
- post: sends information to the server page or CGI program for processing. Requires the `params` argument. |
| url       | Required | The absolute URL of the host name or IP address of the server on which the file resides. The URL must include the protocol (http or https) and host name. |
| username  | Optional | When required by a server, a username. |
| password  | Optional | When required by a server, a password. |
| resolveurl | Optional | For `Get` and `Post` methods.  
- Yes or No. Default is No.  
For `GET` and `POST` operations, if Yes, the page reference that is returned into the `Filecontent` property has its internal URLs fully resolved, including port number, so that links remain intact. The following HTML tags, which can contain links, are resolved:  
- `img src`  
- `a href`  
- `form action`  
- `applet code`  
- `script src`  
- `embed src`  
- `embed pluginspace`  
- `body background`  
- `frame src`  
- `bgsound src`  
- `object data`  
- `object classid`  
- `object codebase`  
- `object usemap` |
| params    | Optional | HTTP parameters passed as an array of objects. Supports the following parameter types:  
- name  
- type  
- value  
CF.http `params` are passed as an array of objects. The `params` argument is required for `POST` operations. |
| path      | Optional | The path to the directory in which to store files. When using the `path` argument, the `file` argument is required. |
| file      | Optional | Name of the file that is accessed. For `GET` operations, defaults to the name specified in the `url` argument. Enter path information in the `path` argument. This argument is required if you are using the `path` argument. |
Usage
You can write the `CF.http` function using named arguments or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```plaintext
CF.http({method:"method", url:"URL", username:"username", password:"password", 
   resolveurl:"yes or no", params:arrayvar, 
   path:"path", file:"filename"});
```

*Note: The named argument style uses curly braces {} to surround the function arguments.*

Positional arguments let you use a shorthand coding style. However, not all arguments are supported for the positional argument style. Use the following syntax to code the `CF.http` function using positional arguments:

```plaintext
CF.http(url);
CF.http(method, url);
CF.http(method, url, username, password);
CF.http(method, url, params, username, password);
```

*Note: Do not use curly braces {} with positional arguments.*

The following parameters can only be passed as an array of objects in the `params` argument in the `CF.http` function:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The variable name for data that is passed</td>
</tr>
<tr>
<td>type</td>
<td>The transaction type:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• FormField</td>
</tr>
<tr>
<td></td>
<td>• Cookie</td>
</tr>
<tr>
<td></td>
<td>• CGI</td>
</tr>
<tr>
<td></td>
<td>• File</td>
</tr>
<tr>
<td>value</td>
<td>Value of URL, FormField, Cookie, File, or CGI variables that are passed</td>
</tr>
</tbody>
</table>

The `CF.http` function returns data as a set of object properties, as described in the following table:
You access these attributes using the `get` function:

```plaintext
function basicGet()
{
    url = "http://localhost:8100/";

    // Invoke with just the url. This is an HTTP GET.
    result = CF.http(url);
    return result.get("Filecontent");
}
```

**Note:** For more information on using server-side ActionScript, see Using Server-Side ActionScript in the Developing ColdFusion Applications.

**Example**

The following examples show a number of the ways to use the `CF.http` function:

You access these attributes using the `get` function:

**Example**

The following examples show a number of the ways to use the `CF.http` function:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>A Boolean value that indicates whether the specified URL location contains text data.</td>
</tr>
<tr>
<td>Charset</td>
<td>The charset used by the document specified in the URL. HTTP servers normally provide this information, or the charset is specified in the charset parameter of the Content-Type header field of the HTTP protocol. For example, the following HTTP header announces that the character encoding is EUC-JP: <code>Content-Type: text/html; charset=EUC-JP</code></td>
</tr>
<tr>
<td>Header</td>
<td>Raw response header. For example: <code>HTTP/1.1 200 OK</code> <code>Date: Mon, 04 Mar 2002 17:27:44 GMT</code> <code>Server: Apache/1.3.22 (Unix) mod_perl/1.26</code> <code>Set-Cookie: MM_cookie=207.22.48.162.4731015262864476; path=/; expires=Wed, 03-Mar-04 17:27:44 GMT; domain=adobe.com</code> <code>Connection: close</code> <code>Content-Type: text/html</code></td>
</tr>
<tr>
<td>Filecontent</td>
<td>File contents, for text and MIME files.</td>
</tr>
<tr>
<td>Mimetype</td>
<td>MIME type. Examples of MIME types include text/html, image/png, image/gif, video/mpeg, text/css, and audio/basic.</td>
</tr>
<tr>
<td>responseHeader</td>
<td>Response header. If there is only one header key, its value can be accessed as simple type. If there are multiple header keys, the values are put in an array in a responseHeader structure.</td>
</tr>
<tr>
<td>Statuscode</td>
<td>HTTP error code and associated error string. Common HTTP status codes returned in the response header include: 400: Bad Request 401: Unauthorized 403: Forbidden 404: Not Found 405: Method Not Allowed</td>
</tr>
</tbody>
</table>
function postWithNamedArgs()
{
    // Set up the array of Post parameters.
    params = new Array();
    params[1] = {name:"arg1", type:"FormField", value:"value1"};
    params[2] = {name:"arg2", type:"URL", value:"value2"};
    params[3] = {name:"arg3", type:"CGI", value:"value3"};

    url = "http://localhost:8100/";

    path = application.getContext("/").getRealPath("/");
    file = "foo.txt";

    if (result)
        return result.get("Statuscode");
    return null;
}

// Example of a basic HTTP GET operation
// Shows that HTTP GET is the default
function basicGet()
{
    url = "http://localhost:8100/";

    // Invoke with just the url. This is an HTTP GET.
    result = CF.http(url);
    return result.get("Filecontent");
}

// Example showing simple array created to pass params arguments
function postWithParams()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[3] = {name:"arg3", type:"CGI", value:"value3"};
}
url = "http://localhost:8100/";

// Invoke with the method, url, and params
result = CF.http("post", url, params);
return result.get("Filecontent");

// Example with username and params arguments
function postWithParamsAndUser()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[1] = {name:"arg2", type:"URL", value:"value2"};

    url = "http://localhost:8100/";

    // Invoke with the method, url, params, username, and password
    result = CF.http("post", url, params, "karl", "salsa");
    return result.get("Filecontent");
}
