</table>
Volume Above Ceiling

Volume of the space above the ceiling boundary. All volumes are calculated from the base volume.

Volume Below Floor

Volume of the space below the floor boundary.

Volume Overall

Overall volume of the space including ceiling and floor boundaries, and the volume above the ceiling and below the floor.

Wall Area

The area of the wall sides. Used for example in paint and plaster calculations.

Width

Width of the space

Calculation Modifiers

A calculation modifier is a formula that you can apply to a space to change the calculated results of its associated area or perimeter values. Calculation modifiers can also be applied to a zone to change the calculated results of all spaces attached to that zone. You might want to change calculated results for number of purposes; for example, to account for plaster deductions or the tiling in a bathroom.

By default, a calculation modifier is applied only to the base area and base perimeter of the space. To apply the modifier to the net, usable, and gross boundaries of a space, you need to create and apply a property set definition that contains properties for the calculated area and perimeter values of the those boundaries. For more information, see Property Set Definitions on page 3823.

Calculation modifiers work cumulatively. When you apply several different modifiers to a space or a zone, they are all applied. Therefore, it is important to define the order in which they are used.

Example: You have a space area of 25 square meters. You want to apply 2 different calculation modifiers to it. Calculation modifier A deducts a value of 0.3 square meters for a column. Calculation modifier B divides the space...
by 2 (in some international calculation schemes, this is used for calculating balconies).

■ If you apply the plaster deduction first and the division second, you get the following result:
  Calculation Modifier A: 25 m² - 0.3 m² = 24.7 m²
  Calculation Modifier B: 24.7 m² / 2 = 12.35 m²

■ If you apply the division first and the plaster deduction second, you get the following result:
  Calculation Modifier B: 25 m² / 2 = 12.5 m²
  Calculation Modifier A: 12.5 m² - 0.3 m² = 12.2 m²

You can set the order of calculation modifiers in the properties of the space. For information about ordering calculation modifiers, see Adding and Removing Calculation Modifiers for Spaces on page 3164.

**Adding and Removing Calculation Modifiers for Spaces**

Use this procedure to attach, detach, or sort calculation modifiers for spaces. Calculation modifiers are values and formulas that can be applied to the area and perimeter values of a space to modify them. By default, a calculation modifier is applied only to the base area and base perimeter of a space. To apply the modifier to the net, usable, and gross boundaries of a space, you need to create and apply a property set definition that includes properties for these boundaries. For more information, see Property Set Definitions on page 3823

1 Select the spaces you want to attach a calculation modifier to, and double-click one of them.

   **NOTE** This procedure can be applied to multiple spaces only when they all have the same modifiers attached in exactly the same order.

2 On the Properties palette, expand Basic, and expand General.
3 Click the setting for Calculation modifiers.
Attach or detach calculation modifiers:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then …</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a calculation modifier</td>
<td>for Available, select the desired calc-</td>
</tr>
<tr>

<td>the calculation modifier down in the</td>
</tr>
<tr>
<td></td>
<td>list.</td>
</tr>
</tbody>
</table>

**NOTE** Calculation modifiers are processed in the same top-down order in which they are listed on this worksheet.

5 Click OK.

Creating a Calculation Modifier Style

Use this procedure to create a calculation modifier style. You can start by using the default style or you can copy an existing style to use as your template. You then edit the style properties to customize the characteristics of the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2 Expand Documentation Objects, and expand Calculation Modifier Styles.
Create a new calculation modifier style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a new modifier style with default properties</td>
<td>right-click Calculation Modifier Styles, and click New.</td>
</tr>
<tr>
<td>create a new modifier style from an existing style</td>
<td>right-click the calculation modifier you want to copy, and click Copy. Right-click, and click Paste.</td>
</tr>
</tbody>
</table>

4 Enter a name for the new calculation modifier style, and press ENTER.

5 Edit the properties of your new calculation modifier style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>define the calculation type of the modifier style</td>
<td>see Specifying the Application for a Calculation Modifier Style on page 3166.</td>
</tr>
<tr>
<td>define the formula of the modifier style</td>
<td>see Defining the Formula for a Calculation Modifier on page 3167.</td>
</tr>
<tr>
<td>add notes, files, or documents to the modifier style</td>
<td>see Attaching Notes and Files to a Calculation Modifier Style on page 3169.</td>
</tr>
</tbody>
</table>

6 Click OK.

**Specifying the Application for a Calculation Modifier Style**

A space contains 2 values that can be affected by a calculation modifier: the area and the perimeter. You can choose to have a calculation modifier apply to either or both of these calculations.

For example you might want to set up a modifier that reduces the calculated base area by 50 percent. (This is obligatory for several space types in various international architectural standards.)

Or you might want a modifier that deducts length from the perimeter of a room for openings and stairs. This would be helpful in calculating the amount of baseboard material needed for this room.
Defining the Formula for a Calculation Modifier

Use this procedure to define or edit the formula for a calculation modifier style.

Variable and formula for modifier

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, and expand Calculation Modifier Styles.
3 Select the modifier for which you want to define a formula.
4 Click the Definition tab.
5 Add a variable to the calculation modifier.
   A variable consists of the variable name and its value. For example, to create a plaster deduction of 3 percent, click Add, and enter Plaster_Deduction for Variable and 0.97 for Value.
   You should use a descriptive name as a variable name to add transparency to your formulas.
   To set up formulas, you can also enter direct mathematical values.
The following characters and words are not allowed:

- Special characters such as ?()*- (You may, however use an underscore).
- Spaces
- Accent marks such as ä, ö, ü, è, ë, â
- Key words from Visual Basic®.

For information about Visual Basic key words, refer to the Visual Basic Reference.

One of the following values is displayed for Data depending on current selections on the Apply To tab:

- AreaValue (if Area is selected)
- PerimeterValue (if Perimeter is selected)
- Value (if both Area and Perimeter are selected)

You cannot edit this value; if you want to change it, click the Apply To tab and change the current selections there as desired.

6 For Expression, enter the formula for calculating the modifier. You can enter direct mathematical values and operators, variables you have created, and Visual Basic key words, such as Mod, Exp, or Log.

For example, if you want to set up a plaster deduction of 3 percent, and you have defined a variable called Plaster_Deduction with a value of 0.97, enter AreaValue * Plaster_Deduction.

NOTE It is important to enter the variable names AreaValue and PerimeterValue exactly as they are displayed in the Data field. Alternative spellings such as “Area Value” or “perimetervalue” are not recognized.

7 To test your formula, enter a sample value for Input, press ENTER, and check the result for Output.

8 Click OK.
Attaching Notes and Files to a Calculation Modifier Style

Use this procedure to enter notes and attach reference files to a calculation modifier style. You can also edit reference files attached to the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, and expand Calculation Modifier Styles.
3 Select the modifier to which you want to attach notes or files.
4 Click the General tab.
5 To add a description to the modifier, enter it for Description.
6 Click Notes.
7 To add a note, click the Notes tab, and enter the note.
8 Click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application. Close the application when you are done editing.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click Delete.</td>
</tr>
</tbody>
</table>

9 Click OK.

Setting Calculation Cut Planes for 3D Freeform Spaces

Use this procedure to set calculation either or both of the cut planes available for 3D freeform spaces. These can be useful for rooms under a roof where the space area can be calculated only for the parts of a space with a specific height. Calculation planes can be automatically scheduled.
1 Select the spaces for which you want to define the 2 calculation cut planes, and double-click one of them.
2 Expand Basic, and expand Advanced Dimensions.
3 For Calculation plane height 1 and Calculation plane height 2, enter the desired values for the calculation cut plane height.

**TIP** You can activate display components for the calculation cut planes and the calculation cut plane hatches in Plan view. For more information, see Specifying the Display Properties of a Space Style on page 3101.

### Generating Output Data and Exporting Space Data

Space data can be displayed and delivered in various output formats. Depending on your needs, you should choose one of the methods below to deliver and communicate space data:

- **Schedule table (DWG):** When you create a schedule table within a drawing file, the space property data is available for every user that has a version of AutoCAD Architecture, or any software that can read DWG files, like AutoCAD. For information on creating schedule tables, see Basic Schedules on page 3747.

- **DWF:** You can export a drawing file with property data to a DWF file. For more information, see Publishing Drawings to DWF and DWFx on page 276.

- **Database (XLS/CSV/TXT):** You can export space property data to XLS (Microsoft Excel), CSV, and TXT formats which are readable by a number of spreadsheet calculation and database applications. For more information, see Exporting a Schedule on page 3791 and Exporting Schedule Data for Selected Objects on page 3792.

- **Space evaluation (XLS/TXT):** When you generate a space evaluation document, selected properties of spaces are exported to either an XLS or TXT document. Space evaluations display only a subset of space properties. You need a space evaluation for example if you want to export space decomposition data. For more information, see Space Decomposition on page 3171 and Space Evaluation on page 3177.

- **Autodesk MapGuide:** you can export space property set data to Autodesk MapGuide. For more information, see Publishing Drawing Files to Autodesk MapGuide on page 268.
Database (MDB): You can export space property data to a Microsoft Access MDB file. For more information, see Exporting Property Set Data to an MDB on page 276.

**NOTE** If you previously used the SpaceInfo command to generate MDB data from spaces, you would now use the AecExportPropertyData command.

### Space Decomposition

In some countries, such as Germany and Japan, an important part of space evaluation is the visual decomposition of spaces into subdivisions for the proof that must be approved by the cognizant administrative authority.

A space decomposition is a Plan display representation in which the spaces are displayed as triangles or trapezoids, depending on the decomposition method. Additionally, the decomposition shows height lines as well as edge and height dimensions. Architects need space decomposition for calculation proof.

Decomposition is set in the display properties of the space object, the space style, or in the drawing defaults.

With styles, you can control how the decomposition is displayed, the decomposition method used, color settings for decomposition components, and tags.
Displaying the Space Decomposition

In the Plan High Detail and Plan Low Detail display configurations, the space decomposition is displayed by default in the bottom view direction.

If the space decomposition is not displayed in the desired display configuration, use the following steps to display it:

1. Click Manage tab ➤ Style & Display panel ➤ Display Manager.
2. Select the display configuration where you want to display the space decomposition.
3. Expand the display configuration.
4. Select the display set in which you want to display the space decomposition.
5 Click the Display Representation Control tab.
6 Scroll through the list of objects until you reach the Space object.
7 Select the check box for the Decomposed display representation.
8 Click OK.

Specifying Layer/Color/Linetype Settings of the Space Decomposition

Use this procedure to change the properties of the display components of the space decomposition view for a space style.

The following decomposition display components are available:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additive Edge</td>
<td>Decomposition lines of a space with a positive value, such as a room</td>
</tr>
<tr>
<td>Subtractive Edge</td>
<td>Decomposition lines of a space with a negative value, or a hole</td>
</tr>
<tr>
<td>Additive Tag</td>
<td>Tag for a space subdivision with a positive value</td>
</tr>
<tr>
<td>Subtractive Tag</td>
<td>Tag for a space subdivision with a negative value</td>
</tr>
<tr>
<td>Additive Height</td>
<td>Height lines of a space subdivision with a positive value</td>
</tr>
<tr>
<td>Subtractive Height</td>
<td>Height lines of a space subdivision with a negative value</td>
</tr>
<tr>
<td>Edge Dimension Text</td>
<td>Label for a space edge displaying its length</td>
</tr>
<tr>
<td>Height Dimensions</td>
<td>Label for a height line displaying its length</td>
</tr>
</tbody>
</table>

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Architectural Objects, and expand Space Styles.
3 Select the space style where you want to change decomposition settings.
Click the Display Properties tab.
5 Select the Decomposed display representation, and select either Style Override or Drawing Default, depending on which display source you want for the decomposition.

6 If necessary, click .
7 Click the Layer/Color/Linetype tab.
8 Select the space decomposition component to change, and change the following settings:
   ■ Visibility
   ■ Layer
   ■ Color
   ■ Linetype/Lineweight/Linetype Scale
   ■ Plot Style
9 Click OK twice.

**Specifying the Type of Space Decomposition**

In the decomposition view of the space style, you specify the type of subentities into which the space will be decomposed (trapezoid or triangulated) and the AutoCAD entities the decomposed space is converted to when exploded (lines or closed polyline faces).
1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2 Expand Architectural Objects, and expand Space Styles.
3 Select the space style where you want to change decomposition settings.
4 Click the Display Properties tab.
5 Select the Decomposed display representation, and select either Style Override or Drawing Default, depending on which display source you want for the decomposition.
6 If necessary, click .
7 Click the Decomposition tab.
8 Under Decomposition Type, select an option for Type:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>display a trapezoid decomposition</td>
<td>select Trapezoid.</td>
</tr>
</tbody>
</table>
### If you want to… Then…

<table>
<thead>
<tr>
<th>Display a triangular decomposition without overlapping triangles</th>
<th>select Triangle.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display a triangular decomposition with overlapping triangles</td>
<td>select Triangle (overlap).</td>
</tr>
</tbody>
</table>

9. Under Explode Result, select an option:

<table>
<thead>
<tr>
<th>If you want to… Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the decomposed space into single lines after exploding</td>
</tr>
<tr>
<td>change the decomposed space into closed polylines for each decomposed part</td>
</tr>
</tbody>
</table>

10. Click OK twice.

---

### Specifying Text Settings for Space Decomposition

Use this procedure to modify the numbers of the space subdivisions as well as the edge and height annotations.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager 📜.
2. Expand Architectural Objects, and expand Space Styles.
3. Select the space style where you want to change decomposition settings.
4. Click the Display Properties tab.
5. Select the Decomposed display representation, and select either Style Override or Drawing Default, depending on which display source you want for the decomposition.
6. If necessary, click 📜.
7. Click the Proof tab.
8 Define the prefix settings:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>display a prefix for the numbers of the space subdivisions</td>
<td>enter a prefix.</td>
</tr>
<tr>
<td>change the style of the numbers of the space subdivisions</td>
<td>either select a text style from the list or click the Browse button and create a new text style. For more information, see “Text Style Dialog Box” in AutoCAD Help.</td>
</tr>
<tr>
<td>change the height of the numbers in the space subdivisions</td>
<td>enter a value for Height.</td>
</tr>
</tbody>
</table>

9 Define the edge dimension settings:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the style of the edge dimensions</td>
<td>either select a text style from the list or click the Browse button and create a new text style. For more information, see “Text Style Dialog Box” in AutoCAD Help.</td>
</tr>
<tr>
<td>change the height of the edge dimensions</td>
<td>enter a value for Height.</td>
</tr>
</tbody>
</table>

10 Click OK twice.

**Space Evaluation**

The space evaluation is a documentation feature that calculates and evaluates the space information of your finished floor plan. This information is stored in a separate file that you can export to a spreadsheet or word processing application. Evaluation templates ensure that the information is formatted and arranged in a consistent, structured way.

**Examples for Using the Space Evaluation**

Architects need the space evaluation feature for submitting floor plans to the building plan approval authorities and to customers. Space evaluation can
also be used for performing cost estimates, assigning jobs to contractors, or organizing facility management.

You can create evaluations for

■ Selected spaces and zones in the current drawing
■ Selected spaces and zones from multiple open drawings
■ All spaces and zones in a drawing
■ All spaces and zones from all open drawings
■ Spaces and zones from external references

**Transitioning from Area Evaluation to Space Evaluation**

In previous versions of the software, areas and area groups could be evaluated with the area evaluation feature. Areas are now converted to spaces, area groups to zones, and the area evaluation has been converted to the space evaluation. If you attempt to use a legacy tool or run a legacy command to start the area evaluation, the following message will appear:

![Obsolete Command](image)

If you click Run Space Evaluation, the space evaluation will be started instead. You should remove area evaluation tools from your palettes and exchange area evaluation commands for space evaluation commands in your scripts. For a listing of obsolete commands and their corresponding new commands, see Appendix 1: Command Changes for Spaces and Areas on page 3198.

**Preparing the Space Evaluation**

Before you create an evaluation file, you select the spaces and zones to include, and you set a number of options that control the output for export.
Selecting Spaces and Zones for Evaluation

Use this procedure to select spaces and zones to include in the evaluation.

1. Open the Scheduling tool palette, and select the Space Evaluation tool.

   **NOTE** Alternatively, you can click Home tab ➤ Inquiry panel ➤ Space Evaluation.

Selecting space and zones for an evaluation

In the left pane, all open drawings are listed with spaces and zones in a tree structure.
When you highlight one of the spaces or zones, the following information is displayed on the right side:

- Name
- Description
- Base Area
- Calculated Area (base space after application of calculation modifiers)
- Base Perimeter
- Calculated Perimeter (base perimeter after application of calculation modifiers)
- Calculation Type (Area or Perimeter)
Calculation Modifier Styles

To include spaces and zones from external references in the list view, click 📚.

**NOTE** Spaces and zones from external references are displayed with the External References icon (📖). You can select them in the same way as spaces and zones from open drawings.

3 Select the spaces and zones you want to include in the evaluation of the floor plan by selecting their check boxes.

There are different colors for the check box marks:

- A black check mark means that you have selected this space or zone directly for evaluation. You can clear that mark directly.
- A gray check mark means that you have selected a space or zone contained in the gray-marked zone. This does not mean that the gray-marked zone is included in the evaluation; if you want to include it, select it directly.
- A blue check mark on a space or zone means that you have selected the zone these items are contained in. These zones and spaces are included in the evaluation because their containing zone is included.

**NOTE** There is one exception to this rule. If you want to run a Space Evaluation on a drawing that contains a zone, but the zone’s associated spaces are located in an xref, the referenced spaces need to be explicitly checked (black) in the Evaluation dialog in order to be included in the evaluation.

**Evaluation Content**

Use this procedure to specify which of the following components to include in the evaluation file. You select components for spaces and zones separately.

1 Open the Scheduling tool palette, and select the Space Evaluation tool.

**NOTE** Alternatively, you can click Home tab ➤ Inquiry panel ➤  ➤ Space Evaluation 🗂.
2 Click Evaluation Options.
3 Click the Evaluation tab.
4 Select Space for Select.
5 In the list displayed, select the components you want to appear
   in the evaluation file.
   You can choose these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the space or zone</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the space or zone</td>
</tr>
<tr>
<td>Overview Image</td>
<td>Graphic image of the space or zone in bitmap format</td>
</tr>
<tr>
<td>Base Area Label</td>
<td>Fixed prefix for the base area value of the space or zone</td>
</tr>
<tr>
<td>Base Area Result</td>
<td>Base area value of space or zone without calculation modifiers applied</td>
</tr>
<tr>
<td>Calculated Area Label</td>
<td>Fixed prefix for the area of the space or zone after applying calculation modifiers</td>
</tr>
<tr>
<td>Calculated Area Result</td>
<td>Area value of the space or zone with calculation modifier styles applied</td>
</tr>
<tr>
<td>(Area) Modifier Label</td>
<td>Prefix showing the name of a modifier applied to space area</td>
</tr>
<tr>
<td>(Area) Modifier Expression</td>
<td>Formula of calculation modifier applied to the space area</td>
</tr>
<tr>
<td>(Area) Modifier Result</td>
<td>Resulting value of applied calculation modifier</td>
</tr>
<tr>
<td>(Area) Proof Label - Spaces only</td>
<td>Number of the space subdivisions plus any prefixes you may have set</td>
</tr>
</tbody>
</table>
6 If necessary, repeat the component selection for zones.
7 Click OK.

**Image Display Properties**

Use this procedure to specify display settings for any preview images you want to include in your evaluation file.
1 Open the Scheduling tool palette, and select the Space Evaluation tool.

   **NOTE** Alternatively, you can click Home tab ➤ Inquiry panel ➤ Space Evaluation.

2 Click Evaluation Options.

3 Click the Image Display tab.

   **Image display for space evaluation document**

4 Select the drawing for which you want to set image properties.

   **NOTE** If you want to create include several open drawings in the evaluation, you need to set the image properties for each open drawing separately.

5 Choose the desired color depth for the images in the evaluation file. Not that a high resolution enhances the quality of the images but also enlarges the file size.

6 For each object category (Spaces, Spaces Decomposed, and Zones) select the desired display configuration, and specify the desired width and height for the image size:

   **NOTE** In the list, you will see only those display configurations in which display representations for spaces, zones, or decomposed spaces are turned on.

7 Click OK.
Data Format Style Properties

You can set different data format styles for different components of the evaluation file.

![Evaluation Properties dialog box](image)

**NOTE** For information about creating data format styles, see Property Data Formats on page 3802.

1. Open the Scheduling tool palette, and select the Space Evaluation tool.

   **NOTE** Alternatively, you can click Home tab ➤ Inquiry panel ➤ Space Evaluation.

2. Click Evaluation Options.

3. Click the Data Format Styles tab.

4. In the tree view under Apply To, select the element to which you want to assign a data format style. You can choose from these elements:
   - Area Result
   - (Area) Modifier Expression
   - (Area) Proof Expression
   - Perimeter Result
   - (Perimeter) Modifier Expression

5. Select the drawing from which you want to take a data format style.
6 Select the desired data format style.
7 For Area Result and Perimeter Result, if you want to include the exact, unrounded values as additional information in the evaluation file, select Additional Exact value.

The area or perimeter result will then displays with the precision set in the data format style and, in an extra column, with their exact precision without rounding.

**Example:**

<table>
<thead>
<tr>
<th>Calculated Perimeter = 33.778 m</th>
<th>Exact Calculated Perimeter = 33.777692 m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calculated Area = 88.532 m²</td>
<td>Exact Calculated Area = 88.5321423 m²</td>
</tr>
</tbody>
</table>

8 Click OK.

**Setting the Default Templates**

An evaluation document is saved as a spreadsheet (XLS) file or as an ASCII text format (TXT) file. To create an XLS file, you need an XLT template, and to create a TXT document, you need a TXT template.

AutoCAD Architecture includes preset templates for both formats. You can use those templates as provided or you can modify them according to your needs.

You can also create your own XLT and TXT templates in Microsoft® Excel or any word processor, like NotePad or Microsoft® Word.

After a default template is set, it is used for all evaluations until you change the default settings again. If no default template has been set, you are prompted for a template each time you create an evaluation.

1 Open the Scheduling tool palette, and select the Space Evaluation tool.
2 Click Evaluation Options.
3 Click the Templates tab.
4 Set a default template for evaluations:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>set a default template for XLS evaluation files</td>
<td>enter a file name and directory path for Excel Template File.</td>
</tr>
<tr>
<td>To set a default template for TXT evaluation files</td>
<td>enter a file name and directory path for Text Template File.</td>
</tr>
</tbody>
</table>

NOTE The evaluation templates shipped with the software are located under C:\ProgramData\Autodesk\ACA 2012\enu\Template\Evaluation Templates.

5 Click OK.

Creating the Space Evaluation Document

When you perform a space evaluation, a separate file that contains the space information from the specified drawing files. This file is saved as an XLS file or a TXT file, depending on your settings.

Creating an XLS Evaluation Document

Use this procedure to export a space evaluation to an Excel spreadsheet.

One of the most frequently used formats for space evaluation documents is XLS, the native file format of Microsoft® Excel. It is a powerful spreadsheet file format with numerous calculation and formatting abilities. You can easily export data from Excel to formats like HTML, XML, CSV (comma-delimited) or DBF (dBase).

You can export text (results, modifier expressions, and labels) and images (bitmap previews of spaces and zones). For a detailed list of elements that can be exported, see Evaluation Content on page 3180.

You can create your own XLT templates into which the evaluation is integrated. For more information, see Creating XLT Templates on page 3188.

1 Open the Scheduling tool palette, and select the Space Evaluation tool.
NOTE Alternatively, you can click Home tab ➤ Inquiry panel ➤ Space Evaluation.

2 Prepare the space evaluation as described in Preparing the Space Evaluation on page 3178.

3 In the Space Evaluation dialog box, click .
   If you did not select a default XLT template in the Evaluation Properties dialog box, you are prompted to select a template now.

4 Select a file directory, and enter a name for the XLS evaluation file.

5 Click Save.

6 When the export is finished, click Close.

The space evaluation file is saved to the specified directory. You can open it with Microsoft Excel or any other spreadsheet application that can read XLS.

Creating a TXT Evaluation Document

Use this procedure to export a space evaluation to a text file.

NOTE In TXT format, you can export text (results, modifier expressions, and labels), but not images. If you need to export images in the evaluation, use XLS format instead.

You can create your own TXT templates into which the evaluation is then integrated.

1 Open the Scheduling tool palette, and select the Space Evaluation tool.

NOTE Alternatively, you can click Home tab ➤ Inquiry panel ➤ Space Evaluation.

2 Prepare the evaluation as described in Preparing the Space Evaluation on page 3178.

3 In the Space Evaluation dialog box, click .
If you did not select a default TXT template in the Evaluation Properties dialog box, you are prompted to select a template now.

4 Select a file directory, and enter a name for the space evaluation file.
5 Click Save.
6 When the export is finished, click Close.

The space evaluation file is saved to the specified file directory. You can open it with any word processor.

Creating XLT Templates

Use this procedure to create the XSLT template file needed for exporting a space evaluation to an Excel spreadsheet.

You can use the following predefined field settings to format your XLT templates:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AREA EVALUATION_BEGIN</td>
<td>The row in which the space evaluation begins</td>
</tr>
<tr>
<td>AREA_COLUMN_IMAGE</td>
<td>The column in which the exported space images are placed</td>
</tr>
<tr>
<td>AREA_COLUMN_LABEL</td>
<td>The column in which the space labels and descriptions are placed</td>
</tr>
<tr>
<td>AREA_COLUMN_EXPRESSION</td>
<td>The column in which the space decomposition expressions and modifier formulas are placed</td>
</tr>
<tr>
<td>AREA_COLUMN_RESULT</td>
<td>The column in which all space results are placed</td>
</tr>
<tr>
<td>AREA_COLUMN_EXACT_VALUE</td>
<td>The column in which the unrounded space results are placed</td>
</tr>
</tbody>
</table>

1 Open Microsoft Excel.
2 Select the table cell in which you want to place a special type of information, such as pictures or results.
3 Click the name box in the upper-left corner of the Excel sheet, and enter the desired field definition.
4 Repeat steps 2 and 3 for all field settings you want to place.
5 Define additional settings for your template. Settings in an XLT file include

- Header and footer information
- Company logos
- Company fonts
- Special cell formatting (borders, colors)

6 Save the resulting file with the extension XLT (Excel Template) to the default directory you are using for templates. The template is then available for selection next time you create a space evaluation.

Using Spaces for Load Analysis

You can use spaces and zones to aid in calculating the heating and cooling loads for a building plan.

After you create spaces and zones, you can assign to them engineering data necessary for calculating loads and airflows. You export the engineering and building information in Green Building XML (gbXML) format. You can use gbXML files in external analysis tools. After you analyze the file, you can import the results into your drawing. You can view the calculated loads and airflows for the spaces and zones, and design your duct systems accordingly.

Configuring Space Styles

You can configure space styles for the different room types in the building plan. For example, if you are designing an HVAC system for a manufacturing facility, you can create space styles for offices, manufacturing areas, and warehouse areas.

Regarding load calculations, the most important setting for a space style is its classification. When you define a classification for a space style, the occupant density and outside air flow requirements are automatically set. These values are included in the software, and are based on the appropriate mechanical
standard or code. For more information, see Viewing Classification Settings on page 3191.

If multiple rooms use the same density of lighting and equipment, you can add property sets to the style that enable you to specify lighting and equipment loads per area. This alleviates the need to manually enter lighting and equipment loads for each individual space. If you need to change the lighting and equipment load for a space, you can override these values using the Properties palette.

To specify a lighting and equipment load per area in the space style

1. Create a new space style, as described in Creating a Space Style on page 3094.
2. In the right pane, click the General tab.
3. At the bottom of the pane, click Property Sets.
4. In the Edit Property Sets Data dialog, click (Add property sets).
5. In the Add Property Sets dialog, select SpaceEngineeringStyles, and click OK.

   **NOTE** If this property set is not available, you can copy and paste it from the Aecb Model drawing template using Style Manager. In Style Manager, it is located in Documentation Objects ➤ Property Set Definitions.

6. In the Edit Property Sets Data dialog, enter the area lighting and equipment loads.
   You can also specify a gbXML space type override if you want to restrict this style to a specific space type. If you use this setting, it overrides any classification you specify for the space style as shown in the following steps.
7. Click OK.

To specify a classification

8. Click the Classifications tab.
9. For Space Occupancy, click [...].
10. In the Select Classification dialog, expand the directories under the desired standard, select a space type, and click OK.
11. Use the previous steps to create additional space styles.
12. To modify the display of spaces with the selected style, click the Display Properties tab, and modify the display settings as desired.
NOTE You must assign a classification to use the gbXML export feature. You can assign a classification to the space style, or you can specify a classification override in the space style property set. You can also manually specify a classification on the Extended Data tab of the Properties palette.

13 Click OK.

Viewing Classification Settings

You can view the occupant densities and air flows configured for classification types.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ Style Manager.
2 In Style Manager, click Space Occupancy.
3 In the right pane, click the Classifications tab.
4 Expand the classifications under Space Occupancy, and select the space type you want to view.
5 On the right side of Style Manager, click Property Sets.
   The Edit Property Set Data dialog displays the values for the classification.

Configuring Zone Styles

You can create zone styles to specify the display and design rules for zones. In regard to load calculations, however, zone styles have no relevant settings that you need to configure. Zone styles are located in Style Manager under the Documentation Objects. For complete information, see Zone Styles on page 3138.

Adding Engineering Data to Spaces

For load calculation purposes, you must add a SpaceEngineeringObjects, ThermalProperties, and ZoneEngineeringObjects styles property sets to all spaces that you want to analyze. From the Style Manager, copy property set definitions from the gbxml Property Set Definitions drawing into your current drawing. Once you have assigned these property set definitions to the spaces and zones in your drawing, you can edit the engineering data to model the
appropriate environmental conditions. You are then ready export this data in gbXML format for use in various analysis software programs.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager. 
2. In the Style Manager, click File menu ➤ Open Drawing. 
3. In the Open Drawing dialog, click Content. 
4. Navigate to the Styles/Imperial folder. 
5. Select the gbxml Property Set Definitions (Imperial) drawing and click Open. 
6. Expand the gbxml Property Set Definitions Documentation Objects folder. 
7. Select Property Set Definitions.
   The SpaceEngineeringObjects, ThermalProperties, and ZoneEngineeringObjects styles comprise this property set.
8. Copy the Property Set Definitions to your current drawing, and then click OK.
   The engineering data styles are ready to be applied the spaces and zones in your drawing.
9. Select the spaces to which you want to add the property set data. 
10. On the Properties palette, click the Extended Data tab, and then click (Add property sets). 
11. In the Add Property Sets dialog, select SpaceEngineeringObjects and SpaceObjects, and then click OK.
The property set is added to the selected spaces, and it can be viewed on the Extended Data tab.

Under Property Sets, you can specify values for the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConditionType</td>
<td>Specify how to condition the room.</td>
</tr>
<tr>
<td>LightingLoad</td>
<td>Enter the lighting load for the room. If you specified lighting load per area in the style, the DefaultLightingLoad property set calculates the lighting load based on the room area. You can override that value by entering a value for LightingLoad here.</td>
</tr>
<tr>
<td>EquipmentLoad</td>
<td>Enter the equipment load for the room. If you specified equipment load per area in the style, the DefaultEquipmentLoad property</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OutsideAirFlow</td>
<td>Enter outside airflow value.</td>
</tr>
<tr>
<td>SupplyAirFlow and ReturnAirFlow</td>
<td>Enter supply and return airflow values for your reference. These values are for the flow rate for the room, not for the flow per unit area or per person.</td>
</tr>
</tbody>
</table>

**Attaching Property Sets to Zones**

Before exporting space data to gbXML, you must assign all spaces to a zone. You configure a zone for analysis by specifying the heating and cooling temperatures for the zone.

**To attach property sets to a zone**

1. Create zones, as described in [Creating a Zone Style](#) on page 3139.
2. Select all zones.
3. On the Extended Data tab of the Properties palette, click *(Add property sets)*.
4. In the Add Property Sets dialog, select ZoneEngineeringObjects, and click OK.

![Add Property Sets dialog](image)
The property set is added to the selected zone, and it can be viewed on the Extended Data tab.

5 Under Property Sets, specify the appropriate values for design heating and cooling temperatures.

Attaching Spaces to Zones

For load calculation purposes, you must assign all spaces to one or more zones. You can also attach zones to other zones. This is useful for exporting zone data through reference drawings.

1 Select a zone.
2 Click the Add (Plus) grip or click Zone tab ➤ Modify panel ➤ Attach.
3 Select the spaces or zones to attach to the zone.
   You can attach spaces or zones in reference drawings to a zone in the current drawing.
4 Continue attaching spaces to zones using the previous steps.

**IMPORTANT** Zones in reference drawings cannot be exported to gbXML unless they are attached to a zone in the current drawing.

**TIP** You can use the Space/Zone Manager to review the zone hierarchy, and to review space information such as surface and opening type. For more information, see Opening the Space/Zone Manager on page 3062 and Editing Surface Properties on page 3064.
Exporting Zones for Load Analysis

After you have configured spaces with property set values, and have attached spaces to zones, you can export the engineering and building information in gbXML format.

1 Open the drawing that contains the zone data you want to analyze.

**NOTE** You can analyze a complete building by attaching zones and spaces in xref drawings to zones in a current drawing. The adjacent spaces and space surface types are automatically detected for all spaces at export.

2 Click ➤ Export ➤ gbXML.

3 In the Export to gbXML dialog, specify the export settings:
   - File name: Specify a file name and location.
   - Select Objects: The dialog automatically detects all zones in the current drawing. Zones in reference drawings cannot be exported unless they are attached to a zone in the current drawing. If the dialog does not detect all zones, click Select Objects and select the desired zones.
   - Building Type: Specify a building type and postal ZIP code that may be used by the external analysis program.
   - Progress: Click Start to run the export.
Success: If any errors occur during export, click View Event Log to view error messages.

4 Click Close.

The gbXML file can now be used in various analysis software programs.

Conversion of Space Boundaries to Walls and Spaces

Space boundaries from previous versions of the software will not persist as independent objects in AutoCAD Architecture. When a legacy drawing is opened in the current version of the software, any legacy space boundaries will be converted to walls. If the legacy space boundary manages contained spaces, these will be converted to spaces associative to the converted walls.

All legacy space boundary edges are converted to walls. Edges of the boundary type Separation or edges of the boundary type Solid with 0 width are converted to 0 width walls. If the legacy space boundary manages contained spaces, those spaces are associative to the converted walls.

Legacy property set definitions that apply to legacy space boundaries will automatically be migrated to property set definitions that apply to walls. Legacy property data attached to space boundaries will be attached to the
walls that are optionally created from the space boundary during drawing migration.

**Appendix 1: Command Changes for Spaces and Areas**

Since the merge of areas and spaces, a number of commands have become obsolete or have been changed to other names.

**Area Commands**

The following area-related commands are obsolete. Corresponding current space commands are listed where applicable:

<table>
<thead>
<tr>
<th>Previous command</th>
<th>New command</th>
</tr>
</thead>
<tbody>
<tr>
<td>AecSpaceConvertArea</td>
<td>N/A</td>
</tr>
<tr>
<td>AecAreaAdd</td>
<td>AecSpaceAdd</td>
</tr>
<tr>
<td>AecAreaConvert</td>
<td>N/A</td>
</tr>
<tr>
<td>AecAreaDetect</td>
<td>AecSpaceAutoGenerate</td>
</tr>
<tr>
<td>AecAreaStyle</td>
<td>AecSpaceStyle</td>
</tr>
<tr>
<td>AecNameDef</td>
<td>AecListDefinition</td>
</tr>
<tr>
<td>AecArea</td>
<td>AecSpace</td>
</tr>
<tr>
<td>AecAreaAddSelected</td>
<td>AecSpaceAddSelected</td>
</tr>
<tr>
<td>AecAreaAttach</td>
<td>AecSpaceAttach</td>
</tr>
<tr>

<tr>
<td>AecSpaceBoundaryRemoveEdges</td>
<td>N/A</td>
</tr>
<tr>
<td>AecSpaceBoundaryConvertEdges</td>
<td>N/A</td>
</tr>
</tbody>
</table>
Appendix 2: Predefined Area Calculation Standards

You can calculate the offsets of space boundaries according to an area calculation standard defined for a drawing. Area calculation standards usually contain country or organization specific rules by which space boundaries must be set up. AutoCAD Architecture provides 3 predefined area calculation standards based on the rules of the BOMA, DIN-277, and SIS standards. In addition, a generic Basic standard is supplied. The following sections outline the rules of these standards that have been implemented in the software. For more detailed information, use a regulation book for the desired standard.

For information about applying an area calculation standard to a drawing, see Working with Space Boundaries on page 3004.
Calculating Spaces Based on the Basic Area Calculation Standard

The Basic area calculation standard supplied with AutoCAD Architecture provides a rule for the general practice of measuring gross and net area as accepted by most building inspectors and zoning officials in the US.

<table>
<thead>
<tr>
<th>Space Boundary Type</th>
<th>Classification</th>
<th>boundary Objects</th>
<th>Wall Type</th>
<th>Boundary</th>

</tr>
</tbody>
</table>

Calculation Rules for AutoCAD Objects

You can use AutoCAD objects like closed polylines or rectangles to generate a space that is deducted from an associative space (see Deducting Spaces from an Associative Space on page 2971.) You could do this for example to represent construction spaces or otherwise unavailable areas. Since AutoCAD objects cannot be classified to control their behavior, the following standard behavior is applied to enclosed deducted spaces formed by AutoCAD objects in the Basic standard:

- **Net area**: the area enclosed by AutoCAD linework is deducted from the net area.
- **Gross area**: the area enclosed by AutoCAD linework is not deducted from the gross area.
Calculating Spaces Based on the DIN 277 Standard

DIN 277 is the area calculation standard for Germany and German-speaking countries. The DIN 277 standard included in AutoCAD Architecture includes the subset of DIN 277 rules described in the following sections:

Space Classifications in DIN 277

The space type classifications in DIN 277 are the following:

<table>
<thead>
<tr>
<th>Space Type_DIN</th>
<th>Definition</th>
</tr>
</thead>
</table>
| A              | ■ has roof  
                  ■ fully enclosed by walls or curtain walls on all sides  
                  ■ the wall or curtain wall is as high or higher than the space=full height enclosure |
| B              | ■ has roof  
                  ■ partially enclosed by walls or curtain walls  
                  ■ at least one wall or curtain wall is lower than the space=partial height enclosure |
| C              | ■ no roof |
| Exterior       | ■ exterior space |

The net area type classifications in DIN 277 are the following:

<table>
<thead>
<tr>
<th>NetArea Type_DIN</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Utilized</td>
<td>Living, office, production, craft, experiments, storage, sale, education, culture, health care, other uses</td>
</tr>
<tr>
<td>Technical</td>
<td>Operations, mechanical room, water supply, heating room, electrical room, etc.</td>
</tr>
<tr>
<td>NetArea Type_DIN</td>
<td>Use</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>Circulation</td>
<td>Halls, corridors, stairs, elevators, etc.</td>
</tr>
</tbody>
</table>

**Calculation Rules for AutoCAD Objects**

You can use AutoCAD objects like closed polylines or rectangles to generate a space that is deducted from an associative space (see *Deducting Spaces from an Associative Space* on page 2971.) You could do this for example to represent construction spaces or otherwise unavailable areas. Since AutoCAD objects cannot be classified to control their behavior, the following standard behavior is applied to enclosed deducted spaces formed by AutoCAD objects in the DIN 277 standard:

- Net area: the enclosed area is deducted from the net area.
- Gross area: the enclosed area is not deducted from the gross area.

**Net Area Calculations**

The net boundaries are created on the inside of the walls.

Technical spaces: When the area of a technical space is larger than or equal to 1 m², the net boundary will be calculated to the inside of the wall. When the area of a technical space is smaller than 1 m², the space will not have a net boundary, and the area will be calculated as constructive area.
Gross Area Calculations
The gross boundaries are created according to the following rules:

<table>
<thead>
<tr>
<th>Gross Area (Space Type_DIN A)</th>
<th>Boundary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjacent Space</td>
<td>Boundary</td>
</tr>
<tr>
<td>Space Type_DIN A</td>
<td>Measured from centerline of wall</td>
</tr>
<tr>
<td>Space Type_DIN B or C, or no adjacent space</td>
<td>Measured from outside face of wall</td>
</tr>
<tr>
<td>Adjacent space not classified (unspecified)</td>
<td>Measured from outside face of wall</td>
</tr>
</tbody>
</table>
### Gross Area (Space Type_DIN B)

<table>
<thead>
<tr>
<th>Adjacent Spaces</th>
<th>Boundary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space Type_DIN A</td>
<td>Measured from inside face of wall</td>
</tr>
<tr>
<td>Space Type_DIN B</td>
<td>Measured from centerline of wall</td>
</tr>
<tr>
<td>Space Type_DIN C or no adjacent space</td>
<td>Measured from outside face of wall</td>
</tr>
<tr>
<td>Adjacent space not classified (unspecified)</td>
<td>Measured from outside face of wall</td>
</tr>
</tbody>
</table>

### Gross Area (Space Type_DIN C)

<table>
<thead>
<tr>
<th>Adjacent Spaces</th>
<th>Boundary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space Type_DIN A or B</td>
<td>Measured from inside face of wall</td>
</tr>
<tr>
<td>Space Type_DIN C</td>
<td>Measured from centerline of wall</td>
</tr>
</tbody>
</table>
Calculating Spaces Based on the SIS Standard

SIS is the area calculation standard for Sweden and is used with some variations across all Scandinavian countries. The SIS standard included in AutoCAD Architecture includes the subset of SIS rules described in the following sections:

**Tenants/Units**

When selecting the SIS area calculation standard in AutoCAD Architecture, the zone style Unit Usage_SIS will automatically be created. This zone style can be used to specify the usage of the spaces in the drawing. The calculation of the usable boundary is dependent on whether the adjacent spaces are in the same unit or not. The usable boundaries are created to the interior side of the wall when the adjacent space is attached to another zone. If the adjacent space is attached to the same zone, the usable boundary is offset 0.15m into the wall.

**Shafts**

Shafts need to be classified as Shaft. (For more information, see Classifying a Space According to an Area Calculation Standard on page 3011.) Shaft spaces do not have usable boundaries. The usable area will report N/A. When a shaft is in the same zone as its adjacent spaces, the usable boundaries of the adjacent

---

Gross Area (SpaceType_DIN C)

<table>
<thead>
<tr>
<th>Adjacent Spaces</th>
<th>Boundary</th>
</tr>
</thead>
<tbody>
<tr>
<td>No adjacent space</td>
<td>Measure from outside face of wall</td>
</tr>
<tr>
<td>Adjacent space not classified (unspecified)</td>
<td>Measured from outside face of wall</td>
</tr>
</tbody>
</table>
spaces are measured 0.15m into the shaft. The distance is measured from the inside of the wall and into the shaft. When a shaft is not in the same zone as its adjacent spaces, the usable boundaries of the adjacent spaces are measured to the inside of the wall.

**NOTE** The interaction between the spaces and zones will only work as described if the zones are in the same drawing as the attached spaces.

**Calculation Rules for AutoCAD Objects**

You can use AutoCAD objects like closed polylines or rectangles to generate a space that is deducted from an associative space (see [Deducting Spaces from an Associative Space](#) on page 2971.) You could do this for example to represent construction spaces or otherwise unavailable areas. Since AutoCAD objects cannot be classified to control their behavior, the following standard behavior is applied to enclosed deducted spaces formed by AutoCAD objects in SIS:

- **Net area**: the enclosed area is deducted from the net area.
- **Usable area**: the enclosed area is deducted from the usable area.
- **Gross area**: the enclosed area is not deducted from the gross area.

![Diagram of calculation rules](image)
Room Height

According to the SIS standard, a space should have a room height of at least 1.90 meter with a width of at least 0.6 meter to be counted as measurable area. The SIS calculation standard delivered with this software is automatically checking the height of each space to make sure the space height conditions are met. Otherwise, the boundaries for Net area (NTA) and Usable Area (BRA) are offset according to the SIS standard rules.

The room height rule is applied only to associative 3D freeform spaces. For extruded 3D spaces the user-defined space height is used uniformly on the space.

NOTE
The calculation of the room height for SIS is new to AutoCAD Architecture 2012. In previous versions the room height was not automatically calculated for the SIS standard. If you have legacy drawings from earlier versions, SIS-calculated spaces might change their boundaries when opening the drawing in AutoCAD Architecture 2012.

Net Area (NTA)

The following rules apply to the generation of net boundaries with the SIS standard:

- The net boundaries are measured to the inside of the wall.
If wall openings have a width larger than or equal to 1.50m, the net boundaries are offset to the center of the wall.

If doors have a width larger than or equal to 1.50m, the net boundaries are offset to the inside of the door frame.

If wall openings have a width smaller than 1.50m, the net boundaries are measured to the inside of the wall.

If columns are set to bound spaces, as described in Setting the Bound Spaces Property in the Object Style on page 2949 and Setting the Bound Spaces Property in the Properties Palette on page 2949, the area of the column will be subtracted from the net area.

**Usable Area (BRA)**

The following rules apply to the generation of usable boundaries with the SIS standard:

- The usable boundaries of a space are offset 0.15m into the wall if the space has an adjacent space. If the width of the wall is less then 0.30m the offset will be to the center of the wall. If there is no adjacent space, the usable boundaries are measured to the inside of the wall.
- If wall openings have a width larger than or equal to 1.50m, the usable boundaries are offset to the center of the wall.
- If doors have a width larger than or equal to 1.50m, the usable boundaries are measured to the inside of the door frame.
- If wall openings have a width smaller than 1.50m, the usable boundaries are offset 0.15m into the wall.

- If columns are set to bound spaces, as described in Setting the Bound Spaces Property in the Object Style on page 2949 and Setting the Bound Spaces Property in the Properties Palette on page 2949 the usable boundary will be offset 0.15m into the column. The rest of the column area will be subtracted from the usable area. Freestanding columns are calculated as an interior wall. The usable boundary is offset 0.15m into the column.
Gross Area

The following rules apply to the generation of gross boundaries with the SIS standard:

■ The gross boundaries are measured to the center of the wall if the space has an adjacent space. If there is no adjacent space, the gross boundary is offset to the opposite side of the wall.

■ If columns are set to bound spaces, as described in Setting the Bound Spaces Property in the Object Style on page 2949 and Setting the Bound Spaces Property in the Properties Palette on page 2949 the area of the column will not be subtracted from the gross area.

Calculating Spaces Based on the BOMA Standard

BOMA is an area calculation standard used predominantly in the United States. The BOMA standard included in AutoCAD Architecture includes the subset of BOMA rules that are described in the following sections.
In the BOMA area calculation standard, spaces are classified as follows:

<table>
<thead>
<tr>
<th>Classification</th>
<th>Space Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office Area</td>
<td>Office</td>
</tr>
<tr>
<td>Store Area</td>
<td>Store</td>
</tr>
<tr>
<td>Major Vertical Penetration (MVP)</td>
<td>Stairs, elevator shafts, flues, pipe shafts, vertical ducts, atria, atrium spaces above the finished floor, light wells, and similar penetrations above the finished floor</td>
</tr>
<tr>
<td>NOTE</td>
<td>Not included are vertical penetrations built for the private use of a tenant occupying office area on more than one floor.</td>
</tr>
<tr>
<td>Floor Common Area (FCA)</td>
<td>Washrooms, janitorial closets, electrical rooms, telephone rooms, mechanical rooms, elevator lobbies, and public corridors</td>

**Calculation Rules for AutoCAD Objects**

You can use AutoCAD objects like closed polylines or rectangles to generate a space that is deducted from an associative space (see Deducting Spaces from an Associative Space on page 2971.) You could do this for example to represent construction spaces or otherwise unavailable areas. Since AutoCAD objects
cannot be classified to control their behavior, the following standard behavior is applied to enclosed deducted spaces formed by AutoCAD objects in BOMA:

- **Net area**: the enclosed area is deducted from the net area.
- **Usable area**: the enclosed area is not deducted from the usable area.
- **Gross area**: the enclosed area is not deducted from the gross area.

### Net Area
The net boundaries will be created inside of the wall.

### Usable Area
When calculating exterior walls, the usable boundaries will be created inside the window glass if the window height is larger or equal to 50% of the space ceiling height. The usable boundaries will be created inside of the wall if the window height is smaller than 50% of space ceiling height.

#### Usable Area (Space Type_BOMA: MVP)

<table>

</tbody>
</table>
Gross Area

The gross boundaries will be created to the outside face of the wall if there is no adjacent space or the adjacent space is street frontage.

The gross boundaries will be created to the centerline of the wall if there is an adjacent space other than street frontage/exterioer.

Appendix 3: Implementing an Area Calculation Standard Plug-in with the AutoCAD Architecture .NET API

Area calculation standards are .NET plug-ins that implement a set of rules to define offsets for the net, usable, and gross boundaries of spaces in AutoCAD Architecture 2012. When a plug-in is loaded into the software, it will be available to be applied to a drawing as described in Specifying an Area Calculation Standard for a Drawing on page 3010. Only one area calculation standard can be applied to a drawing. If the boundary offsets of a space are set to By Standard, the calculation standard that is currently assigned to the drawing will be applied to create the boundary offsets. For more information, see Changing the Area Calculation Standard for Existing Spaces on page 3012.
Boundaries generated by Basic area calculation standard

The API (Application Programming Interface) that is used to implement those plug-ins is available for 3rd party developers as part of the AutoCAD Architecture .NET API. This appendix describes how to implement a custom area calculation standard.

System Requirements
In order to implement a new area calculation standard plug-in, you must have a system with AutoCAD Architecture 2012 installed. You also need a development environment capable of creating assemblies for the .NET Framework 2.0, such as Visual Studio 2005, Visual C# 2005, Visual Basic 2005 or the .NET Framework 2.0 Software Development Kit (SDK).

Implementing an Area Calculation Standard
The following sections describe the .NET API that is used to implement area calculation standards, referencing the sample project that is delivered with AutoCAD Architecture as a C# as well as a VB.NET project. This documentation uses the C# project.

Setting up a New Project
Before you can implement a new standard, you must create a new project from your development environment. Alternatively, you may use the sample project AecSpaceOffsetStandardSample.

NOTE An area calculation standard plug-in is implemented as a .NET class library, not a Windows application.

1 Open Microsoft Visual Studio 2005.
2 Select the New tab on the main menu.
3 Click File menu ➤ Project.
4 In the New Project dialog, choose the class library template from one of these locations:
   - Visual Basic ➤ Windows
   - Visual C# ➤ Windows
   - Visual C++ ➤ CLR.

Defining project settings

5 Enter a name for the new project.
   It is recommended to use the prefix `AecAreaCalculationStandard`, for example to create a name like `AecAreaCalculationStandardMyOffsetRules`. This way the naming is consistent with the naming of the plug-ins provided with AutoCAD Architecture (for example `AecAreaCalculationStandardBasic`, `AecAreaCalculationStandardBOMA`, etc.) The software then recognizes that this prefix describes an area calculation plug-in and is able to extract the name from the assembly for diagnostic purposes.

   Before proceeding, verify that you have a .NET class library project set up, so you can start editing the source code and project files.

Setting up required assembly references

6 In order to create an area calculation standard plug-in, the .NET class library created in the previous steps needs to reference the .NET API that AutoCAD Architecture provides. This API is implemented in the `AecSpaceOffsetRuleManager.dll` assembly which you need to reference in your new project.

Adding references to the project

7 If you are working with Microsoft Visual Studio, you can add the assembly reference to `AecSpaceOffsetRuleManager.dll` to your class library project by right-clicking References in the Solution Explorer of the project, and selecting Add Reference.

8 Navigate to the Browse page on the property sheet and search for the `AecSpaceOffsetRuleManager.dll` assembly under `C:\Program Files\AutoCAD Architecture 2012` (or the path you chose during installation).
Referencing the AutoCAD Architecture and AutoCAD .NET API

9 Add references to the following assemblies of your installation:
   ■ acdbmgd.dll (AutoCAD .NET API)
   ■ aecbasemgd.dll (AutoCAD Architecture base classes)
   ■ aecarchmgd.dll (AutoCAD Architecture objects)

   These DLLs are found in the same folder as the AecSpaceOffsetRuleManager.dll assembly.

10 Right-click each reference in the Solution Explorer tree under References, and click Properties to verify that the Copy Local reference property is set to False for each of the references.

Setting up copying the .dll so that AutoCAD Architecture can reference it

AutoCAD Architecture searches for custom area calculation standard assemblies in C:\Program Files\AutoCAD Architecture 2012\Space Calculation Standards, or the path you chose during installation (see Usage of a New Standard on page 3243). Each time you compile the .dll you need to restart AutoCAD Architecture in order to load and test it. Do the following to set up copying the .dll to the appropriate folder each time it is compiled:

11 Select the project in the Solution Explorer.
12 Right-click, and click Properties.
13 Click the Build Events tab.
14 On the Post-build event command line, enter the following:
   @if exist $(TargetPath) @copy $(TargetPath) "C:\Program Files\AutoCAD Architecture 2012\Space Calculation Standards"
   @if exist $(TargetDir)$ (TargetName).pdb @copy $(TargetDir)$ (TargetName).pdb "C:\Program Files\AutoCAD Architecture 2012\Space Calculation Standards"

Creating a Space Standard Class

You must define a new class derived from AecSpaceOffsetStandard. This class will be the framework that manages the individual rules and the entry point that AutoCAD Architecture calls into when loading and applying the standard.
Adding a new class derived from AecSpaceOffsetStandard

1 If you have created a new project, as described in Setting up a New Project on page 3218, the project will include one source file similar to this:

```csharp
using System;
using System.Collections.Generic;
using System.Text;
namespace AecSpaceOffsetStandardSample
{
    public class Class1
    {
    }
}
```

Add your standard class derived from the abstract base class Autodesk.Aec.SpaceOffsetRulesManager.AecSpaceOffsetStandard.

**NOTE** The Autodesk.Aec.SpaceOffsetRulesManager namespace is only available if you have correctly set up the reference to AecSpaceOffsetRuleManager.dll.

Including the Autodesk.Aec.SpaceOffsetRulesManager namespace

2 To simplify the creation of the area calculation standard plug-in, it is recommended to add a namespace for all required classes. Add the following code line to your source file:

```csharp
using Autodesk.Aec.SpaceOffsetRulesManager;
```

3 Rename Class1 to a name describing your standard (for example, AecSpaceOffsetStandardMyStandard) and make it a derivation of the AecSpaceOffsetStandard abstract base class.

4 Add a parameterless default constructor to the class, which will be needed in the following steps:

```csharp
using System;
using System.Collections.Generic;
using System.Text;
using Autodesk.Aec.SpaceOffsetRulesManager;
namespace AecSpaceOffsetStandardSample
{
    public class AecSpaceOffsetStandardSample : AecSpaceOffsetStandard
    {
        public AecSpaceOffsetStandardSample()
```
Implementing the standard interfaces

5 When the new class is set up correctly in your source file, you can start implementing some of the methods that the base class AecSpaceOffsetStandard exposes and that AutoCAD Architecture will call into.

Adding a call to the AecSpaceOffsetStandard.SetName(string name) method

6 The AecSpaceOffsetStandard.SetName() method is implemented in the base class and cannot be overridden. It needs to be called to register a name for the standard in the constructor of the class. This is the name that will show up in the list of available area calculation standards in AutoCAD Architecture. For more information, see Specifying an Area Calculation Standard for a Drawing on page 3010.

Add the call to the SetName() method in the constructor of your class.

The following example shows the call for the sample project AecSpaceOffsetStandardSample which registers itself in the software as the Basic area calculation standard.

```csharp
public class AecSpaceOffsetStandardSample : AecSpaceOffsetStandard
{
    public AecSpaceOffsetStandardSample()
    {
        SetName("Basic");
    }
}
```
Adding the AecSpaceOffsetStandard.InitRules() method

After registering the area calculation standard plug-in name, you must add the new AecSpaceOffsetStandardSample.InitRules() method to your class. The method will override the abstract AecSpaceOffsetStandard.InitRules() interface. AutoCAD Architecture will call that interface to register all individual offset rules you are going to implement. As this method is abstract, it must be implemented by your custom standard class. See the following example for instructions:

```csharp
public class AecSpaceOffsetStandardSample : AecSpaceOffsetStandard
{
    public AecSpaceOffsetStandardSample()
    {
        SetName("Basic");
    }
    protected override void InitRules()
    {
        // register rules
    }
}
```

Registering rules with InitRules()

The rule objects of the standard must be registered with the 3 different offset boundaries (net, usable, and gross). The AecSpaceOffsetStandard base class has 3 containers for these rules.
sets, which the derived class can add new rule instances to. These containers can be referenced with the following methods:

- `AecSpaceOffsetStandard.NetRules()`
- `AecSpaceOffsetStandard.UsableRules()`
- `AecSpaceOffsetStandard.GrossRules()`

For information about implementing the individual rules in a standard, see Implementing Offset Rules on page 3226.

Each of these calls will return a reference to an object of the `Autodesk.Aec.SpaceOffsetRulesManager.AecSpaceOffsetRuleCollection` class, which exposes functions to register the different rule types. These objects are maintained and used by AutoCAD Architecture. The following example shows how to register rules with the 3 different offset types:

```csharp
public class AecSpaceOffsetStandardSample : AecSpaceOffsetStandard
{
    public AecSpaceOffsetStandardSample()
    {
        SetName("Basic");
    }

    protected override void InitRules()
    {
        // Register the rules with this standard, so the offset calculation algorithm can call them for the according boundary type
        NetRules().AppendBoundingOpeningRule(new BoundingOpeningRuleNet());
        // no usable boundary
        UsableRules().SetSpaceRule(new NullSpace());
        GrossRules().AppendBoundingObjectRule(new BoundingObjectRuleGross());
        GrossRules().AppendBoundingAdjacencyRule(new BoundingAdjacencyRuleGross());
    }
}
```

**Implementing the AecSpaceOffsetStandard.InitCurrentDatabase() method (Optional)**

9 `AecSpaceOffsetStandard` provides another virtual method that your own standard can implement:

```csharp
Implementing the AecSpaceOffsetStandard.InitCurrentDatabase() method (Optional)
```
AecSpaceOffsetStandard.InitCurrentDatabase(). Since this is not an abstract method of the base class, it can be implemented, but is not mandatory, as opposed to the InitRules() method. It can be used by an area calculation standard to initialize the current drawing with additional data that the rules might require, such as classification definitions or zone styles. If implemented, AutoCAD Architecture will call that implementation every time the standard is assigned to a drawing. The usage of that method is described in an example in Advanced: Using Classifications in Area Calculation Standards on page 3244.

```csharp
public class AecSpaceOffsetStandardSample : AecSpaceOffsetStandard
{
    public AecSpaceOffsetStandardSample()
    {
        // set the name of the standard
        SetName("Basic");
    }

    // must be overridden
    protected override void InitRules()
    {
    }

    // can be overridden
    protected override void InitDatabase(Database* database)
    {
        // ...init database with classification definitions
        // or zone styles, etc...
    }
}
```
Reference: AecSpaceOffsetStandard Class

The following list shows all members of the AecSpaceOffsetStandard base class:

```
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public abstract class AecSpaceOffsetStandard
    {
        protected internal AecSpaceOffsetStandard();
        protected internal void SetName(string str);
        protected internal abstract void InitRules();
        protected internal AecSpaceOffsetRuleCollection NetRules();
        protected internal AecSpaceOffsetRuleCollection UsableRules();
        protected internal AecSpaceOffsetRuleCollection GrossRules();
        protected internal virtual void InitDatabase(Database* database);
        protected internal virtual bool IsStandardStyle(ObjectId id Style);
    }
}
```

Reference: AecSpaceOffsetRuleCollection Class

The following list shows all members of the AecSpaceOffsetRuleCollection base class:

```
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public class AecSpaceOffsetRuleCollection
    {
        public void AppendBoundingAdjacencyRule(AecBoundingAdjacencyRule rule);
        public void AppendBoundingObjectRule(AecBoundingObjectRule rule);
        public void AppendBoundingOpeningRule(AecBoundingOpeningRule rule);
        public void SetSpaceRule(AecSpaceRule rule);
    }
}
```

Implementing Offset Rules

After creating a new standard class, rules must be implemented. The code so far can be compiled and the built assembly can successfully be loaded as an
area calculation standard into AutoCAD Architecture and be applied to space objects in a drawing. However, no offsets will be created, because no rules have been set up yet.

There are 4 different types of offset rules that can be combined to define an area calculation standard. A rule can be applied to one or more offset types (net, usable, and gross) in the implementation of AecSpaceOffsetStandard.InitRules(). For each rule type there is a base class that the implementation of a custom rule needs to derive from. All of these base classes are derived from one common abstract base class, so it is recommended to view that class first.

**AecSpaceOffsetBaseRule Abstract Base Class**

The AecSpaceOffsetBaseRule public abstract base class is a member of the namespace Autodesk.Aec.SpaceOffsetRulesManager and the base class for all rule classes.

**Void AecSpaceOffsetBaseRule.RegisterType(System.Type type) Method**

The only method the AecSpaceOffsetBaseRule base class implements is void RegisterType(System.Type type). This method defines functionality that is required for all specific rule types. This method is used to register object types for which a specific rule implementation needs to be called by AutoCAD Architecture. The following sections contain some examples for the usage of this method. If a rule implementation needs to be called for all object types, you do not need to call the RegisterType method for all of them. Instead, you can make one call to RegisterType(Autodesk.Aec.SpaceOffsetRulesManager.kAllTypes).

**Reference: AecSpaceOffsetBaseRule Class**

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager {
    public abstract class AecSpaceOffsetBaseRule {
        protected AecSpaceOffsetBaseRule();
        protected void RegisterType(Type type);
    }
}
```
Implementing Specific Offset Rules

Common to all rules is a public abstract `Apply` method, where the return type and arguments are specific to the rule type, which needs to be implemented by each new rule class. The following sections describe the base class of each rule type, and show one example for an implementation of such a rule.

**Space Rule**

(SpaceOffsetRulesManager.AecSpaceRule Base Class)

A space rule is applied to the whole space, as opposed to all other rule types which are more specific. Space rules are the only type of offset rules that can only be registered once for each standard (once for each of the offset types net, usable, and gross.)

**Implementing a Space Rule**

To implement a space rule, you must add a new class that is derived from the `SpaceOffsetRulesManager.AecSpaceRule` base class. The new class must implement the `Apply` interface of the base class. It need not call the `AecSpaceOffsetRuleBase.RegisterType()` method of the base class since it always applies to space objects. The `Apply` method that each rule needs to implement has the following syntax for the `AecSpaceRule` class:

```csharp
public abstract bool Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace);
```
The boolean return value determines if the space has a valid offset boundary. If so, it can be used to deactivate all boundaries of a certain offset type. The following example shows the framework for a new space rule class:

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class SpaceRule: AecSpaceRule
    {
        public SpaceRule()
        {
        }
        public override bool Apply(ObjectId idSpace)
        {
            // return false to switch boundary off
        }
    }
}
```

**Sample Space Rule NullSpace**

A common use case is that an area calculation standard includes only net and gross offsets, but no usable offset. You can accomplish that by implementing a space rule derived from `AecSpaceRule` that always returns false in the implementation of the `Apply` method. Register one instance of that rule with the usable offset in the standards implementation of `AecSpaceOffsetStandard.InitRules()`.

A more complex space rule might define that all spaces with an area smaller than a certain predefined value do not contribute to a certain offset type. The following example shows the space rule that is part of the sample project and

Implementing Offset Rules | 3229
that will invalid all spaces. It is used within the sample standard to switch off the usable boundary:

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class NullSpace: AecSpaceRule
    {
        public SpaceRuleNet()
        {
        }
        public override bool Apply(ObjectId idSpace)
        {
            return false;
        }
    }
}
```

**Reference: AecSpaceRule Class**

The following list shows all members of the `AecSpaceRule` base class:

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public abstract class AecSpaceRule : AecSpaceOffsetBaseRule
    {
        public AecSpaceRule();
        public abstract bool Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
                                   Autodesk.Aec.Modeler.Body body);
    }
}
```

**Bounding Object Rule**

(Bounding Object Rule is a base class)

Bounding object rules allow objects that are bounding the base profile of the space, such as structural members, to be marked as non-bounding, so that they will not be processed when creating the offset profile. Each standard can define and apply multiple bounding object rules for each boundary offset type.
Implementation of a Bounding Object Rule

To implement a custom bounding object rule, you need to add a new class that is derived from the `SpaceOffsetRulesManager.AecBoundingObjectRule` base class. The new class needs to implement the `Apply` interface of the base class and register itself for the object types it should be called for in the constructor by calling the `AecSpaceOffsetRuleBase.RegisterType()` base method. The `Apply` method of this rule type has the following syntax:

```csharp
public abstract bool Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
                          Autodesk.AutoCAD.DatabaseServices.ObjectId idObject);
```

The first argument is the current space for which the offset boundary profile is to be calculated. The second argument `idObject` is the Object ID of the object that bounds the space. Within the `Apply` method, the space object as well as the bounding object can now be opened and queried for certain properties to decide if this object should contribute to the generated profile. If the method returns false, the boundaries of the object are removed from the offset profile. This implies that the object will not be considered anymore when the offset rules are applied. The following example shows the framework for a new space rule called `BoundingObjectRuleGross`:

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class BoundingObjectRuleBasic : AecBoundingObjectRule
    {
        public BoundingObjectRuleGross()
        {
            RegisterType(typeof(kAllTypes));
        }
        public override bool Apply(ObjectId idSpace, ObjectId idObject)
        {
            //return false to mark object as non-contributing
        }
    }
}
```

Sample Bounding Object Rule `BoundingObjectRuleGross`

The following example shows the bounding object rule implementation used for the gross profile of the sample project. This rule removes all segments from the profile that are bound by a structural member. This is a common case for
defining the gross area of a space, where structural members are not considered, even if they are bounding the base profile of the space.

```csharp
public class BoundingObjectRuleGross : AecBoundingObjectRule
{
    public BoundingObjectRuleGross()
    {
        RegisterType(typeof(kAllTypes));
    }

    public override bool Apply(ObjectId idSpace, ObjectId idObject)
    {
        bool result=true;
        Autodesk.AutoCAD.DatabaseServices.Database db = idObject.Data
        base;
        {
            Member member = transaction.GetObject(idObject, OpenMode.For
            Read) as Member;
            if (member == null)
            {
                MemberType memType = member.MemberType;
                if (memType == MemberType.Column)
                {
                    result = false;
                }
            }
            transaction.Commit();
        }
        return result;
    }
}
```

The figure below shows an example of applying this rule, where the net boundary (green) includes the columns, while the gross boundary (blue) ignores them.
Reference: AecBoundingObjectRule Class

The following list shows all members of the `AecBoundingObjectRule` base class:

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public abstract class AecBoundingObjectRule : AecSpaceOffsetBaseRule
    {
        public AecBoundingObjectRule();
        public abstract bool Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
                                    Autodesk.AutoCAD.DatabaseServices.ObjectId idObject);
    }
}
```

Bounding Adjacency Rule

*(SpaceOffsetRulesManager.AecBoundingAdjacencyRule Base Class)*

Bounding adjacency rules define an offset for segments of the space base profile depending on the space that is adjacent to this segment. A common use case for gross offset profiles is that bounding adjacency rules define that the boundary should be offset to the center of the bounding object at interior walls and to the outside of the bounding object at exterior walls.

**Implementation of a Bounding Adjacency Rule**

To implement a bounding adjacency rule, you need to add a new class that is derived from `SpaceOffsetRulesManager.AecBoundingAdjacencyRule`. As with all previously described offset types, the new class needs to implement the `Apply` interface of this base class and register itself for the object types it should be called for in the constructor by calling the base method.
AecSpaceOffsetRuleBase.RegisterType(). The Apply method each rule needs to implement has the following form in AecBoundingAdjacencyRule:

```csharp
public abstract bool Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
Autodesk.AutoCAD.DatabaseServices.ObjectId idObject,
Autodesk.AutoCAD.DatabaseServices.ObjectId idAdjSpace);
```

The first ObjectId argument is the current space for which the offset boundary is to be calculated. The second ObjectId is the bounding object between the space from the first argument and the adjacent space. The third argument is the ObjectId of the adjacent space. When there is no adjacent space, which is the case at exterior walls, the value of this argument will be ObjectId.Null. The following example shows the frame for a new space rule called BoundingAdjacencyRuleGross:

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class BoundingAdjacencyRuleGross : AecBoundingAdjacencyRule
    {
        public BoundingAdjacencyRuleGross()
        {
        }
        public override AecSpaceOffsetInfo Apply(ObjectId idSpace,
            ObjectId idObject, ObjectId idAdjSpace)
        {
            //
        }
    }
}
```

Sample Bounding Adjacency Rule BoundingAdjacencyRuleGross

The following example shows the implementation of a bounding adjacency rule that is used in the sample project. It defines an offset to the center of the
bounding object for 2 spaces at interior walls and an offset to the outside of the wall if there is no adjacent space.

    public class BoundingAdjacencyRuleGross : AecBoundingAdjacencyRule
    {
        public BoundingAdjacencyRuleGross()
        {
        }
        public override AecSpaceOffsetInfo Apply(ObjectId idSpace, ObjectId idObject, ObjectId idAdjSpace)
        {
            if (idAdjSpace.IsNull)
            {
                // If there is no adjacent space (exterior wall), keep the 'Opposite' offset
                return new AecSpaceOffsetInfo(AecSpaceOffsetType.Opposite);
            }
            else
            {
                // If there is an adjacent space (interior wall), its center
                return new AecSpaceOffsetInfo(AecSpaceOffsetType.Center);
            }
        }
    }

Reference: AecBoundingAdjacencyRule Class

The following list shows all members of the AecBoundingAdjacencyRule base class:

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public abstract class AecBoundingAdjacencyRule : AecSpaceOffset
    BaseRule
    {
        public AecBoundingAdjacencyRule();
        public abstract AecSpaceOffsetInfo Apply(
            Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
            Autodesk.AutoCAD.DatabaseServices.ObjectId idObject,
            Autodesk.AutoCAD.DatabaseServices.ObjectId idAdjSpace);
    }
}
```

Bounding Openings

(SpaceOffsetRulesManager.AecBoundingOpeningRule Base Class)

A bounding opening rule can be used to define an offset at the openings in walls that are bounding a space, such as doors and windows. For example, the net offset profile cannot be defined by offsetting the profile only from the bounding walls. Usually, the wall is cut at doors and windows too. This rule type can be used to describe this in the offset profile calculated by the area calculation standard.

Implementation of a Bounding Opening Rule

To implement a bounding opening rule, you need to add a new class that is derived from SpaceOffsetRulesManager.AecBoundingOpeningRule. The new class needs to implement one or more of the Apply interfaces of the base class and register itself for the object types it should be called for in the constructor by calling the AecSpaceOffsetRuleBase.RegisterType() base method. Note that this rule can only be applied to the following classes:

- Openings
- Doors
- Windows
- Door and Window Assemblies
Registering this rule for other object types will not have any result. The *Apply* method of that class that each rule needs to implement has the following syntax in *AecBoundingOpeningRule*:

```csharp
public abstract AecSpaceOffsetOpeningInfo*
Apply(Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
    Autodesk.AutoCAD.DatabaseServices.ObjectId idAdjSpace,
    Autodesk.AutoCAD.DatabaseServices.ObjectId idObject,
    Autodesk.AutoCAD.DatabaseServices.ObjectId idOpening);
```

The first argument is the *ObjectId* of the current space for which the boundary offset is to be calculated. The second argument is the *ObjectId* of the adjacent space. When there is no adjacent space, which is the case at exterior walls, the value of this argument will be *ObjectId.Null*. The third argument is the *ObjectId* of the object the opening is anchored to, which usually is a wall that bounds the space and owns the opening. The fourth parameter is the *ObjectId* of the opening that is under investigation. The following example shows the framework for a new opening rule called *BoundingOpeningRuleNet*:

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class BoundingOpeningRuleNet : AecBoundingOpeningRule
    {
        public BoundingOpeningRuleNet ()
        {
            RegisterType(typeof(Door));
        }
        public override AecSpaceOffsetInfo* Apply(ObjectId idSpace,
            ObjectId idAdjSpace, ObjectId idObject, ObjectId idOpening)
        {
        }
    }
}
```

**Sample Bounding Opening Rule BoundingOpeningRuleNet**

The following example shows a simple bounding opening rule, where an offset is defined for doors. To make sure the rule is not applied to windows, it is only registered for the Door object, so that AutoCAD Architecture will not call it for any other openings. This rule is used in the sample project.
*AecSpaceOffsetStandardSample*. The offset is defined to go to the inside of the door panel.

```csharp
namespace AecSpaceOffsetStandardSample
{
    public class BoundingOpeningRuleNet : AecBoundingOpeningRule
    {
        public BoundingOpeningRuleNet()
        {
            RegisterType(typeof(Door));
        }
        public override AecSpaceOffsetOpeningInfo* Apply(ObjectId idSpace, ObjectId idAdjSpace, ObjectId idObject, ObjectId idOpening)
        {
            return new AecSpaceOffsetOpeningInfo(AecSpaceOffsetOpeningType.PanelAdjacent);
        }
        return new AecSpaceOffsetInfo(AecSpaceOffsetType.NoChange);
    }
}
```

Net boundary and net hatch are offset to the center of the door, but not offset at the wall opening.
Reference: AecBoundingOpeningRule Class

The following list shows all members of the `AecBoundingOpeningRule` base class:

```csharp	namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public abstract class AecBoundingOpeningRule : AecSpaceOffsetBaseRule
    {
        public AecBoundingOpeningRule();
        public AecSpaceOffsetOpeningInfo* Apply(
            Autodesk.AutoCAD.DatabaseServices.ObjectId idSpace,
            Autodesk.AutoCAD.DatabaseServices.ObjectId idAdjSpace,
            Autodesk.AutoCAD.DatabaseServices.ObjectId idObject,
            Autodesk.AutoCAD.DatabaseServices.ObjectId idOpening
        );
    }
}
```

Reference1

AecSpaceOffsetInfo Class

The `AecSpaceOffsetInfo` class is used to describe an offset as a result of the application of a bounding adjacency rule. It is returned by the implementation of the `Apply` methods of that class that is called by AutoCAD Architecture when the software needs to calculate the boundary offsets of a space according to the standard this rule is assigned to.

You define an offset with 2 properties, the type and the value. The type defines where on the bounding object the offset is to align, such as the adjacent face of the wall. The value defines an additional offset distance from that alignment, where positive is away from the space under consideration. For example, you can define an offset that is aligned with the center of the wall, which is then offset an additional 1° toward the opposite face.
Reference: AecSpaceOffsetInfo Class

The following list shows all members of the `AecSpaceOffsetInfo` base class:

```csharp	namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public class AecSpaceOffsetInfo
    {
        public static AecSpaceOffsetInfo kNoChange;
        public static AecSpaceOffsetInfo kOffsetToAdjacent;
        public static AecSpaceOffsetInfo kOffsetToCenter;
        public static AecSpaceOffsetInfo kOffsetToOpposite;
        public AecSpaceOffsetInfo(AecSpaceOffsetType type);
        public AecSpaceOffsetInfo(AecSpaceOffsetType type, double value);
        public AecSpaceOffsetType OffsetType { get; set; }
        public double OffsetValue { get; set; }
    }
}
```

The `Autodesk.Aec.SpaceOffsetRulesManager.AecSpaceOffsetType` enumeration type can be one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjacent</td>
<td>Defines an offset to the inside of the bounding object (usually this equals no offset at all)</td>
</tr>
<tr>
<td>Center</td>
<td>Defines an offset to the center of the bounding object</td>
</tr>
<tr>
<td>Opposite</td>
<td>Defines an offset to the opposite side of the bounding object</td>
</tr>
<tr>
<td>NoChange</td>
<td>Will not change any offsets already applied</td>
</tr>
</tbody>
</table>

Reference 2

AecSpaceOffsetOpeningInfo Class

The `AecSpaceOffsetOpeningInfo` class is used to describe an offset as a result of the application of a bounding opening rule. It is returned by the
implementation of the Apply methods of that class that is called by AutoCAD Architecture when the software needs to calculate the boundary offsets of a space according to the standard this rule is assigned to.

You define an offset with two properties, the type and the value. The type defines where on the bounding object the offset is to align, such as the adjacent face of the wall or the center of the door panel. The value defines an additional offset distance from that alignment, where positive is away from the space under consideration. For example, you can define an offset that is aligned with the adjacent frame, which is then offset an additional 1" toward the opposite face.

**Reference: AecSpaceOffsetOpeningInfo Class**

The following list shows a list of all members of the `AecSpaceOffsetOpeningInfo` base class:

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public class AecSpaceOffsetOpeningInfo
    {
        public AecSpaceOffsetOpeningInfo(AecSpaceOffsetOpeningType type);
        public AecSpaceOffsetOpeningInfo(AecSpaceOffsetOpeningType type, double value);
        public AecSpaceOffsetOpeningType OffsetType { get; set; }
        public double OffsetValue { get; set; }
    }
}
```

The `Autodesk.Aec.SpaceOffsetRulesManager.AecSpaceOffsetOpeningType` enumeration type can be one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WallAdjacent</td>
<td>Defines an offset to the inside of the bounding object (usually this equals no offset at all)</td>
</tr>
<tr>
<td>WallCenter</td>
<td>Defines an offset to the center of the bounding object</td>
</tr>
<tr>
<td>WallOpposite</td>
<td>Defines an offset to the opposite side of the bounding object</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FrameAdjacent</td>
<td>Defines an offset to the inside of the frame of the bounding opening</td>
</tr>
<tr>
<td>FrameCenter</td>
<td>Defines an offset to the center of the frame of the bounding opening</td>
</tr>
<tr>
<td>FrameOpposite</td>
<td>Defines an offset to the opposite side of the frame of the bounding opening</td>
</tr>
<tr>
<td>PanelAdjacent</td>
<td>Defines an offset to the inside of the panel of the bounding opening</td>
</tr>
<tr>
<td>PanelCenter</td>
<td>Defines an offset to the center of the panel of the bounding opening</td>
</tr>
<tr>
<td>PanelOpposite</td>
<td>Defines an offset to the opposite side of the panel of the bounding opening</td>
</tr>
<tr>
<td>OpeningOwner</td>
<td>Defines an offset to be whatever the offset is for the bounding object that owns the opening. No additional defined rules will be applied.</td>
</tr>
<tr>
<td>OpeningBaseCurve</td>
<td>Defines an offset to align with the base curve of the bounding opening</td>
</tr>
<tr>
<td>NotApplicable</td>
<td>Defines no offset. Additional defined rules will continue to be applied until an offset is defined.</td>
</tr>
</tbody>
</table>

**NOTE** Currently, door and window assemblies do not support the Frame and Panel options, which will be converted to OpeningBaseCurve.
Usage of a New Standard

Installation

When the required rules are implemented and the plug-in assembly has been successfully built, you need to test the results in AutoCAD Architecture. In order to apply the new standard, it must be moved or copied into the AutoCAD Architecture area calculation standards plug-ins subfolder under \Program Files\AutoCAD Architecture 2012\Space Calculation Standards\ where the predefined standards that are delivered with the software also located. Note that if you copy the assembly into the plug-in folder while AutoCAD Architecture is running, you will need to restart it in order for the standard to be loaded.

Application

When you start AutoCAD Architecture after copying the new standard plug-in into the folder specified above, the software will automatically find and load the standard together with all other standards located in the same folder. If the standard is correctly implemented, it will show up with its name and can be selected to be applied to the current drawing.

1 Start AutoCAD Architecture.

2 Click ➤ Options.

3 Click the AEC Object Settings tab.

4 Under Calculation Standards, select your standard.
Advanced: Using Classifications in Area Calculation Standards

A common way of implementing a standard is to define offsets between spaces depending on their classifications. Even though you can do this with the area calculation standard API described in the previous sections and through usage of the available .NET API from AutoCAD Architecture, the Autodesk.Aec.SpaceOffsetRulesManager.AecSpaceOffsetClassification class provides some functionality to make the handling of classifications for offset calculations easier.

Definition of Classifications in Resource Assembly

Since classification names are displayed to the user in AutoCAD Architecture, their names should be localized. The API to use classifications within area calculations pays respect to that through the usage of resources to define the classification names of the classification set of a standard. Before you can apply and use classifications in your custom area calculation standard, you need to define them in a resource file that you need to add to your existing project (alternatively, you could create a resource-only assembly that is referenced). Please refer to the help of your development environment or the MSDN Online Library for information about creating string resources. It is assumed that the reader of this appendix is able to create and build a project that contains localized strings. Within this example, a resource file that
implements one string table is assumed that defines the following global/local string pairs:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office</td>
<td>Office Area</td>
</tr>
<tr>
<td>Exterior</td>
<td>Street Frontage</td>
</tr>
</tbody>
</table>

**Adding Classification Support to the Standard**

If you want your standard to work with classifications, you need to add an object of the type `AecSpaceOffsetClassification` to the standard after creating a resource set for the classification names. This class will handle all the classification-related functionality for the standard and within the implementation of the rule.

**Initializing the Database with Classifications**

The following example shows the required steps to populate the drawing the standard is applied to with the classification definitions. This must occur within the standard’s `AecSpaceOffsetStandard.InitDatabase` virtual base class method, because the classifications need to be added to each new drawing that uses this standard. The following example shows how a new
The `AecSpaceOffsetClassification` object is created and initialized into the currently active database:

```csharp	namespace AecSpaceOffsetStandardISA
{
    public class AecSpaceOffsetStandardISA: AecSpaceOffsetStandard
    {
        public AecSpaceOffsetClassification classification
        public AecSpaceOffsetStandardISA()
        {
        }
        protected override void InitDatabase(Database database)
        {
            classification = new AecSpaceOffsetClassification();
            classification.Init(
                database,
                Assembly.GetExecutingAssembly(),
                new CultureInfo(SystemObjects.DynamicLinker.ProductLcid,
                true);
                "AecSpaceOffsetStandardISA.AecSpaceOffsetStandardISAClassifications",
                "Classification Name"
            );
        }
    }
}
```

The `AecSpaceOffsetClassification.Init` method is defined as:

```csharp
public void Init(Database database, Assembly assembly, CultureInfo culture, string resBaseName, string classificationSetName)
```

The first 3 arguments are usually identical in all cases. The first one is the database to which the classification set needs to be applied. The second argument is the current assembly that implements the standard plug-in. The third argument is the localization for which the classifications are to be set up (in the example, the current setting of AutoCAD Architecture is used, which is the recommended procedure). The fourth argument is the name of the string table within the resources of the assembly. The last argument defines a name for the classification set in AutoCAD Architecture. This should be localized too, because it will be visible to the user. However, this section focuses on classification handling only. When running the standard with the resource file set up correctly, the drawing should now contain classification definitions
that apply only to spaces with the names defined in the resource’s string-table when the standard is assigned to the drawing.

**BOMA classification inserted in drawing**

![BOMA classification inserted in drawing](image)

### Using Classifications in the Rule Implementation

After adding classifications to the current database, you want to use them within area calculation standard plug-ins. You are in principle able to determine the classification from a space that is passed to a rule with the existing AutoCAD Architecture .NET API. This however could be complex, especially as you always need to use the global name of classifications within your rules, in order to work with all localizations of the classifications display name. Therefore, the class `AecSpaceOffsetClassification` provides functionality to simplify this.

**Reading the Global Classification Name from a Space Object**

The `AecSpaceOffsetClassification` class has a method to get the global classification name from a space object so that it can be compared to the names defined by the resource string table to decide how to offset boundaries. The method is the public string `GetClassificationName(Object Id objId)`. The following example shows a bounding adjacency rule that uses the classifications described in the example table above. Because the rule needs to be able to access the `AecSpaceOffsetClassification` object of the standard, the standard is passed through the constructor and assigned to a member of the rule. This means you will...
need to create the rule in the standard’s `InitRules()` implementation with a “this” reference to the current standard.

```csharp
public class BoundingAdjacencyRuleGross : AecBoundingAdjacencyRule
{
    private AecSpaceOffsetStandardISA standard;
    public BoundingAdjacencyRuleGross(AecSpaceOffsetStandardISA standardISA)
    {
        standard = standardISA;
    }
    public override AecSpaceOffsetInfo Apply(ObjectId idSpace, ObjectId idObject, ObjectId idAdjSpace)
    {
        String classificationNameThis = "";
        String classificationNameAdjacent = "";
        if (!idSpace.IsNull)
        {
            classificationNameThis = standard.Classification.GetClassName(idSpace);
        }
        if (!idAdjSpace.IsNull)
        {
            classificationNameAdjacent = standard.Classification.GetClassName(idAdjSpace);
        }
        if (idAdjSpace.IsNull || classificationNameAdjacent == "Exterior")
        {
            return new AecSpaceOffsetInfo(AecSpaceOffsetType.Opposite);
        }
        if (!idAdjSpace.IsNull && classificationNameThis == "Exterior")
        {
            return new AecSpaceOffsetInfo(AecSpaceOffsetType.Adjacent);
        }
        if (classificationNameThis == "Office")
        {
            return new AecSpaceOffsetInfo(AecSpaceOffsetType.Adjacent);
        }
        // for the rest
        return new AecSpaceOffsetInfo(AecSpaceOffsetType.Center);
    }
}
```
Reference: AecSpaceOffsetClassification Class

The following list shows all members of the AecSpaceOffsetClassification base class:

```csharp
namespace Autodesk.Aec.SpaceOffsetRulesManager
{
    public class AecSpaceOffsetClassification
    {
        public AecSpaceOffsetClassification();
        public ObjectId ClassificationDefinitionID { get; }
        public string GetClassificationName(ObjectId objId);
        public void Init(Database database, Assembly assembly, CultureInfo culture, string resBaseName, string classificationSetName);
    }
}
```
A section represents a building model as if the model were cut vertically to show interior detail. You can create two-dimensional (2D) or three-dimensional (3D) section objects, or a live section view of the model. You can control the size and shape of the section you generate and assign materials to the section for an optimal visual representation of the sectioned objects. Section objects remain linked to the building model that you used to create them, unless you explode the section. Because of this link between the section and the building model, any changes to the building model can be reflected in the section as well.

Section Line and Marks

The section line defines the extents of the section that you extract from the building model. Sections lines can be straight or jogged. You can also specify the length and the height of the area defined by the section line. Section marks, which typically contain a letter or number and indicate the direction of the section, appear at each end of the section line.

After you draw the section line, you can create a section object or a live section view from the line.
Creating a Section

2D sections are created by cutting a number of objects with a section line and then creating a 2D section object from them. The section object is drawn without hidden and overlapping lines. You can edit a 2D section by changing its object display properties or its style display properties. The 2D section style

2D Sections

2D sections are created by cutting a number of objects with a section line and then creating a 2D section object from them. The section object is drawn without hidden and overlapping lines. You can edit a 2D section by changing its object display properties or its style display properties. The 2D section style
lets you add display components to the display representation of the section and create rules that assign different parts of the section to different display components. You can control the visibility, layer, color, linetype, linewidth, and linetype scale of each component. You can also choose whether materials, such as brick or concrete hatches, are used to display individual components of the section object or the 2D section style. Furthermore, you can use linework editing commands to assign individual lines in a 2D section to different display components, and merge geometry into a 2D section. You can dimension 2D sections.

2D section with surface and shrinkwrap hatch detail

3D Sections

3D sections are created by cutting a number of objects with a section line and then creating a 3D isometric section object from them. 3D sections do not use styles. However, you can control the display of subdivisions within 3D sections. Using the Hidden Line Projection command, you can create 2D hidden line projections of any view of the 3D section that you can explode and edit or hatch. For more information about using this command, see Creating a Hidden Line Projection on page 3385.
Section Subdivisions

A 2D or 3D section object can have a number of subdivisions partitioning the section object. This feature is useful when you want to create a view of the object in which the parts that are closer to the viewer are drawn with darker and stronger lines, and parts that are farther off are drawn lighter.

Live Section View

A live section view is a special view of a 3D section where the objects that are sectioned are not converted to a 3D section object. Instead, the existing model objects are displayed as a 3D section. The parts of the objects within the bounding box of the section line keep their individual display components while the parts of the objects outside of the section line can optionally be displayed or hidden. To control the appearance of the object parts outside of the section line, you need to assign a material to the sectioned objects. When you render a live section, you can show the outside part as a half-transparent addition, for example.

For more information, see Creating and Editing a Live Section View on page 3275.

Materials in Sections

In AutoCAD Architecture, you can assign materials to different components of an object. These materials are displayed when you create a 2D or 3D section.
object or a live section view. Materials have specific settings for sections, such as a 2D section hatch setting and a sectioned boundary for live section views. In a 2D or 3D section object, you can specify whether to use the display properties of the materials or the display properties of the section object.

2D section with different surface hatches

AutoCAD Architecture provides a large number of predefined materials for all common design purposes. You can use these predefined materials, or modify them to your special designs. You can also create your own materials from scratch. For more information, see About 2D and 3D Section Display Components and Materials on page 3306.

Subdivisions in 2D Section Styles and Materials

When you create subdivisions in your style, you usually want the objects in them to be visually distinct from other subdivisions. When you assign materials to the objects, you can set the 2D section style so that it uses the hatch pattern from the material, but uses the color and linetype from the subdivision display properties.

3D section with subdivisions and assigned colors in 3D view
Material Boundaries in 2D Sections

Material boundaries allow you to erase or limit portions of a 2D section or elevation. For example, you might do the following:

- Limit the amount of hatching to produce cleaner construction documents.
- Highlight a region in an elevation or section.
- Mask out a portion of a section so that more detail can be drawn.
- Crop an irregular-shaped portion of a section or elevation.
Workflow to Create a 2D or 3D Section or a Live Section View

Watch the movie

Draw a section line and mark

Create a 2D or 3D section or a live section view

Make changes to the section or the building model

Review the steps

The section line on page 3260 defines the extents of the section (its width, height, and length) to extract from the building model for 2D, 3D, and live section views.

Create a 2D or 3D section by selecting the section line and the objects to be included, and generate on page 3271 a section. Live section views on page 3275 are created from the section line. All objects in the drawing are automatically included.

You can edit on page 3258 the section line and the section object to refine the appearance of the objects.
Drawing and Editing Section Lines

The first step in creating a section is to draw a section line through the building model. The section line defines the extents of the section to extract from the building model.

**NOTE** You can create vertical sections and horizontal sections.

**Creating a Section Object from a Section Line**

When you generate a section from a section line, you specify the type of section object that is created.

<table>
<thead>
<tr>
<th>When you create…</th>
<th>The result is…</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D section object</td>
<td>an orthographic projection from the building model.</td>
</tr>
<tr>
<td>a 3D section object or a live section</td>
<td>the area of the building model defined in the section line.</td>
</tr>
</tbody>
</table>

**Creating a Live Section View from a Section Line**

When you create a live section view from a section line, you do not create a new section object but instead switch to a special view of the 3D building model. You do not select objects to include in the section; the live section view includes all objects in the drawing. The section line controls how objects are displayed in a live section view. Objects or parts of objects that are within the bounding box of the section line retain their original display properties. Objects or parts of objects that are outside of the section line are either not displayed at all or are displayed with a special display component for the sectioned body.
**Viewing the Section Line**

In plan view, the section line is displayed as you would expect on a construction document. The section marks point in the direction that the section is cut.

*Viewing the section line and mark in plan view*

In an isometric view, the same section line is displayed with a boundary that defines the extents of the section.

*Viewing a section line in isometric view*

**Changing the Section Line**

You can change the section line to control the section that you create. Using the section line, you can change the height and shape of the section. You can also add a lower extension to the section and create section subdivisions.

You can change section line properties before or after you create a section. After changing section line properties, you can apply the changes to a section.
that you previously created with the section line. For information about updating existing sections, see Updating a 2D or 3D Section on page 3295.

For information about updating existing live section views, see Updating a Live Section View on page 3277.

**Using Subdivisions in Sections**

You can set up graphic subdivisions in section line properties. These subdivisions are added to the 2D or 3D section you create. Subdivisions are specified at distances from the cutting plane of the section line. You can control the lineweight and other display properties of subdivisions to add levels of depth to sections. For example, you can display one subdivision with a heavy lineweight and another subdivision with a lighter lineweight to suggest that the first subdivision is in front of the second subdivision.

You can use the display properties of a subdivision together with the display properties of a material. For more information, see Use Subdivision Properties and Materials in 2D Section Styles on page 3313.

**Drawing a Section Line and Marks**

Use this procedure to draw a section line with a section mark at each end. You draw a section line by specifying a start point, an endpoint, a length, and a height for the section. You can specify additional points between the start point and the endpoint to create jogs in the section. The section line acts as a cutting plane, slicing a section from the building model.

**NOTE** If you are working with a drawing set where several xrefs are linked to a main drawing, draw the section line in the main drawing.

**TIP** You can also create sections with Callout tools. For more information, see Placing Section Callouts on page 3709.

1. On the default tool palette set, click the Design tab, and then click the Vertical Section tool.
   If necessary, scroll the palette to display the tool that you need.

   **NOTE** Alternatively, click Home tab ➤ Section & Elevation panel ➤ Section Line .

2. Specify the start point of the section line.
3. Continue to specify points to define the section line, if needed.
You can create jogs in the section line to cut through portions of the building model that you want to show in the section, but which are not along a single straight path.

4 Specify the endpoint of the section line, and press \textit{ENTER}.

Specifying section line start and end points in 3D view

5 Specify the length of the section, or press \textit{ENTER} to accept the length taken from the endpoints of the line.

The section line is displayed in the drawing. Depending on the direction in which you drew the section line, the section marks point in the direction of the section.
The section marks are multi-view blocks, anchored to the section line. You can edit the section marks to change the information displayed in the bubbles. For more information, see Changing Section Mark Attributes on page 3268.

The height of the section line is set to the extents of the selected objects. You can change the properties of the line to change the height and depth of the section, add a lower extension, or add subdivisions. For more information, see Changing the Height of a Section Using Grips on page 3262.

### Changing the Height of a Section Using Grips

Use this procedure to change the height of any section connected to the section line. You can change the height of the section line before or after you create a connected section. If you change the height after creating the section, you need to update the section to show the changes.

You can also change the height of a section using the Properties palette.

1. Click View tab ➤ Appearance panel ➤ Views ➤ SW Isometric.
2. Select the section line you want to change.
3. Select the Model Extents grip to turn off use of model extents for section height.
4. Select the Height grip.

**NOTE** If you use model extents for height mode, the height of the section is determined by the height of the objects in the section and is not available to modify dynamically.
Viewing Section Grips in 3D View

5 Move the grip until the height value you want is displayed, and click once; or enter a value.
   The objects are cut at this height when you create or update a section.

6 Right-click, and click Deselect All to turn off grips.
   To update a 2D or 3D section created from this section line, see Updating a 2D or 3D Section on page 3295.

Changing the Lower Extension of a Section Using Grips

Use this procedure to change the lower extension of any section connected to the section line. You can change the lower extension of the section line before or after you create a connected section. If you change the lower extension after creating the section, you need to update the section to show the changes.

You can also change the lower extension of a section using the Properties palette.

1 Click View tab ➤ Appearance panel ➤ Views ➤ SW Isometric .

2 Select the section line you want to change.
3 Select the Model Extents grip to turn off model extents for height.
4 Select the Lower Extension grip.

**NOTE** If you turn off model extents, the default for the lower section is 1 foot below the XY plane.

---

**Viewing Section Grips in 3D View**

5 Move the grip until the lower extension value you want is displayed, and click once; or enter a value.
6 Right-click, and click Deselect All to turn off grips.

To update a 2D or 3D section created from this section line, see **Updating a 2D or 3D Section** on page 3295.

---

**Changing the Length of a Section Using Grips**

Use this procedure to change the length of any section boundary connected to the section line. You can change the length of the section as a whole, or you can change the length of the sides of the section boundary individually.

You can change the length of the section boundary before or after you create a connected section. If you change the length after creating the section, you need to update the section to show the changes.

You can also define the depth of a section (its length) by changing the length of the sides of a section boundary on the Properties palette.
1. Select the section line you want to change.
2. Select the Length grip.

**Viewing Section Grips in Plan View**

3. Move the grip until the length value you want is displayed, and click once.
   The entire section boundary length is updated.

4. To change the length of side 1 of the section boundary, click the Side 1 Endpoint grip.
   Side 1 starts from the first point specified for the section line.

5. Move the grip to the desired location, and click once; or enter a value on the command line, and press **ENTER**.

**Viewing Section Grips in Plan View**

6. To change the length of side 2 of the section boundary, click the Side 2 Endpoint grip.
Move the grip to the desired location, and click once; or enter a value on the command line, and press ENTER.

Right-click, and click Deselect All to turn off grips.

To update a 2D or 3D section created from this section line, see Updating a 2D or 3D Section on page 3295.

Changing the Angle Dimensions of a Section

Use this procedure to change the angle of the sides of the building section boundary. You can change the angle dimensions before or after you create a connected section. If you change the angles after creating the section, you need to update the section to show the changes.

1 Double-click the section line you want to change.
2 On the Properties palette, click the Design tab, expand Basic, and expand Component Dimensions.
3 Specify values for Angle 1 and Angle 2.
   These values define the angles of the two sides from the section line to create the section box. The apex of Angle 1 is the start point of the section line. The apex of Angle 2 is the endpoint of the section line. Values for these angles must be between 0 and 90 degrees.

Specifying section angle parameters

4 Right-click, and click Deselect All to turn off grips.
To update a 2D or 3D section created from this section line, see Updating a 2D or 3D Section on page 3295.

Creating Graphic Subdivisions for 2D and 3D Sections

Use this procedure to define subdivisions that are created when you generate a section. Each subdivision is specified as a distance from the cutting plane of the section line.

**A section line with graphic subdivisions**

You can control the lineweight and other display properties of the subdivisions to add different levels of depth to sections.

You can use the display properties of a subdivision together with the display properties of a material. For more information, see Workflow to Create a 2D or 3D Section or a Live Section View on page 3257 and Use Subdivision Properties and Materials in 2D Section Styles on page 3313.

1. Double-click the section line you want to change.
2. On the Properties palette, click the Design tab, expand Basic, and expand Dimensions.
3. Click the setting for Subdivisions, and then add or modify subdivisions:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a subdivision</td>
<td>click ![...]. To change the default distance from the section line, select</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
the subdivision, click the value, and enter a new one. | 
change the length of a subdivision | select the subdivision, click its value, and enter a new one.
delete a subdivision | select the subdivision, and click \( \times \).

4 Click OK.

**Changing a Subdivision Using Grips**

Use this procedure to change the distance of a subdivision, as measured from the section line. You can drag the constrained grip to the desired distance, or you can enter a specific value for the distance measurement.

**Viewing Section Subdivision Grips**

1 Select the section line you want to change.
2 Select the Distance grip for the subdivision you want to modify.
3 Move the grip until the distance value you want is displayed, and click once; or enter a value.
4 Right-click, and click Deselect All to turn off grips.

**Changing Section Mark Attributes**

Use this procedure to change the information displayed in the section mark. The section mark is a multi-view block.
1 Double-click the section mark you want to change.
2 On the Properties palette, expand Advanced.
3 Click Attributes.
4 Select the existing attribute under Value, and enter the new information to include in the bubble.
5 Click OK.

**Changing the Location of a Section Line**

Use this procedure to relocate a section line by changing the coordinate values of its insertion point. The section line also has an orientation with respect to the WCS or the current UCS. For example, if the top and bottom of the section line are parallel to the XY plane, its normal is parallel to the Z axis. You can change the orientation of the section line by aligning its normal with another axis. You can also rotate the section line on its plane by changing the rotation angle.

For information about the world coordinate system (WCS) and the user coordinate system (UCS), see “Use Coordinates and Coordinate Systems” in AutoCAD Help.

1 Double-click the section line you want to relocate.
2 On the Properties palette, click the Design tab, expand Basic, and expand Location.
3 Click Additional Information.
4 Specify the location of the section line:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>relocate the section line</td>
<td>enter new coordinate values under Insertion Point.</td>
</tr>
<tr>
<td>locate the section line on the XY plane</td>
<td>make the normal of the section line parallel to the Z axis: under Normal, enter 1 for Z, and enter 0 for X and Y.</td>
</tr>
<tr>
<td>locate the section line on the YZ plane</td>
<td>make the normal of the section line parallel to the X axis: under Normal, enter 1 for X, and enter 0 for Y and Z.</td>
</tr>
</tbody>
</table>
If you want to… Then…

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>locate the section line on the XZ plane</td>
<td>make the normal of the section line parallel to the Y axis: under Normal, enter 1 for Y, and enter 0 for X and Z.</td>
</tr>
<tr>
<td>change the rotation of the section line</td>
<td>enter a new value for Rotation Angle.</td>
</tr>
</tbody>
</table>

5 Click OK.

To update an existing section created from this section line, see Updating a 2D or 3D Section on page 3295.

**Modifying a Section Line Using Grips**

Use this procedure to change the start point, endpoint, edge, or vertex of a section line. You can drag the grip to the desired location, or you can enter a specific value for the measurement.

1 Select the section line you want to change.

2 Select a section line grip, and move it to the desired location.

You can also move the grip in the desired direction and enter a specific value on the command line.

**Viewing Section Grips in Plan View**

3 Right-click, and click Deselect All to turn off grips.
Attaching Hyperlinks, Notes, and Files to a Section Line

Use this procedure to add hyperlinks, enter notes, and attach reference files to a section line. You can also edit notes and edit or detach reference files from a section line.

1 Double-click the section line you want to attach notes or files to.
2 On the Properties palette, click the Extended Data tab.
3 To add a hyperlink, click next to Hyperlink, and specify the link.
4 To add a note, click next to Notes, enter text, and click OK.
5 To attach, detach, or edit a reference file, click next to Reference documents, and then do any of the following:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click , select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click .</td>
</tr>
</tbody>
</table>

6 Click OK.

Creating a 2D or 3D Section

Use this procedure to create a 2D or 3D section. After you draw a section line, you extract a section from the section line and the objects you select in the building model.

**TIP** Before you create a section, thaw and turn on all layers containing objects that you want to include in the section. Objects on layers that are off or frozen cannot be part of the selection set for the section. To enhance performance, turn off the layers of the objects that you do not need to include in the section.
WARNING If you want to insert a 2D section in a Plan view, make sure that the display set used for the Plan view does not section objects by display range. In that case, the section result would not be displayed in the Plan view. To make sure that this is not the case, click Manage tab ➤ Style & Display panel ➤ Display Manager. Select the Plan display set for the currently used display configuration. On the Display Options tab, verify that Section AEC Objects by Display Range defined in Display Configuration is cleared.

1 Draw a section line in the drawing. For more information, see Drawing a Section Line and Marks on page 3260.

2 Select the section line, and click Building Section Line tab ➤ Modify panel ➤ Generate Section .

3 Select the type of section object you want to create:

<table>
<thead>
<tr>
<th>If you want to create…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D section</td>
<td>select 2D Section/Elevation Object with Hidden Line Removal.</td>
</tr>
<tr>
<td>a 3D section</td>
<td>select 3D Section/Elevation Object.</td>
</tr>
</tbody>
</table>

4 For Style to Generate, select a style for a 2D section. If you want to use a particular style, select it from Style to Generate. Otherwise, use the Standard style. For more information, see 2D Section Styles on page 3301. 3D sections do not use styles.

5 Under Selection Set, click (Select Objects), and select the objects that you want to include in the section. Press ENTER when you finish selecting objects.

NOTE If you select an object that you do not want to include in the section, hold down SHIFT and select the object again to remove it from the selection set.

6 Under Display Set, select a display set for the section object. The display set controls the representation of the section.
7 Under Placement, select New Object, and specify where to place the section:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a location graphically</td>
<td>click (Pick Point), and specify the location for the new section object in the drawing.</td>
</tr>
<tr>
<td>specify the coordinates of the insertion point for the section</td>
<td>enter X, Y, and Z coordinates for the location of the new section object.</td>
</tr>
</tbody>
</table>

8 Click OK.

A 2D or 3D section is created from the section line properties and the selected objects in the building model. The section is linked to the building model. If you make changes to the building model after you create the section, you can update the section to reflect the changes. For more information, see Updating a 2D or 3D Section on page 3295.

You can edit certain characteristics of the section to control its placement and appearance. For more information, see Editing a 2D or 3D Section on page 3279.

You can also use a 2D section style to control the display of selected objects in a 2D section, and you can control the display of individual lines in a 2D section. For more information, see 2D Section Styles on page 3301 and Editing and Merging Linework in a 2D Section on page 3291.

### Creating a Horizontal 2D Section

Use this procedure to create a horizontal section or elevation of a plan view.

The Hidden Line control available in AutoCAD Architecture makes it possible to create horizontal sections and elevations of Plan views. With a horizontal section or elevation, you can look “down” on the model. Previously, users could achieve that effect only by manually changing the UCS. Now, a tool enables you to create a horizontal section or elevation. This feature could be useful for creating a detailed display of sill components in tapered walls.

The illustration below displays a horizontal section line for an irregularly shaped building.
On the default tool palette set, click the Design tab, and then click the Horizontal Section tool.
If necessary, scroll the palette to display the tool that you need.
2 Specify the first point of the section plane.
3 Specify the second corner of the section plane.
4 Specify the elevation of the section plane, and press ENTER.
5 Specify the depth of the section, and press ENTER.
6 Proceed with creating the section, as described in Creating a 2D or 3D Section on page 3271.

Creating and Editing a Live Section View

A live section view is a special view of a 3D model section. A live section view is always applied to all objects in the drawing. Unlike a 2D or 3D section, you do not choose a selection set of objects to be contained in the section. All objects are contained in the live section view. Their display properties are determined by whether or not they are situated within the bounding box of the section line.

The objects contained in the live section view are not converted into a section object, but are retained as objects in the drawing. They keep all of their properties and display components, and can be edited. The area of objects that lie outside of the section line, or objects that lie completely outside of the section line, can be displayed or hidden. The appearance of these objects, and of parts of objects outside of the section line, is controlled by the Sectioned Body component. When you render a live section, you can show the outside part as a half-transparent addition, for example.

The live section view can be turned on and off in a drawing.
Creating a Live Section View

Use this procedure to create a live section view of your building model.

1. Draw a section line through the building model.
   For more information, see Drawing a Section Line and Marks on page 3260.

   **NOTE** You do not need to select objects for the live section view. The live section view is created from the whole drawing.

2. Switch to a 3D view, such as SW Isometric.
3. Select the section line, and click Building Section Line tab ➤ Live Section panel ➤ Enable Live Section 🌟.
Updating a Live Section View

When you create a live section view, the sectioned objects are not converted into a section object. Instead, the objects remain in the drawing. The objects and object areas which are inside the section line retain their previous display properties. A brick wall inside a section line retains its brick pattern and its dark red linework. The objects and object areas outside of the section line change their display properties, since they are now placed on the Sectioned Body display component and use its display properties.

The live section updates interactively when you change the objects associated with it. If you drag a wall outside of the section line, the wall uses the display properties of the Sectioned Body component. If you drag a wall inside of the section line, the wall uses its own display properties.

When you change the material assignment of an object in a live section view, the new material is automatically used in the live section.

NOTE If you change from a material in which the Sectioned Boundary and Sectioned Body components are turned on, to a material in which these components are turned off, it might look as if objects outside of the section line disappear. You can edit the current material definition to display objects outside of the section line, as described in Displaying the Sectioned Body in a Live Section View on page 3277.

Displaying the Sectioned Body in a Live Section View

Use this procedure to display the parts of the drawing in a live section view that are outside the section.

Whether objects and areas of objects outside the section line are displayed in the live section view depends on the material settings for each object and object style. The sectioned objects inside the section are displayed with their regular display components and material assignments. For example, a brick wall inside a section displays its regular brick surface hatch.

Objects or object parts that are outside of the section are displayed differently. You can either hide them completely, or display them on the Sectioned Body display component. The Sectioned Body display component is specified in the material assigned to the object.

The sectioned body is often displayed in a lighter, half-transparent color, or as dotted linework.
In a material definition, the Sectioned Body and Sectioned Boundary display components influence the display of the live section view. The Sectioned Body includes the objects or object parts outside of the section line. The Sectioned Boundary is the cut line created by the section line.

1. Select the object for which you want to display the sectioned body, right-click and click Edit Object Display.
2. Click the Materials tab.
3. Select the material definition you want to change, and click .
4. Select the display representation of the material, and click .
5. Click the Layer/Color/Linetype tab.
6. Change the display of the sectioned body and sectioned boundary:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>hide the sectioned body</td>
<td>set Visible off for the Sectioned Body and Sectioned Boundary components.</td>
</tr>
<tr>
<td>display the sectioned body</td>
<td>set Visible on for the Sectioned Body and Sectioned Boundary components, and assign them display properties as needed.</td>
</tr>
</tbody>
</table>

7. Click OK three times.
NOTE When the Sectioned Body component is set to visible and the material display component is on, you can turn the display of the sectioned body on and off by selecting the section line and clicking Building Section Line tab ➤ Live Section panel ➤ Toggle Body Display.

Removing a Live Section View

Use this procedure to turn off a live section view. You can also remove the live section view by deleting the section line that was used to create it.

1. Select the section line that was used to create the live section view.
2. Click Building Section Line tab ➤ Live Section panel ➤ Disable Live Section.

After turning off the live section view, you see the regular 3D building model again. You can turn live section view on and off as long as the section line remains in the drawing.

Editing a 2D or 3D Section

After you create a 2D or 3D section, you can edit the section line and the section object to refine the appearance of the section in any of the following ways:

- Add, remove, or modify graphic subdivisions.
- Reverse the section to display a different area of the building.
- Relocate the section.
- Add notes or reference files.
- Select a different style. A section style determines how the linework in a 2D section is displayed.
- Change the display properties of selected linework.
- Add linework and details that are not part of the building model.

In addition, you can continue to modify the building model and then update the section to incorporate the changes.

You can also create and edit material boundaries for 2D sections. For more information, see Creating a Material Boundary in a 2D Section on page 3285.
For information about switching from a view other than a section to a temporary section view to edit objects, see Editing Objects in a Temporary Section View on page 1136.

Using Grips to Edit Linework in a 2D Section

Use this procedure to edit linework in a 2D section. You can assign selected linework to fixed display components that determine the display of every section that you generate, or you can assign linework to display components that you have defined.

For information about adding custom display components, see Adding a Display Component to a 2D Section Style on page 3304. After you assign linework to display components, you can change the display properties (visibility, color, layer, lineweight, linetype, and linetype scale) to change the display of lines.

1. Select the section to be changed.
2. Select the Edit Linework grip.
3. Click Edit In Place: Linework tab ➤ Profile panel ➤ Zoom To to zoom to the section.
4. Select the linework to edit and click Edit In Place ➤ Linework tab ➤ Profile panel ➤ Modify Component.
5 Select the component you want to put the lines on. For example, if you want to make the lines invisible, select Erased Vectors for Linework Component.

You can also click (Match existing linework), and select linework in the elevation whose display component you want to match.

6 Click OK.

7 Exit the linework edit in place mode:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then click...</th>
</tr>
</thead>
<tbody>
<tr>
<td>save all changes to the linework</td>
<td>Edit in Place tab ➤ Edits panel ➤ Finish.</td>
</tr>
<tr>
<td>discard all changes to the linework</td>
<td>Edit in Place tab ➤ Edits panel ➤ Cancel.</td>
</tr>
</tbody>
</table>

**Changing the Display of Graphic Subdivisions in a 2D Section**

Use this procedure to change the display of subdivisions in a 2D section by changing its display properties.

You create subdivisions by adding them to the section line. You can then change their length using grips or by editing the values in the section line properties. For more information, see Creating Graphic Subdivisions for 2D and 3D Sections on page 3267.
Each subdivision in a 2D section is assigned to a numbered subdivision display component in the display properties of the section or the 2D section style. You can control the visibility, layer, color, linetype, lineweight, and linetype scale of each subdivision by changing the display properties of each component. You can apply these changes to the selected section, to the current 2D section/elevation style, or to all 2D sections and elevations in the drawing that do not have a style override.

1. Select the 2D section in the drawing, and do one of the following:
   - To change the display for the graphic subdivisions in the 2D section style, click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.
   - To change the display for the graphic subdivisions for the selected 2D section object only, right-click, and Edit Object Display. Then, check the Object Override box.

2. Click the Display Properties tab.

3. Select the property source to edit:
   - To change the display for the graphic subdivisions in the 2D section style, check the Style Override box.
   - To change the display for the graphic subdivisions for the selected 2D section object only, check the Object Override box.

4. If necessary, click .

5. Click the Layer/Color/Linetype tab to list all the components that contribute to the display of the object.
   The defining line represents the cutting plane of the section line. The numbered subdivision components correspond to subdivisions added to the section line. For example, the display component Subdivision 1 corresponds to the subdivision closest to, but not on, the cutting plane of the section line.

6. Turn the visibility on or off, and change the layer, color, linetype, lineweight, or linetype scale as needed for each subdivision component.

7. Click the Hatching tab to change the shrinkwrap hatch pattern of the section.

8. Click the Other tab to add a custom display component to the display of the 2D section.
For more information about adding custom display components, see Adding a Display Component to a 2D Section Style on page 3304.

9 Click OK twice.

Changing the Display of Graphic Subdivisions in a 3D Section

Use this procedure to change the display of subdivisions in a 3D section by changing its display properties.

You create the subdivisions by adding them to the section line. You can then change their length using grips or by editing the values in the section line properties. For more information, see Creating Graphic Subdivisions for 2D and 3D Sections on page 3267.

Each subdivision in a 3D section is assigned to a numbered subdivision display component in the display properties of the 3D section. You can control the visibility, layer, color, linetype, lineweight, and linetype scale of each subdivision by changing the display properties of each component. You can apply these changes to the selected 3D section or to all 3D sections in the drawing.

1 Select the 3D section in the drawing, right-click, and click Edit Object Display.
2 Click the Display Properties tab.
3 Select the Sub-divisions display representation.
4 Check the Object Override box.
5 If necessary, click .
6 Click the Layer/Color/Linetype tab to list all the components that contribute to the display of the object.
   The defining line represents the cutting plane of the section line. The numbered subdivision components correspond to subdivisions added to the section line. For example, the display component Subdivision 1 corresponds to the subdivision closest to, but not on, the cutting plane of the section line.
7 Turn the visibility on or off, and change the layer, color, linetype, lineweight, or linewidth scale as needed for each subdivision component.
8 Click OK twice.
Reversing a 2D or 3D Section

Use this procedure to reverse the direction of a section by reversing the section line and refreshing the section.

The direction of the section is determined by the direction in which you drew the section line. You can select the section line in plan view to see the bounding box that defines the area of the model included in the section. If the box does not include the area of the model that you intended, you can reverse the section line. If you have already created a section from the section line, update the section after reversing the section line.

1 Select the section line that you used to create the section, and click Building Section Line tab ➤ Modify panel ➤ Reverse . The section line is mirrored about its own axis, as is the bounding box with its original parameters.

2 Select the existing section.

<table>
<thead>
<tr>
<th>If you selected…</th>
<th>Then click…</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D section</td>
<td>click 2D Section/Elevation tab ➤ Modify panel ➤ Regenerate .</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong> If you do not need to respecify the objects to include in the section, you can instead click 2D Section/Elevation tab ➤ Modify panel ➤ Refresh . This immediately updates the section.</td>
</tr>
</tbody>
</table>

| a 3D section     | click 3D Section/Elevation tab ➤ Modify panel ➤ Regenerate . |

3 If you want to include different objects in the updated section, click (Reselect Objects), and select the objects. Press ENTER when you finish selecting objects.

4 Click OK.
Changing the Style of a 2D Section

Use this procedure to select a different style for a 2D section. A 2D section/elevation style controls the appearance of any 2D section object to which the style is applied.

1. Double-click the section you want to change.
2. On the Properties palette, click the Design tab, expand Basic, and expand General.
3. Select a new style for the section.

Creating a Material Boundary in a 2D Section

Use this procedure to create a material boundary in a 2D section. For more information, see Material Components and Display Properties on page 898.

1. Draw a polyline around the area in the section that you want to mask or to highlight.
2. Select the section, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Add .
3. Select the polyline.
4. Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.
5. Specify the settings of the material boundary:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>highlight the area inside the polyline</td>
<td>select Limit for Purpose.</td>
</tr>
<tr>
<td>mask (erase) the area inside the polyline</td>
<td>select Erase for Purpose.</td>
</tr>
<tr>
<td>apply the highlight or mask only to specific parts of the section</td>
<td>select the appropriate parts for Apply to. You can choose Surface and Section Hatching, Section Hatching Only, Surface Hatching Only, Edge Linework Only, and All Linework.</td>
</tr>
<tr>
<td>apply the material boundary to all materials used in the section</td>
<td>select All Materials for Material Selection.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
apply the material boundary only to selected materials | select Specific Materials for Material Selection and then select the desired materials in the list below.

apply the highlighting or masking within the polyline to the shrinkwrap linework | select Apply to section shrinkwrap linework. For information on section shrinkwrap, see *Shrinkwrap* on page 3308 and *Shrinkwrap Hatch* on page 3309.

apply the highlighting or masking within the polyline to the shrinkwrap hatching | select Apply to section shrinkwrap hatching. For information on section shrinkwrap, see *Shrinkwrap* on page 3308 and *Shrinkwrap Hatch* on page 3309.

6 Click OK.

**Editing a Material Boundary**

You can edit existing material boundaries in a number of different ways:

- Change the content within the material boundary. For example, you can determine if you want to see only surface hatching, or both surface and section hatching.

- Change the shape of the material boundary. For example, you can make the boundary bigger or smaller, or add additional rings and vertex points to it.

For more information, see *Material Components and Display Properties* on page 898.

**Editing the Content of a Material Boundary**

Use this procedure to change the content of a material boundary. The content includes such settings as materials displayed, hatch types, and boundary type.
1. Select the 2D section with the material boundary, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.

You are now in edit in place mode. The material boundary is highlighted, and the grips are displayed.

2. Click Edit In Place tab ➤ Profile panel ➤ Edit Material Boundary.

3. Specify the content of the material boundary:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>highlight the area inside the boundary</td>
<td>select Limit for Purpose.</td>
</tr>
<tr>
<td>mask (erase) the area inside the boundary</td>
<td>select Erase for Purpose.</td>
</tr>
<tr>
<td>apply the highlight or mask only to specific parts of the section</td>
<td>select the appropriate parts for Apply to. You can choose Surface and Section Hatching, Section Hatching Only, Surface Hatching Only, Edge Linework Only, and All Linework.</td>
</tr>
<tr>
<td>apply the material boundary to all materials used in the section</td>
<td>select All Materials for Material Selection.</td>
</tr>
<tr>
<td>apply the material boundary only to selected materials</td>
<td>select Specific Materials for Material Selection, and then select the desired materials from the list below.</td>
</tr>
</tbody>
</table>

4. Click OK.

5. To exit edit in place mode,

<table>
<thead>
<tr>
<th>if you want to…</th>
<th>then click…</th>
</tr>
</thead>
<tbody>
<tr>
<td>save all changes</td>
<td>Edit in Place: Material Boundary tab ➤ Edits panel ➤ Finish.</td>

</tbody>
</table>
Adding a Vertex to a Material Boundary

Use this procedure to add a vertex to a material boundary.

1. Select the 2D section with the material boundary to change, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place. You are now in edit in place mode. The material boundary is highlighted, and the grips are displayed.
2. Right-click, and click Add Vertex.
3. Specify the point at which to add a vertex.
4. Specify additional vertex points as needed.
5. Press ENTER.
6. To exit edit in place mode, if you want to.. then click...
   - save all changes Edit in Place: Material Boundary tab ➤ Edits panel ➤ Finish
   - discard all changes Edit in Place: Material Boundary tab ➤ Edits panel ➤ Cancel

Removing a Vertex from a Material Boundary

Use this procedure to remove a vertex from a material boundary.

1. Select the 2D section with the material boundary to change, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place. You are now in edit in place mode. The material boundary is highlighted, and the grips are displayed.
2. Right-click, and click Remove Vertex.
3. Specify the vertex points to remove.
4. Press ENTER.
Adding a Ring to a Material Boundary

Use this procedure to add a ring to a material boundary.

A material boundary can consist of more than one closed polyline. For example, you could use one polyline to highlight a wall detail and another polyline to highlight a window detail in another location.

1. Draw a polyline for the new material boundary ring.
2. Select the material boundary to add a new ring to, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place .

You are now in edit in place mode. The material boundary is highlighted, and the grips are displayed.

3. Click Edit In Place: Material Boundary tab ➤ Profile panel ➤ Add Ring .
4. Select the polyline you drew in Step 1.
5. Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.
6. To exit edit in place mode,

<table>
<thead>
<tr>
<th>if you want to...</th>
<th>then click...</th>
</tr>
</thead>
<tbody>
<tr>
<td>save all changes</td>
<td>Edit in Place: Material Boundary tab ➤ Edits panel ➤ Finish.</td>
</tr>
<tr>
<td>discard all changes</td>
<td>Edit in Place: Material Boundary tab ➤ Edits panel ➤ Cancel.</td>
</tr>
</tbody>
</table>
Removing a Ring from a Material Boundary

Use this procedure to remove a ring from a material boundary.

A material boundary can consist of more than one closed ring. You can remove each ring individually.

**NOTE** You cannot remove the last ring from a material boundary.

1. Select the 2D section with the material boundary to change, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.
   
   You are now in edit in place mode. The material boundary is highlighted and the grips are displayed.

2. Click Edit In Place: Material Boundary tab ➤ Profile panel ➤ Remove Ring.

3. Select the ring you want to remove.

4. To exit edit in place mode,
   
   **if you want to..** then click...
   
   save all changes Edit in Place: Material Boundary tab ➤ Edits panel ➤ Finish
   
   discard all changes Edit in Place: Material Boundary tab ➤ Edits panel ➤ Cancel

Replacing a Ring from a Material Boundary with Another

Use this procedure to replace a ring from a material boundary with a different ring.

1. Draw the polyline to replace one of the existing material boundary rings.

2. Select the 2D section with the material boundary to change, and click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.
   
   You are now in edit in place mode. The material boundary is highlighted and the grips are displayed.
3 Click Edit In Place: Material Boundary tab ➤ Profile panel ➤ Replace Ring.
4 Select the ring to be replaced.
5 Select the closed polyline you drew in Step 1.
6 Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.
7 To exit edit in place mode, if you want to then click...

<table>
<thead>
<tr>
<th>save all changes</th>
<th>Edit in Place tab ➤ Edits panel ➤ Finish</th>
</tr>
</thead>
<tbody>
<tr>
<td>discard all changes</td>
<td>Edit in Place tab ➤ Edits panel ➤ Cancel</td>
</tr>
</tbody>
</table>

**Editing and Merging Linework in a 2D Section**

After you create a 2D section, you can edit the display of individual lines that make up the section. For example, you may want to assign linework for small details to a display component with a lighter lineweight, so that the details are not obscured when plotted.

You can also merge existing geometry into the section.

**Editing Linework in a 2D Section**

Use this procedure to edit individual lines in a 2D section by assigning them to display components in the section. For information about the Edit Linework grip, see Using Grips to Edit Linework in a 2D Section on page 3280.

You can assign selected linework to fixed display components that determine the display of every section that you generate, or you can assign linework to display components that you have defined. For information about adding custom display components, see Adding a Display Component to a 2D Section Style on page 3304. After you assign linework to display components, you can change the display properties (visibility, color, layer, lineweight, linetype, and linetype scale) to change the display of lines.
1 Select the section to be changed, and click 2D Section/Elevation tab ➤ Linework panel ➤ Edit . The contextual Edit In Place: Linework tab is displayed.

2 Select the lines that you want to assign to a display component, and click Edit In Place ➤ Linework tab ➤ Profile panel ➤ Modify Component .
A list of available display components is displayed.

3 Select the component on which to put the lines.
For example, to make the lines invisible, select Erased Vectors for Linework Component.

You can also click (Match existing linework) and select linework in the section whose display component you want to match.

4 Click OK.

5 If you want to undo an individual component change, enter Aec2dSectionResultAbortChanges on the command line, and select the component. This will undo all changes to that component during the edit in place session, and automatically exit the edit in place mode.

6 To finish the linework editing process,

<table>
<thead>
<tr>
<th>if you want to..</th>
<th>then click…</th>
</tr>
</thead>
<tbody>
<tr>
<td>save all changes</td>
<td>Edit in Place: Linework tab ➤ Edits panel ➤ Finish</td>
</tr>
<tr>
<td>discard all changes</td>
<td>Edit in Place: Linework tab ➤ Edits panel ➤ Cancel</td>
</tr>
</tbody>
</table>

**Merging Linework into a 2D Section**

Use this procedure to merge geometry into a 2D section. When you merge linework into a section, you assign additional linework to a display component of a section. Use this feature to add detail, or to add linework that you did not model.

1 Draw the geometry that you want to merge into a 2D section.
2 Select the 2D section to be changed, and click 2D Section/Elevation tab ➤ Linework panel ➤ Merge.

3 Select the geometry to merge into the section, and press ENTER.

4 Select the display component to assign the linework to.

You can also click (Match existing linework) and select linework in the section whose display component you want to match.

5 Click OK.

The linework is merged into the 2D section. When you select the section, the linework is selected with it.

Changing the Location of a 2D or 3D Section

You can relocate a section by changing the coordinate values of its insertion point. The section also has an orientation with respect to the WCS or the current UCS. For example, if the top and bottom of the section are parallel to the XY plane, its normal is parallel to the Z axis. You can change the orientation of the section by aligning its normal with another axis. You can also rotate the section on its plane by changing the rotation angle.

For information about the world coordinate system (WCS) and the user coordinate system (UCS), see “Use Coordinates and Coordinate Systems” in AutoCAD help.

1 Double-click the section you want to move.

2 On the Properties palette, click the Design tab, expand Basic, and expand Location.

3 Click Additional information.

4 Specify a new location or rotation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>relocate the section</td>
<td>enter new coordinate values under Insertion Point.</td>
</tr>
<tr>
<td>locate the section on the XY plane</td>
<td>make the normal of the section parallel to the Z axis: under Normal, enter 1 for Z, and enter 0 for X and Y.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
locate the section on the YZ plane | make the normal of the section parallel to the X axis: under Normal, enter 1 for X, and enter 0 for Y and Z.
locate the section on the XZ plane | make the normal of the section parallel to the Y axis: under Normal, enter 1 for Y, and enter 0 for X and Z.
change the rotation of the section | enter a new value for Rotation Angle.

5 Click OK.

**Attaching Hyperlinks, Notes, and Files to a 2D or 3D Section**

Use this procedure to add hyperlinks, enter notes, and attach reference files to a 2D or 3D section. You can also edit notes and edit or detach reference files from a 2D or 3D section.

1 Double-click the 2D or 3D section you want to attach notes or files to.
2 On the Properties palette, click the Extended Data tab.
3 To add a hyperlink, click \( \mathbf{ } \) next to Hyperlink, and specify the link.
4 To add a note, click \( \mathbf{ } \) next to Notes, enter text, and click OK.
5 To attach, detach, or edit a reference file, click \( \mathbf{ } \) next to Reference documents, and then do any of the following:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click ( \mathbf{ } ), select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
</tbody>
</table>
If you want to... | Then...
--- | ---
edit a reference file | double-click the reference file name to start its application.
detach a reference file | select the file name, and click .

6 Click OK.

**Updating a 2D or 3D Section**

Use this procedure to update a 2D or 3D section to reflect changes you have made to the building model or to section line properties. For 2D sections, you also update the section to show changes made to the 2D section style. You can update a 2D or 3D section if you have not exploded the section, which destroys the link between the section and the building model.

When you update a section, you can add or remove objects from the section, change the location of the section in the drawing, and change the display set of the section.

If you do not need to change the section definition in any way, you can skip the following procedure. Instead, select the section you want to update, and click 2D Section/Elevation tab ➤ Modify panel ➤ Refresh .

**1 Select the section you want to update.**

<table>
<thead>
<tr>
<th>If you selected...</th>
<th>then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D section object</td>
<td>click 2D Section/Elevation tab ➤ Modify panel ➤ Regenerate .</td>
</tr>
<tr>
<td>a 3D section object</td>
<td>click 3D Section/Elevation tab ➤ Modify panel ➤ Regenerate .</td>
</tr>
</tbody>
</table>
2 Select a result type:

<table>
<thead>
<tr>
<th>If the section is…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D section object</td>
<td>select 2D Section/Elevation Object with Hidden Line Removal.</td>
</tr>
<tr>
<td>a 3D section object</td>
<td>select 3D Section/Elevation Object.</td>
</tr>
</tbody>
</table>

3 To change the style of a 2D section, select a new style for Style to Generate.

4 If you edited linework in the 2D section, select a style in which to save the changes you made that cannot be reapplied. Choose a style that will distinguish the unapplied changes in the section.

5 Under Selection Set, specify the objects that you want to include in the section:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the objects in the selection set you specified when you created the section or when you previously updated it</td>
<td>proceed to the next step.</td>
</tr>
<tr>
<td>add new objects to the selection set that you specified when you created the original section</td>
<td>click Select Additional Objects, select the new objects in the drawing, and press ENTER.</td>
</tr>
<tr>
<td>select a new selection set of objects for the section</td>
<td>click Reselect Objects, select a new selection set of objects for the section, and press ENTER.</td>
</tr>
</tbody>
</table>

**NOTE** If you select an object that you do not want to include in the section, hold down **SHIFT**, and select the object again to remove it from the selection set.

6 Under Display Set, select a display set for the section.

7 Under Placement, locate the section in the drawing:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a new section object without overwritten the original object</td>
<td>select New Object, and either click to specify an insertion point in</td>
</tr>
</tbody>
</table>
Globally Updating 2D Sections

AutoCAD Architecture makes it possible for you to globally update all sections and elevations within a project or a specified folder.

Updating Sections and Elevations in a Project

AutoCAD Architecture includes the Drawing Management feature that allows users to combine their floor plans, section and elevation views, construction sheets, and reusable components in one building project. A project consists of a number of drawings linked together with a powerful external referencing mechanism. You can open a project and update all 2D sections and elevations included in that project in one comfortable workflow. For information on which project file types can be updated, see Supported Project Drawing Types on page 3298.

Updating Sections and Elevations in a Specific Folder

When you are working without a project, you can also globally update sections and elevations by specifying a folder and updating all sections and elevations in that folder. When you select a specific folder for updating, you can also include its subfolders in the update.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace the original section with the updated section</td>
<td>select Replace Existing.</td>
</tr>
</tbody>
</table>

8 Click OK.
Section of a building project

For more information about building projects, see Drawing Management on page 303.

**Supported Project Drawing Types**

When you are updating a project, you can globally update all 2D sections and elevations within the views and sheets of the project. You cannot globally update elements and constructs, because these project drawings usually contain reusable elements and individual parts of the building project. They normally do not contain sections or elevations.

For more information about project drawing types, see Views on page 446 and Sheets on page 481.

**NOTE** When you globally update the sections and elevations in a project drawing, all model and paper space layouts are updated.

When you are updating a specified folder within a project, or a folder outside of a project, all sections and elevations in that folder are updated regardless of their type. For example, if you choose to update a specific folder within the Constructs category of a project, the sections and elevations in that folder will be updated, even though they are Construct drawings. If you do not specify a folder, but choose to update the whole project, these construct drawings are not updated.
Globally Updating 2D Sections and Elevations in a Project or a Folder

Use this procedure to globally update all 2D sections and elevations in a project or a specified folder.

**NOTE** To update all 2D sections and elevations in a project, the project must be defined as current. If no project is current, you receive an error message if you try to globally update 2D sections and elevations. For information on setting a project current, see *Setting a Project Current* on page 327.

1. Click Home tab ➤ Section & Elevation panel ➤ Batch Refresh.

![Batch Refresh 2D Section/Elevations dialog box](image)
2 Select if you want to update the 2D sections and elevations in the current project, or only the 2D sections and elevations in a specific folder.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>update the 2D sections</td>
<td>select Current Project.</td>
</tr>
<tr>
<td>and elevations in the</td>
<td>have specified a folder, you can specify whether the subfolders of that</td>
</tr>
<tr>
<td>current project</td>
<td>folder should be updated as well. To update the subfolders, select...</td>
</tr>
<tr>
<td></td>
<td>Process subfolders.</td>
</tr>
<tr>
<td>update the 2D sections</td>
<td>select Folder. Then click the Browse button, select the folder...</td>
</tr>
<tr>
<td>and elevations in a</td>
<td>containing the files you want to update, and click OK.</td>
</tr>
<tr>
<td>specific folder</td>
<td></td>
</tr>
</tbody>
</table>

3 If you have specified a folder, you can specify whether the subfolders of that folder should be updated as well. To update the subfolders, select Process subfolders.

NOTE When you are working with a large building project, updating all sections and elevations can be a time-consuming process. In this case, you might consider updating only a selected subfolder of your project and thereby improve system performance.

4 Click Begin.
Globally updating all sections and elevations may take a while. A status window lets you know which drawing is currently being updated.

When you start the global update, the Stop button is available. If you want to interrupt the global update, click Stop. When the global update is finished, the Begin button is available.

**Updating Legacy Drawings**

During the global update of 2D sections and elevations, each drawing in the project or specified folder is opened, updated, and saved again. If you are updating drawings from an earlier version of the software, the drawings are converted to the current version. Before you convert the drawings, a warning message notifies you of the conversion. To update the drawings to the new version, click OK. To cancel the update of all sections and elevations, press **CTRL+BREAK**.
**Update Exceptions**

There are a number of cases in which a 2D section or elevation cannot be updated with the global update.

- The drawing containing the 2D section or elevation is read-only.
- The 2D section or elevation is placed on a locked layer.
- There have been user edits to a 2D section or elevation that could not be reapplied to the 2D section or elevation.

When a 2D section or elevation cannot be updated, an error message is displayed in the status window.

To fix the problem, you can set the drawing to read/write instead of read-only, you can unlock the section layer, or you can undo a specific user edit to a 2D section or elevation.

**2D Section Styles**

A 2D section/elevation style is a group of properties assigned to a 2D section or to an elevation that determines the appearance and other characteristics of that object.

**Using 2D Section Styles**

A 2D section/elevation style controls the linework in a section, using design rules that determine how different parts of the section are displayed. You can apply the style to one or more sections to control their appearance. You can also change the display of individual lines in the section, and save the changes in a 2D section/elevation style.

**Display Components and Design Rules**

Display components determine the graphical characteristics, such as color and linetype, of linework assigned to each display component. Design rules determine how the linework in a section is assigned to display components.

When you create a design rule, you specify the part of the 2D section to control based on the color of those objects in the building model and their context in the section. You then select the display component to use for linework that meets the criteria you specified. You can assign the linework to a default display component or to a custom display component that you have added to the style. For example, you might define a rule that assigns all objects that
are color 150 in the model and that are located along the section line (the defining line) to a custom display component named Darker that you created in the style. Or you might hide a staircase behind a wall using a rule that assigns all blue linework to the Hidden display component.

**Managing 2D Section Styles**

To create, edit, copy, or purge styles, you access the Style Manager. The Style Manager provides a central location in AutoCAD Architecture where you can work with styles from multiple drawings and templates. For more information about using the Style Manager, see Style Manager Overview on page 870.

**Materials and 2D Section Styles**

You can use 2D section styles to specify which section components will have their display controlled by materials and which will not. Custom components cannot use materials.

**Subdivisions in 2D Section Styles and Materials**

When you are creating subdivisions in your style, you usually want the objects in them to be visually distinct from other subdivisions. When you assign materials to the objects, you can set the 2D section style so that it uses the hatch pattern from the material, but the color and linetype from the subdivision display properties.

*Section subdivision surface hatching with color assignments*
Creating a 2D Section Style

Use this procedure to create a 2D section style. You can create a style using default style properties or by copying an existing style. After you create the style, you edit the style properties to customize the characteristics of the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ Style Manager.
2 Expand Documentation Objects, and expand 2D Section/Elevation Styles.

NOTE Alternatively, select a 2D section in the drawing, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ 2D Section/Elevation Style ➤ 2D Section/Elevation Style.

3 Create a 2D section style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a style using default properties</td>
<td>right-click 2D Section/Elevation Styles, and click New. Enter a name for the new 2D section style, and press ENTER.</td>
</tr>
<tr>
<td>create a style from an existing style</td>
<td>right-click the 2D section style you want to copy, and click Copy. Right-click, and click Paste. Right-click the new style, and click Rename. Enter a name and press ENTER.</td>
</tr>
</tbody>
</table>

4 Edit the 2D section style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add display components to the style</td>
<td>see Adding a Display Component to a 2D Section Style on page 3304.</td>
</tr>
<tr>
<td>remove display components from the style</td>
<td>see Removing a Display Component from a 2D Section Style on page 3305.</td>
</tr>
<tr>
<td>use the subdivision properties of the section for the display</td>
<td>see Use Subdivision Properties and Materials in 2D Section Styles on page 3313.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
--- | ---
use the 3D Body component of the material for the section linework | see Use the 3D Body Component of a Material for the 2D Section Linework on page 3313.
add design rules to the style | see Adding a Design Rule to a 2D Section Style on page 3314.
change design rules in the style | see Changing a Design Rule in a 2D Section Style on page 3316.
add classifications to a style | see Adding Classifications to a 2D Section Style on page 3317.
change the display properties of the display components in the style | see Changing the Layer, Color, and Linetype of a 2D Section Style on page 3317.
add notes, files, or documents to the style | see Attaching Notes and Files to a 2D Section Style on page 3318.

5 Click OK.

**Adding a Display Component to a 2D Section Style**

Use this procedure to add a custom display component to a 2D section style. After you add a component, you assign linework in the section to the new component. To apply these style changes to existing 2D sections, you must update the section.

2D sections include the following default display components: Defining Line, Hidden, Erased, Unknown, and Subdivision.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style 📝.
2 Click the Components tab.
3 Click Add.
4 Enter a name and a description for the new component.
To enter a name, click Unnamed and enter a new name. To enter a description, click in the Description column next to the name, and enter a description.

5 Click the Display Properties tab.
6 Select the display representation in which to display the changes, and select Style Override.

7 If necessary, click .
8 Click the Layer/Color/Linetype tab.
9 Specify the display properties of the new component.
10 Click OK twice.

To create a design rule that uses the new display component, see Adding a Design Rule to a 2D Section Style on page 3314. To manually assign linework to the display component, see Editing Linework in a 2D Section on page 3291.

Removing a Display Component from a 2D Section Style

Use this procedure to remove a custom display component from a 2D section style. Removing a display component also removes any design rules that use the component. You cannot remove the default display components.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style .
2 Click the Components tab.
3 Select the component that you want to remove, and click Remove. If the component is used in a design rule, a dialog box is displayed, warning you that the associated design rule is removed as well.
4 Click OK.
5 Update the section to apply the style changes to the section.

For more information, see Updating a 2D or 3D Section on page 3295.
About 2D and 3D Section Display Components and Materials

2D and 3D section object consist of a number of display components which can be determined by materials.

When you assign materials to an object, you assign one material to each display component of an object. For example, you assign a wood material to the frame of a window and a glass component to the glass of a window.

When you create a 2D or 3D section object from building objects, the material assignments of the source objects are applied to the section. You do not assign a material directly to a 2D/3D section. The section takes its material assignments from the objects that are sectioned. For example if you create a section through a wall with a window, the section hatch you have defined in the glass, wood, and brick materials of the wall and the window are displayed in the section.

If you do not want to use the material display properties, but instead use those of the 2D or 3D section object, or the 2D section style, you can deactivate the material assignments in the display properties of the section or the section style.
**Material Component Assignments**

Material definitions consist of display components which correspond to component types of objects. For example, the Linework component of a material is used for all linework of objects in Plan view. The Surface Hatch component of a material is used to hatch all object surfaces in 3D model views and elevations.

For a complete list of material components and their description, see Material Components and Display Properties on page 898.

The following table lists all section components plus information about the material components that determine them.

**NOTE** Keep in mind that materials are not assigned directly to 2D section objects, but that the assignment of materials happens indirectly via the sectioned objects. For example, if a brick material has a surface hatch component with a red brick pattern, this surface hatch determines the display of the surface hatch in a brick wall. When you create a 2D section from that wall, the resulting section object will inherit the red brick pattern from the wall. When you change the material of the wall from brick to concrete, and then update the 2D section, it will now display with a grey concrete pattern.

</tr>
</tbody>
</table>

**Defining Line**

The defining line determines where the section cuts the objects it contains. The material component which controls the display of the Defining Line is the Linework component. The defining line is a display component of both 2D and 3D section objects.

For example, if you cut a brick wall that contains a window, you can specify one uniform color for the defining line, or use different colors where the section line cuts the wall and where it cuts the window. If you want to use a uniform color for the Defining Line component, assign a color to it and do not use the properties of the material. If you want the color of the defining line to be influenced by the objects in the section, use the material properties. In the case of a section through a brick wall with a window, you might use a red defining line where the wall is cut and a blue defining line where the window is cut.

**Specifying cut line colors for different materials**

![Diagram of Defining Line](image)

**Shrinkwrap**

The shrinkwrap displays the union of all object faces cut by the section line. The Outer Shrinkwrap component represents the outline of solid, filled components, such as a wall shrinkwrap. The Inner Shrinkwrap component
represents the outline of holes which have been cut, such as a space. These components are specific to 2D sections.

You can exclude individual objects from contributing to the shrinkwrap. For example, you might do this for glass components in windows. For information on excluding objects from the 2D shrinkwrap, see Excluding a Material Definition from 2D Section Shrinkwrap on page 928.

2D section with red outer shrinkwrap

![2D section with red outer shrinkwrap](image)

Window glass excluded from shrinkwrap

![Window glass excluded from shrinkwrap](image)

The Outer and Inner Shrinkwrap components cannot be defined by a material component.

**Shrinkwrap Hatch**

The Shrinkwrap Hatch component hatches the union of all object faces cut by a section line. The Shrinkwrap Hatch is defined by either an outer or an inner shrinkwrap line component. This component is specific to 2D sections.
Shrinkwrap Hatch with glass excluded from shrinkwrap detail

The Shrinkwrap Hatch component cannot be defined by a material component.

**NOTE** The Shrinkwrap Hatch and Section Hatch components overlap each other. This could result in two different hatches in the same location. To avoid a conflict, either assign a solid hatch for Shrinkwrap Hatch, or do not use the Shrinkwrap and Section Hatch components simultaneously.

### Surface Hatch Linework

The Surface Hatch Linework component draws all linework coming from surface hatches of the objects cut. Surface hatches appear in faces of the section object that are not cut by the section line. This component is specific to 2D sections.

**NOTE** Surface hatches that you have assigned to objects will display in a 3D section object. However, you cannot set them separately in a 3D section; you can do that only in a 2D section object.

The surface hatch linework component is controlled by the surface hatch component of the material. For information about the surface hatch component of the material, see [Surface Hatch Material Component](#) on page 900.
Section Hatch Linework

The Section Hatch Linework component draws all linework coming from section hatches. Section hatches appear on all faces that are cut by the section line. A section hatch is similar to a shrinkwrap hatch. The difference is that in a section hatch the sectioned faces are not merged into one shrinkwrap component. Use either a section hatch or a shrinkwrap hatch on a 2D section. For information on shrinkwrap hatches see Shrinkwrap Hatch on page 3309.

The Section Hatch Linework display component is specific to 2D section.

Section hatches on walls, roof and door

The Section Hatch Linework component is controlled by the Section Hatch component of the material. For information about the Section Hatch component of the material, see Creating a Hidden Line Projection on page 3385.

Hidden Component

The Hidden component contains all linework that is hidden in the 2D projection because other components are in front of it. By default, this component is turned off. You can use design rules to achieve special effects, such as a see-through effect, using the Hidden component. The Hidden component is specific to 2D sections.
The Hidden component cannot be defined by a material component. You can only set it in the display properties of the 2D section. For information on setting the display properties of a 2D section, see Creating a Hidden Line Projection on page 3385.

**Erased Component**

The Erased component contains linework in the section object that you do not want to see. For example, if you have a section of a multi-story building in which you want to hide the lines between each floor, you can edit the linework of the section and assign the floor lines to the Erased component. Since the Erased component is turned off by default, the floor lines do not display. For information on linework editing of a section, see Editing Linework in a 2D Section on page 3291.

The Erased component is specific to 2D sections.

The Erased component cannot be defined by a material component.

**Subdivision Components**

The subdivision components partition a section object. They are useful to create perspective effects, where parts closer to the viewer are drawn with darker, stronger lines and parts which are farther from the user are drawn with lighter, thinner lines. Subdivisions can have no individual material assignments. However the display properties of the subdivisions can be used for the surface hatching of the subdivisions by selecting “Use Subdivision Properties for Surface Hatching” in the Other tab of the 2D section display properties. For information on using the subdivision display properties to display the section divisions, see Use Subdivision Properties and Materials in 2D Section Styles on page 3313.

Subdivisions are a display component of both 2D and 3D section objects.

The subdivision components are either controlled by the 2D Section/Elevation Linework component of the material or by the 3D Body component of a material. For information how to switch between these component assignments, see Use the 3D Body Component of a Material for the 2D Section Linework on page 3313.
Use Subdivision Properties and Materials in 2D Section Styles

Use this procedure to use the display properties of materials together with the display properties of section subdivisions.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.
2 Click the Display Properties tab.
3 Select the display representation in which to display the changes, and select Style Override.
4 If necessary, click .
5 Click the Layer/Color/Linetype tab.
6 To set a subdivision to use the surface hatch of the material, while using the layer, color, and linetype display properties of the subdivision, perform the following steps:
   ■ Clear By Material.
   ■ Specify the layer, color and linetype settings of the subdivision as desired. For example, the first subdivision could have a darker color and stronger linetype the second subdivision.
7 Click the Other tab.
8 Select Use Subdivision properties for surface hatching.
9 Click OK twice.
   For more information, see Updating a 2D or 3D Section on page 3295.

Use the 3D Body Component of a Material for the 2D Section Linework

Use this procedure to use the 3D Body component of a material for the linework in a 2D section.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style .
2 Click the Display Properties tab.
3 Select the display representation in which to display the changes, and select Style Override.

4 If necessary, click .

5 Click the Other tab.

6 Determine if the 3D body component of the selected material should control the display of the linework in the 2D section:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>control the display of the 2D section linework by the 3D Body component of the material,</td>
<td>select Use 3D Body display component for By Material linework.</td>
</tr>
<tr>
<td>control the display of the 2D section linework by the 2D Section/Elevation Linework component of the material,</td>
<td>clear Use 3D Body display component for By Material linework. This is the default behavior.</td>
</tr>
</tbody>
</table>

7 Click OK twice.

For more information, see Updating a 2D or 3D Section on page 3295.

### Adding a Design Rule to a 2D Section Style

Use this procedure to add a design rule to a 2D section style. A design rule has four fields of information that identify lines in the section and determine how to display them:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color</td>
<td>Identifies the color of the objects in the building model represented by lines in the section.</td>
</tr>
<tr>
<td>Context</td>
<td>Identifies the context of the lines in the 2D section, such as on the defining line (the cutting plane) or in a graphic subdivision.</td>
</tr>
<tr>
<td>Component</td>
<td>Identifies the display component to which the lines are assigned.</td>
</tr>
<tr>
<td>Description</td>
<td>Contains a description of the design rule.</td>
</tr>
</tbody>
</table>
For example, a design rule has the color 50, a context of Within Subdivision 2, and a component of New. This rule assigns any lines in the section representing objects that have the color 50 in the building model and that are within subdivision 2 in the section to the user-defined display component, New.

You can also specify that all hidden linework that is not handled by a specific design rule will be assigned to the Hidden display component. You could use this option if you want to generate a section of an object or a set of objects and see all edges, for example, if you are creating foundations and formwork.

NOTE Alternatively, you can define which hidden linework should be displayed by object material. For more information, see Controlling the Display of Hidden Lines by Material on page 929.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style. 

2 Click the Design Rules tab, and click Add. A new design rule is created with default color, context, and component values.

3 Specify settings for the new design rule:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify the color of objects in the building model that are affected by this rule</td>
<td>click the default color, select a new color, and click OK.</td>
</tr>
<tr>
<td>specify the context in which the linework for the objects appears in the section</td>
<td>click the default context, and select a new context.</td>
</tr>
<tr>
<td>select the display component for the linework</td>
<td>click the default component, and select a new component.</td>
</tr>
<tr>
<td>enter a description of the rule</td>
<td>click the Description field, enter a description, and press ENTER.</td>
</tr>
</tbody>
</table>

4 To place all hidden linework on the Hidden display component, select Keep all hidden linework.

5 Click OK.
Changing a Design Rule in a 2D Section Style

Use this procedure to change the settings in the fields that define a design rule.

1. Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.
2. Click the Design Rules tab.
3. Specify settings for the design rule you want to change:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify the color of objects in the building model that are affected by this rule</td>
<td>click the current color, select a new color, and click OK.</td>
</tr>
<tr>
<td>specify the context in which the linework for the objects appears in the section</td>
<td>click the current context, and select a new context.</td>
</tr>
<tr>
<td>select the display component for the linework</td>
<td>click the current component, and select a new component.</td>
</tr>
<tr>
<td>edit the description of the rule</td>
<td>click the description, edit the description, and press ENTER.</td>
</tr>
</tbody>
</table>

4. Click OK.
5. Update the section to apply the style changes to the section.

For more information, see Updating a 2D or 3D Section on page 3295.

Removing a Design Rule from a 2D Section Style

Use this procedure to remove a design rule from a 2D section style.
1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.
2 Click the Design Rules tab.
3 Select the rule that you want to remove, and click Remove.
4 Click OK.
5 Update the section to apply the style changes to the section.
   For more information, see Updating a 2D or 3D Section on page 3295.

Adding Classifications to a 2D Section Style

Use this procedure to specify classifications for any classification definition applied to a 2D section style.

For more information about creating and applying classification definitions, see Classification Definitions on page 3872.

1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.
2 Click the Classifications tab.
   By default, the classification for all classification definitions is Unspecified. If no classification definitions are listed, none are applied to 2D section styles.
3 For each classification definition, select the classification you want to apply to the current 2D section style.
4 Click OK twice.

Changing the Layer, Color, and Linetype of a 2D Section Style

Use this procedure to change the following display properties of a 2D section style:

- Visibility (component is on or off)
- Display properties by materials
- Layer
■ Color
■ Linetype
■ Lineweight
■ Linetype scale

**NOTE** The custom display components in the display properties are identical to those listed on the Components tab of the 2D Section/Elevation Styles dialog box. For more information about custom display components, see *Adding a Display Component to a 2D Section Style* on page 3304.

1. Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.

2. Click the Display Properties tab.

3. Select the display representation in which to display the changes, and select Style Override.

4. If necessary, click .

5. Click the Layer/Color/Linetype tab.

6. Select the component to change, and select a different setting for the property.

7. Select By Material for any component that you want to use the display properties of the materials assigned to the sectioned objects.

**NOTE** Not all display components of a 2D section have an associated material definition. For example, Hidden and Erased cannot be set by material. For a list of all display components and their associated material components, see *About 2D and 3D Section Display Components and Materials* on page 3306.

8. Click OK twice.

**Attaching Notes and Files to a 2D Section Style**

Use this procedure to enter notes and attach reference files to a 2D section style. You can also edit reference files attached to the style.
1 Select a section that has the style you want to change, and click 2D Section/Elevation tab ➤ General panel ➤ Edit Style drop-down ➤ Edit Style.

2 Click the General tab.

3 To add a description to the 2D section, enter the description under Description.

4 Click Notes.

5 To add or edit a note, click the Notes tab, and enter the note.

6 To attach, edit, or detach a reference file, click the Reference Docs tab:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Edit the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application. Click OK when you are done editing.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, click Delete, and click OK.</td>
</tr>
</tbody>
</table>

7 Click OK twice.
Elevations

You can create elevations of the building models in your drawings by first drawing an elevation line and mark, and then creating a 2D or 3D elevation based on that line. You can control the size and shape of any elevation that you create, and you can update an existing elevation when the objects included in the elevation are modified. 2D elevations are created with hidden and overlapping lines removed. You can control the appearance of 2D elevations by applying rules that are controlled by the style and display properties of the 2D elevation.

Working With Elevations

You can create elevations of the building models in your drawings by first drawing an elevation line and mark, and then creating a 2D or 3D elevation based on that line. You can control the size and shape of any elevation that you create, and you can update an existing elevation when the objects included in the elevation are modified. 2D elevations are created with hidden and overlapping lines removed. You can control the appearance of 2D elevations by applying rules that are controlled by the style and display properties of the 2D elevation.

Elevation Line and Marks

The elevation line defines the extents of the elevation view of your building model. Elevation lines can be straight or jogged. You can also specify the length and the height of the area defined by the elevation line. Elevation marks, which typically contain a letter or number and indicate the direction of the elevation, appear at each end of the elevation line.

After you draw the elevation line, you create an elevation object from the line.
Viewing the elevation line and mark

2D Elevations

2D elevations are created by drawing an elevation line in front of a number of objects and then creating a 2D elevation object from them. The elevation object is drawn without hidden and overlapping lines. You can edit a 2D elevation by changing its object display properties or its style display properties. The 2D elevation style lets you add display components to the display representation of the elevation and create rules that assign different parts of the elevation to different display components. You can control the visibility, layer, color, linetype, lineweight, and linetype scale of each component. You can also assign a material, such as a brick or concrete hatch, to individual components of the object or the style. Furthermore, you can use linework editing commands to assign individual lines in a 2D elevation to different display components, and merge geometry into a 2D elevation. You can dimension 2D elevations.

2D building elevation
3D Elevations

3D elevations are created by drawing an elevation line in front of a number of objects and then creating a 3D isometric elevation object from them. 3D elevations do not use styles. However, you can control the display of subdivisions within 3D elevations. Using the Hidden Line Projection command, you can create 2D hidden line projections of any view of the 3D elevation that you can explode and edit or hatch. For more information about using this command, see Creating a Hidden Line Projection on page 3385.

3D elevation in 3D view

Elevation Subdivisions

A 2D or 3D elevation object can have a number of subdivisions partitioning the elevation object. This feature is useful when you want to create a perspective view of the object, in which the parts that are closer to the viewer are drawn with darker and stronger lines, and parts that are farther off are drawn lighter.

3D elevation with subdivisions in perspective view

Live Section View

A live section view is a special view of a 3D section where the objects that are sectioned are not converted to a 3D section object, but remain in the drawing as objects. The parts of the objects within the bounding box of the section line keep their individual display components while the parts of the objects outside of the section line can be displayed or hidden. To control the
appearance of the object parts outside of the section line, you need to assign a material to the sectioned objects.

When you render a live section, you can show the outside part as a half-transparent addition, for example.

You can use the live section view in an elevation in order to clip out just the region you need momentarily and to focus on that specific area. This can accelerate performance and make working with the building model easier.

For information on creating live section views, see Creating a Live Section View on page 3276.

Rendered live section view with transparent body component

Materials in Elevations

In AutoCAD Architecture, you can assign materials to different components of an object. These materials are displayed when you create a 2D or 3D elevation object. You can specify whether to use the display properties of the materials or the display properties of the elevation object.
AutoCAD Architecture provides a large number of predefined materials for all common design purposes. You can use these predefined materials or modify them to your special designs. You can also create your own materials. For more information, see About 2D and 3D Elevation Display Components and Materials on page 3374.

**Subdivisions in 2D Elevation Styles and Materials**

When you are creating subdivisions in your style, you usually want the objects in them to be visually distinct from other subdivisions. When you have assigned materials to the objects, you can set the 2D elevation style so that it uses the hatch pattern from the material, but uses the color and linetype from the subdivision display properties.
Elevation subdivisions with assigned surface hatching

For more information see Use Subdivision Properties and Materials in 2D Elevation Styles on page 3378.

Material Boundaries in 2D Elevations

Material boundaries allow you to erase or limit portions of a 2D elevation:

- Limit the amount of hatching to produce cleaner construction documents.
- Highlight a region in an elevation.
- Mask out a portion of an elevation so that more detail can be drawn.
Crop an irregular-shaped portion of an elevation.

For more information, see Creating a Material Boundary in a 2D Elevation on page 3356.

Workflow to Create a 2D or 3D Elevation

1. Draw an elevation line and mark
   - The elevation line on page 3331 defines the extents of the elevation (its width, height, and length) to extract from the building model.

2. Create a 2D or 3D elevation
   - Select the elevation line and the objects to be include, and generate on page 3342 an elevation.
Drawing and Editing Elevation Lines

The first step in creating elevations is to draw an elevation line relative to your building model. The elevation line defines the extents of the elevation view of the building model.

**NOTE** You can create vertical elevations and horizontal elevations.

Creating an Elevation Object from an Elevation Line

When you generate an elevation from an elevation line, you specify the type of elevation object that is created.

<table>
<thead>
<tr>
<th>When you create...</th>
<th>The result is...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D elevation object</td>
<td>an orthographic projection from the building model.</td>
</tr>
<tr>
<td>a 3D elevation object</td>
<td>the area of the building model defined in the elevation line.</td>
</tr>
</tbody>
</table>

Viewing the Elevation Line

In plan view, the elevation line is displayed as you would expect on a construction document.
Creating an Elevation

In an isometric view, the same elevation line is displayed with a boundary that defines the depth of elevation view.
Drawing an elevation line in 3D view

Resulting elevation line in 3D view

Changing the Elevation Line

You can change the elevation line to control the elevation that you create. Using the elevation line's grips, you can change the height and shape of the elevation. You can also add a lower extension to the elevation and create elevation subdivisions.
You can change elevation line properties before you create an elevation. You can also change elevation line properties and update an elevation that you have already created. For more information about updating existing elevations, see Updating a 2D or 3D Elevation on page 3364.

**Using Subdivisions in Elevations**

You can set up graphic subdivisions in elevation line properties. These subdivisions are then added to the 2D or 3D elevation you create. Subdivisions are specified at distances from the elevation line. You can control the lineweight and other display properties of subdivisions to add levels of depth to elevations. For example, you can display one subdivision with a heavy lineweight and another subdivision with a lighter lineweight to suggest that the first subdivision is in front of the second subdivision.

**Drawing an Elevation Line and Mark**

Use this procedure to draw an elevation line with an elevation mark at each end. You draw an elevation line by specifying a start point and an endpoint for the line in relation to your building model.

**NOTE** If you are working with a drawing set in which several xrefs are linked to a main drawing, draw your elevation line in the main drawing.

**TIP** You can also create elevations with Callout tools. For more information, see Placing Elevation Callouts on page 3717.

1. Click Home tab ➤ Section & Elevation panel ➤ Elevation Line ➤.

2. Specify the elevation line start point.

   **NOTE** Specify the start point and endpoint for the elevation line so that it extends past the face or segment of your building model view, thus ensuring that all objects are included in the elevation view.

3. Specify the elevation line endpoint.

   The elevation line is displayed in your drawing with an elevation mark. The elevation line boundary is drawn using the elevation line as its left side and forming a box with the elevation line. This is the area that defines the elevation.
Drawing an elevation line in 3D view

Depending on the direction in which you drew the elevation line, the elevation mark points in the direction of the elevation view.

The elevation mark is a multi-view block, anchored to the elevation line. You can edit the elevation mark to change the information that is displayed in
the bubble. For more information, see Changing Elevation Mark Attributes on page 3339.

Once you have an elevation line in your drawing, you can change the properties of the line to change the elevation.

### Changing the Height of an Elevation Using Grips

Use this procedure to change the height of any elevation connected to the elevation line. You can change the height of the elevation line before or after you create a connected elevation. If you change the height after creating the elevation, you need to update the elevation to show the changes.

You can also change the height of an elevation using the Properties palette.

1. On the floating View panel, click View drop-down ➤ SW isometric.
2. Select the elevation line you want to change.
3. Select the Model Extents grip to turn off model extents mode.
   If you use model extents for height, the height of the elevation is determined by the height of the objects in the elevation and is not available to modify dynamically.
4. Select the Height grip.
5. Move the grip until the height value you want is displayed, and then click once, or enter a value.
The objects are cut at this height when you create or update an elevation.

6 Right-click, and click Deselect All to turn off grips.

To update an elevation created from this elevation line, see Updating a 2D or 3D Elevation on page 3364.

Changing the Lower Extension of an Elevation Using Grips

Use this procedure to change the lower extension of any elevation connected to the elevation line. You can change the lower extension of the elevation line before or after you create a connected elevation. If you change the lower extension after creating the elevation, you need to update the elevation to show the changes.

You can also change the lower extension of an elevation using the Properties palette.

1 On the floating View panel, click View drop-down ➤ SW isometric.

2 Select the elevation line you want to change.

3 Select the Model Extents grip to turn off model extents for height mode.

   If you use model extents, the default for the lower elevation is 1 foot below the XY plane.

4 Select the Lower Extension grip.
5 Move the grip until the lower extension value you want is displayed, and click once; or enter a value.

6 Right-click, and click Deselect All to turn off grips.

To update an elevation created from this elevation line, see Updating a 2D or 3D Elevation on page 3364.

Changing the Length of an Elevation Using Grips

Use this procedure to change the length of any elevation boundary connected to the elevation line. You can change the length of the elevation as a whole, or you can change the length of the sides of the elevation boundary individually.

You can change the length of the elevation boundary before or after you create a connected elevation. If you change the length after creating the elevation, you need to update the elevation to show the changes.

You can also define the depth of an elevation (its length) by changing the length of the sides of an elevation boundary on the Properties palette.

1 Select the elevation line you want to change.
2 Select the Length grip.
3. Move the grip until the length value you want is displayed, and click once.
   The entire elevation boundary length is updated.

4. To change the length of side 1 of the elevation boundary, click the Side 1 Endpoint grip.
   Side 1 starts from the first point specified for the elevation line.

5. Move the grip to the desired location, and click once; or enter a value on the command line, and press ENTER.

6. To change the length of side 2 of the elevation boundary, click the Side 2 Endpoint grip.
   Side 2 starts from the endpoint of the elevation line.

7. Move the grip to the desired location, and click once; or enter a value on the command line, and press ENTER.

8. Right-click, and click Deselect All to turn off grips.

To update an elevation created from this elevation line, see Updating a 2D or 3D Elevation on page 3364.

**Changing the Angle Dimensions of an Elevation**

Use this procedure to change the angle of the sides of the building elevation boundary. You can change the angle dimensions before or after you create a connected elevation. If you change the angles after creating the elevation, you need to update the elevation to show the changes.

1. Double-click the elevation line you want to change.
2 On the Properties palette, expand Basic, and expand Component Dimensions.
3 Specify values for Angle 1 and Angle 2.
   These values define the angles of the two sides from the elevation line to create the elevation box. The apex of Angle 1 is the start point of the elevation line. The apex of Angle 2 is the endpoint of the elevation line. Values for these angles must be between 0 and 90 degrees.

Specifying section angle parameters

4 Right-click, and click Deselect All to turn off grips.

To update an elevation created from this elevation line, see Updating a 2D or 3D Elevation on page 3364.

Creating Graphic Subdivisions for 2D and 3D Elevations

Use this procedure to define subdivisions that are created within the elevation when you generate it. Each subdivision is specified as a distance from elevation line.

You can view the location of a subdivision by viewing the elevation line with its boundary in an isometric view. In this view, you can use grips to relocate a subdivision.
You can control the lineweight and other display properties of the subdivisions to add different levels of depth to elevation.

1 Double-click the elevation line you want to change.
2 On the Properties palette, expand Basic, and expand Dimensions.
3 Click the setting for Subdivisions, and then add or modify subdivisions:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a subdivision</td>
<td>click . To change the default distance from the elevation line, select the subdivision, click the value, and enter a new value.</td>
</tr>
<tr>
<td>change the length of a subdivision</td>
<td>select the subdivision, click its value, and enter a new value.</td>
</tr>
<tr>
<td>delete a subdivision</td>
<td>select the subdivision, and click .</td>
</tr>
</tbody>
</table>

4 Click OK.
Changing Elevation Mark Attributes

Use this procedure to change the information displayed in the elevation mark. The elevation mark is a multi-view block.

1. Double-click the elevation mark you want to change.
2. On the Properties palette, expand Advanced.
3. Click Attributes.
4. Select the existing attribute under Value, and enter the new information to include in the bubble.
5. Click OK.

Changing the Location of an Elevation Line

Use this procedure to relocate an elevation line by changing the coordinate values of its insertion point. The elevation line also has an orientation with respect to the WCS or the current UCS. For example, if the top and bottom of the elevation line are parallel to the XY plane, its normal is parallel to the Z axis. You can change the orientation of the elevation line by aligning its normal with another axis. You can also rotate the elevation line on its plane by changing the rotation angle.

For information about the world coordinate system (WCS) and the user coordinate system (UCS), see “Use World and User Coordinate Systems in 3D” in AutoCAD Help.

**TIP** The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

1. Double-click the elevation line you want to relocate.
2. On the Properties palette, expand Basic, and expand Location.
3. Click Additional Information.
4. Specify the location of the elevation line:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>relocate the elevation line</td>
<td>enter new coordinate values under Insertion Point.</td>
</tr>
</tbody>
</table>

| Changing Elevation Mark Attributes | 3339 |
If you want to… | Then…
---|---
locate the elevation line on the $XY$ plane  | make the normal of the elevation line parallel to the $Z$ axis: under Normal, enter 1 for $Z$, and enter 0 for $X$ and $Y$.
locate the elevation line on the $YZ$ plane  | make the normal of the elevation line parallel to the $X$ axis: under Normal, enter 1 for $X$, and enter 0 for $Y$ and $Z$.
locate the elevation line on the $XZ$ plane  | make the normal of the elevation line parallel to the $Y$ axis: under Normal, enter 1 for $Y$, and enter 0 for $X$ and $Z$.
change the rotation of the elevation line  | enter a new value for Rotation Angle.

5 Click OK.

To update an existing elevation created from this elevation line, see Updating a 2D or 3D Elevation on page 3364.

### Modifying an Elevation Line Using Grips

Use this procedure to change the start point, end point, or edge of an elevation line. You can drag the grip to the desired location, or you can enter a specific value for the measurement.

1 Select the elevation line you want to change.
2 Select an elevation line grip and move it to the desired location.
   You can also move the grip in the desired direction and enter a specific value on the command line.
3 Right-click, and click Deselect All to turn off grips.

**Attaching Hyperlinks, Notes and Files to an Elevation Line**

Use this procedure to add hyperlinks, enter notes and attach reference files to an elevation line. You can also edit notes and edit or detach reference files from an elevation line.

1 Double-click the elevation line you want to attach notes or files to.
2 On the Properties palette, click the Extended Data tab.
3 To add a hyperlink, click the setting for Hyperlink, and specify the link.
   For more information, see “Add Hyperlinks to a Drawing” in AutoCAD Help.
4 To add a note, click next to Notes, enter text, and click OK.
5 Click next to Reference documents, and then attach, detach, or edit a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click , select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
</tbody>
</table>
Creating a 2D or 3D Elevation

Use this procedure to create a 2D or 3D elevation. After you draw an elevation line, you extract an elevation from the elevation line and the objects you select in the building model.

When you create a 2D elevation, the object that is created is a 2D Section/Elevation object. Both 2D sections and elevations share the same object type and style.

**TIP** Before you create an elevation, thaw and turn on all layers of objects in the building model that you want to include in the elevation. Objects on layers that are off or frozen cannot be part of the selection set for the elevation. To speed performance, turn off the layers of the objects that you do not need to include in the elevation.

1. Draw an elevation line in the drawing.
   For more information, see [Drawing an Elevation Line and Mark](#) on page 3331.

2. Select the elevation line.

3. Click Building Elevation Line tab ➤ Modify panel ➤ Generate Elevation 🔄.

4. Select the type of elevation object you want to create:

<table>
<thead>
<tr>
<th>If you want to create...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D elevation</td>
<td>select 2D Section/Elevation Object with Hidden Line Removal.</td>
</tr>
<tr>
<td>a 3D elevation</td>
<td>select 3D Section/Elevation Object.</td>
</tr>
</tbody>
</table>
5 For Style to Generate, select a style for a 2D elevation. If you want to use a particular style, select it from Style to Generate. Otherwise, use the Standard style. For more information, see 2D Elevation Styles on page 3369. 3D elevations do not use styles.

6 Under Selection Set, click \(\text{Select Objects}\), select the objects that you want to include in the elevation, and press \(\text{ENTER}\).

**NOTE** If you select an object that you do not want to include in the elevation, press and hold \(\text{SHIFT}\) and select the object again to remove it from the selection set.

7 Under Display Set, select a display set for the elevation object. The display set controls the representation of the elevation.

8 Under Placement, select New Object, and specify where to place the elevation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a location graphically</td>
<td>click (\text{Pick Point}), and specify the location for the new elevation object in the drawing.</td>
</tr>
<tr>
<td>specify the coordinates of the insertion point for the elevation</td>
<td>enter (X, Y,) and (Z) coordinates for the location of the new elevation object.</td>
</tr>
</tbody>
</table>

9 Click OK.

A 2D or 3D elevation is created from the elevation line properties and the selected objects in the building model. The elevation is linked to the building model. If you make changes to the building model after you create the elevation, you can update the elevation to reflect the changes. For more information, see Updating a 2D or 3D Elevation on page 3364.

You can edit certain characteristics of the elevation to control its placement and appearance. For more information, see Editing a 2D or 3D Elevation on page 3346.

You can also use a 2D section/elevation style to control the display of selected objects in a 2D elevation, and you can control the display of individual lines.
in a 2D elevation. For more information, see 2D Elevation Styles on page 3369 and Editing and Merging Linework in a 2D Elevation on page 3361.

Creating a Horizontal 2D Elevation

Use this procedure to create a horizontal section or elevation of a plan view. The Hidden Line control available in AutoCAD Architecture makes it possible to create horizontal sections and elevations of Plan views. With a horizontal section or elevation, you can look “down” on the model. Previously, users could achieve that effect only by manually changing the UCS. Now, a tool enables you to create a horizontal section or elevation. This feature could be useful for creating a detailed display of sill components in tapered walls.

The illustration below displays a horizontal section line for an irregularly shaped building.

Horizontal elevation line

The illustration below displays the view results. Note the sill displays of the tapered walls and the correct representation of the sloped curtain walls.
1. Click Home tab ➤ Section & Elevation panel ➤ Horizontal Section.

**NOTE** Alternatively, on the default tool palette set, click the Design tab, and then click the Horizontal Section tool. If necessary, scroll the palette to display the tool that you need.

2. Specify the first point of the elevation plane.
3. Specify the second corner of the elevation plane.
4. Specify the elevation of the plane, and press ENTER.
5. Specify the depth of the elevation, and press ENTER.
6. Proceed with creating the elevation, as described in Creating a 2D or 3D Elevation on page 3342.
Editing a 2D or 3D Elevation

After you create an elevation, you can edit the elevation line and the elevation object to refine the appearance of the elevation in any of the following ways:

- Edit the elevation line to add, remove, or modify graphic subdivisions.
- Display a different area of the building model by reversing the elevation.
- Place the elevation in a different location in the drawing.
- Add notes or reference files to the elevation.
- Select a different style for 2D elevations. An elevation style determines how the linework in a 2D elevation is displayed.
- Edit a 2D elevation object to change the display properties of selected linework or to add linework and details that are not part of the building model.

In addition, you can continue to modify the building model, updating the elevation later to incorporate the changes.

For information about switching from a view other than an elevation to a temporary elevation view to edit objects, see Editing Objects in a Temporary Elevation View on page 1137.

Using Grips to Edit Linework in a 2D Elevation

Use this procedure to edit linework in a 2D elevation. You can assign selected linework to fixed display components that determine the display of every elevation that you generate, or you can assign linework to display components that you have defined. After you assign linework to display components, you can change the display properties (visibility, color, layer, linewidth, linetype, and linetype scale) to change the display of lines.

For information about adding custom display components, see Adding a Display Component to a 2D Elevation Style on page 3373.

1 Select the elevation.
2 Select the Edit Linework grip.

The Edit In Place tab opens.

3 Click Edit In Place tab ➤ Profile panel ➤ Zoom To to zoom to the elevation.

4 Select the linework to edit.

5 Click Edit In Place tab ➤ Profile panel ➤ Modify Component .

6 Select the component you want to put the lines on. For example, if you want to make the lines invisible, select Erased Vectors for Linework Component.

You can also click (Match existing linework), and select linework in the elevation whose display component you want to match.

7 Click OK.

8 To finish the linework editing process, click Edit In Place tab ➤ Edits panel ➤ Finish to save all changes, or click Edit In Place tab ➤ Edits panel ➤ Cancel to discard them and exit the edit-in-place session.
Changing the Display of Graphic Subdivisions in a 2D Elevation

Use this procedure to change the display of subdivisions in a 2D elevation by changing its display properties.

You create subdivisions by adding them to the elevation line. You can then change their length using grips or by editing the values in the elevation line properties. For more information, see Creating Graphic Subdivisions for 2D and 3D Elevations on page 3337.

Each subdivision in a 2D elevation is assigned to a numbered subdivision display component in the display properties of the elevation or the 2D elevation style. You can control the visibility, layer, color, linetype, lineweight, and linetype scale of each subdivision by changing the display properties of each component. You can apply these changes to the selected elevation, to the current 2D section/elevation style, or to all 2D sections and elevations in the drawing that do not have a style override.

You can use the display properties of a subdivision together with the display properties of a material. For more information, see Use Subdivision Properties and Materials in 2D Elevation Styles on page 3378.

1 Select the 2D elevation in the drawing, right-click, and click Edit Object Display.
2 Click the Display Properties tab.
3 Select the property source to edit:

<table>
<thead>
<tr>
<th>If you want to edit graphic subdivisions…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>for all 2D sections and elevations in the current drawing (except those that have a 2D Section/Elevation Style override)</td>
<td>select Drawing Default.</td>
</tr>
<tr>
<td>for all 2D sections and elevations that use the current style</td>
<td>select 2D Section/Elevation Style, and click Object Override.</td>
</tr>
<tr>
<td>for the selected 2D elevation</td>
<td>Select 2D Section/Elevation, and click Object Override.</td>
</tr>
</tbody>
</table>

4 If necessary, click .
5 Click the Layer/Color/Linetype tab to list all the components that contribute to the display of the object.
6 Turn the visibility on or off, and change the layer, color, linetype, lineweight, or linetype scale as needed for each subdivision component.

7 Click the Other tab to add a custom display component to the display of the 2D elevation.

For more information about adding custom display components, see Adding a Display Component to a 2D Elevation Style on page 3373.

8 Click OK twice.

Changing the Display of Graphic Subdivisions in a 3D Elevation

Use this procedure to change the display of subdivisions in a 3D elevation by changing its display properties.

You create the subdivisions by adding them to the elevation line. You can then change their length using grips or by editing the values in the elevation line properties. For more information, see Creating Graphic Subdivisions for 2D and 3D Elevations on page 3337.

Each subdivision in a 3D elevation is assigned to a numbered subdivision display component in the display properties of the elevation. You can control the visibility, layer, color, linetype, lineweight, and linetype scale of each subdivision by changing the display properties of each component. You can apply these changes to the selected 3D elevation or to all 3D elevations in the drawing.

1 Select the 3D elevation in the drawing, right-click, and click Edit Object Display.

2 Click the Display Properties tab.

3 Select the Subdivisions display representation.

4 Select the property source to edit:

<table>
<thead>
<tr>
<th>If you want to edit graphic subdivisions...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>for all 3D elevations in the current drawing</td>
<td>select Drawing Default.</td>
</tr>
<tr>
<td>for the selected 3D elevation</td>
<td>select Bldg Section, and click Object Override.</td>
</tr>
</tbody>
</table>
5 If necessary, click 

6 Click the Layer/Color/Linetype tab to list all the components that contribute to the display of the object.

   The defining line represents the cutting plane of the elevation line. The numbered subdivision components correspond to subdivisions added to the elevation line. For example, the display component Subdivision 1 corresponds to the subdivision closest to, but not on, the cutting plane of the elevation line.

7 Turn the visibility on or off, and change the layer, color, linetype, lineweight, or lineweight scale as needed for each subdivision component.

8 Click OK twice.

**Reversing a 2D or 3D Elevation**

Use this procedure to reverse the direction of an elevation by reversing the elevation line and updating the elevation.

The direction of the elevation is determined by the direction in which you drew the elevation line. You can select the elevation line in plan view to see the bounding box that defines the area of the model included in the elevation. If the box does not include the area of the model that you intended, you can reverse the elevation line. If you have already created an elevation from the elevation line, update the elevation after reversing the elevation line.

1 Select the elevation line that you used to create the elevation.

2 Click Building Elevation Line tab ➤ Modify panel ➤ Reverse 

   The elevation line is mirrored about its own axis, as is the bounding box with its original parameters.

3 Select the existing elevation.

4 Click 2D or 3D Section/Elevation tab ➤ Modify panel ➤ Regenerate 

**NOTE** For a 2D elevation, if you do not need to respecify the objects to include in the elevation, you can click 2D Section/Elevation tab ➤ Modify panel ➤ Refresh instead of Regenerate. This immediately updates the elevation.
If you need to include different objects in the updated elevation, click (Reselect Objects), select the objects, and press ENTER.

6 Click OK.

**Changing the Style of a 2D Elevation**

Use this procedure to select a different style for a 2D elevation. A 2D section/elevation style controls the appearance of any 2D elevation object to which the style is applied.

1. Double-click the elevation you want to change.
2. On the Properties palette, expand Basic, and expand General.
3. Select a new style for the elevation.

**Adding and Removing Custom Components for an Elevation**

Use this procedure to add or remove custom display components for an elevation.

1. Double-click the elevation.
2. On the Properties palette, click the Display tab.
3. Under the General category, for Display component, verify that *NONE* is selected.
4. For Display controlled by, select This object.

**NOTE** To apply your changes to all elevations in the drawing, select Drawing default setting. To apply changes to all elevations of this style, select Elevation Style:<style name>. For more information on styles, see 2D Elevation Styles on page 3369.

5 If necessary, expand Object Display Properties ➤ Advanced.
6 Click Additional Properties.

7 Add or remove components or edit component names:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add a new component</td>
<td>click Add, double-click the Unnamed entry, and enter a name for the new component.</td>
</tr>
<tr>
<td>remove an existing component</td>
<td>select the component, and click Remove.</td>
</tr>
<tr>
<td>edit the name of an existing com-</td>
<td>double-click the component name, and edit it as needed.</td>
</tr>
<tr>
<td>ponent</td>
<td></td>
</tr>
</tbody>
</table>

8 When you are finished working with the Custom Display Components list, click OK. To specify display properties for a component you have added, click the value (*NONE*) for Display component, select the component, and then adjust the default settings under Component Display Properties as needed.

You can also access and modify these same additional settings through the elevation's context menu, as follows:

1 Select the elevation, right-click, and click Edit Object Display.
2 In the Object Display dialog, click the Display Properties tab.
3 Select the display representation where you want the changes to appear, and select Object Override.
   The display representation in bold is the current display representation.
If necessary, click 🔄.

In the Display Properties dialog, click the Other tab, and then change the settings as needed.

To specify display properties for any component you add, click the Layer/Color/Linetype tab, select the component, and change the column values as needed.

Click OK twice.

### Specifying the Display of Surface Hatching for an Elevation Subdivision

Use this procedure to specify whether the surface hatching for an elevation subdivision is determined by the display properties of the subdivision component or those of the Surface Hatch Linework component.

1. Double-click the elevation.
2. On the Properties palette, click the Display tab.
3. Under the General category, for Display component, verify that *NONE* is selected.
4. For Display controlled by, select This object.

**NOTE** To apply your changes to all elevations in the drawing, select Drawing default setting. To apply changes to all elevations of this style, select Elevation Style:<style name>. For more information on styles, see 2D Elevation Styles on page 3369.

5. If necessary, expand Object Display Properties ➤ Advanced.
6 Click Additional properties.

7 Specify which properties to use for surface hatching:

<table>
<thead>
<tr>
<th>If you want to use the display properties of…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>the subdivision component</td>
<td>select Use Subdivision properties for surface hatching.</td>
</tr>
<tr>
<td>the Surface Hatching Linework component</td>
<td>clear Use Subdivision properties for surface hatching.</td>
</tr>
</tbody>
</table>

8 Click OK.

9 If you cleared the Use Subdivision properties for surface hatching option, the display is now controlled by the By material property of the Surface Hatching Linework component. To change this setting, click the value (*NONE*) for Display component, select the Surface Hatching Linework component, and then select a different value for By material.

You can also access the Use Subdivision properties for surface hatching option through the elevation’s context menu, as follows:

1 Select the elevation, right-click, and click Edit Object Display.
2 In the Object Display dialog, click the Display Properties tab.
3 For the General display representation, select Object Override.
4 If necessary, click .
5 In the Display Properties dialog, click the Other tab, and then select or deselect this option as desired.
6 Click OK twice.

Specifying the Display of 2D Linework for an Elevation

Use this procedure to specify whether to use the 3D Body display component of a material for the linework in a 2D elevation.

1 Double-click the elevation.
2 On the Properties palette, click the Display tab.
3 Under the General category, for Display component, verify that *NONE* is selected.
4 For Display controlled by, select This object.

NOTE To apply your changes to all elevations in the drawing, select Drawing default setting. To apply changes to all elevations of this style, select Elevation Style:<style name>. For more information on styles, see 2D Elevation Styles on page 3369.

5 If necessary, expand Object Display Properties ➤ Advanced.
6 Click Additional properties.

7 Select or deselect Use 3D Body display component for By Material linework.
8 Click OK.

You can also access this option through the elevation’s context menu, as follows:

1 Select the elevation, right-click, and click Edit Object Display.

Specifying the Display of 2D Linework for an Elevation | 3355
2 In the Object Display dialog, click the Display Properties tab.
3 For the General display representation, select Object Override.

4 If necessary, click .
5 In the Display Properties dialog, click the Other tab, and then select or deselect this option as desired.
6 Click OK twice.

Creating a Material Boundary in a 2D Elevation

Use this procedure to create a material boundary in a 2D elevation.

1. Draw a polyline around the area in the elevation that you want to mask or to highlight.
2. Select the elevation.
3. Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Add .
4. Select the polyline.
5. Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.
6. Specify the settings of the material boundary:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>highlight the area inside the polyline</td>
<td>select Limit for Purpose.</td>
</tr>
<tr>
<td>mask (erase) the area inside the polyline</td>
<td>select Erase for Purpose.</td>
</tr>
<tr>
<td>apply the highlight or mask only to specific parts of the elevation</td>
<td>select the appropriate parts for Apply to. You can choose Surface Hatch, Edge Linework, and All Linework.</td>
</tr>
<tr>
<td>apply the material boundary to all materials used in the elevation</td>
<td>select All Materials for Material Selection.</td>
</tr>
<tr>
<td>apply the material boundary only to selected materials</td>
<td>select Specific Materials for Material Selection and then select the appropriate materials in the list below.</td>
</tr>
</tbody>
</table>
Editing a Material Boundary

You can edit existing material boundaries in two ways:

- Change the content within the material boundary. For example, you can determine if you want to see only brick hatching, or both brick and glass hatching.
- Change the shape of the material boundary. For example, you can make the boundary bigger or smaller, or add additional rings and vertex points to it.

Editing the Content of a Material Boundary

Use this procedure to change the content of a material boundary. The content includes such settings as materials displayed, hatch types, and boundary type.

1. Select a 2D elevation.
2. Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.
   The material boundary is highlighted and edit-in-place grips are displayed.
3. Click Edit In Place tab ➤ Profile panel ➤ Edit Material Boundary.
4. Specify the content of the material boundary:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>highlight the area inside the boundary</td>
<td>select Limit for Purpose.</td>
</tr>
<tr>
<td>mask (erase) the area inside the boundary</td>
<td>select Erase for Purpose.</td>
</tr>
<tr>
<td>apply the highlight or mask only to specific parts of the elevation</td>
<td>select the appropriate parts for Apply to. You can choose Surface Hatch, Edge Linework, and All Linework.</td>
</tr>
</tbody>
</table>
If you want to… Then…

| apply the material boundary to all materials used in the elevation | select All Materials for Material Selection. |
| apply the material boundary only to selected materials | select Specific Materials for Material Selection, and then select the appropriate materials from the list below. |

5 Click OK.

6 Click Edit In Place tab ➤ Edits panel ➤ Finish ✅ to save the changes you made, or click Edit In Place tab ➤ Edits panel ➤ Cancel ✗ to undo them.

**Adding a Vertex to a Material Boundary**

Use this procedure to add a vertex to a material boundary.

1 Select the elevation to which the material boundary has been assigned.

2 Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place. The material boundary is highlighted and edit-in-place grips are displayed.

3 Right-click, and click Add Vertex.

4 Specify the point at which to add a vertex.  
5 Specify additional vertex points.  
6 Press ENTER.

7 Select the material boundary again, right-click, and click Save Changes to save the changes you made, or click Discard All Changes to undo the changes to the material boundary.

**Removing a Vertex from a Material Boundary**

Use this procedure to remove a vertex from a material boundary.

1 Select the elevation to which the material boundary has been assigned.
2 Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place ☐. The material boundary is highlighted and edit-in-place grips are displayed.

3 Right-click, and click Remove Vertex.

4 Specify the vertex points to remove.

5 Remove additional vertex points as needed.

6 Press ENTER.

7 Select the material boundary again, right-click, and click Save Changes to save the changes you made, or click Discard All Changes to undo the changes to the material boundary.

### Adding a Ring to a Material Boundary

Use this procedure to add a ring to a material boundary.

A material boundary can consist of more than one closed polyline. For example, you could use one polyline to highlight a wall detail, and another polyline to highlight a window detail in another location.

1 Draw a polyline for the new material boundary ring.

2 Select a 2D elevation.

3 Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place ☐. The material boundary is highlighted and edit-in-place grips are displayed.

4 Click Edit In Place tab ➤ Profile panel ➤ Edit Material Boundary ☐.

5 Click Edit In Place tab ➤ Profile panel ➤ Add Ring ☐.

6 Select the polyline you drew in step 1.

7 Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.

8 Click Edit In Place tab ➤ Edits panel ➤ Finish ✅ to save the changes you made, or click Edit In Place tab ➤ Edits panel ➤ Cancel ✗ to undo the changes to the material boundary.
Removing a Ring from a Material Boundary

Use this procedure to remove a ring from a material boundary.

A material boundary can consist of more than one closed ring. You can individually remove each ring.

**NOTE** You cannot remove the last ring from a material boundary.

1. Select a 2D elevation.
2. Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.
   The material boundary is highlighted and edit-in-place grips are displayed.
3. Click Edit In Place tab ➤ Profile panel ➤ Edit Material Boundary.
4. Click Edit In Place tab ➤ Profile panel ➤ Remove Ring.
5. Select the ring you want to remove.
6. Click Edit In Place tab ➤ Edits panel ➤ Finish to save the changes you made, or click Edit In Place tab ➤ Edits panel ➤ Cancel to undo the changes to the material boundary.

Replacing a Ring from a Material Boundary with Another

Use this procedure to replace a ring from a material boundary with a different ring.

1. Draw the polyline to replace one of the existing material boundary rings.
2. Select a 2D elevation.
3. Click 2D Section/Elevation tab ➤ Material Boundary panel ➤ Edit In Place.
   The material boundary is highlighted and edit-in-place grips are displayed.
4. Click Edit In Place tab ➤ Profile panel ➤ Edit Material Boundary.
5 Click Edit In Place tab ➤ Profile panel ➤ Replace Ring 
6 Select the ring to be replaced with another ring.
7 Select the closed polyline you drew in step 1.
8 Enter y (Yes) to erase the polyline, or n (No) to keep the polyline in the drawing.
9 Click Edit In Place tab ➤ Edits panel ➤ Finish ✓ to save the changes you made, or click Edit In Place tab ➤ Edits panel ➤ Cancel ✗ to undo the changes to the material boundary.

Editing and Merging Linework in a 2D Elevation

After you create a 2D elevation, you can edit the display of individual lines that make up the elevation. For example, you may want to assign linework for small details to a display component with a lighter lineweight, so that the details are not obscured when plotted.

You can also merge existing geometry into the elevation.

Editing Linework in a 2D Elevation

Use this procedure to edit linework in a 2D elevation. You can also edit individual lines in a 2D elevation by assigning them to display components in the elevation. For information about the Edit Linework grip, see Using Grips to Edit Linework in a 2D Elevation on page 3346.

You can assign selected linework to fixed display components that determine the display of every elevation that you generate, or you can assign linework to display components that you have defined. For information about adding custom display components, see Adding a Display Component to a 2D Elevation Style on page 3373. After you assign linework to display components, you can change the display properties (visibility, color, layer, lineweight, linetype, and linetype scale) to change the display of lines.

1 Select the elevation to be changed.
2 Click 2D Section/Elevation tab ➤ Linework panel ➤ Edit 
3 Select the lines that you want to assign to a display component
4 Click Edit In Place ➤ Linework tab ➤ Profile panel ➤ Modify Component 

A list of available display components is displayed.

5 Select the component you want to put the lines on.
   For example, if you want to make the lines invisible, select Erased Vectors for Linework Component.

   You can also click (Match existing linework), and select linework in the elevation whose display component you want to match.

6 Click OK.

7 To finish the linework editing process, click Edit In Place tab ➤ Edits panel ➤ Finish to save the changes you made, or click Edit In Place tab ➤ Edits panel ➤ Cancel to undo your linework changes.

---

**Merging Linework into a 2D Elevation**

Use this procedure to merge geometry into a 2D elevation. When you merge linework into an elevation, you assign additional linework to a display component of an elevation. Use this feature when you want to add detail, or add linework that you did not model.

1 Draw the geometry that you want to merge into a 2D elevation.
2 Select the 2D elevation to be changed.

3 Click 2D Section/Elevation tab ➤ Linework panel ➤ Merge.
4 Select the geometry to merge into the elevation, and press ENTER.
5 Select the display component to which you want to assign the linework.

   You can also click (Match existing linework) and select linework in the elevation whose display component you want to match.

6 Click OK.

The linework is merged into the 2D elevation. When you select the elevation, the linework is selected with it.
Changing the Location of a 2D or 3D Elevation

You can relocate an elevation by changing the coordinate values of its insertion point. The elevation also has an orientation with respect to the WCS or the current UCS. For example, if the top and bottom of the elevation are parallel to the XY plane, its normal is parallel to the Z axis. You can change the orientation of the elevation by aligning its normal with another axis. You can also rotate the elevation on its plane by changing the rotation angle.

For information about the world coordinate system (WCS) and the user coordinate system (UCS), see “Use World and User Coordinate Systems in 3D” in AutoCAD Help.

1 Double-click the elevation you want to move.
2 On the Properties palette, expand Basic, and expand Location.
3 Click Additional Information.
4 Specify a new location or rotation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>relocate the elevation</td>
<td>enter new coordinate values under Insertion Point.</td>
</tr>
<tr>
<td>locate the elevation on the XY plane</td>
<td>make the normal of the elevation parallel to the Z axis: under Normal, enter 1 for Z, and enter 0 for X and Y.</td>
</tr>
<tr>
<td>locate the elevation on the YZ plane</td>
<td>make the normal of the elevation parallel to the X axis: under Normal, enter 1 for X, and enter 0 for Y and Z.</td>
</tr>
<tr>
<td>locate the elevation on the XZ plane</td>
<td>make the normal of the elevation parallel to the Y axis: under Normal, enter 1 for Y, and enter 0 for X and Z.</td>
</tr>
<tr>
<td>change the rotation of the elevation</td>
<td>enter a new value for Rotation Angle.</td>
</tr>
</tbody>
</table>

5 Click OK.
Attaching Hyperlinks, Notes, and Files to a 2D or 3D Elevation

Use this procedure to add hyperlinks, enter notes, and attach reference files to a 2D or 3D elevation. You can also edit notes and edit or detach reference files from a 2D or 3D elevation.

1 Double-click the 2D or 3D elevation you want to attach notes or files to.
2 On the Properties palette, click the Extended Data tab.
3 To add a hyperlink, click the setting for Hyperlink, and specify the link.
   For more information, see “Add Hyperlinks to a Drawing” in AutoCAD Help.
4 To add a note, click next to Notes, enter text, and click OK.
5 Click next to Reference documents, and then attach, detach, or edit a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click <img src="https://example.com/image" alt="image" />, select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of</td>
<td>enter text under Description.</td>
</tr>
<tr>
<td>a reference file</td>
<td></td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click <img src="https://example.com/image" alt="image" />.</td>
</tr>
</tbody>
</table>

6 Click OK.

Updating a 2D or 3D Elevation

Use this procedure to regenerate a 2D or 3D elevation to reflect changes you have made to the building model or to elevation line properties. For 2D elevations, you also update the elevation to show changes made to the 2D elevation style. You can update a 2D or 3D elevation if you have not exploded
the elevation, which destroys the link between the elevation and the building model.

When you update an elevation, you can add or remove objects from the elevation, change the location of the elevation in the drawing, and change the display set of the elevation.

If you do not need to change the elevation definition in any way, you can skip the following procedure. Instead, click 2D Section/Elevation tab ➤ Modify panel ➤ Refresh .

1 Select the elevation you want to update.

2 Click 2D or 3D Section/Elevation tab ➤ Modify panel ➤ Regenerate .

3 Select a result type:

<table>
<thead>
<tr>
<th>If the elevation is…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>a 2D elevation object</td>
<td>select 2D Section/Elevation Object with Hidden Line Removal.</td>
</tr>
<tr>
<td>a 3D elevation object</td>
<td>select 3D Section/Elevation Object.</td>
</tr>
</tbody>
</table>

4 To change the style of a 2D elevation, select a new style for Style to Generate.

5 If you edited linework in the 2D elevation, select a style in which to save the changes you made that cannot be reapplied. Select a style that distinguishes the unapplied changes in the elevation.

6 Under Selection Set, specify the objects that you want to include in the elevation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the objects in the selection set you specified when you created the elevation or when you previously updated it</td>
<td>proceed to the next step.</td>
</tr>
<tr>
<td>add new objects to the selection set that you specified when you created the original elevation</td>
<td>click Select Additional Objects, select the new objects in the drawing, and press ENTER.</td>
</tr>
</tbody>
</table>

Updating a 2D or 3D Elevation | 3365
If you want to... | Then...
--- | ---
select a new selection set of objects for the elevation | click Reselect Objects, select a new selection set of objects for the elevation, and press ENTER.

**NOTE** If you select an object that you do not want to include in the elevation, press and hold *SHIFT* and select the object again to remove it from the selection set.

7 Under Display Set, select a display set for the elevation.
8 Under Placement, locate the elevation in the drawing:

| If you want to... | Then... |
--- | ---
create a new elevation object without overwriting the original object | select New Object, and either click to specify an insertion point in the drawing area, or enter X, Y, and Z coordinates for the new elevation.

replace the original elevation with the updated elevation | select Replace Existing.

9 Click OK.

**Globally Updating 2D Elevations**

AutoCAD Architecture makes it possible for you to globally update all sections and elevations within a project or a specified folder.

**Updating Sections and Elevations in a Project**

AutoCAD Architecture includes the Drawing Management feature that allows users to combine their floor plans, section and elevation views, construction sheets, and reusable components in one building project. A project consists of a number of drawings linked together with a powerful external referencing mechanism. AutoCAD Architecture enables you to open a project and update all 2D sections and elevations included in that project in one comfortable workflow. For information on which project file types can be updated, see Supported Project Drawing Types on page 3367.
Updating Sections and Elevations in a Specific Folder

When you are working without a project, you can also globally update sections and elevations by specifying a folder and updating all sections and elevations in that folder. When you select a specific folder for updating, you can also include its subfolders in the update.

Section of a building project

For more information about building projects, see Drawing Management on page 303.

Supported Project Drawing Types

When you are updating a project, you can globally update all 2D sections and elevations within the views and sheets of the project. You cannot globally update elements and constructs, because these project drawings usually contain reusable elements and individual parts of the building project. They normally do not contain sections or elevations.

For more information about project drawing types, see Views on page 446 and Sheets on page 481.

**NOTE** When you globally update the sections and elevations in a project drawing, all model and paper space layouts are updated.

When you are updating a specified folder within a project, or a folder outside of a project, all sections and elevations in that folder are updated regardless of their type. For example, if you choose to update a specific folder within the Constructs category of a project, the sections and elevations in that folder will be updated, even though they are Construct drawings. If you do not specify
a folder, but choose to update the whole project, these construct drawings are not updated.

Globally Updating 2D Sections and Elevations in a Project or a Folder

Use this procedure to globally update all 2D sections and elevations in a project or a specified folder.

**NOTE** To update all 2D sections and elevations in a project, the project must be defined as current. If no project is current, you receive an error message if you try to globally update 2D sections and elevations. For information on setting a project current, see Setting a Project Current on page 327.

1. Click Home tab ➤ Section & Elevation panel ➤ Batch Refresh.
2. Select if you want to update the 2D sections and elevations in the current project, or only the 2D sections and elevations in a specific folder.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>update the 2D sections and elevations in the current project</td>
<td>select Current Project.</td>
</tr>
<tr>
<td>update the 2D sections and elevations in a specific folder</td>
<td>select Folder. Then click the Browse button, select the folder containing the files you want to update, and click OK.</td>
</tr>
</tbody>
</table>

3. If you have specified a folder, you can specify whether the subfolders of that folder should be updated as well. To update the subfolders, select Process subfolders.

**NOTE** When you are working with a large building project, updating all sections and elevations can be a time-consuming process. In this case, you might consider updating only a selected subfolder of your project and thereby improve system performance.

4. Click Start.
Globally updating all sections and elevations may take a while. A status window lets you know which drawing is currently being updated.

When you start the global update, the Stop button is available. If you want to interrupt the global update, click Stop. When the global update is finished, the Start button is available.

**Updating Legacy Drawings**

During the global update of 2D sections and elevations, each drawing in the project or specified folder is opened, updated, and saved again. If you are updating drawings from an earlier version of the software, the drawings are converted to the current version. Before you convert the drawings, a warning message notifies you of the conversion. To update the drawings to the new version, click OK. To cancel the update of all sections and elevations, press `CTRL+BREAK`.

**Update Exceptions**

There are a number of cases in which a 2D section or elevation cannot be updated with the global update.

- The drawing containing the 2D section or elevation is read-only.
- The 2D section or elevation is placed on a locked layer.
- There have been user edits to a 2D section or elevation that could not be reapplied to the 2D section or elevation.

When a 2D section or elevation cannot be updated, an error message is displayed in the status window.

To fix the problem, you can set the drawing to read/write instead of read-only, you can unlock the section layer, or you can undo a specific user edit to a 2D section or elevation.

**2D Elevation Styles**

A 2D section/elevation style is a group of properties assigned to a 2D elevation that determines the appearance and other characteristics of that object.
Using 2D Elevation Styles

A 2D section/elevation style controls the linework in an elevation, using design rules that determine how different parts of the elevation are displayed. You can apply the style to one or more elevations to control their appearance. You can also change the display of individual lines in the elevation, and save the changes in a 2D section/elevation style.

Display Components and Design Rules

Display components determine the graphical characteristics, such as color and linetype, of linework assigned to each display component. Design rules determine how the linework in an elevation is assigned to display components.

When you create a design rule, you specify the part of the 2D elevation to control based on the color of those objects in the building model and their context in the elevation. You then select the display component to use for linework that meets the criteria you specified. You can assign the linework to a default display component or to a custom display component that you have added to the style. For example, you might define a rule that assigns all objects that are color 150 in the model and located along the elevation line to a custom display component named Darker that you created in the style. Or you might hide a staircase behind a wall using a rule that assigns all blue linework to the Hidden display component.

Managing 2D Elevation Styles

To create, edit, copy, or purge styles, you access the Style Manager. The Style Manager provides a central location in AutoCAD Architecture to work with styles from multiple drawings and templates. For more information about using the Style Manager, see Style Manager Overview on page 870.

Materials and 2D Elevation Styles

Two-dimensional elevation styles offer an easy way to assign materials to 2D elevation objects. You can specify which section components should have its display controlled by materials and which do not. Custom components cannot have any material assignments.

Subdivisions in 2D Elevation Styles and Materials

When you are creating subdivisions in your style, you usually want the objects in them to be visually distinct from other subdivisions. When you have assigned materials to the objects, you can set the 2D elevation style so that it uses the hatch pattern from the material, but the color and linetype from the subdivision display properties.
Creating a 2D Elevation Style

Use this procedure to create a 2D elevation style. You can create a style using default style properties or by copying an existing style. After you create the style, you edit the style properties to customize the characteristics of the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
2 Expand Documentation Objects, and expand 2D Section/Elevation Styles.
3 Create a new 2D elevation style:

<table>
<thead>
<tr>
<th>If you want to create a style…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>using default properties</td>
<td>right-click 2D Section/Elevation Styles, and click New.</td>
</tr>
<tr>
<td>style from an existing style</td>
<td>right-click the 2D elevation style you want to copy, and click Copy. Right-click, and click Paste.</td>
</tr>
</tbody>
</table>

4 Enter a name for the new 2D elevation style, and press ENTER.
5 Edit the 2D elevation style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add display components to the style</td>
<td>see Adding a Display Component to a 2D Elevation Style on page 3373.</td>
</tr>
<tr>
<td>remove display components from the style</td>
<td>see Removing a Display Component from a 2D Elevation Style on page 3373.</td>
</tr>
<tr>
<td>use the subdivision properties of the elevation for the display</td>
<td>see Use Subdivision Properties and Materials in 2D Elevation Styles on page 3378.</td>
</tr>
<tr>
<td>use the 3D Body component of the material for the elevation linework</td>
<td>see Use the 3D Body Component of a Material for the 2D Elevation Linework on page 3379.</td>
</tr>
<tr>
<td>add design rules to the style</td>
<td>see Adding a Design Rule to a 2D Elevation Style on page 3379.</td>
</tr>
<tr>
<td>change design rules in the style</td>
<td>see Changing a Design Rule in a 2D Elevation Style on page 3381.</td>
</tr>
<tr>
<td>add classifications to a style</td>
<td>see Adding Classifications to a 2D Elevation Style on page 3382.</td>
</tr>
<tr>
<td>change the display properties of the display components in the style</td>
<td>see Changing the Layer, Color, and Linetype of a 2D Elevation Style on page 3383.</td>
</tr>
<tr>
<td>add notes, files, or documents to the style</td>
<td>see Attaching Notes and Files to a 2D Elevation Style on page 3384.</td>
</tr>
</tbody>
</table>

6 Click OK.

You can click Apply instead of OK to save the changes and continue working in the Style Manager.
Adding a Display Component to a 2D Elevation Style

Use this procedure to add a custom display component to a 2D elevation style. After you add a component, you assign linework in the elevation to the new component. To apply these style changes to existing 2D elevations, you must update the elevation.

2D elevations include the following default display components: Defining Line, Hidden, Erased, Unknown, and Subdivision.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2. Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3. Click the Components tab.
4. Click Add.
5. Enter a name and a description for the new component.
   To enter a name, click Unnamed and enter a new name. To enter a description, click in the Description column next to the name, and enter a description.
6. Click the Display Properties tab.
7. Select 2D Section/Elevation Style for the property source, and click.
8. Click the Layer/Color/Linetype tab.
9. Specify the display properties of the new component.
10. Click OK twice.

To create a design rule that uses the new display component, see Adding a Design Rule to a 2D Elevation Style on page 3379. To manually assign linework to the display component, see Editing Linework in a 2D Elevation on page 3361.

Removing a Display Component from a 2D Elevation Style

Use this procedure to remove a custom display component from a 2D elevation style. Removing a display component also removes any design rules that use the component. You cannot remove the default display components.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3 Click the Components tab.
4 Select the component that you want to remove, and click Remove.
   If the component is used in a design rule, the associated design rule is removed as well.
5 Click OK.
6 Update the elevation to apply the style changes to the elevation.
   For more information, see Updating a 2D or 3D Elevation on page 3364.

About 2D and 3D Elevation Display Components and Materials

A 2D or 3D elevation object consists of a number of display components that can be determined by materials. When you assign materials to an object, you assign one material to each display component of the object. For example, you assign a wood material to the frame of a window and a glass component to the glass of a window.

When you create a 2D or 3D elevation object from building objects, the material assignments of the source objects are applied to the elevation. You do not assign a material directly to a 2D/3D elevation. The elevation takes its material assignments from the objects. For example, if you create an elevation of a wall with a window, the surface hatches you have defined in the glass, wood, and brick materials of the wall and the window are displayed in the elevation object.
If you do not want to use the material display properties, but instead use those of the 2D or 3D elevation object or the 2D elevation style, you can deactivate the material assignments in the display properties of the elevation or the elevation style.

Material definitions consist of display components that correspond to component types of objects. For example, the Linework component of a material is used for all linework of objects in Plan view. The Surface Hatch component of a material is used to hatch all object surfaces in 3D model views and elevations.

For a complete list of material components and their description, see Material Components and Display Properties on page 898.

The following table lists elevation components plus information about the material components that determine them.
NOTE An elevation is technically the same object as a section, and has the same display components as a section. The following topics describe the display components most relevant to elevations. For a complete list of all section and elevation components, see About 2D and 3D Section Display Components and Materials on page 3306.

<table>
<thead>
<tr>
<th>2D Elevation Component</th>
<th>Material Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface Hatch Linework</td>
<td>Surface Hatch</td>
</tr>
<tr>
<td>Hidden</td>
<td>No Material</td>
</tr>
<tr>
<td>Erased</td>
<td>No Material</td>
</tr>
<tr>
<td>Subdivision 1-10</td>
<td>2D Section/Elevation Linework or 3D Body. For information on switching between these material components, see Use the 3D Body Component of a Material for the 2D Elevation Linework on page 3379.</td>
</tr>
</tbody>
</table>

**Surface Hatch Linework in Elevations**

The Surface Hatch Linework component draws all linework coming from surface hatches of the objects in the elevation. This component is specific to 2D elevations.

**NOTE** Surface hatches you have assigned to objects display in a 3D elevation object. However, you cannot set them separately in a 3D elevation; you can do that only in a 2D elevation object.

The surface hatch linework component is controlled by the surface hatch component of the material. For information about the surface hatch component of the material, see Surface Hatch Material Component on page 900.
Hidden Component

The Hidden component contains all linework that is hidden in the 2D projection because other components are in front of it. By default, this component is turned off. You can use design rules to achieve special effects, such as a see-through effect, using the Hidden component. The Hidden component is specific to 2D elevations.

The Hidden component cannot be defined by a material component. You can only set it in the display properties of the 2D elevation. For information on setting the display properties of a 2D elevation, see Changing the Layer, Color, and Linetype of a 2D Elevation Style on page 3383.

Erased Component

The Erased component contains linework in the elevation object that you do not want to see. For example, if you have an elevation of a window front with three windows, but you want to display only one (for a higher level of abstraction), edit the linework of the elevation and assign the linework of the remaining two windows to the Erased component. Because the Erased component is turned off by default, the two windows do not display. For information on linework editing of an elevation, see Creating a Hidden Line Projection on page 3385.

The hidden component is specific to 2D elevations, and cannot be defined by a material component.

Subdivision Components

The subdivision components partition an elevation object. They are useful to create perspective effects, where parts closer to the viewer are drawn with darker, stronger lines and parts farther from the user are drawn with lighter,
Subdivisions can have no individual material assignments. However, the display properties of the subdivisions can be used for the surface hatching of the subdivisions by selecting Use Subdivision Properties for Surface Hatching in the Other tab of the 2D elevation display properties. For information on using the subdivision display properties to display the elevation divisions, see Use Subdivision Properties and Materials in 2D Elevation Styles on page 3378.

Subdivisions are a display component of both 2D and 3D elevation objects. The subdivision components are either controlled by the 2D Section/Elevation Linework component of the material or by the 3D Body component of a material. For information on how to switch between these component assignments, see Use the 3D Body Component of a Material for the 2D Elevation Linework on page 3379.

Use Subdivision Properties and Materials in 2D Elevation Styles

Use this procedure to use the display properties of materials together with the display properties of elevation subdivisions.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2 Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3 Click the Display Properties tab.
4 Select 2D Section/Elevation Style for the property source, and click Style Override.
5 If necessary, click ➤.
6 Click the Layer/Color/Linetype tab.
7 To set a subdivision to use the surface hatch of the material, while using the layer, color, and linetype display properties of the subdivision, clear By Material, and specify the layer, color, and linetype settings of the subdivision.
   For example, the first subdivision could have a darker color and stronger linetype than the second subdivision.
8 Click the Other tab.
9 Select Use Subdivision Properties for Surface Hatching.
10 Click OK twice.
Use the 3D Body Component of a Material for the 2D Elevation Linework

Use this procedure to use the 3D Body component of a material for the linework in a 2D elevation.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2 Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3 Click the Display Properties tab.
4 Select 2D Section/Elevation Style for the property source, and click Style Override.
5 If necessary, click ➤ .
6 Click the Other tab.
7 Specify whether the 3D body component of the selected material should control the display of the linework in the 2D elevation:

<table>
<thead>
<tr>
<th>If you want to control the display...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>of the 2D elevation linework by the 3D Body component of the material</td>
<td>select Use 3D Body Display Component for By Material Linework.</td>
</tr>
<tr>
<td>of the 2D elevation linework by the 2D Section/Elevation Linework component of the material</td>
<td>deselect Use 3D Body Display Component for By Material Linework. This is the default behavior.</td>
</tr>
</tbody>
</table>

8 Click OK twice.

Adding a Design Rule to a 2D Elevation Style

Use this procedure to add a design rule to a 2D elevation style. A design rule has four fields of information that identify lines in the elevation and determine how to display them:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color</td>
<td>Identifies the color of the objects in the building model presented by the lines in the elevation</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Context</td>
<td>Identifies the context of the lines in the elevation, such as in a graphic subdivision</td>
</tr>
<tr>
<td>Component</td>
<td>Identifies the display component to which the lines are assigned</td>
</tr>
<tr>
<td>Description</td>
<td>Contains a description of the design rule</td>
</tr>
</tbody>
</table>

For example, a design rule has the color 50, a context of Within Subdivision 2, and a component of New. This rule assigns any lines in the elevation representing objects that have the color 50 in the building model and that are within subdivision 2 in the elevation to the user-defined display component, New.

On the Design Rules tab, you can also specify that all hidden linework that is not handled by a specific design rule will be assigned to the Hidden display component. You could use this option if you want to generate an elevation of an object or a set of objects and see all edges, for example, if you are creating foundations and form work.

**NOTE** Alternatively, you can define which hidden linework should be displayed by object material. For more information, see Controlling the Display of Hidden Lines by Material on page 929.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3. Click the Design Rules tab, and click Add.
   A new design rule is created with default color, context, and component values.
4. Specify settings for the new design rule:
<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify the color of objects in the building model that are affected by this rule</td>
<td>click the default color, select a new color, and click OK.</td>
</tr>
<tr>
<td>specify the context in which the linework for the objects appears in the elevation</td>
<td>click the default context, and select a new context.</td>
</tr>
</tbody>
</table>
Changing a Design Rule in a 2D Elevation Style

Use this procedure to change the settings in the fields that define a design rule.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3 Click the Design Rules tab.
4 Specify settings for the design rule you want to change:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify the color of objects in the building model that are affected by this rule</td>
<td>click the current color, select a new color, and click OK.</td>
</tr>
<tr>
<td>specify the context in which the linework for the objects appears in the elevation</td>
<td>click the current context, and select a new context.</td>
</tr>
<tr>
<td>select the display component for the linework</td>
<td>click the current component, and select a new component.</td>
</tr>
<tr>
<td>edit the description of the rule</td>
<td>click the description, edit the description, and press ENTER.</td>
</tr>
</tbody>
</table>

5 Click OK.

6 Update the elevation to apply the style changes to the elevation.

For more information, see Updating a 2D or 3D Elevation on page 3364.
6 Update the elevation to apply the style changes to the elevation. For more information, see Updating a 2D or 3D Elevation on page 3364.

### Removing a Design Rule from a 2D Elevation Style

Use this procedure to remove a design rule from a 2D elevation style.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➔.
2. Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3. Click the Design Rules tab.
4. Select the rule that you want to remove, and click Remove.
5. Click OK.
6. Update the elevation to apply the style changes to the elevation. For more information, see Updating a 2D or 3D Elevation on page 3364.

### Adding Classifications to a 2D Elevation Style

Use this procedure to specify classifications for any classification definition applied to a 2D elevation style.

For more information about creating and applying classification definitions, see Classification Definitions on page 3872.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➔.
2. Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3. Click the Classifications tab.
   By default, the classification for all classification definitions is Unspecified. If no classification definitions are listed, none are applied to 2D elevation styles.
4. For each classification definition, select the classification you want to apply to the current 2D elevation style.
5. Click OK twice.
Changing the Layer, Color, and Linetype of a 2D Elevation Style

Use this procedure to change the following display properties of a 2D elevation style:

- Visibility (component is on or off)
- Display properties by materials
- Layer
- Color
- Linetype
- Lineweight
- Linetype scale

**NOTE** The custom display components in the display properties are identical to those listed on the Components tab of the 2D Section/Elevation Styles dialog box. For more information about custom display components, see Adding a Display Component to a 2D Elevation Style on page 3373.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
2. Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3. Click the Display Properties tab.
4. Select 2D Section/Elevation Style for the property source, and click Style Override.
5. If necessary, click .
6. Click the Layer/Color/Linetype tab.
7. Select the component to change, and select a different setting for the property.
8. Select By Material for any component that you want to use the display properties of the materials assigned to the elevation objects.
NOTE Not all display components of a 2D elevation have an associated material definition. For example, Hidden and Erased cannot be set by material. For a list of all display components and their associated material components, see About 2D and 3D Elevation Display Components and Materials on page 3374.

9 Click OK twice.

### Attaching Notes and Files to a 2D Elevation Style

Use this procedure to enter notes and attach reference files to a 2D elevation style. You can also edit notes and edit or detach reference files attached to the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, expand 2D Section/Elevation Styles, and select the style you want to change.
3 Click the General tab.
4 To add a description to the 2D elevation, enter the description under Description.
5 Click Notes.
6 To add or edit a note, click the Notes tab, and enter the note.
7 To attach, edit, or detach a reference file, click the Reference Docs tab:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Edit the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application. Click OK when you are done editing.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, click Delete, and click OK.</td>
</tr>
</tbody>
</table>

8 Click OK twice.
Hidden Line Projection

You can create flat 2D projections with hidden background lines from a 3D view of objects in your drawing. The Hidden Line Projection command produces quick sections and elevations of objects in your drawings that are not updated automatically when you make changes to your 3D model.

Creating a Hidden Line Projection

Use this procedure to create a 2D graphic from a 3D view of one or more objects in your drawing. The 2D graphic that you create is a flattened representation of the objects in the current 3D view, with hidden background lines. Use the Hidden Line Projection command to create quick 2D elevations and sections.

After you create an elevation or section hidden line projection, you can hatch or shade the cut areas. You can also use hidden line projections to create detail drawings. For more information about creating elevations and sections, see Working With Elevations on page 3321 and Sections on page 3251.

When you create hidden line projections, the 3D objects that you select are copied and collected into an unnamed (also called anonymous) 2D block. The unnamed block can be placed in your drawing in the current 3D view, or placed parallel to the XY plane to be viewed in plan view. You can edit or explode the inserted block. If you want to insert the block in another drawing as a named
block, define the block. For more information about inserting blocks, see “Insert Blocks” in AutoCAD help.

**TIP** The quickest way to locate and view an AutoCAD topic is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

**NOTE** Your 2D hidden line projections are not dynamically linked to the objects in the 3D view. Therefore, if you edit the original object or objects in 3D view, the 2D graphic does not change. You must edit or re-create the 2D hidden line projection to reflect any changes that you make to the original objects.

1. Open the tool palette that you want to use, and select a hidden line projection tool.
2. In a 3D view select one or more objects that you want to use to create your hidden line projection, and press **ENTER**.
3. Specify an insertion point in your current drawing for the 2D hidden line projection.
4. Specify the insertion point for the 2D hidden line projection into your drawing:
   - Press **ENTER** to insert the 2D block in plan view.
   - Enter **n** (No) to insert the 2D block in the current view.
AEC Dimensions

AEC dimensions are associative annotation objects used to display the relevant measurements of a building object, like the width of a wall or the length of a beam. The appearance of dimensions is controlled through styles and can be adjusted for different drawing views or to accommodate the standards of a particular company or country.

AEC Dimensions

AutoCAD Architecture offers different ways of dimensioning objects and points in a drawing. AEC dimensions can be associative to objects or be used to dimension user-specified points in the drawing. If you create an associative dimension, the dimension value changes when the object changes its measurements.

Components of an AEC dimension

Using Grips to Modify AEC Dimensions

When you select an AEC dimension, various grips are displayed. You can use the grips to add and remove dimension points, move dimension chains, change the offset of extension lines, and override wall component dimensions.
AEC dimension grips

Dimensioning Wall Components

When dimensioning wall components, you have the option of using the center of the component or either side as the dimension point. For example, you can dimension a wall component from its center or from one of its edges. You can also dimension wall components according to their structural function.

Grips for the individual component dimension points allow you to override style-defined dimension points on walls to accommodate special cases.

Wall component dimension grips

Overriding Dimension Values

The dimension values in an AEC dimension are calculated from the actual current dimensions of associated objects. You can override a value with a manually inserted value. For detailed information, see Overriding Dimension Values and Hiding Dimension Segments on page 3443.

Overriding dimension text with a new value
Dimension Options and Uses

In AutoCAD Architecture, you can dimension object points specified in the AEC dimension style, points on objects picked in the drawing, or user-specified points in the drawing. AEC dimensions associated with objects update when the object changes. User-specified points are not associative and have to be changed manually, if necessary. In addition to AEC dimensions, you can also use AutoCAD dimensions. The following table lists the differences between the different dimension methods:

An AEC dimension can contain both associative and non-associative points. For example, you can create an AEC dimension that dimensions a wall, a multi-view block representing a floor drain, and user-specified points selected anywhere in the drawing.

Associative Dimensions from Selecting Objects

Associative AEC dimensions are style-based annotation objects that update automatically when the associated object changes. The AEC dimension style defines the dimension points that determine which measurements are displayed for each object that the style can be used to dimension.

In the example below, walls lengths, opening widths, and wall intersections are set as the dimensioned points in the style. If a door is made wider, the dimensions update to reflect the new measurements.

You can define styles for specific object types. For example, one AEC dimension style might specify that for walls, dimensions will be displayed for lengths,
maximum opening widths of windows in walls, and wall intersections. Another AEC dimension style for mass elements might specify the mass element edges and center as dimension points.

For a complete list of objects for which you can specify dimension points in AEC dimension styles, see Associative Dimensions from Objects on page 3393.

**NOTE**

AEC objects can be associatively dimensioned in external references, even when they are nested multiple levels deep. This is useful for large drawing projects, where the parts of the building are distributed over various drawing files.

You can also define different dimension points for different views. For example, in Plan Low Detail, you might want to dimension only the outer boundaries of a building, whereas in Plan High Detail you might want to dimension wall lengths and openings in walls as well.

In the AEC dimension style, you can define up to ten dimension chains, each with different dimension points. For example, the first chain can dimension wall lengths and openings in walls, while the second chain dimensions structural components of multi-component walls.

In the AEC dimension style, you can also specify whether to use superscripting in dimensions, and whether the extension line length is fixed or variable.

### Associative Dimensions from Picked Points

When you use an AEC dimension tool, the Pick points option lets you select the base point and OSNAP points on an AEC object to create an associative dimension. In addition, you can define an offset from a selected point, so that virtually any point on an object can be dimensioned. This option lets you dimension AEC objects for which dimension points cannot be set in the AEC dimension style, like multi-view blocks or 2D building sections, or objects for which the dimension point you need is not settable in the style. For example, you cannot dimension the location of a pilaster in a wall in the AEC dimension style, but you can pick an endpoint on the wall, and then offset it so that becomes a dimension point for the pilaster location.

Because a dimension generated by picking points on objects is associative, if you move the object, the dimension points are updated accordingly, observing any offsets you have specified.

For a list of objects that can only be dimensioned associatively by picking points on them, see Associative Dimensions From Picked Points on page 3402.
Picking associative points to dimension

Non-Associative Dimensions from Picked Points

You can create non-associative dimensions from points you pick anywhere in the drawing. For each point you pick, a location point is generated and dimensioned. If the point is used to dimension an object, and the object is moved, the non-associative point is not updated. You have to manually move the non-associative point to reflect the change.

Non-associative grip points on AEC dimension

You can convert AutoCAD dimensions to non-associative AEC dimensions. The AutoCAD dimension points are converted to location points on the AEC dimension. For more information, see Converting an AutoCAD Dimension to an AEC Dimension on page 3418.

AutoCAD Dimensions

AutoCAD dimensions can be associated with AutoCAD objects like polylines. Additionally you can create non-associative AutoCAD dimensions.

Associative AutoCAD dimensions are turned on by default in AutoCAD Architecture. To work with traditional non-associative AutoCAD dimensions, set the system variable DIMASSOC to 1 (Non-Associative Dimensions). To create AutoCAD object dimensions, set DIMASSOC to 2 (Associative Dimensions).

For more information about AutoCAD dimensions, see “Dimensions and Tolerances” in AutoCAD Help.
Process Overview: Creating AEC Dimensions

An AEC dimension consists of a number of components and settings to make it the optimal tool for dimensioning objects.

**TIP** AutoCAD Architecture ships with predefined dimension tools for many uses. Before you create a new tool or AEC or AutoCAD dimension style, look through the templates to find an existing tool or style that contains most or all of your desired settings. You can then modify it for your purposes, if necessary.

The general process for creating AEC dimensions involves the following steps:

1. Specify the drawing options for the AEC dimension, as described in Specifying AEC Dimension Preferences on page 3403. Important settings include the dimension unit, superscripting preferences, and the automatic scaling of AutoCAD dimension styles.

2. Verify that there is an AutoCAD dimension style that has the settings you need. If necessary, create a new AutoCAD dimension style that defines the color of the dimension lines, size and font of the dimension text, arrows, unit format, and unit precision. For more information, see “Use Dimension Styles” in the AutoCAD help.

3. If you are dimensioning walls, create or modify a wall style with dimension settings for wall components. For more information, see Defining the Dimension Settings for Wall Components on page 1309.

4. Create an AEC dimension style that specifies the desired values for the following settings:
   - number of dimension chains
   - object types to be dimensioned (for example, walls or mass elements)
   - object points to be dimensioned (for example, wall components and wall intersections)
   - underlying AutoCAD dimension style

   For more information, see AEC Dimension Styles on page 3453.

5. Use a dimension tool and dimension objects and points in the drawing. For more information, see Creating an AEC Dimension with User-Specified Settings on page 3408.
**Associative Dimensions from Objects**

The AEC dimension style defines the dimension points that determine which measurements are displayed for each type of object to which the AEC dimension can be applied. You can either create a dimension style that defines dimension points for multiple object types, or you can create separate styles for individual object types.

For information about how to define dimension points in AEC dimension styles, see **Specifying Object Dimension Points in AEC Dimension Styles** on page 3460.

**Dimension Points for Walls**

The following wall dimension points can be specified in the AEC dimension style:

<table>
<thead>
<tr>
<th>Wall Dimension Points</th>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Overall</td>
<td>Dimensions the two outer points of all dimensioned walls.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Length of Wall: Outer Boundaries</td>
<td>Dimensions the outer boundaries of every selected wall. When wall boundaries overlap, only those facing the dimension direction are dimensioned.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Length of Wall: Wall Length</td>
<td>Dimensions the length of each wall in the selection set.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Wall Width: Overall</td>
<td>Dimensions the overall width of a wall.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Wall Width: All Components</td>
<td>Dimensions the width of each component in a wall.</td>
<td></td>
</tr>
</tbody>
</table>
### Wall Dimension Points

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wall Width: Center</td>
<td>Dimensions the center line of a single-component or multi-component wall</td>
<td><img src="example1.png" alt="Example" /></td>
</tr>
<tr>
<td>Wall Width: From Style</td>
<td>Dimensions the wall components according to the settings in the wall style.</td>
<td><img src="example2.png" alt="Example" /></td>
</tr>
<tr>
<td></td>
<td>For more information, see <a href="#">Defining the Dimension Settings for Wall Components</a> on page 1309.</td>
<td></td>
</tr>
<tr>
<td>Wall Width: Structural from Style</td>
<td>Dimensions the structural wall components according to the settings in the wall style.</td>
<td><img src="example3.png" alt="Example" /></td>
</tr>
<tr>
<td></td>
<td>For more information, see <a href="#">Defining the Dimension Settings for Wall Components</a> on page 1309.</td>
<td></td>
</tr>
<tr>
<td>Wall Intersections</td>
<td>Dimensions the intersection points of walls that are connected to the selected walls.</td>
<td><img src="example4.png" alt="Example" /></td>
</tr>
</tbody>
</table>

### Dimension Points for Wall Components

The dimensioning of wall components can be specified in 2 different locations: in the wall style and in the AEC dimension style.

In the wall style, you can set following information that is relevant to the dimension:

- **Component side to dimension:** In the wall style, you can define for each wall component whether it should be dimensioned to its positive or negative side, or to the center of the component. The positive and negative sides of a wall are determined by the direction in which the wall is drawn: if you draw a wall from left to right, the positive side is the left (top). If you draw a wall from the right side to the left, then the positive side is the right (bottom). If you determine that a wall component is only dimensioned to one side, you can select either the positive or negative side of the wall.
Structural function: You can define a wall component as structural or non-structural. When you set up the AEC dimension style you can define that only structural wall components, or all wall components should be dimensioned.

In the AEC dimension style you can define the following additional or overriding settings for dimensioning wall components:

- By Style: the dimension points selected in the wall style are used to dimension the wall components width.
- Structural by Style: the dimension points specified for the structural components of the wall style are used.
- All Components: each component of the wall is dimensioned.
- Overall: the overall width of the wall is dimensioned.
- Center: the center of the wall is dimensioned.
**Dimension Points for Wall Openings**

The following wall opening dimension points can be specified in the AEC dimension style:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opening Max. Width</td>
<td>Dimensions the maximum width of a window, door or opening in a wall.</td>
<td><img src="image1" alt="Example" /></td>
</tr>
<tr>
<td>Opening Min. Width</td>
<td>Dimensions the minimum width of a window, door, or opening in a wall.</td>
<td><img src="image2" alt="Example" /></td>
</tr>
<tr>
<td>Center of Opening</td>
<td>Dimensions the center point of a window, door, or opening in a wall.</td>
<td><img src="image3" alt="Example" /></td>
</tr>
</tbody>
</table>

**NOTE** If you click ➤ Options, and then click AEC Object Settings, there are two options under Wall settings: Dimension to Center of Opening and Dimension to Outer Frame of Opening. These settings have no influence on how openings are dimensioned in AEC dimensions.

**Dimension Points for Grids**

You can set dimension points for the following grid types in the AEC dimension style:

- Column grids
- Ceiling grids
- 2D layout grids

**NOTE** 3D layout volumes have no style-based associative dimension points.
The following grid dimension points can be specified in the AEC dimension style:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall</td>
<td>Dimensions the two outermost grid lines of all selected grids</td>
<td><img src="image1" alt="Example" /></td>
</tr>
<tr>
<td>Outer Grid Lines</td>
<td>Dimensions the outer grid lines of selected grids</td>
<td><img src="image2" alt="Example" /></td>
</tr>
<tr>
<td>All Grid Lines</td>
<td>Dimensions all grid lines in selected grids</td>
<td><img src="image3" alt="Example" /></td>
</tr>
</tbody>
</table>

**Dimension Points for Other Object Types**

The same set of dimension points can be specified individually in the AEC dimension style for these objects:

- Mass elements/mass groups
- Curtain walls
- Window assemblies
- Structural members (columns/braces/beams)
- Standalone windows/doors/openings
- Others
  - Stairs
  - Railings
  - Spaces
  - Roofs/roof slabs/slabs
TIP If you need different dimension points for individual items from the Other group, it is recommended that you create different dimension styles containing the varying settings. For example, you can create an AEC dimension style for stairs where you dimension the bounding box only, and another dimension style for spaces that dimensions the space edges.

The following dimensions points can be specified in the AEC dimension style for the objects in this category:

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall</td>
<td>Dimensions the two outer points of selected objects</td>
<td><img src="image1.png" alt="Example" /></td>
</tr>
<tr>
<td>Bounding Box</td>
<td>Dimensions the bounding box of each object in the selection set</td>
<td><img src="image2.png" alt="Example" /></td>
</tr>
<tr>
<td>Edges: All Edges</td>
<td>Dimensions all edges in an object</td>
<td><img src="image3.png" alt="Example" /></td>
</tr>
<tr>
<td>Edges: Facing Edges</td>
<td>Dimensions the edges of the object that are visible from the direction of the dimension line</td>
<td><img src="image4.png" alt="Example" /></td>
</tr>
<tr>
<td>Center</td>
<td>Dimensions the center point of an object</td>
<td><img src="image5.png" alt="Example" /></td>
</tr>
</tbody>
</table>

AutoCAD Dimension Points

You can define points for most AutoCAD linework objects in the AEC dimension style.
Use an AEC dimension style to dimension the following AutoCAD linework objects:

- Lines
- Arcs
- Circles
- Open and closed polylines
- AutoCAD polygons
- Rectangles
The following AutoCAD points can be associatively dimensioned in the AEC dimension style:

<table>
<thead>
<tr>
<th>AutoCAD Line-work Dimension Points</th>
<th>Selection</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extents</td>
<td>Dimensions the two overall outer points of all selected objects.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Endpoints</td>
<td>Dimensions the endpoints of selected objects. If you selected a polyline with multiple segments, the endpoints of each segment are measured. Endpoints can be measured for all AutoCAD linework objects listed above except circles.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Midpoints</td>
<td>Measures the midpoints of all segments of the selected object that are lying in the direction of the dimensions. Midpoints can be measured for all AutoCAD linework objects listed above except circles.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Center</td>
<td>Measures the center of the curve of circular objects. Centers can be measured for circles, arcs, and curved polyline segments.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Quadrant</td>
<td>Measures the quadrants of circles, arcs, and curved polylines segments.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AutoCAD linework objects include line-based objects, such as lines and open polylines, as well as non-linear geometry, such as closed polylines and circles. The results of using AEC dimensions to dimension these objects can be quite different. For example, for a single line, the options Overall, Bounding Box, All Edges, and Facing Edges return exactly the same dimension points. Some objects, like circles, have no edges to dimension.
The best way to handle the different dimension points for AutoCAD linework is to create a number of AEC dimension styles for the individual objects. For example, you can create a style named “Line,” which has only one dimension chain for dimensioning line edges, or a dimension style named “Circle,” which dimensions only circle centers and circle quadrants. For more information on creating AEC dimension styles, see AEC Dimension Styles on page 3453.

You cannot define associative dimension points for the following AutoCAD linework objects in the AEC dimension style:

- Multilines
- Splines
- Ellipses
- Blocks
- AutoCAD dimensions
- Leaders
- Text
- Surfaces
- Images
- OLE frames
- Proxies
- Solids

Associative Dimensions in External References

You can associatively dimension objects from external references in the following cases:

- Attach an external reference drawing to a host drawing, and dimension objects from the external reference and the host drawing in the host drawing.

- Attach a nested external reference drawing to a host drawing, and dimension objects from the external reference, its nested external reference and from the host drawing in the host drawing.
Objects from external references are dimensioned in the same way and with the same dimension points as objects from the host drawing.

You can create any level of nesting inside the external reference and still dimension all nested referenced objects.

You will need the ability to dimension external references often when you are working in a project environment. For detailed information on using dimensions in a project, see Workflow for Annotating a Project on page 529.

**Associative Dimensions From Picked Points**

For AEC objects that cannot have associative dimension points specified in the AEC dimension style, you can pick points on the object in the drawing to generate an associative dimension; points that are picked on the object remain associative to the object.

You can pick either the base point of an object to dimension or any of its OSNAP points. For each point, you can additionally define an offset from the picked point to the dimension point, so that you can dimension virtually any point on an object.

You can also pick a point on an object that can be set in the dimension style, in case you want to dimension a point that is not included in the style-based points. For example, if you want to dimension a recess in a wall with an individual dimension point, you can pick a point on the desired location on the wall.

**NOTE** You cannot pick associative points on AutoCAD objects.

The following AEC objects can be dimensioned associatively only by picking points on them:

- Multi-view blocks

**NOTE** You cannot dimension multi-view blocks that have Xdata attached to them.

- Curtain wall units
- AEC polygons
- Mask blocks
- 2D Sections/Elevations
Specifying AEC Dimension Preferences

Use this procedure to specify dimension preferences before you add AEC dimensions to your drawing.

Settings for AEC dimensions include the following:

■ Superscript for millimeters
■ Dimension display unit
■ Automatic rescale of existing AutoCAD dimension styles
■ Update behavior of points added or removed

1 Click ➤ Options.
2 Click the AEC Dimension tab.
3 Specify how dimension chains are updated when you remove or add dimension points:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>update the display after every point you remove from or add to a dimension chain</td>
<td>select Update Added / Removed Points Immediately.</td>
</tr>
<tr>
<td>update the display only after you have finished removing or adding dimension points</td>
<td>clear Update Added / Removed Points Immediately.</td>
</tr>
</tbody>
</table>

For more information, see Adding Non-Associative Dimensions from Picked Points to an AEC Dimension on page 3428 and Removing Object Points Set in the AEC Dimension Style on page 3429.
4. Specify if manual dimension points are associative or non-associative:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify associative manual dimension points</td>
<td>select Make Manual Dimension Points Associative</td>
</tr>
<tr>
<td>specify non-associative manual dimension points</td>
<td>clear Make Manual Dimension Points Associative</td>
</tr>
</tbody>
</table>

5. Set the global behavior of manually overridden dimension values:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>have an automatic underline for each manually overridden dimension value</td>
<td>select Override Display of Underlined Text, and then select Underline All.</td>
</tr>
<tr>
<td>have no underline for any overridden dimension value</td>
<td>select Override Display of Underlined Text, and then select Underline None.</td>
</tr>
<tr>
<td>set underlines for each overridden dimension value manually</td>
<td>clear Override Display of Underlined Text.</td>
</tr>
</tbody>
</table>

For more information, see Overriding Dimension Values and Hiding Dimension Segments on page 3443.

6. Under Units, for Dimension in, select the unit in which dimensions are to be displayed.

This unit can differ from the drawing unit. For example, you can create a drawing in meters, but have the dimensions displayed in centimeters.

7. If meters or centimeters are your drawing units, and you want to display the millimeters as superscripted text, select Use Superscript mm.

Millimeters superscripted (left) and millimeters not superscripted (right)
If you do not want zeros at the end of superscripted numbers, select Trailing Zeros Suppression for Superscript. You can select this option only if you have selected Use Superscript mm.

Trailing zeros not suppressed (left) and suppressed (right)

Under Automatic Scale of AutoCAD Dimstyles, select the AutoCAD dimension styles to be rescaled when you change the drawing units. For example, you change the drawing units from meters to millimeters. The following settings in your AutoCAD dimension style are rescaled:

<table>
<thead>
<tr>
<th>Description</th>
<th>Variable</th>
<th>AutoCAD Dimstyle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimension line spacing</td>
<td>DIMDU</td>
<td>Meters</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Millimeters</td>
</tr>
<tr>
<td>Dimension line extension</td>
<td>DIMDLE</td>
<td>0.5000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>500.000</td>
</tr>
<tr>
<td>Extension line length</td>
<td>DIMEXE</td>
<td>0.1250</td>
</tr>
<tr>
<td></td>
<td></td>
<td>125.0000</td>
</tr>
<tr>
<td>Text offset from dimension</td>
<td>DIMGAP</td>
<td>0.1000</td>
</tr>
<tr>
<td>line</td>
<td></td>
<td>100.0000</td>
</tr>
<tr>
<td>Dimension text height</td>
<td>DIMTXT</td>
<td>0.2000</td>
</tr>
<tr>
<td></td>
<td></td>
<td>200.0000</td>
</tr>
</tbody>
</table>

Creating AEC Dimensions Using AEC Dimension Tools

Tool palettes provided with AutoCAD Architecture let you quickly place AEC dimensions by selecting an AEC dimension tool with a specific AEC dimension style and other predefined properties. You can also use the AEC dimension
tools to convert AutoCAD dimensions to AEC dimensions and to apply the settings of an AEC dimension tool to an existing AEC dimension.

**Tool palette containing AEC dimension tools**

The default tool palettes in the workspace contain sample AEC dimension tools that you can use and customize as needed. In addition, the following catalogs provided with the software contain AEC dimension tools that you can add to your tool palettes:

- AutoCAD Architecture Stock Tool catalog
- AutoCAD Architecture Sample Palette catalog

Custom palettes created by your CAD manager or other users may also contain AEC dimension tools with AEC dimension styles and properties that are customized for your projects or office standards.

## Creating an AEC Dimension

Use this procedure to add a new AEC dimension that has the properties specified in the AEC dimension tool that you select. To specify settings when you add an AEC dimension, see Creating an AEC Dimension with User-Specified Settings on page 3408.

1. Open the tool palette that you want to use, and select the tool.

   **NOTE** Alternatively, you can click Home tab ➤ Annotation panel ➤ Dimension drop-down ➤ AEC Dimension or Annotate tab ➤ Dimensions panel, and select one of the available dimension tools there.
2 Select the objects or points you want to dimension, and press ENTER.
You can move or hide the Properties palette to expose more of the drawing area.

3 Click where you want to insert the AEC dimension.

Creating an AEC Dimension with User-Specified Settings

Use this procedure to create an AEC dimension with the settings that you specify.

**TIP** To ensure that the Properties palette is displayed before you select a tool, right-click in the drawing area, and click Properties.

An AEC dimension can include associative dimensions from objects, associative dimensions from picked points on objects, and non-associative dimensions from points anywhere in the drawing.

**Associative wall dimensions**

![Associative wall dimensions diagram]

**Associative dimension picked on multi-view block**

![Associative dimension picked on multi-view block diagram]
1 Open the tool palette that you want to use, and select an AEC dimension tool.

**NOTE** Alternatively, you can click Home tab ➤ Annotation panel ➤ Dimension drop-down ➤ AEC Dimension or Annotate tab ➤ Dimensions panel, and select one of the available dimension tools there.

2 On the Properties palette, expand Basic, and expand General.
3 Select a style.
4 Specify which objects or points to dimension:
   
   **If you want to…**  |  **Then…**
   -- | --
   dimension objects specified in the AEC dimension style (creates an associative dimension) | select objects in the drawing that have been specified in the AEC dimension style.
   dimension the base point of objects that cannot be set in the AEC dimension style (creates an associative dimension) | select multiple objects of the object list in *Associative Dimensions From Picked Points* on page 3402.
   dimension OSNAP points on objects (creates an associative dimension) | verify that OSNAP is turned on. Enter p (Pick Points) on the command line, and select points on objects by snapping to them.
   dimension non-associative points in the drawing (creates a non-associative dimension) | verify that OSNAP is turned off. Enter p (Pick Points) on the command line, and specify points in the drawing.
NOTE During adding an AEC dimension, you cannot select objects specified in the style and non-associative points in the same command. You can however, once a dimension is added to the drawing, attach objects and points as necessary. For more information, see Adding Points to an AEC Dimension on page 3423.

5 Press ENTER.

6 Specify the style, position, rotation, and direction of the new dimension:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the style of the AEC dimension</td>
<td>enter s (Style) on the command line, and press ENTER; then, enter the style name and press ENTER again.</td>
</tr>
<tr>
<td>insert the AEC dimension parallel or</td>
<td>drag the cursor in the desired direction, and click at the desired insertion point.</td>
</tr>
<tr>
<td>perpendicular to the dimensioned object</td>
<td></td>
</tr>
</tbody>
</table>

NOTE If your selection set contains objects with different directions, the direction of the first selected object defines the parallel and perpendicular directions.

<table>
<thead>
<tr>
<th>insert the AEC dimension at a specified rotation</th>
<th>enter r (Rotation) on the command line, and press ENTER. Then, enter a rotation angle, either by clicking in the drawing or by entering it on the command line. Press ENTER, and click at the desired insertion point. Alternatively, pressing the SPACE bar rotates the dimension by 90°.</th>
</tr>
</thead>
</table>

NOTE If your selection set contains objects with different directions, the rotation is calculated with reference to the first selected object.

<table>
<thead>
<tr>
<th>insert the AEC dimension parallel to an object other than the dimensioned object in the drawing</th>
<th>enter a (Align) on the command line, and press ENTER. Then, select the object to which to align the AEC dimension.</th>
</tr>
</thead>
</table>
If you want to… | Then…
--- | ---
Press ENTER, and click in the drawing at the desired insertion point.

**NOTE** The direction of the AEC dimension is dependent on the rotation of the chosen object. The drawing direction of the object has no influence on the AEC dimension direction.

Use Cases for AEC Dimensions

AEC dimensions give you the freedom to dimension your model according to your needs. The following sections outline some frequently used use cases for your work with AEC dimensions.

**Creating an Interior Dimension**

Use this procedure to create an interior wall dimension.

When you are dimensioning a set of interior walls and want to place the dimension inside the walls, you need a dimension without extension lines, as shown in the graphic below.

**Dimension string without extension lines**

1. Create a single-component wall style for interior walls and define in the wall style that only one side of the wall component should be dimensioned. For detailed information, see **Specifying the Components of a Wall Style** on page 1299.
2 Create an AEC dimension style that has the following settings:
   ■ Single dimension chain: For detailed information, see Changing the Number of Chains in an AEC Dimension Style on page 3456.
   ■ Wall width dimension “By Style.” This setting ensures that wall components will be dimensioned according to the points you have set in the wall style. For more information, see Dimension Points for Walls on page 3393 and Specifying Object Dimension Points in AEC Dimension Styles on page 3460.
   ■ Extension line length of 0. For detailed information, see Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles on page 3462.

3 Use the AEC dimension style to dimension a set of interior walls in your plan, as described in Creating an AEC Dimension with User-Specified Settings on page 3408.
   Use the preview graphic to place the AEC dimension within the walls as desired.
   
   **NOTE** You can reposition the AEC dimension later with grips.

---

**Dimensioning the Overall Building Length for Multiple Walls**

You can use any of the following methods to dimension the overall length of a building consisting of multiple walls.

■ You can use an AEC dimension style that is designed to create an associative dimension for the overall length of a building.

■ You can pick the outside points of the two outermost walls by snapping to them, and create an associative AEC dimension.

■ You can manually specify two points representing the outermost extents of the building and create a non-associative dimension to these points.

**Dimensioning the outer length of a building with an AEC dimension style**

1 Create an AEC dimension style that dimensions the outer length of all selected walls.
   For more information, see Dimension Points for Walls on page 3393 and Specifying Object Dimension Points in AEC Dimension Styles on page 3460.
2 Select an AEC dimension tool with the style created in the previous step.
3 Select only those walls facing the direction where you want to create the AEC dimension, and insert the dimension in the drawing.

\[\text{TIP} \text{ Do not select any walls that are perpendicular to the dimension. This creates additional unwanted dimension points.}\]

**Dimensioning the outer length of a building with points picked on the walls**

1 Select an AEC dimension tool, and verify that OSNAP is turned on.
2 Enter `p` (Pick Points) on the command line and press ENTER.
3 Select the two outermost snap points on the building you want to dimension.
4 Place the AEC dimension in the drawing.
**TIP** You can select the associative dimension points later and offset them from their original position on the wall.

Dimensioning the outer length of a building with non-associative points

1. Select an AEC dimension tool, and verify that OSNAP is turned off.
2. Enter `p` (Pick Points) on the command line and press ENTER.
3. Specify two points in the drawing you want to dimension, press ENTER, and place the AEC dimension.

The points you selected are not associative to the walls in the building. If you move the walls, you have to move the location points accordingly to bring the dimension up to date.
Dimensioning Wall Components in the Wall Length

Wall components are a part of the wall width, not the wall length. To generate an AEC dimension that displays wall components in the wall length, you have to select the walls vertically intersecting the wall for which you want to dimension the components in the length.

Dimensioning wall components on wall length

Creating Dimensions to OSNAP Points

When you are using an AEC dimension tool with the OSNAP setting turned on, and select a point that snaps to an AEC object, you create a dimension point that is associated with the selected point on the object. For example, if you pick an Endpoint, then an associative dimension to the Endpoint of the object is generated. This allows you to create an AEC dimension that dimensions multiple associative points on one object.

Example: Dimensioning a 2D Building Section

A 2D building section is one of the objects for which dimension points can not be specified in the AEC dimension style. When you start an AEC dimension tool, and select a building section, its base point is the default dimension point. However, because you need at least 2 points to dimension you need to select 2 or more OSNAP points on the 2D section.
1 Verify that OSNAP is turned on.
2 Select an AEC dimension tool.
3 On the command line, enter P (Pick Points).
4 Select the snap points on the 2D building section you want to dimension.
5 Press ENTER to create the dimension.

The OSNAP points you selected on the section object are inserted as associative points on the dimension.

Creating Dimensions Associated with the Object Base Point

When you create associative dimensions for points on objects for which dimension points cannot be set in the AEC dimension style, one associative point is created for each object you select. The point is placed at the base point of the object.
Example: Dimensioning Multi-View Blocks

Associative dimensions for multi-view blocks

1. Verify that OSNAP is turned off.
2. Select an AEC dimension tool.
3. Select at least 2 multi-view blocks. If you select only one, the dimension will display as a defect marker.
4. Insert the dimension in the drawing.
   For each selected object, an associative dimension point is inserted at the base point of the object.

Dimensioning Points in Multi-Chain Dimensions

When you create a multi-chain dimension for which you select points in the drawing, the same points are included in every chain on the dimension.

This may be the desired behavior in a case where you are dimensioning a point of reference that should appear on every chain. If you need a particular point on one chain only, you can do either of the following:
Converting an AutoCAD Dimension to an AEC Dimension

Use this procedure to create an AEC dimension from an AutoCAD dimension. For each AutoCAD dimension point, a non-associative AEC dimension point is created. The resulting AEC dimension has the properties of the AEC dimension tool you select. You can edit these properties after creating the AEC dimension.

For detailed information about non-associative AEC dimension points, see Non-Associative Dimensions from Picked Points on page 3391.
Converting an AutoCAD dimension to an AEC dimension

1 Open the tool palette that you want to use.
2 Right-click an AEC dimension tool, and click Apply Tool Properties to ➤ AutoCAD Dimension.
3 Select the AutoCAD dimensions, and press ENTER.
4 Do one of the following:
   - If you selected one AutoCAD dimension to convert, proceed to Step 7.
   - If you selected multiple AutoCAD dimensions to convert, proceed to Step 5.
5 Specify the position of the AEC dimension by clicking the desired position in the drawing. The AEC dimension can, for example, be placed above or below the object.
6 Do any of the following:
   - Drag the mouse to set the direction of the dimension. The extension lines are drawn into the opposite direction.
   - To place the AEC dimension perpendicular to a point in the drawing, enter perp (Perpendicular) on the command line, and specify the point the dimension is perpendicular to.
   - To set a user-specified angle for the AEC dimension, enter the desired angle on the command line.

   **NOTE** The angle you specify here is calculated in relation to the UCS, and not to the dimensioned object.

7 When prompted to erase the original AutoCAD dimension, press ENTER to keep the AutoCAD dimension, or enter y (Yes) to erase it.
The resulting AEC dimension is displayed as follows:

<table>
<thead>
<tr>
<th>If…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>you selected only one AutoCAD dimension</td>
<td>the new AEC dimension is inserted at the same position as the AutoCAD dimension. If you did not erase the original AutoCAD dimension, the AEC dimension is placed on top of it.</td>
</tr>
<tr>
<td>you selected more than one AutoCAD dimension</td>
<td>the new AEC dimension is inserted according to your specifications from steps 6 and 7. If you did not erase the original AutoCAD dimensions, they remain in their original positions.</td>
</tr>
</tbody>
</table>

**Copying Properties of AEC Dimensions to AutoCAD Dimensions**

Use this procedure to copy the display properties of an AEC dimension to an AutoCAD dimension without converting the AutoCAD dimension. In this case, a number of display attributes are changed while the functionality and behavior of the AutoCAD dimension are not changed.

**NOTE** When you copy the properties of an AEC dimension to an AutoCAD object dimension (DIMASSOC = 2), the associativity of the resulting AutoCAD dimension is lost. Therefore, copy properties to an associative AutoCAD dimension only as the last step in your drawing process, or use traditional, non-associative AutoCAD dimensions (DIMASSOC = 1).

The following dimension display properties are copied from the AEC dimension to the AutoCAD dimension:

- **AutoCAD dimension style**: AEC dimensions have an underlying AutoCAD dimension style, defining settings for the dimension not explicitly set in the AEC dimension style.
  When you copy the properties of an AEC dimension to an AutoCAD dimension, the underlying AutoCAD dimension style of the AEC dimension is applied to the AutoCAD dimension.
For detailed information about the connection between AutoCAD dimension styles and AEC dimension styles, see AEC Dimension Styles and AutoCAD Dimension Styles on page 3453.

- **Superscript settings:** If you have specified superscripted millimeters for AEC dimensions, this is applied to the AutoCAD dimension. For more information about superscripts, see Specifying AEC Dimension Preferences on page 3403.

- **Extension line length:** The extension length you have specified for your AEC dimension is applied to the AutoCAD dimension. When you copy the properties of an AEC dimension to an AutoCAD dimension that has a different extension line length, the definition points of the AutoCAD dimension are adjusted to the new length.

The AutoCAD dimension style and length of the extension lines are view-dependent settings. When you copy the properties of an AEC dimension to an AutoCAD dimension, the settings for the current view are applied.

1. On the command line, enter `AecDimMatch`.
2. Select the AEC dimension to copy properties from.
3. Select the AutoCAD dimensions to copy properties to.
4. Press ENTER.

**Creating an AEC Dimension Tool**

Use this procedure to create an AEC dimension tool and add it to a tool palette. You may want to create your own AEC dimension tools if you are placing multiple AEC dimensions of specific styles with additional AEC dimension properties that you want to be the same each time you add an AEC dimension of that type.

1. Open the tool palette where you want to create a tool.
2. Create the tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a tool from an AEC dimension in the drawing</td>
<td>select the AEC dimension, and drag it to the tool palette.</td>
</tr>
<tr>
<td>create a tool from an AEC dimension style in the Style Manager</td>
<td>click Manage tab ➤ Style &amp; Display panel ➤ Style Manager ➤. Locate the style you want to copy, and</td>
</tr>
</tbody>
</table>
Then…

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>drag it to the tool palette.</td>
<td>Click OK to close the Style Manager.</td>
</tr>
<tr>
<td>copy a tool in the current tool</td>
<td>right-click the tool, and click Copy. Right-click, and click Paste.</td>
</tr>
<tr>
<td>palette</td>
<td></td>
</tr>
<tr>
<td>copy a tool from another tool</td>
<td>right-click the tool, and click Copy. Open the other palette, and click Paste.</td>
</tr>
<tr>
<td>palette</td>
<td></td>
</tr>
<tr>
<td>copy a tool from a tool catalog</td>
<td>click Home tab ➤ Build panel ➤ Tools drop-down ➤ Content Browser. Locate the tool you want to copy. Position the cursor over the i-drop handle, and drag the tool to the tool palette.</td>
</tr>
</tbody>
</table>

3 Right-click the new tool, and click Properties.
4 Enter a name for the tool.
5 Click the setting for Description, enter a description of the tool, and click OK.
6 Expand Basic, and expand General.
7 Click the setting for Description, enter a description of the AEC dimension created from this tool, and click OK.
8 Specify a layer key and any layer key overrides if you do not want to use the layer assignments specified in the layer key style used in the drawing.
9 Select an AEC dimension style.
10 Select the drawing file containing the style used for this AEC dimension tool.
11 Click OK.

Editing AEC Dimensions

You can change the attributes of an AEC dimension, such as the objects and points dimensioned or the dimension display. You can add dimension points to an AEC dimension. You can reverse the dimension direction and manually...
change the length of extension lines. You can also move individual dimension text in crowded plans and override dimension values with “false” values.

AutoCAD Architecture offers several methods for editing AEC Dimensions:

- You can directly edit AEC dimensions using grips.
- You can change AEC dimension settings on the Properties palette.
- You can select editing commands from the context menu for the selected AEC dimension.

Adding Points to an AEC Dimension

You can add points to an AEC dimension in the following ways:

- You can attach a new object to the dimension; if dimension points have been defined for that object type in the dimension style, corresponding associative points are added to the dimension.
- You can add associative points to the dimension by picking base points or OSNAP points on AEC objects.
- You can add non-associative points to the dimension by picking points selected anywhere in the drawing. These points are not connected to objects and are therefore not associative. To change their position, you need to move the location grips generated on the dimension.

When you attach an object for which dimension points have been specified in the AEC dimension style, the points are dimensioned and added to the appropriate dimension chains. For example, if you add a wall to an AEC dimension that has style settings for wall components in 2 chains, component dimensions are added to these 2 chains.

If an object is not specified in the AEC dimension style, you can either dimension the base point of the object or pick any of its OSNAP points as dimension points. These dimension points can be manually offset while retaining the associativity to the object. For example, you can dimension the base point of a multi-view block and offset the dimension from the base point. If the multi-view block is moved or rotated, the dimension moves and rotates with it while observing the offset.

To add non-associative dimension points in a drawing, you specify points, which are added as location grips, and are dimensioned on the selected dimension chain. When the location grip is moved, the dimension point is...
updated accordingly. Non-associative dimension points can be useful if you want to dimension a component not represented by an AEC object, like a property line, or AutoCAD objects like blocks.

**NOTE** You can specify if manual dimension points near custom objects can be associative or non-associative. For more information, refer to Specifying AEC Dimension Preferences on page 3403

**Moving a non-associative location point and updating an AEC dimension**

![Diagram](image)

**Adding Associative Dimensions to Objects Defined in the AEC Dimension Style**

Use this procedure to add associative dimensions by attaching an object for which dimension points have been defined in the AEC dimension style.
Attaching objects to an AEC dimension

You can also attach AEC objects for which dimension points are not specified in the AEC dimension style. In that case, the base point of the selected object is added as a dimension point.

1 Select the AEC dimension to which you want to attach objects, and click the Add grip ( ) or click AEC Dimension tab ➤ Modify panel ➤ Add Objects .

2 Select the objects for which you want dimension points to be added to the AEC dimension, and press ENTER.
Any dimension points specified in the style for the selected objects are added to the chains of the AEC dimension.

If a selected object has no dimension points specified in the AEC dimension style, a dimension point is added at the base point of the object.

3 If you want to offset a dimension point from an object not specified in the AEC dimension style, select its location grip on the dimension, and move it to the desired location.

**Adding Associative Dimensions from Picked Points to an AEC Dimension**

Use this procedure to add associative dimensions to an AEC dimension by picking OSNAP points on an AEC object.
Adding and offsetting non-style defined dimension point to an AEC dimension

1 Verify that OSNAP is turned on.
2 Select the AEC dimension to which you want to add associative points, and click AEC Dimension tab ➤ Modify panel ➤ Add Extension Lines ➤
3 Select the AEC object OSNAP points you want to dimension.

**NOTE** OSNAP points on AutoCAD objects will be filtered out of the dimension.

4 Press ENTER.
Select the AEC dimension chain to which the points should be added.

**Adding Non-Associative Dimensions from Picked Points to an AEC Dimension**

Use this procedure to add non-associative points picked in the drawing to an AEC dimension.

1. Select the AEC dimension to which you want to add points, and click AEC Dimension tab ➤ Modify panel ➤ Add Extension Lines ➤  .
2. Select the points in the drawing that you want to dimension, and press ENTER.
3. Select the dimension chain to which the points should be added.
   For each added point, a location grip is added at the end of the extension line, and the dimensions on the chain are updated.

**Detaching Dimension Points from an AEC Dimension**

You can detach dimension points from an AEC dimension.

**Detaching Objects from an AEC Dimension**

Use this procedure to detach objects from an AEC dimension. When you detach the object, all style-specified dimension points for the object are removed from the dimension.

Detaching objects from a dimension
1 Select the AEC dimension from which you want to detach objects, and click AEC Dimension tab ➤ Modify panel ➤ Remove Objects.
2 Select the objects to detach from the AEC dimension.
3 Press ENTER.

The dimension points belonging to the selected objects are removed from the AEC dimension.

Removing Object Points Set in the AEC Dimension Style

Use this procedure to remove object points set in the AEC dimension style from an AEC dimension.

Removing these dimension points creates an override to the AEC dimension style.

**IMPORTANT** Removing points from an object dimension is not identical to detaching an object from an AEC dimension. Even if you remove all extension lines pointing to dimensioned points on an object, the object is still invisibly attached to the dimension through the AEC dimension style. If you turn on the display component Removed Points Marker in the AEC dimension style, you can see that the object points still exist and can be restored. If you want to detach an object from an AEC dimension completely, use the procedure in Detaching Objects from an AEC Dimension on page 3428.

1 Select the AEC dimension from which you want to remove style-defined points.
2 Click the Remove grip ( ) on the extension line of the point you want to remove, or click AEC Dimension tab ➤ Modify panel ➤ Remove Ext. Lines.
3 Proceed to remove points.

**NOTE** Make sure to select only extension lines referring to objects that are specified in the AEC dimension style. Only these points can be restored later.
If you remove object points using the context menu, the behavior of the removal can differ according to your preference settings:

- If the Update Added/Removed Points Immediately setting is selected, the selected points are deleted immediately.
- If the Update Added/Removed Points Immediately setting is cleared, the selected points are deleted after you end the command.

For more information, see Specifying AEC Dimension Preferences on page 3403.

**NOTE** If the deleted points are still visible as a crossed circle, the display component Removed Points Marker is turned on. If you do not want the removed points marker to appear, turn off the component. For more information, see Restoring Object Points Set in the AEC Dimension Style on page 3430.

When you remove multiple points, some removed points may reappear. This can happen when you have selected the option Update Added/Removed Points Immediately, and the entity display component Removed Points Marker is turned off. The reason for this behavior is that during your current removal operation, you accidentally selected an invisible removed point marker for a dimension point already removed. Removing an already removed point restores it. To avoid this effect, turn on the Removed Points Marker component in the entity display. For more information about turning components on and off, see Changing the AEC Dimension Display Components on page 3457.

**Restoring Object Points Set in the AEC Dimension Style**

Use this procedure to restore dimension points that have been removed from an AEC dimension and that are set in the AEC dimension style. Because the object points are set in the AEC dimension style, information about the type and position of the removed point is still present in the AEC dimension style.

1. Select the dimension chain on which to restore a removed object point.

2. Verify that the removed point is visible:
   
<table>
<thead>
<tr>
<th>If...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>the point removed is still visible as a crossed circle</td>
<td>proceed to step 9.</td>
</tr>
</tbody>
</table>
Then…

If…

the point removed is not visible as a crossed circle

Then…

make it visible by following steps 3 through 9.

3 Right-click, and click Object Display.
4 Click the Display Properties tab.
5 Select the display representation on which the changes should appear, and select Object Override.
   The display representation in bold is the current one.
6 If necessary, click Object Display.
7 Click the Layer/Color/Linetype tab.
8 Select the Removed Points Marker component, and turn on the setting for Visibility.
9 Click OK twice.
   The removed dimension point on the dimension chain is now visible as a crossed circle.
10 If necessary, select the AEC dimension again, and click AEC Dimension tab ➤ Modify panel ➤ Remove Ext. Lines.
11 Click the center of the circle for the dimension points to restore.
   ■ If the Update Added/Removed Points Immediately setting is selected, the selected points are deleted immediately.
   ■ If the Update Added/Removed Points Immediately setting is cleared, the selected points are deleted after you end the command.

For more information, see Specifying AEC Dimension Preferences on page 3403.
Removing Non-Style Defined Dimension Points

Use this procedure to remove dimension points that are not set in the AEC dimension style from an AEC dimension. These can be points that are generated by picking object OSNAP points or by picking non-object associated points in the drawing. Unlike style-defined dimension points, they cannot be restored once they are deleted, however, you can recreate them if desired.
Removing a point from an AEC dimension

1. Select the AEC dimension from which to remove dimension points.

2. Click the Remove grip ( ) on the extension line of each point to remove, or click AEC Dimension tab ➤ Modify panel ➤ Remove Ext. Lines .

Reversing the Direction of an AEC Wall Dimension

You can reverse the direction of an AEC dimension that is associated with walls. Reversing the dimension direction can change the points on the wall that are dimensioned.
For an AEC dimension to be reversible, these conditions must be met:

- The dimensioned wall has either two interior or two exterior sides.

  **TIP** If you want to reverse the dimensioned points on a wall with an interior and exterior side, you need to reverse the wall direction.

- Wall components must be dimensioned on only one side, either on the positive or the negative side.

For example, if you dimension one side of a wall component of a wall that has two interior or two exterior sides, reversing the dimension direction will dimension the opposite side of the component. For information on defining the dimensioning of wall components, see Defining the Dimension Settings for Wall Components on page 1309 and Specifying Object Dimension Points in AEC Dimension Styles on page 3460.

**Reversing an AEC dimension**

1. Select the dimension for which you want to reverse the direction, and click , or click AEC Dimension tab ➤ Modify panel ➤ Reverse .
Flip Text Position for AEC Dimensions

AutoCAD is introducing two new text settings for the AutoCAD dimension style:

■ Vertical text position: controls the vertical placement of text in relation to the dimension line. Possible settings are above the dimension line, below the dimension line, centered between extension lines, outside the dimension line, and according to JIS (Japanese Industrial Standard).

■ Text view direction: Specifies the reading direction of dimension text. Possible settings are left-to-right and right-to left. For more information, see “Control the Location of Dimension Text” in the AutoCAD Help.

When vertical AEC dimensions are rotated greater than 90 degrees, the dimension text flips sides. In some cases, when dimensions are part of a series of dimensions this is an undesired result.

Using the Text Flip grip addresses this issue by swapping the settings of vertical text position and reading direction so that the dimension displays correctly. In detail, these are the changes that are made:

■ The vertical text setting defined in the AutoCAD dimension style will be overridden, and be set to the Below setting.

■ The reading direction will be swapped from left-to-right to right-to-left or vice versa.

■ Any dimension texts that have a positional override will flip in place around their location point.

NOTE You can also perform these changes in the underlying AutoCAD dimension style. This will however, affect all AEC dimensions of that style, whether they are rotated or not. In most cases an override on a specific dimension will work better.
1 Select the rotated dimension.

2 Click the Flip text to opposite side of dimension grip.

Overriding Associative Wall Component Dimension Points

If you have specified wall component dimension points in the AEC dimension style, you can override individual component dimension points on the dimension so that they override their style settings.

You can make the following overrides to a wall component dimension point:

- Move a dimension point from one location on the component to another: For example, you can move a dimension point from the center of the component to the left side or to the right side.
Modify an existing wall component dimension

- Move a dimension point from one component to another: For example, you can move a dimension point from the stud component to the gyp board component on the same wall.

- Add a new dimension point for a component: You can add a dimension point to the edges or to the center of the selected component, in a case
where this dimension point is not specified in the AEC dimension style or wall style.

**Adding wall component dimension point**

- Remove overrides and revert back to the component dimension settings specified in the style.
Overriding a component dimension

1. Select the AEC dimension on which you want to override a wall component dimension point.

2. Select the Override grip ( • ) for the desired component.
   When you select the Override grip, the associated component is highlighted in the drawing.

3. Move the grip to the desired position on the component, or onto another component.
   A red temporary line shows you the position on the component.

Add a new dimension point for a component

1. Select the AEC dimension to which you want to add a wall component dimension point.

2. While pressing control, click the Override grip ( • ) for the desired component, and drag the new point to the desired location.
   You can add a dimension point in 3 locations on a component: the positive edge, the negative edge, and the center.

Modifying an overridden component dimension

1. Select the AEC dimension on which you want to modify a wall component override.

2. Select an overridden component dimension.
   When a component dimension point is overridden, it is marked with a yellow grip ( • ).

3. Drag the grip to the desired position.

Remove overrides from a component dimension

1. Select the AEC dimension from which you want to remove a wall component dimension override.

2. Do one of the following:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>move a component back to its style-defined position</td>
<td>drag the override grip ( • ) to the original position on the component. When you…</td>
</tr>
</tbody>
</table>
If you want to… Then…

release and re-select the grip its color changes to cyan ( ).

remove a component you have added through an override click the Remove Extension line grip ( ).

reset all overrides click AEC Dimension tab ➤ Modify panel ➤ Remove Override drop-down ➤ All Components ( ).

Repositioning Dimension Texts, Extension Lines, and Dimension Chains

Use this procedure to reposition individual dimension texts, extension lines, and dimension chains on an AEC dimension.

The length of extension lines and the distance between dimension chains are set in the AEC dimension style, and are identical for all chains and all extension lines in the dimension. In some cases, you need to override those settings, and display varying extension lines or chain distances. Also, you might need to move individual dimension texts to a different location.

Viewing AEC Dimension Move All Chains and Edit in Place grips

AEC dimensions offer you the ability to change the display of a dimension with direct editing via grips.

NOTE You can only display and move the in-place grips of an AEC dimension if the underlying AutoCAD dimension style has the correct text placement settings. To ensure this, select the AEC dimension, right-click, and click AEC Dimension Style. Then, select the display representation where you want the changes to appear, and select Style Override. If necessary, click , and click the Other tab. Click Edit, and in the Dimension Style Manager click Modify. Click the Fit tab, and select Over the dimension line, without a leader for Text Placement.
1 Select the AEC dimension on which to reposition individual texts, extension lines or dimension chains, and click its Edit In Place grip.

**NOTE** Alternatively, you can click AEC Dimension tab ➤ Modify panel ➤ Edit in Place.

The dimension now displays grip points for
- individual texts
- individual extension lines
- individual dimension chains

**Viewing AEC Dimension Edit In Place grips**

2 Use the grips to reposition dimension texts, lengthen or shorten extension lines, and reposition dimension chains.

**Resetting Repositioned Dimension Texts, Extension Lines and Dimension Chains**

Use this procedure to reset repositioned dimension texts, extension lines and dimension chains.
Repositioning text in a dimension

**NOTE** You can only reset those dimension texts that you have manually moved to a different place. If dimension texts are offset from their positions because they do not, for example, fit on the appropriate dimension segment, you cannot automatically reset them here. To make sure that your dimension texts are always placed on the dimension segment, set this in the underlying AutoCAD dimension style. Select the AEC dimension, right-click, and click AEC Dimension Style. Then, select the display representation where you want the changes to appear, and select Style Override. If necessary, click , and click the Other tab. Click Edit, and in the Dimension Style Manager click Modify. Click the Fit tab, and select Always keep text between ext lines under Fit Options.

1 Select the AEC dimension with repositioned components to be reset.

3442 | Chapter 44  AEC Dimensions
2 Set the components to their original positions:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>set the extension lines</td>
<td>click AEC Dimension tab ➤ Modify panel ➤ Remove Override dropdown ➤</td>
</tr>
<tr>
<td>to their style settings</td>
<td>All Extension Lines.</td>
</tr>
<tr>
<td></td>
<td>click AEC Dimension tab ➤ Modify panel ➤ Remove Override dropdown ➤</td>
</tr>
<tr>
<td></td>
<td>All Text Positions.</td>
</tr>
</tbody>
</table>

**NOTE** To reset the distance between dimension chains, set the distance between chains to the original value in the AEC dimension style. For information, see Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles on page 3462.

### Overriding Dimension Values and Hiding Dimension Segments

The dimension values in an AEC dimension are the real-life calculated values taken from the objects that are dimensioned. When the dimensioned object is updated, the dimension value is updated accordingly. In some cases you might want to override that value and exchange it for a manually inserted value.

**Overriding dimension text with a new value**

![Before overriding text](image1)

![After overriding text](image2)

In other cases, you might want to retain the original value, but supplement it with a prefix or suffix.
Overriding dimension text with a suffix

![Image](image1.png)

Sometimes, you need to hide a dimension text or a whole dimension segment.

**Overriding dimension text by hiding text**

![Image](image2.png)

Overridden dimension values can be marked in different ways:

- Each manually overridden value, hidden text, or prefixed/suffixed value, is marked by a short overline. For information on how to hide the overline, see [Hiding the Overline of Overridden Dimension Values](#) on page 3447.

- You can add an underline to each overridden value. For information, see [Hiding the Overline of Overridden Dimension Values](#) on page 3447.

- You can specify in the drawing setup to underline each override automatically. For information, see [Global Underline Options for Overrides](#) on page 3446.

When you manually override a dimension value, the correct automatic value still exists. You can remove the override, and restore the correct value again.

**Overriding Dimension Values**

Use this procedure to exchange an automatic dimension value for a manually inserted one, to add prefixes and suffixes to dimension values, and to hide dimension texts and segments.
1 Select the dimension on which to override a dimension value, and click AEC Dimension tab ➤ Modify panel ➤ Override Text & Lines [ ].

2 Click the value to override.

3 Specify the value override:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>hide the selected dimension text</td>
<td>select Hide Text.</td>
</tr>
<tr>
<td>hide the selected dimension seg-</td>
<td>select Hide Text and Lines.</td>
</tr>
<tr>
<td>ment</td>
<td></td>
</tr>
<tr>
<td>override the dimension value</td>
<td>enter a value for Text.</td>
</tr>
<tr>
<td></td>
<td>NOTE You can enter all alph-</td>
</tr>
<tr>
<td></td>
<td>numeric characters here.</td>
</tr>
<tr>
<td>mark an overridden value with an</td>
<td>select Underline Text.</td>
</tr>
<tr>
<td>underline</td>
<td></td>
</tr>
<tr>
<td>add a prefix to a dimension value</td>
<td>enter one for Prefix.</td>
</tr>
<tr>
<td>add a suffix to a dimension value</td>
<td>enter one for Suffix.</td>
</tr>
</tbody>
</table>

4 Click OK.

**Removing Overrides from Dimension Values**

Use this procedure to remove overrides from dimension values. The results of removing overrides are as follows:

- Overridden values are reset to their correct value.
- Underlines and overlines are removed.
- Prefixes and suffixes are removed.
- Hidden text and hidden segments are redisplayed.
## Global Underline Options for Overrides

Use this procedure to set the underlines of overridden dimension values globally in the drawing.

Documentation guidelines of a company or regional office may require underlining all overridden dimension values. It would be cumbersome to underline each overridden value individually. AutoCAD Architecture offers you the ability to set underlining of overridden values as the default behavior. This means that whenever you override a dimension value, it is automatically underlined.

Similarly, you might need a quick way to remove all underlines from a plan; for example, to create a preview sheet from a not-yet-finished plan.

In this case, you can set global underlining instead of underlining or removing underlines from individual overrides.

**NOTE** The global underline setting is applied to existing overrides and new overrides.

1. Click ➤ Options.
2. Click the AEC Dimension tab.
3. Select Override Display of Dimensioned Text.
4. Set the global underline behavior:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>underline all overridden dimension values in the drawing, regardless of individual settings</td>
<td>Select Underline All.</td>
</tr>
<tr>
<td>remove the underline from all overridden dimension values in the</td>
<td>Select Underline None.</td>
</tr>
</tbody>
</table>
Hiding the Overline of Overridden Dimension Values

Use this procedure to hide the overline of overridden dimension values.

When you create an override for a dimension value—entering a different value, hiding a text or a segment, adding a prefix/suffix—the override is marked by a small overline above the changed value. The overline is useful for seeing at a glance which values have been overridden. It is also useful when you have hidden texts and segments, to select the hidden segment.

In some cases, however, you might want to hide the overline. The overline is placed on the DEFPOINTS layer, and by default is not plotted. If you want to hide it in the AutoCAD Architecture session as well, you need to hide the DEFPOINTS layer.

1. In the Layer Properties toolbar, select the DEFPOINTS layer.
2. Click the light bulb icon to hide the layer.

**NOTE** Alternatively, you can hide the DEFPOINTS layer in the Layer Manager.

Changing the AEC Dimension Style

Use this procedure to change the style of an AEC dimension. AEC dimension styles contain information about the objects to dimension, the number of chains, and the display of the dimension. For information about how to define AEC dimension styles, see AEC Dimension Styles on page 3453.

1. Select one or more AEC dimensions and double-click one of them.
2. Expand Basic, and expand General.
3. Select an AEC dimension style.

Specifying Object Dimension Points for an AEC Dimension

Use this procedure to specify the objects and points to be dimensioned associatively for an AEC dimension in a particular display representation.
1 Double-click the window.
2 Click the Display tab.
3 Under the General category, for Display component, verify that "NONE" is selected.
4 For Display controlled by, select This object.

**NOTE** To apply your changes to all AEC dimensions in the drawing, select Drawing default setting. To apply changes to all AEC dimensions of this style, select AEC Dimension Style:<style name>. For more information on styles, see AEC Dimension Styles on page 3453.

5 For Display representation, verify that the desired display representation is selected.
6 If necessary, expand Object Display Properties ➤ Advanced, and click Contents.
7 For Apply To, select the type of object you want to dimension.
   Example: In the first chain, you want to dimension the length of walls and wall intersections. For Apply To, you select Wall.
8 Under Chains, select the chain on which the dimension points appear.
   Example: In the first chain, you want to dimension the length of walls. In the previous step, you selected Wall. Now, you select Chain 1.

**NOTE** Selecting in this context means highlighting the desired chain, and not selecting the check mark. The check mark is set automatically depending on whether dimension points for this chain are selected. Example: If you clear all possible dimension points for a chain, its check is automatically cleared.

9 On the right side, select the points to include in the highlighted chain.
   Example: In the first chain, you want to dimension the length of walls and wall intersections. In the previous steps, you selected Walls and highlighted Chain1. Now, you select the check mark for Length of Wall and choose Wall Length. Then, you select the check mark for Wall Intersections.
NOTE Under Wall Width, you have two settings that override the AEC dimension style settings for the dimensioning of wall components: From Style and Structural from Style. If you select From Style, the dimensioning of wall components is done according to the settings in the wall style. If you select Structural from Style, the dimensioning of wall components is done according to the settings in the wall style, but takes into account only components that have been marked as Structural in the wall style. For information on setting the dimensioning of wall components in the wall style, see Defining the Dimension Settings for Wall Components on page 1309.

10 Repeat steps 7–9 until your dimension contains all objects and points you want to dimension.

11 Click OK.

You can also access and modify AEC dimension contents through the AEC dimension’s context menu, as follows:

1 Select the AEC dimension you want to change, right-click, and click Edit Object Display.
2 Click the Display Properties tab.
3 For the desired display representation, select Object Override. The display representation in bold is the current display representation.

4 If necessary, click .
5 Click the Contents tab.
6 Adjust the settings as desired, and click OK twice.

**Specifying the AutoCAD Style and Other Properties for an AEC Dimension**

Use this procedure to specify the AutoCAD dimension style underlying the current AEC dimension style and to specify other display settings for an AEC dimension in a particular display representation. These settings include:

- Distance between dimension chains
- Length of extension lines
- Dimension layer
Display of height of openings

1. Double-click the AEC dimension.
2. Click the Display tab.
3. Under the General category, for Display component, verify that *NONE* is selected.
4. For Display controlled by, select This object.

**NOTE** To apply your changes to all AEC dimensions in the drawing, select Drawing default setting. To apply changes to all AEC dimensions of this style, select AEC Dimension Style:<style name>. For more information on styles, see AEC Dimension Styles on page 3453.

5. For Display representation, verify that the desired display representation is selected.
6. If necessary, expand Object Display Properties ➤ Advanced, and click Dimension settings.
7. To change the underlying AutoCAD dimension style of the AEC dimension style, select an AutoCAD dimension style.
8. To edit the AutoCAD dimension style, click Edit.
   For more information about AutoCAD dimension styles, see AEC Dimension Styles and AutoCAD Dimension Styles on page 3453.
9. When you are finished editing the selected style, click OK.
10. Under AEC Dimension Settings, for Distance Between Chains, enter the desired distance between the single dimension chains in the AEC dimension.

   **Different distances between dimension chains**

11. Specify whether you want fixed or variable extension lines.
Fixed extension lines have the same length. Variable extension lines adapt to the outline of the object they dimension. AutoCAD dimensions use variable extension lines by default.

**Fixed extension lines (left) and variable extension lines (right)**

12 If you selected Use Fixed Length Extension Lines, enter the length of the extension lines.

**Different lengths of extension lines**

13 Specify whether to display the height of openings.

**NOTE** This opening dimension is used specifically for European working plans, where you need a detailed description of measurements.

14 Click Layer to select the layer on which to place the AEC dimension.

15 Click OK twice.

You can also access and modify these same settings through the AEC dimension’s context menu, as follows:

1 Select the AEC dimension you want to change, right-click, and click Edit Object Display.

2 Click the Display Properties tab.

3 For the desired display representation, select Object Override.
4 If necessary, click .
5 Click the Other tab.
6 Adjust the settings as desired, and click OK twice.

**Attaching Hyperlinks, Notes, and Files to an AEC Dimension**

Use this procedure to attach hyperlinks, text notes, and files to an AEC dimension.

1 Double-click the AEC dimension to which to attach information.
2 Click the Extended Data tab.
3 To add a hyperlink, click the setting for Hyperlink, and specify the link.
   For more information about adding Hyperlinks, see “Add Hyperlinks to a Drawing” the AutoCAD help.
4 Click the setting for Notes, and add a note. Then, click OK.
5 Click the setting for Reference Documents.
6 Attach or detach reference files:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click , select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click .</td>
</tr>
</tbody>
</table>

7 Click OK.
AEC Dimension Styles

The AEC dimension style defines objects to dimension in the AEC dimension, and the display of the AEC dimension.

You can create and edit AEC dimension styles, import and export AEC dimension styles between drawings, and purge AEC dimension styles that are not in use. When you create, purge, import, export, or edit styles, you access the Style Manager. The Style Manager provides a central location in AutoCAD Architecture where you can work with styles from multiple drawings and templates. For more information about using the Style Manager, see Style Manager Overview on page 870.

You can create an AEC dimension tool from any AEC dimension style. You can drag the style from the Style Manager onto a tool palette. You can then specify default settings for any AEC dimensions created from the tool. For more information, see Creating an AEC Dimension Tool on page 3421.

AEC Dimension Styles and AutoCAD Dimension Styles

Every AEC dimension style has an underlying AutoCAD dimension style, which controls settings that are not set directly in the AEC dimension style.

The AutoCAD dimension style defines the following properties:

- Color of dimension lines and extension lines
- Lineweight of dimension lines and extension lines
- Shape and size of dimension arrowheads
- Dimension text height and color
- Units, precision, and decimal separator symbol

The AEC dimension style defines the following properties:

- Number of dimension chains
- Dimensioned objects
- Distance between dimension chains
- Fixed or variable extension lines
- Display of opening height dimensions
The AEC Dimension Style Wizard

There are two ways of editing a dimension style:

- You can edit the dimension style in the Style Manager. The advantage of this method is that you can edit all AEC dimension style settings here.

- You can edit the dimension style with the AEC Dimension Style Wizard. The advantage of this method is that you can edit the most important display settings of the style in a fast and uncomplicated way. However, you can not change all settings here; for example, the number of chains and the objects to dimension can be edited only with the AEC Dimension Styles Properties dialog box. For more information about the AEC Dimension Style Wizard, see Changing Style Properties with the AEC Dimension Style Wizard on page 3464.

Creating AutoCAD Dimension Styles

You need to create an underlying AutoCAD dimension style before you create an AEC dimension style.

AutoCAD Architecture comes with a number of preset AutoCAD dimension styles specifically designed for use in AEC dimensions. To save time, look at these, to see if you can use them directly or with modifications.

To create an AutoCAD dimension style for use with AEC dimension styles, be sure to specify the following settings:

- Dimension line and extension line settings
- Arrowhead settings
- Text display settings
- Unit settings

1. Click Home tab ➤ Annotation panel ➤ ➤ AEC Dimension Style.
2. In the Dimension Style Manager, click New.
3. Follow the instructions for creating a new AutoCAD dimension style, as described in “Use Dimension Styles” in AutoCAD help.
For more information about connecting the AutoCAD dimension style to an AEC dimension style, see Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles on page 3462.

Creating an AEC Dimension Style

Use this procedure to create an AEC dimension style. You can create a new style with default style properties, or you can create a new style by copying an existing style. After you create the style, you edit the style properties to customize the characteristics of the style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➔.
2 Expand Documentation Objects, and expand AEC Dimension Styles.
3 Create a new AEC dimension style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a new style with default</td>
<td>right-click AEC Dimension Styles, and click New.</td>
</tr>
<tr>
<td>properties</td>
<td></td>
</tr>
<tr>
<td>create a new style from an existing</td>
<td>right-click the AEC dimension style you want to copy, and click Copy.</td>
</tr>
<tr>
<td>style</td>
<td>Right-click, and click Paste.</td>
</tr>
</tbody>
</table>

4 Enter a name for the new AEC dimension style, and press ENTER.
5 To edit the style properties of your new AEC dimension style, select the style and edit it in the Style Manager tabs:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the Layer/Color/Linetype</td>
<td>see Changing the AEC Dimension Display Components on page 3457.</td>
</tr>
<tr>
<td>properties</td>
<td></td>
</tr>
<tr>
<td>change the number of chains in an</td>
<td>see Changing the Number of Chains in an AEC Dimension Style on page 3456.</td>
</tr>
<tr>
<td>AEC dimension style</td>
<td></td>
</tr>
<tr>
<td>specify objects and points to dimension</td>
<td>see Specifying Object Dimension Points in AEC Dimension Styles on page 3460.</td>
</tr>
</tbody>
</table>
If you want to... Then...
change the AutoCAD dimension style and other settings see Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles on page 3462.
change an existing AEC dimension style with the AEC Dimension Style Wizard see Changing Style Properties with the AEC Dimension Style Wizard on page 3464.
add notes, files, or documents to the style see Attaching Notes and Files to an AEC Dimension Style on page 3467.

6 When you have finished changing the AEC dimension style properties, click OK.
7 If you want to assign the style to an AEC dimension tool, drag the style from the Style Manager to a tool palette.
   You can later rename the tool and specify other properties for it as described in Creating an AEC Dimension Tool on page 3421.
8 Click OK.

Changing the Number of Chains in an AEC Dimension Style

Use this procedure to change the number of dimension chains in an AEC dimension style.

To set the contents of chains, see Specifying Object Dimension Points in AEC Dimension Styles on page 3460.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2 Expand Documentation Objects, and expand AEC Dimension Styles.
3 Select the style you want to edit.
4 Click the Chains tab.
5 Enter the number of dimension chains to define for this dimension style.
6 Click OK twice.
Changing the AEC Dimension Display Components

Use this procedure to change the properties of the display components of an AEC dimension style.

The following AEC dimension display components are available:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AEC Dimension Group</td>
<td>Use this component only to turn the visibility of an AEC dimension on or off for a specific view. All the other settings, like color, linetype, and linewidth are specified in the underlying AutoCAD dimension style; any changes you enter here are not displayed.</td>
</tr>
<tr>
<td>Removed Points Marker</td>
<td>This component shows removed associative dimension points. Make it visible if you want to restore removed dimension points, as described in <a href="#">Restoring Object Points Set in the AEC Dimension Style</a>.</td>
</tr>
<tr>
<td>AEC Dimension Group Marker</td>
<td>Marker of the dimension base point.</td>
</tr>
<tr>
<td>Override Text &amp; Lines Marker</td>
<td>This component is displayed when a dimension segment is hidden or a dimension text hidden or overwritten. For more information, see <a href="#">Overriding Dimension Values and Hiding Dimension Segments</a> on page 3443.</td>
</tr>
</tbody>
</table>

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
2. Expand Documentation Objects, and expand AEC Dimension Styles.
3. Select the style you want to edit.
4. Click the Display Properties tab.
5. Select the display representation where you want the changes to appear, and select Style Override.
6. If necessary, click .
7 Click the Layer/Color/Linetype tab.
8 Select the component to change, and select a different setting for the property.
9 Click OK twice.

Defining Dimensioned Objects in the AEC Dimension Style

In an AEC dimension style, you can define points on objects that are dimensioned associatively with this AEC dimension style. The points that are available for each object are dependent on the object features. For example, in a wall you can dimension length, width, wall components, and openings in the wall. In a window, you can dimension the maximum and minimum opening widths, and the window center.

For a complete list of objects that can be specified in the AEC dimension style, see Associative Dimensions from Objects on page 3393.

Each AEC dimension can have up to ten dimension chains. Each chain can contain dimension points for the objects specified in the style. For more information, see Changing the Number of Chains in an AEC Dimension Style on page 3456.

Example 1: You create an AEC dimension style that contains only one chain. This chain contains wall lengths and wall intersections and the maximum opening width of openings within the wall.

Single AEC dimension chain example

Example 2: You create an AEC dimension style designed exclusively to dimension walls, but the wall dimension points are distributed on four individual chains:

- Chain 1 dimensions the wall lengths and the wall widths.
- Chain 2 dimensions the wall lengths, wall widths and wall intersections.
- Chain 3 dimensions only the wall lengths.
- Chain 4 dimensions the outer boundaries of all selected walls.
Four AEC dimension chains example

Example 3: You create an AEC dimension style that dimensions the length of walls in a building on one chain, and a row of structural columns within the building on a second chain.

Two AEC dimension chains example

The following guidelines can help you to create AEC dimension styles:

- Create a separate dimension style for each use. For example, create a style that dimensions window assemblies and curtain walls, and another one that dimensions walls and openings in walls.
- Do not include too many dimension points in one dimension chain.
- Do not include too many objects within one dimension style.
Specifying Object Dimension Points in AEC Dimension Styles

Use this procedure to specify the objects and points to be dimensioned associatively in an AEC dimension style.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Documentation Objects, and expand AEC Dimension Styles.
3. Select the style you want to edit.
4. Click the Display Properties tab.
5. Select the display representation where you want the changes to appear, and select Style Override.
6. If necessary, click .
7. Click the Contents tab.

Selecting the contents of dimension chains

Under Apply To, you find the list of objects that can be dimensioned associatively.

Refer to Associative Dimensions from Objects on page 3393 for a complete list of objects and their dimension points.

Below the Apply To list, you find the list of available chains in this AEC dimension style.

For information on changing the number of chains, see Changing the Number of Chains in an AEC Dimension Style on page 3456.
8 For Apply To, select a object you want to dimension.
Example: In the first chain, you want to dimension the length of walls and wall intersections. For Apply To, you select Wall.

9 Under Chains, select the chain on which the dimension points appear.
Example: In the first chain, you want to dimension the length of walls. In the previous step, you selected Wall. Now, you select Chain 1.

**NOTE** “Selecting” in this context means highlighting the desired chain, and not selecting the check mark. The check mark is set automatically depending on whether dimension points for this chain are selected. Example: If you clear all possible dimension points for a chain, its check is automatically cleared.

10 On the right side, select the points to include in the highlighted chain.
Example: In the first chain, you want to dimension the length of walls and wall intersections. In the previous steps, you selected Walls and highlighted Chain1. Now, you select the check box for Length of Wall and choose Wall Length. Then, you select the check mark for Wall Intersections.

**NOTE** Under Wall Width, you have two settings that override the AEC dimension style settings for the dimensioning of wall components: From Style and Structural from Style. If you select From Style, the dimensioning of wall components is done according to the settings in the wall style. If you select Structural from Style, the dimensioning of wall components is done according to the settings in the wall style, but takes into account only components that have been marked as Structural in the wall style. For information on setting the dimensioning of wall components in the wall style, see Defining the Dimension Settings for Wall Components on page 1309.

11 Repeat steps 7–9 until your dimension contains all objects and points you want to dimension with this style.

12 Click OK three times.
Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles

Use this procedure to select the AutoCAD dimension style underlying the AEC dimension style and these other settings that affect the appearance of the AEC dimension:

- Distance between dimension chains
- Length of extension lines
- Dimension layer
- Display of height of openings

**NOTE** Activating the display of the opening height takes effect only if you select dimension points for openings in one or more chains of this dimension style. For information on selecting opening dimension points, see Specifying Object Dimension Points in AEC Dimension Styles on page 3460.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2. Expand Documentation Objects, and expand AEC Dimension Styles.
3. Select the style you want to edit.
4. Click the Display Properties tab.
5. Select the display representation where you want the changes to appear, and select Style Override.
6. If necessary, click .
7. Click the Other tab.
8. To change the underlying AutoCAD dimension style of the AEC dimension style, select an AutoCAD dimension style.
9. To edit the AutoCAD dimension style, click Edit.
   For more information about AutoCAD dimension styles, see AEC Dimension Styles and AutoCAD Dimension Styles on page 3453.
   To return to the Other tab in the Display Properties dialog box, click Close.
10. Specify the distance between the single dimension chains in the AEC dimension.
11 Specify whether you want fixed or variable extension lines. Fixed extension lines have the same length. Variable extension lines adapt to the outline of the object they dimension. AutoCAD dimensions use variable extension lines by default.

Fixed extension lines (left) and variable extension lines (right)

12 If you select fixed extension lines, enter the length of the extension lines.

Different lengths of extension lines

13 Specify whether to display the height of openings.

NOTE This opening dimension is used specifically for European working plans, where you need a detailed description of measurements.
14 Click Layer to select the layer on which to place the AEC dimension and click OK.
15 Click OK twice.

**Changing Style Properties with the AEC Dimension Style Wizard**

Use this procedure to change a number of AEC dimension style properties with the help of a wizard. The AEC Dimension Style Wizard offers you a fast way of changing these properties of a style:

- Arrowhead shape and size
- Length and color of extension lines
- Color of dimension lines
- Distance between dimension chains
- Dimension text style, size, and color
- Rounding-off value
- Layer assignment

1 Click Manage tab ➤ Style & Display panel ➤ ➤ Dimension Style Wizard.
2 Select the AEC dimension style to edit and click Next.

**IMPORTANT** If you choose a dimension style that has its property source set to System Default, you get a warning message. If you want to edit the style, close the Wizard, open the style in the Style Manager, and set the display property source to a style override. For more information about working with the Style Manager, see *Style Manager Overview* on page 870.

3 Select the display representation to change.

**NOTE** If the AEC dimension style you choose to edit is based on the same AutoCAD dimension style for different display representations, the edits you make apply to all display representations. To avoid this, make sure that the AEC dimension style uses different AutoCAD dimension styles for different display representations. For more information about assigning AutoCAD dimension styles to AEC dimension styles, see *Selecting the AutoCAD Dimension Styles and Other Properties of AEC Dimension Styles* on page 3462.

4 Specify line and arrow settings:
- Select new arrowhead symbols.
- Change the size of the arrowheads.
- Define a new length for the extension lines.
- Define a new distance between the individual dimension chains.
5 Click Next.
6 Specify text settings:
   - Select a new text style.
   - Enter a new text height.
   - Define a new round-off precision for dimension values.

7 Click Next.
8 Specify Color and Layer settings:
   ■ Select a new text color.
   ■ Select a new dimension line color.
   ■ Select a new extension line color.
   ■ Select a new layer for the dimension.

9 Click Finish.

**Attaching Notes and Files to an AEC Dimension Style**

Use this procedure to attach text notes and files to an AEC dimension style.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2 Expand Documentation Objects, and expand AEC Dimension Styles.
3 Select the style you want to edit.
4 Click the General tab.
5 To add a description to the AEC dimension style, enter the description under Description.
6 Click Notes.
7 To add a note, click the Notes tab, and enter the note.
Click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Edit the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application. Click OK when you are done editing.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, click Delete, and click OK.</td>
</tr>
</tbody>
</table>

Click OK twice.

Q and A for Working with AEC Dimensions

This topic contains questions and answers that can help you to achieve the results you want when working with AEC dimensions.

Changing Color, Text Size and Arrowheads

How do I change the color, text size, and arrowheads of an AEC dimension?

Those settings are specified in the AutoCAD dimension style that underlies the AEC dimension style. To access them easily, use the AEC Dimension Style Wizard. For more information, see The AEC Dimension Style Wizard on page 3454.

Updating AEC Dimensions On Demand

How can I specify that AEC dimensions are updated only on demand?

If you freeze the layer on which an AEC dimension is placed, the AEC dimension is updated only when the layer is thawed again or if you execute the REGEN command.

When you switch to another view, for example, a three-dimensional (3D) view, and then back to a Plan view, the AEC dimension is not updated. Freezing
the dimension layer can enhance drawing performance, especially for big drawings.

You can add new AEC dimensions even when the layer is frozen. However, you can edit them only after the layer has been thawed again.

Changing the Text Height of Superscripted Numbers

**How can I change the text height of superscripted numbers in an AEC dimension?**

By default, the text height of superscripted numbers in AEC dimensions is set to 50 percent of the text height of the underlying AutoCAD dimension style (DIMTXT). To change this default, you must change the corresponding value in the Registry file.

**WARNING** Making changes in the Registry file can have far-reaching consequences for the whole application. Before you change anything here, make sure that this is what you really want to do. If you are not sure, consult your CAD manager or IT department.

1. Open the Windows Registry Editor.
2. Navigate to `HKEY_LOCAL_MACHINE\SOFTWARE\Autodesk\AutoCAD\R18.0\ACAD-8004:409\AEC\6.0\AecArchDACHBase60\ObjectDefaults\AEC Dimension\SuperscriptScaleFactor`.
3. Enter the desired value. The value here is relative to the AutoCAD dimension text height (DIMTXT).

Fixing the Error Symbol

**The AEC dimension for a wall 1 meter high is displayed only with an error symbol. How can I get a correct dimension display?**

The cut plane of the AEC dimension is taken from the cut plane of the dimensioned wall in the current display configuration. If the cut plane is set to a higher value, you must change it to include the lower wall into the dimension. For information on setting the wall cut plane, see **Specifying the Cut Plane Display of a Wall Style** on page 1319.
Finding More Dimension Points than Expected

I am dimensioning the intersection points of walls and receive more dimension points than expected on the dimension. How can I check if this dimension is correct?

When you receive more wall intersection dimension points than you expect, it is possible that the walls you are dimensioning intersect with other walls that are not included in this dimension chain. To see if this is so, and if your dimension is correct, you can prolong the extension lines so that they actually meet the point they dimension. You can then verify that the dimension points on your chain are placed correctly.
Elevation Labels

Elevation labels are used to dimension height values in plan and section views.

Elevation Labels and Coordinate Systems

Elevation labels are interactive multi-view blocks used for dimensioning heights in a drawing. They are anchored to either the world coordinate system (WCS) or a named user coordinate system (UCS). Elevation labels are used primarily for measuring the heights of building elements like walls or windows, but they can be used to measure every point in your drawing. You can add elevation labels in plan and section views. AutoCAD Architecture offers a number of predefined blocks for commonly used elevation labels. You can also define your own elevation labels.

When elevation labels are moved along the Z-axis, their Z-values change accordingly. Elevation labels can, however, be anchored only to a named UCS or the WCS; not to any building object. If the object height is changed, the value of the elevation label is not updated automatically.

An elevation label measures the height of a point with relation to the reference height. The reference height can be taken from the Z-coordinate of the WCS or the Z-coordinate of a named UCS.
Using Elevation Label Tools to Create Elevation Labels

Tools provided with AutoCAD Architecture let you quickly place elevation labels using an elevation label tool with specific predefined properties. You can use the default settings of the tool, or you can change the properties.

The default tool palettes in the workspace contain sample elevation label tools that you can use and customize as needed. In addition, the following catalogs
provided with the software contain elevation label tools that you can add to your tool palettes:

- Stock Tool catalog
- AutoCAD Architecture Sample Palette catalog
- My Tool catalog

Custom palettes created by your CAD manager or other users may also contain elevation label tools with multi-view block definitions and properties that are customized for your projects or office standards.

Creating an Elevation Label

Use this procedure to add a new elevation label that has the properties specified in the elevation label tool that you select. To specify settings when you add an elevation label, see Creating Elevation Labels with User-Specified Settings on page 3473.

1. Click Annotate tab ➤ Tools panel ➤ Annotation Tools.
2. Select an elevation label tool.
   If necessary, scroll to display the tool that you want to use.
3. Specify the insertion point of the elevation label.
   You can move or hide the Properties palette to expose more of the drawing area.
4. Click OK.

Creating Elevation Labels with User-Specified Settings

Use this procedure to add an elevation label with settings that you specify.

1. Click Annotate tab ➤ Tools panel ➤ Annotation Tools.
2. Select an elevation label tool.
   If necessary, scroll to display the tool that you want to use.
3. In the drawing area, specify the insertion point of the elevation label.
You can move or hide the Properties palette to expose more of the drawing area.

The Add Elevation Label dialog is displayed.

![Add Elevation Label dialog](image)

4 Select the coordinate system for the elevation label:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>select an existing coordinate system from the drawing</td>
<td>under UCS, select the coordinate system from the list.</td>
</tr>
<tr>
<td>create a new named user coordinate system (UCS)</td>
<td>click (Define UCS), and define the new UCS on screen. For more information about creating user coordinate systems, see “Use Coordinates and Coordinate Systems” in AutoCAD help.</td>
</tr>
</tbody>
</table>

**TIP** The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

5 Enter the elevation value of your label.

The value you enter here is always calculated in relation to the coordinate system you have selected. When you redefine the
coordinate system, the Z-value of the elevation label is recalculated accordingly. For example, you have a UCS named “First Floor,” with its Z-origin at 3 m. When you insert an elevation label in WCS and set it to 2 m, and then change the coordinate system to “First Floor” the Z-value of the elevation label is changed to -1 m.

6 If necessary, enter a prefix and suffix for the elevation label.
7 Click OK.

Creating an Elevation Label Tool

Use this procedure to create an elevation label tool and add it to a tool palette. You may want to create your own elevation label tools if you are placing multiple elevation labels of a specific style and they all have the same properties.

Elevation labels consist of a multi-view block definition connected to a custom AEC command. Therefore, the process of creating an elevation label tool differs from the process of creating a regular object tool, like a door tool.

To create an elevation label tool, you need a multi-view block definition with a custom command that is placed in DesignCenter™. Predefined elevation labels are available in DesignCenter, so check to see if the desired elevation label is already there.

If you find no elevation label meeting your needs, create one, as described in Creating User-Defined Elevation Labels on page 3481, and place it into AutoCAD DesignCenter.

From AutoCAD DesignCenter, you create an elevation label tool.

1 Click Insert tab ➤ Content panel ➤ Content Browser drop-down ➤ Design Center.
2 Navigate to the folder containing the elevation label from which you want to create a tool.
3 Open the tool palette on which you want to add the elevation label tool.
4 Create the tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a tool from the AutoCAD DesignCenter</td>
<td>drag the desired elevation label from the AutoCAD DesignCenter to the tool palette.</td>
</tr>
<tr>
<td>copy a tool in the current tool palette</td>
<td>right-click the tool, and click Copy. Right-click, and click Paste.</td>
</tr>
<tr>
<td>copy a tool from another tool palette</td>
<td>right-click the tool, and click Copy. Reopen the tool palette where you want to add the tool, right-click, and click Paste.</td>
</tr>
<tr>
<td>copy a tool from a tool catalog in the Content Browser</td>
<td>Click Home tab ➤ Build panel ➤ Tools drop-down ➤ Content Browser ➤ , open the catalog and locate the tool you want to copy. Position the cursor over the i-drop handle, and drag the tool to the tool palette.</td>
</tr>
</tbody>
</table>

5 Right-click the new tool, and click Properties.
6 Enter a name for the tool.
7 Click the setting for Description, enter a description of the tool, and click OK.

**Modifying Elevation Labels**

You can change the attributes of an elevation label, such as the associated UCS or the scaling factor.

- You can change elevation label settings on the Properties palette.
- You can select editing commands from the contextual ribbon tab and shortcut menu for a selected elevation label.
Changing the Elevation of an Elevation Label

Use this procedure to change the value for the elevation of an elevation label. The value of an elevation label is always calculated in relation to the coordinate system of the label.

1. Select the elevation label you want to change, right-click, and click Elevation Label Modify.
2. Enter the new elevation value.
3. Click OK.

Changing the Coordinate System of an Elevation Label

Use this procedure to change the coordinate system of an elevation label.

For more information on how elevation labels are dependent on coordinate systems, see Elevation Labels on page 3471.

1. Select the elevation label you want to change, right-click, and click Elevation Label Modify.
2. Select a new coordinate system for the elevation label from the list.
3. Click OK.

Changing the Associated Multi-View Block Definition

Use this procedure to change the multi-view block definition associated to an elevation label. For information about multi-view block definitions and elevation labels, see Creating User-Defined Elevation Labels on page 3481.

1. Select the elevation labels you want to change, and click Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties .

   NOTE Alternatively, right-click and choose Properties.

2. On the Properties palette, expand Basic, and expand General.
3. Select a different multi-view block definition for Definition.
Changing the Scale Factor of an Elevation Label

Use this procedure to change the scale factor of an elevation label.

1 Select the elevation labels you want to change, and click Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties .

**NOTE** Alternatively, right-click and choose Properties.

2 On the Properties palette, expand Basic, and expand Scale.

3 Change the scale factor of the elevation label:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the X scale factor</td>
<td>enter a new value for X.</td>
</tr>
<tr>
<td>change the Y scale factor</td>
<td>enter a new value for Y.</td>
</tr>
<tr>
<td>change the Z scale factor</td>
<td>enter a new value for Z.</td>
</tr>
</tbody>
</table>

Changing the Offset of an Elevation Label

Use this procedure to change the offset of the elevation label from its insertion point.

When you add an elevation label to a drawing, the offset value is set to 0. You can change the position of the elevation label in the drawing by offsetting it from its original insertion point.

1 Select the elevation label you want to change and click Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties .

**NOTE** Alternatively, right-click and choose Properties.

2 On the Properties palette, expand Advanced.

3 Click next to Insertion Offsets.

4 Select the view block for the appropriate view. For example, to change the offset in Plan 1:100, select a view block to indicate that it belongs to that view (for example, ElevationLabel100).
5 Change the offset of the elevation label from its insertion point:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the offset from the X insertion point</td>
<td>enter a new value for X offset.</td>
</tr>
<tr>
<td>change the offset from the Y insertion point</td>
<td>enter a new value for Y offset.</td>
</tr>
<tr>
<td>change the offset from the Z insertion point</td>
<td>enter a new value for Z offset.</td>
</tr>
</tbody>
</table>

6 Click OK.

**Display the View Blocks and Attributes of an Elevation Label**

Use this procedure to display the blocks and attributes contained in an elevation label.

An elevation label is created from a multi-view block definition which, in turn, is built from blocks and attributes. You can display the blocks and attributes to understand how the label is structured.

1 Select the elevation label for which to display blocks and attributes, and click Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties.

   **NOTE** Alternatively, right-click and choose Properties.

2 On the Properties palette, expand Advanced.

3 Click next to Attributes.

   In the Multi-view Block Attributes worksheet, the blocks from which your elevation label is composed are displayed. The list on the right shows the attributes of the blocks and their current values.

   For more information about multi-view blocks, blocks, and attributes, see Creating User-Defined Elevation Labels on page 3481.
NOTE Although you can edit the values in the list, those modifications are not applied; your modified values are overwritten by the values the elevation label gets from its coordinate system.

4 Click OK.

Attaching Hyperlinks, Notes, or Files to an Elevation Label

Use this procedure to attach hyperlinks, text notes, and files to an elevation label.

1 Select the elevation label to which you want to attach information, and click Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties.

NOTE Alternatively, right-click and choose Properties.

2 On the Properties palette, click the Extended Data tab.

3 To add a hyperlink, click next to Hyperlink, and specify the link.

For more information, see “Add Hyperlinks to a Drawing” in AutoCAD help.

4 Click next to Notes, add a note, and then click OK.

5 Click next to Reference Documents.

6 Attach or detach reference files:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click , select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
</tbody>
</table>
If you want to… Then…
detach a reference file select the file name, and click.

7 Click OK.

Creating User-Defined Elevation Labels

The AutoCAD Architecture templates provide a number of predefined elevation labels. You may, however, want to create specific labels that are not included in any of the templates.

You can choose attributes for your own elevation labels, combine them into blocks, and create elevation labels from them.

Process Overview: Creating User-Defined Elevation Labels

Creating a user-defined elevation label consists of these basic steps:

1 Determine the location of the property set definition of the custom label.
2 If necessary, create a new property set definition to use in the custom label.
3 Create a graphic symbol.
4 Add attributes from the property set definition to the drawing.
5 Create a block from the attributes.
6 Create a multi-view block from the block.
7 Add the elevation label to DesignCenter™.

Creating a Graphic Symbol

Elevation labels usually consist of a graphic symbol and attributes that define elevation height and other information.

You can create a graphic symbol with any of the drawing commands in AutoCAD, or you can import a symbol from another drawing or from a symbol library.
For information about drawing objects in AutoCAD, see “Create and Use Blocks (Symbols)” in AutoCAD help.

**Adding Attributes**

Use this procedure to add attributes to an elevation label.

An elevation label usually contains attributes for displaying the elevation, prefixes, and suffixes.

Elevation label attributes come from a property set definition. Predefined attributes are available when you start with one of the templates, or when you start from scratch and drag a predefined elevation label from DesignCenter™ into the drawing.

<table>
<thead>
<tr>
<th>Attribute label attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute/Tag</td>
<td></td>
</tr>
<tr>
<td>ELEVATION</td>
<td>Displays the height of an elevation label in relation to the coordinate system chosen.</td>
</tr>
<tr>
<td>ELEVATION:MM</td>
<td>Displays the millimeters of the elevation value in superscript. You need this attribute only when working with metric units.</td>
</tr>
<tr>
<td>PREFIX</td>
<td>To enter a prefix for the elevation label, you must add this attribute. For more information about entering prefixes, see Creating Elevation Labels with User-Specified Settings on page 3473.</td>
</tr>
<tr>
<td>SUFFIX</td>
<td>To enter a suffix for the elevation label, you must add this attribute. For more information about entering suffixes, see Creating Elevation Labels with User-Specified Settings on page 3473.</td>
</tr>
</tbody>
</table>

To use different attributes in elevation labels, create your own Property Set Definition for elevation labels. For more information, see Property Set Definitions on page 3823.

1. Click Insert tab ➤ Attributes panel ➤ Define Attributes .
For Tag, enter one of the attributes from the table. For example, to create an attribute for the height of the elevation, enter 
-ELEVATION.

Proceed with creating the attribute. For more information, see “Attach Data to Blocks (Block Attributes)” in AutoCAD help.

Repeat steps 1–3 for each attribute you want to add to the elevation label.

Creating a Block

Use this procedure to create a block from the attributes you have created.

1 Click Insert tab ➤ Block panel ➤ Create Block ✎.
2 Enter a name for the block.
3 Click Select Objects, and select the graphic symbol and the attributes to include in the elevation label.
4 For Insert Units, select Unitless.
5 Proceed with creating the block as described in “Block Definition Dialog Box” in AutoCAD help.

Creating a Multi-View Block

Use this procedure to create a multi-view block for the elevation label.

For detailed information about multi-view blocks, see Multi-View Blocks on page 2891.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ☑.
2 Expand Multi-Purpose Objects, and expand Multi-View Block Definitions.
3 Right-click Multi-View Block Definitions, and click New.
4 Enter a name for the new multi-view block definition.
5 Select the new multi-view block definition.
6 Click the View Blocks tab.
7 Select a display representation for the elevation label.
8 Click Add.
9 Select the block you defined in Creating a Block on page 3483, and click OK.
10 Select the view directions for the block.
11 Repeat steps 6–9 for each display representation where you want the elevation label to display.
12 Click OK.

Adding the Elevation Label to the AutoCAD DesignCenter

Use this procedure to add user-defined elevation labels to DesignCenter.

To add the elevation label to AutoCAD DesignCenter, you need to create a DWG file in the AEC Content Wizard. For a detailed description of the AEC Content Wizard, see Using the AEC Content Wizard on page 3917.

1 On the command line, enter **AecCreateContent**.
2 Select Custom Command.
3 Select the multi-view block you created in *Creating a Multi-View Block* on page 3483, and click Add to add it to the Content File.
4 For the Command string, enter **AecAnnoScheduleTagAdd**, followed by a space and then the name of the multi-view block, and its parameters. The command is built as follows:

```
_AecAnnoScheduleTagAdd <name of the drawing containing the property set definition>.dwg _SYMBOL <name of the multi-view block created> _LEADER _None _DIMSTYLE _Current
```

In our example, the custom command could look like this:

```
_AecAnnoScheduleTagAdd ElevationLabelPropertySetDefs.dwg _SYMBOL ElevationLabelMVBlock _LEADER _None _DIMSTYLE _Current
```

5 Click Next.
6 Select Enable AEC Unit Scaling.
7 Select a layer key for the label.

**NOTE** The default layer key for elevation labels is **DIMLINE**.

8 Click Next.
9 Enter a file name and a folder for the label.
**NOTE** Be sure to save the custom label in a folder one level below the used property set definition drawing. If the property set definition drawing is saved in `C:\ProgramData\Autodesk\ACA 2012\enu\AEC\Content\Metric\Documentation\Elevation Labels`, then the custom label could be saved in `C:\ProgramData\Autodesk\ACA 2012\enu\AEC\Content\Metric\Documentation\Elevation Labels\Custom Labels`.

10 Click Finish.
Fields

A field is a multiline text object consisting of a field name and a field value which can be automatically updated to show the latest value for data that may change during the lifecycle of the project. Fields enhance the documentation capabilities within a drawing file and add value to the drawing data.

Fields Overview

Fields are updatable data units within an AutoCAD Architecture drawing. Fields can be entered into the drawing as standalone multi-text elements, as components of AutoCAD text elements or table cells, as attribute values or as part of AutoCAD Architecture property set data. You can choose from a number of field types specific to architectural processes and tasks. For a complete list, see AutoCAD Architecture Field Types on page 3505.

You can update field values on demand or specify various automatic update mechanisms, for example updating a field when the drawing is opened or saved.

For detailed information about AutoCAD field types, see “Use Fields in Text” in AutoCAD help.

TIP The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

You can use fields in the following drawing components:

AutoCAD Text Elements

You can insert fields into AutoCAD text, multi-line text, table cells and attributes. When you insert fields in attributes, you can create interactive annotation that
displays sheet numbers, project details, and other important information. For an example, see Creating New Callout Tools on page 3732.

**Property Set Data**

Fields can be inserted in property set data. You can insert a field into a property set definition, thereby adding it to any object or object style to which the property set is attached. You can also insert a field in any manual property attached to an object or style, using the manual property as a placeholder for the field.

Property set data can be used to create schedule tables of objects and drawings, or to build tags, annotation, and other content. Schedule reports can be placed in an AutoCAD Architecture drawing, or they can be exported to XLS, tab-delimited text, or comma-separated text.

**Annotation Tools**

AutoCAD Architecture provides a number of predefined annotation tools that use different kinds of fields. For example, keynote tools use keynote fields, while callout tools use sheet set fields.

You can also use fields to create your own annotation tools. For an example, see Creating New Callout Tools on page 3732.
Inserting Fields

Fields can be inserted directly into drawings, or as components of other elements. When a field is inserted directly, it is entered as a multiline text element. You can also insert it in existing text and multiline text, tables cells, attributes, and property set definitions.

Inserting Fields in a Drawing

You can create field anywhere in a drawing. When a field is inserted directly, and not within another element, it is created as a multiline text element.
1 Click Annotate tab ➤ Text panel ➤ Field.

2 Select a field category to choose from.

3 Select a field, and if necessary, specify additional information regarding this field.
   For example, if you want to insert a Plot Date field, you need to specify the date format.

4 Click OK.

5 Insert the field in the drawing.

   **If you want to...**  **Then...**

   - insert the field directly: click where the field should be inserted in the drawing area.
   - change the height of the field: enter h (Height) on the command line and press Enter. Enter the new height and press Enter again. Then, select the insertion point.
   - change the orientation of the preview cursor: enter j (Justify) and press Enter. Enter the combination for the desired orientation,
If you want to… Then…
and press Enter. Then, select the insertion point.

Date field inserted in drawing

Creation Date: 1/1/2009

Inserting Fields in Property Set Definitions

Use this procedure to insert a field in a property set definition.

When you insert a field in a property set definition, the field will appear in the properties of any object or object style that has the property set attached.

**NOTE** Fields are always contained in manual properties.

Wall properties with keynote, date, and sheet number fields

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2. In the Style Manager, expand Documentation Objects, and then expand Property Set Definitions.
3. Either click an existing property set definition, or right-click, and click New.
4 Click the Definition tab.

5 Click \( \text{to create a manual property.} \)

6 Enter a name for the manual property, such as Keynote.

7 Verify that DEFAULT is selected for Start With.

8 Click OK.

9 Verify that Text is selected for Type.

10 Right-click in the Default field, and select Insert Field.
11 Define and insert the field and its format.

<table>
<thead>
<tr>
<th>If you want to insert a ...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time, document, hyperlink, object, system variable, Diesel expression, or plot field</td>
<td>see “Use Fields in Text” in AutoCAD help.</td>
</tr>
<tr>
<td>project field</td>
<td>see Selecting a Project Field on page 3506.</td>
</tr>
<tr>
<td>sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>
Inserting Field Placeholders in Object Properties

Use this procedure to insert a field placeholder in the properties of an individual object.

You can add a field to the properties of an individual object by creating a manual property as a placeholder for the field, to be filled when necessary. This would be useful if you want to add information that is different for each object and needs to be updatable.

Creating the placeholder

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ Style Manager.
2. In the Style Manager, expand Documentation Objects, and then expand Property Set Definitions.
3. Either click an existing property set definition, or right-click, and click New.
4. Click the Definition tab.
5. Click to create a manual property.
6. Enter a name for the manual property, such as LinkedFile.
7. Verify that DEFAULT is selected for Start With.
8. Click OK.
9. Verify that Text is selected for Type.

NOTE Do not enter any text in the Default field.

10. Click OK.

Inserting a field in the placeholder

11. Double-click the object in the drawing, and on the Extended Data tab of the Properties palette, click .
12. Select the property set containing the manual property, and click OK.
13 Right-click in the empty manual property, and click Insert Field.

14 Define and insert the field and its format.

<table>
<thead>
<tr>
<th>If you want to insert a...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time, document, hyperlink, object, system variable, Diesel expression, or plot field</td>
<td>see “Use Fields in Text” in AutoCAD help.</td>
</tr>
<tr>
<td>project field</td>
<td>see Selecting a Project Field on page 3506.</td>
</tr>
<tr>
<td>sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>

15 Define and insert the field and its format.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a date/time, document, hyperlink, object, system variable, Diesel expression, or plot field,</td>
<td>see “Use Fields in Text” in AutoCAD help.</td>
</tr>
</tbody>
</table>
If you want to… Then…

<table>
<thead>
<tr>
<th>Insert a project field</th>
<th>see Selecting a Project Field on page 3506.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert a sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>Insert a keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>Insert a database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>

In this example, you would likely insert a hyperlink to another file, selecting Linked for Field category and then selecting a file as the hyperlink.

Adding Fields to Object Style Properties

Use this procedure to add fields to object style properties.

Once a field has been inserted into a property set, you can add the field to an object style by attaching the property set to the style. All objects of that style will then have the property set attached.

1 Create a property set definition containing the necessary fields, as described in Inserting Fields in Property Set Definitions on page 3491.

2 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.

3 In the Style Manager, expand Architectural Objects, and expand the object type for which you want to add a field.

4 Click an existing object style.

5 Click the General tab, and click Property Sets.

6 Click click ➤.

7 Select the property set that contains the field.

8 Click OK three times.
NOTE You can view and edit the style property set data on the object’s Properties palette, just like the object property set data. To edit property set data from a style on the Properties palette, click the worksheet button ( )

Inserting Fields in AutoCAD Text Elements
You can insert fields in the following types of AutoCAD text elements:

- Text
- Multiline text (mtext)
- Attributes
- Table cells

Inserting Fields in AutoCAD Text
Use this procedure to insert fields into AutoCAD text elements.
For information on creating text elements, see “Create Single-Line Text” in AutoCAD help.

1 Select the AutoCAD text in which you want to insert a field.
2 Right-click, and click Text Edit.
3 Right-click at the point within the text where you want to insert a field, and click Insert Field.
4 Define the field and its format.

If you want to insert a … Then…

date/time, document, hyperlink, object, system variable, Diesel expression, or plot field see “Use Fields in Text” in AutoCAD help.

project field see Selecting a Project Field on page 3506.

sheet set field see Selecting a Sheet Set Field on page 3510.
If you want to insert a ... Then...

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>

5 Click OK.

**Inserting Fields in AutoCAD Multiline Text**

Use this procedure to insert fields into AutoCAD multiline text.

For information on creating Multiline text elements, see “Create Multiline Text” in AutoCAD help.

1 Select the AutoCAD multiline text in which you want to insert a field.
2 Right-click, and click Mtext Edit.
3 In the Multiline Text Editor, right-click within the Text at the point where you want to insert the field, and click Insert Field.

**NOTE** Alternatively, click within the Text at the point where you want to insert the field, and click Text Editor tab ➤ Insert panel ➤ Field.

4 Define the field and its format.

<table>
<thead>
<tr>
<th>If you want to insert a ...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time, document, hyper-</td>
<td>see “Use Fields in Text” in AutoCAD help.</td>
</tr>
<tr>
<td>link, object, system variable,</td>
<td></td>
</tr>
<tr>
<td>Diesel expression, or plot field</td>
<td></td>
</tr>
<tr>
<td>project field</td>
<td>see Selecting a Project Field on page 3506.</td>
</tr>
<tr>
<td>sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
</tbody>
</table>
If you want to insert a database field, then see Selecting a Database Field on page 3516.

5 Click OK.

Inserting Fields in AutoCAD Attributes

Use this procedure to insert fields into AutoCAD attributes.

Attributes are often used to provide design and documentation content for tools. When combined with graphics, they can be used as annotation symbols.

Field attributes in callout symbol

1 Click Insert tab ➤ Attributes panel ➤ Define Attributes.
2 Enter a name in the Tag field.
3 Under Value, click .

4 Define the field and its format.

<table>
<thead>
<tr>
<th>If you want to insert a ...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time, document, hyperlink, object, system variable, Diesel expression, or plot field</td>
<td>see “Use Fields in Text” in AutoCAD help.</td>
</tr>
<tr>
<td>project field</td>
<td>see Selecting a Project Field on page 3506.</td>
</tr>
<tr>
<td>sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>

5 Click OK.
Inserting Fields in AutoCAD Table Cells

Use this procedure to insert fields into AutoCAD table cells.

For information on creating AutoCAD tables, see “Create and Modify Tables” in AutoCAD help.

1 Select the AutoCAD table cell in which you want to insert a field, and double-click it.
2 Right-click, and click Insert Field.

**NOTE** Alternatively, click Table Cell tab ➤ Insert panel ➤ Field.

3 Define the field and its format.

<table>
<thead>
<tr>
<th>If you want to insert a…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>date/time, document, hyperlink, object, system variable, Diesel expression, or plot field</td>
<td>see &quot;Use Fields in Text&quot; in AutoCAD help.</td>
</tr>
<tr>
<td>project field</td>
<td>see Selecting a Project Field on page 3506.</td>
</tr>
<tr>
<td>sheet set field</td>
<td>see Selecting a Sheet Set Field on page 3510.</td>
</tr>
<tr>
<td>keynote field</td>
<td>see Selecting a Keynote Field on page 3513.</td>
</tr>
<tr>
<td>database field</td>
<td>see Selecting a Database Field on page 3516.</td>
</tr>
</tbody>
</table>

4 Click OK.

Editing Fields

Use this procedure to edit a field.

Fields can be contained in AutoCAD text, multiline text (mtext), table cells, attributes, property set definitions, object properties, and object styles. For information on inserting fields, see Inserting Fields on page 3489.
When you edit a field, you can change the field value, the field category, and the field format.

1. Navigate to the field you want to edit.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>edit a field in AutoCAD text</td>
<td>select the text element, right-click, and click Text Edit. Then, select the field, right-click, and click Edit Field.</td>
</tr>
<tr>
<td>edit a field in multiline text</td>
<td>select the multiline text element, right-click, and click MText Edit. Then, select the field, right-click, and click Edit Attribute.</td>
</tr>
<tr>
<td>edit a field in an attribute</td>
<td>select the tool or block containing the attribute field, right-click, and click Edit Attributes. Then, select the field value, right-click, and click Edit Field.</td>
</tr>
<tr>
<td>edit a field in a table cell</td>
<td>select the table cell, and double-click it. Then, right-click the field, and click Edit Field.</td>
</tr>
<tr>
<td>edit a field in a property set definition</td>
<td>open the property set definition in Style Manager, and click the Definition tab. Select the field property. Right-click the field value in the Default field, and click Edit Field.</td>
</tr>
<tr>
<td>edit a field in an object style</td>
<td>open Style Manager and open the style. On the General tab, click Property Sets. Then, select the field value you want to change, right-click, and click Edit Field.</td>
</tr>
<tr>
<td>edit a field in the properties of an object</td>
<td>select the object and double-click it. Then, select the field, right-click, and click Edit Field.</td>
</tr>
</tbody>
</table>
If you want to… Then…

Select the field value you want to change, right-click, and click Edit field.

2 Change the field as necessary.

The editable parameters of a field vary depending on the type of field. In date related fields, for example, you can change the date format of the field.

If you want to… Then…

change the field category select a new category under Field category, and then select a new field under Field name.

change the field select a new field under Field name.

change the field formatting select a different format under Format.

3 Click OK.
Editing the Field Display

You can choose if you want to display a field in your drawing with a grey background rectangle or with a transparent background. A grey background helps you identify field values within your drawings easily. In some cases however when you want to display the field value just like other text or attribute values, you can turn off the grey background.

Field display with grey background (left) and transparent (right)

1 On the command line, enter FIELDDISPLAY.
2 Select a value for the display of field backgrounds.
   ■ To display the background of a field value in grey, enter 1.
   ■ To display the background of a field value as transparent, enter 0.

**TIP** By default the field display value is set to 1.

Updating Fields

Use this procedure to update a field manually.

By default fields are updated automatically when the drawing is opened, saved, plotted, regenerated, or sent via e-transmit. For more information, see “Update Fields” in AutoCAD help.

If you have changed that default, or want to update a field without performing any of the operations listed above, you can do so by updating the field manually.

1 Navigate to the field you want to update.

Fields can be contained in AutoCAD text, multiline text (mtext), table cells, attributes, property set definitions, object properties, object styles, and project details. For information about inserting fields in text components, see Inserting Fields on page 3489.
2 Select the field, and double-click the text. Then, select the text, right-click, and click Update Field.

TIP To update all fields in the drawing, click Annotate tab ➤ Text panel ➤ ➤ Update Fields. Then, select the fields to update and press ENTER.

Converting Fields to Text

Use this procedure to convert a field to text.

NOTE This procedure cannot be reversed.

1 Navigate to the field you want to convert to text. Fields can be contained in AutoCAD text, multiline text (mtext), table cells, attributes, property set definitions, object properties, object styles, and project details. For information about inserting fields in text components, see Inserting Fields on page 3489.

2 Select the field, right-click, and click Convert Field to Text.

AutoCAD Architecture Field Types

There are a number of field types that have been created specifically for AutoCAD Architecture users. These fields are generated by information from AutoCAD Architecture projects, keynotes, and databases connected to an AutoCAD Architecture drawing.

Project Fields

AutoCAD Architecture has a number of fields for project-specific information. You could use project fields for example in title blocks on plotting sheets.

The following project-specific fields are available in AutoCAD Architecture:

- Project Name
- Project Number
- Project Description
Selecting a Project Field

Use this procedure to select a project field to insert into a drawing.

1 Open the Field dialog box from one of the following components:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a project field into a</td>
<td>see Inserting Fields in AutoCAD Text Elements on page 3497.</td>
</tr>
<tr>
<td>text element</td>
<td></td>
</tr>
<tr>
<td>insert a project field into a</td>
<td>see Inserting Fields in AutoCAD Multiline Text on page 3498.</td>
</tr>
<tr>
<td>multiline text (mtext) element</td>
<td></td>
</tr>
<tr>
<td>insert a project field into an</td>
<td>see Inserting Fields in AutoCAD Table Cells on page 3501.</td>
</tr>
<tr>
<td>AutoCAD table cell</td>
<td></td>
</tr>
<tr>
<td>insert a project field into an</td>
<td>see Inserting Fields in AutoCAD Attributes on page 3499.</td>
</tr>
<tr>
<td>attribute definition</td>
<td></td>
</tr>
<tr>
<td>insert a project field into a</td>
<td>see Inserting Fields in Property Set Definitions on page 3491.</td>
</tr>
<tr>
<td>property set definition</td>
<td></td>
</tr>
<tr>
<td>insert a project field into an</td>
<td>see Inserting Field Placeholders in Object Properties on page 3494.</td>
</tr>
<tr>
<td>object property</td>
<td></td>
</tr>
<tr>
<td>insert a project field into an</td>
<td>see Adding Fields to Object Style Properties on page 3496.</td>
</tr>
<tr>
<td>object style</td>
<td></td>
</tr>
</tbody>
</table>
2 Under Field Category, select AEC Project.

3 Select the field you want to insert.

4 If you have selected Project Details, you need to select the detail from the categories listed under Project Information.

5 Under Format, select a text format for the field. You can choose between Uppercase, Lowercase, First Capital, and Title case.

6 Click OK.

**Sheet Set Fields**

AutoCAD Architecture has a number of fields for sheet set information.

**NOTE** Sheet set fields can be used for AutoCAD Architecture project sheet sets and for AutoCAD sheet sets. For information about AutoCAD Architecture project sheet sets, see Sheets on page 481. For information about AutoCAD sheet sets, see “Work with Sheets in a Sheet Set” in AutoCAD help.
The following sheet set fields are available:

- **Current Sheet Custom**: You can select an AutoCAD custom property defined for the current sheet here.

  **NOTE** When you are working with an AutoCAD Architecture project sheet set, you will in most cases use Project Details instead of Custom Properties.

- **Current Sheet Description**
- **Current Sheet Number**
- **Current Sheet Number and Title**
- **Current Sheet Set**
- **Current Sheet Set Custom**: You can select an AutoCAD custom property defined for the current sheet here.
- **Current Sheet Set Description**
- **Current Sheet Subset**
- **Current Sheet Title**

- **Sheet Set**: You can select any sheet from a sheet set as the field content here. Available sheet properties for display are the sheet title, sheet number and sheet description.

- **Sheet Set Placeholder**: In the Sheet Set Placeholder field category, you can define a field as a placeholder for sheets and sheet views. You often use that functionality in callouts referenced to model space views, that are later referenced into sheets. The field placeholder in the callout is resolved when the model space view is linked into a sheet. For more information, see Creating New Callout Tools on page 3732. The following fields are available as placeholders:
  - **Sheet Number and Title**
  - **Sheet Title**
  - **Sheet Number**
  - **Sheet Description**
  - **Sheet custom**: You can select an AutoCAD custom property defined for the referenced sheet here.
  - **(Model Space) View Number and Title**
(Model Space) View Title

(Model Space) View Number

(Model Space) Viewport Scale

NOTE The fields for sheet title, sheet number, sheet description, view title, and view number can be associated with a hyperlink that jumps to the sheet or model space view referenced.

Callout symbol with sheet set placeholder

Resolved sheet set placeholders
## Selecting a Sheet Set Field

Use this procedure to select a sheet set field to insert into a drawing.

1. Open the Field dialog box from one of the following components:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a sheet set field into a text element</td>
<td>see <a href="#">Inserting Fields in AutoCAD Text Elements</a> on page 3497.</td>
</tr>
<tr>
<td>insert a sheet set field into a multiline text (mtext) element</td>
<td>see <a href="#">Inserting Fields in AutoCAD Multiline Text</a> on page 3498.</td>
</tr>
<tr>
<td>insert a sheet set field into an AutoCAD table cell</td>
<td>see <a href="#">Inserting Fields in AutoCAD Table Cells</a> on page 3501.</td>
</tr>
<tr>
<td>insert a sheet set field into an attribute definition</td>
<td>see <a href="#">Inserting Fields in AutoCAD Attributes</a> on page 3499.</td>
</tr>
<tr>
<td>insert a sheet set field into a property set definition</td>
<td>see <a href="#">Inserting Fields in Property Set Definitions</a> on page 3491.</td>
</tr>
<tr>
<td>insert a sheet set field into an object property</td>
<td>see <a href="#">Inserting Field Placeholders in Object Properties</a> on page 3494.</td>
</tr>
<tr>
<td>insert a sheet set field into an object style</td>
<td>see <a href="#">Adding Fields to Object Style Properties</a> on page 3496.</td>
</tr>
</tbody>
</table>

2. Under Field Category, select SheetSet.
Under Field Names, all sheet set-related fields are displayed.

3 Select the field you want to insert.

4 If you have selected CurrentSheetSetCustom or CurrentSheetCustom, select the desired property under Custom property name.

5 If you have selected SheetSet, you can select any sheet set and any sheet to be displayed in the field. You can insert the sheet set or sheet field as a hyperlink, so that clicking on the field in the drawing will open the sheet or sheet set associated to the field.

If necessary, browse to a different sheet set.

6 If you have selected SheetSetPlaceholder, select the correct placeholder under Placeholder Type.

**NOTE** The fields for sheet title, sheet number, sheet description, view title, and view number can be created as a hyperlink that jumps to the sheet or model space view referenced.

7 Under Format, select a text format or data format for the field.

8 Click OK.
Keynote Fields

Keynoting is a consistent way of annotating the different types of drawings in a set of construction documents to identify building materials or to provide special instructions or explanations. AutoCAD Architecture provides a flexible tool-based method of inserting keynotes that are linked to a keynote database and thus can be modified globally as well as individually. This method supports both reference keynoting (where the keynote key corresponds to a section in an accompanying specification and may appear on different drawings) and sheet keynoting (where keynote keys are sequentially numbered for each drawing). AutoCAD Architecture supplies pre-specified keynotes for its size-specific default detail components and for architectural objects that represent assemblies with multiple components (for example, 8” CMU wall). In cases where no keynotes are pre-specified, you can configure a keynote insertion tool containing a keynote field.

Keynotes with field

The following keynote fields are available in AutoCAD Architecture:

- Reference Key only
- Reference Note only
- Reference Key and Note
- Sheet Key only
- Sheet Note only
- Sheet Key and Note
You can also insert keynote fields as placeholders that are filled in when they are connected to a building object.

For detailed information on keynotes, see Keynoting Tools on page 3608.

Selecting a Keynote Field

Use this procedure to select a keynote field into a drawing.

1 Open the Field dialog box from one of the following components:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a keynote field into a text element</td>
<td>see Inserting Fields in AutoCAD Text Elements on page 3497.</td>
</tr>
<tr>
<td>insert a keynote field into a multiline text (mtext) element</td>
<td>see Inserting Fields in AutoCAD Multiline Text on page 3498.</td>
</tr>
<tr>
<td>insert a keynote field into an AutoCAD table cell</td>
<td>see Inserting Fields in AutoCAD Table Cells on page 3501.</td>
</tr>
<tr>
<td>insert a keynote field into an attribute definition</td>
<td>see Inserting Fields in AutoCAD Attributes on page 3499.</td>
</tr>
<tr>
<td>insert a keynote field into a property set definition</td>
<td>see Inserting Fields in Property Set Definitions on page 3491.</td>
</tr>
<tr>
<td>insert a keynote field into an object property</td>
<td>see Inserting Field Placeholders in Object Properties on page 3494.</td>
</tr>
<tr>
<td>insert a keynote field into an object style</td>
<td>see Adding Fields to Object Style Properties on page 3496.</td>
</tr>
</tbody>
</table>

2 Under Field Category, select AEC Keynotes.
Under Field Names, all keynote-related fields are displayed.

3 Under Field Names, select the type of keynote field you want to insert.
4 Click Select Keynote to select a keynote from a database.
5 If you want to insert pre-specified keynotes or prompt for manual keynote selection when the keynote is inserted, select Insert as placeholder.
6 If you have selected Reference Key and Note or Sheet key and Note, select a keynote format.
7 Under Format, select a text format for the keynote field.
8 Click OK.

Database Fields

Database fields allow the user to insert a formatted cell from a database into a drawing. A database field consists of a single field of a query or table in a database. This enables users to work with data in a full database environment, creating reports, queries, links to other databases, and link that data into any drawing.
Supported Data Types

The following data types are supported in AutoCAD Architecture database fields:

- Text
- Memo
- Date/Time
- Integer
- Real
- Boolean

All other data types are ignored and will not display in the drawing.

Supported Database Providers and Data Sources

The following database providers are supported in AutoCAD Architecture:

- Microsoft Jet 4.0 OLE DB Provider (Access)
- Microsoft OLE DB Provider for ODBC Drivers

These database providers let you link to the following data sources:

- Microsoft Access database (MDB)
- Microsoft Excel file (XLS)
- Microsoft Text file (TXT, CSV)

The database fields support secure databases in as far as the Microsoft Data Link feature supports them. They may need to encrypt the connection information so as to prevent the wrong users from inadvertently gaining knowledge of the passwords.

The database fields support multi-user access.

Creating a Database Link to a 64-bit Data Source

If you are using a computer with 64-bit architecture, you can create a link to a database source using the 64-bit model. You can also link to any legacy 32-bit data sources.
Selecting a Database Field

Use this procedure to select a database field to insert into a drawing.

1. Open the Field dialog box from one of the following components:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a database field into a text element</td>
<td>see Inserting Fields in AutoCAD Text Elements on page 3497.</td>
</tr>
<tr>
<td>insert a database field into an multiline text (mtext) element</td>
<td>see Inserting Fields in AutoCAD Multiline Text on page 3498.</td>
</tr>
<tr>
<td>insert a database field into an AutoCAD table cell</td>
<td>see Inserting Fields in AutoCAD Table Cells on page 3501.</td>
</tr>
<tr>
<td>insert a database field into an attribute definition</td>
<td>see Inserting Fields in AutoCAD Attributes on page 3499.</td>
</tr>
<tr>
<td>insert a database field into a property set definition</td>
<td>see Inserting Fields in Property Set Definitions on page 3491.</td>
</tr>
<tr>
<td>insert a database field into an object property</td>
<td>see Inserting Field Placeholders in Object Properties on page 3494.</td>
</tr>
<tr>
<td>insert a database field into an object style</td>
<td>see Adding Fields to Object Style Properties on page 3496.</td>
</tr>
</tbody>
</table>

2. Under Field Category, select AEC Database.
3 Under Field Names, select DatabaseField.

4 To select an existing database link file (UDL), click ![link icon].
   
   In the Select Data Link dialog box, browse for the required UDL file.

5 To create a new database link file (UDL), click one of the following buttons:

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![32-bit icon]</td>
<td>Use this button if you want to create a new UDL link on a 32-bit computer.</td>
</tr>
<tr>
<td>![64-bit icon]</td>
<td>Use this button if you are working on a 64-bit computer, but want to create a link to a 32-bit data source.</td>
</tr>
<tr>
<td>![64-bit icon]</td>
<td>Use this button if you are working on a 64-bit computer, and want to create a link to a 64-bit data source.</td>
</tr>
</tbody>
</table>
For more information, see Creating a Data Link to an ODBC Source on page 3519.

6 Under Path Type, specify whether you want a full path to the database or a relative path.

7 Under Select a table or query from the database, select a table or query.
   - To select a database table, expand Tables and click on the desired table entry.
   - To select a database query, expand Queries and click on the desired query.

8 Under Select a record and a field from the table, select the database field you want to insert in the drawing.

   **NOTE** You can preview the database field value in the static text field on the top right of the Field dialog. You can preview the field expression under Field expression at the bottom of the dialog.

**Formatting the field or query**

9 Under Format, select a text format.

   If you have selected a field or query that does not retrieve a text string, you can format the value with an existing property data format.

10 Click Set From Property Data format.

![Set from Property Data Format dialog]

11 Select a property data format, and click OK.

   The settings of the selected property data format are copied to the format codes in the field.

12 Click OK to insert the database field in the drawing.
Creating a Data Link to an ODBC Source

You can link data from a number of data sources to an AutoCAD Architecture drawing. You can use the following database providers for linking to data sources:

- Microsoft Jet 4.0 OLE DB Provider (Access)
- Microsoft OLE DB Provider for ODBC Drivers

These database providers let you link to the following data sources:

- Microsoft Access database (MDB)
- Microsoft Excel file (XLS)
- Microsoft Text file (TXT, CSV)

NOTE The instruction below describes the process of creating a link to a data source from a Microsoft Excel file. In the same way, can create data links to Microsoft Access databases, plain ASCII text files, and comma-separated files.

1. Open the Field dialog box from one of the following components:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>insert a database field into a text element</td>
<td>see Inserting Fields in AutoCAD Text Elements on page 3497.</td>
</tr>
<tr>
<td>insert a database field into an multiline text (mtext) element</td>
<td>see Inserting Fields in AutoCAD Multiline Text on page 3498.</td>
</tr>
<tr>
<td>insert a database field into an AutoCAD table cell</td>
<td>see Inserting Fields in AutoCAD Table Cells on page 3501.</td>
</tr>
<tr>
<td>insert a database field into an attribute definition</td>
<td>see Inserting Fields in AutoCAD Attributes on page 3499.</td>
</tr>
<tr>
<td>insert a database field into a property set definition</td>
<td>see Inserting Fields in Property Set Definitions on page 3491.</td>
</tr>
<tr>
<td>insert a database field into an object property</td>
<td>see Inserting Field Placeholders in Object Properties on page 3494.</td>
</tr>
</tbody>
</table>
If you want to… Then…

insert a database field into an object style see Adding Fields to Object Style Properties on page 349.

2 Under Field Category, select AEC Database.

3 Under Field Names, select DatabaseField.

4 Click one of the following buttons:

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="32-bit.png" alt="32-bit" /></td>
<td>Use this button if you want to create a new UDL link on a 32-bit computer.</td>
</tr>
<tr>
<td><img src="64-bit.png" alt="64-bit" /></td>
<td>Use this button if you are working on a 64-bit computer, but want to create a link to a 32-bit data source.</td>
</tr>
<tr>
<td><img src="64-bit.png" alt="64-bit" /></td>
<td>Use this button if you are working on a 64-bit computer, and want to create a link to a 64-bit data source.</td>
</tr>
</tbody>
</table>
5 Click the Provider tab.

Creating a data link to a Microsoft Excel file

6 Select Microsoft OLE DB Provider for ODBC Drivers, and click Next.

7 In the Connection tab, click Use connection string.
8 Click Build.

9 Click New to build to a new DSN file.

10 In the Create New Data Source dialog box, select the Microsoft Excel Driver (*.xls).

NOTE The other supported drivers here are Microsoft Access Driver (*.mdb) and Microsoft Text Driver (*.txt, *.csv). You can use these to create a link to an Access database, a plain ASCII text file, or a comma-separated file.
11 Click Next.

12 Enter a name for the new DSN file, and click Next.

13 Confirm that your data source settings are correct, and click Finish.

14 In the ODBC Microsoft Excel Setup dialog box, select the version of Microsoft Excel that the DSN file should support.

15 Click Select Workbook.
16 Select an XLS file that should be used as your data source, and click OK three times until you are back in the Connection tab of the Data Link Properties dialog box.

![Data Link Properties dialog box](image)

The Microsoft Excel file you have selected as your data source is displayed under Connection String.

17 To verify that the connection to the data source is working correctly, click Test Connection.

18 Enter a user name and optionally a password for the database connection.

19 Under Enter the initial catalog to use, select the Excel file from the drop-down list.

20 Optionally, you can click the Advanced tab to define network and permission settings.

21 If you have selected a data source on a network server, you can define the network settings.

22 Define the access permissions for the data source.

23 Optionally, you can click the All tab to view and edit the OLE DB initialization properties available for the selected OLE DB provider.

24 Click OK.

25 In the Field dialog box, the selected Excel file is displayed as the data source.
You can select data tables and entries as described in Selecting a Database Field on page 3516.
Detail Components

AutoCAD Architecture uses a tool-based system for managing the components that make up detail drawings. In addition to the wide selection of pre-configured detail component insertion tools provided on the sample tool palettes and in the Sample Palette Catalog, an extensive database of components can be accessed through the Detail Component Manager. These components can be inserted directly into a drawing, or dragged and dropped onto tool palettes. All tools can be customized and are fully integrated with the keynoting feature. You can also use your own databases.

Understanding Detail Components

Detail components represent specific building materials and products, and are made up of simple two-dimensional (2D) linework entities such as lines, polylines, arcs, circles, and hatches. In most cases, the detail component is a collection of such entities grouped as a block, which can be easily copied or moved like a single entity. The following are examples of detail components that are inserted as blocks:

- Bolt heads
- Fixed-length nails
- Section views of beams and columns
- Most section views of framing members
- Units such as CMUs, bricks, and pavers
- Connectors
- Materials with views generated from interrelating parameters; for example, trusses, precast concrete, and hollow metal frames
Other detail components are inserted as loose linework entities if they represent material of variable length, amorphous shape, or something that would likely be cut or otherwise modified in the field. This is the case for views showing the length of a material, such as framing members, sheathing material, or fasteners, for which the detail component database does not include a fixed-length table.

Detail components are inserted into drawings parametrically, using a tool that prompts you for the information needed to perform the drawing routine associated with a particular component. Once inserted into a drawing, the components are largely static: although they can be rescaled or repositioned using Properties palette settings, they do not have object-like intelligence that allows for parameter modifications to the extent that architectural objects do. You can, however, perform various editing operations on detail components using the tools available on the ribbon and the context menu.

The Detail Component Manager provides a centralized location for storing and accessing detail components. Its filter mechanism lets you quickly locate a particular component in a database. You can then insert the component directly into a drawing, or, if you are likely to use it frequently, you can drag and drop it onto a tool palette for even more convenient access.

Many detail components are also available as tools on the default Detailing tool palettes, which can be transferred to the workspace from the Sample Palette Catalog. You can also create a tool by dragging a detail component from a drawing and dropping it onto a tool palette. Because detail component tools can be moved between tool palettes and tool catalogs, or copied over the Internet using i-drop® functionality, they are easily shared by project team members. Tools can be modified using the associated Tool Properties worksheet. You can also apply detail component tool properties to any linework within a drawing so that it can be reference-keynoted according to the organizational system you are using.

In addition to the database supplied with the software (based on the CSI MasterFormat™ 2004) you can add and access your own detail component databases as needed (see Configuring Detail Component Database Availability on page 3583). The Detail Component Manager includes a wizard that lets advanced users define the drawing routines and other parameters required to add new component tables to a database.

**Inserting Detail Components**

All detail components are inserted into drawings using the same basic tool, which performs the insertion routine associated with a selected component.
Each detail component tool provided on the sample tool palettes represents a different configuration of the basic tool. You can activate the detail component insertion tool in five different ways:

- Select a component in the Detail Component Manager, and click Insert Component (or double-click the component).
- Click a detail component tool icon on a tool palette.
- Drag and drop a detail component tool from a Content Browser tool catalog directly into a drawing.
- Select a component in a drawing, right-click, and click Add Selected. This reruns the tool with the same property settings used to insert the existing component, so that you can quickly insert additional copies of the same component.
- Select a component in a drawing, right-click, and click Replace Selected. This erases the selected component and reruns the tool with the same property settings used to insert the erased component; however, you can modify the tool to insert a different component by changing the Component properties (Category, Type, Description, or View) on the Properties palette.

Once the tool is activated, the procedure for inserting the detail component varies according to the type of material or product the component represents and the viewing direction. Some components are available only in one viewing direction. For example, a backfill component, such as gravel, is always oriented for a section view. On the other hand, a steel beam component is available in elevation view, section view, and plan view. The different drawing routines involve different prompts for user input. When depicting a variable-length material with a repeating pattern, such as corrugated sheet metal, you need to specify the start point and endpoint. In the case of bricks, you have the option of specifying a number of courses. For other products, such as screws or bolts, you may want to flip or rotate the component to change its orientation. The procedures described in the following sections offer examples of the basic insertion routines and options for detail components.

**Stamp Components**

Use this procedure to insert detail components that may need to be depicted multiple times at a particular orientation, such as nails or screws. In this example, the tool for inserting a steel beam has the View property set to Section.
1 Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.

2 Click an insertion point in the drawing area to insert the component at the default orientation, or select one of the following options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a different base point</td>
<td>enter b (for Base point), select the new base point, and press ENTER to insert the component using the new base point.</td>
</tr>
<tr>
<td>change the default orientation angle of the component</td>
<td>enter r (for Rotate), and then either enter the number of degrees to rotate the component in a counterclockwise direction, or manually rotate the component to the desired angle and click to set the new orientation. Click again to insert the component at the specified angle.</td>
</tr>
<tr>
<td>flip the component along its X axis</td>
<td>enter x (for Xflip), and click to insert the component.</td>
</tr>
<tr>
<td>flip the component along its Y axis</td>
<td>enter y (for Yflip), and click to insert the component.</td>
</tr>
</tbody>
</table>

3 Click elsewhere in the drawing area to “stamp” additional copies of the component, either at the default orientation or as specified in Step 2.

Steel beam component inserted at default orientation
Linear Array Components

Use this procedure to insert detail components that consist of a pattern repeated as a linear array, such as shingles or corrugated sheet metal. In this example, the tool for inserting corrugated sheet metal has the View property set to End, but the same user prompts are displayed if the View setting is Side.

1. Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.

2. Click a start point in the drawing area to insert the component at the default orientation, or select one of the following options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>flip the component</td>
<td>enter x (for Xflip), and then click to specify the</td>
</tr>
<tr>
<td>along its X axis</td>
<td>starting point for the component.</td>
</tr>
<tr>
<td>flip the component</td>
<td>enter y (for Yflip), and then click to specify the</td>
</tr>
<tr>
<td>along its Y axis</td>
<td>starting point for the component.</td>
</tr>
<tr>
<td>position the component</td>
<td>enter l (for Left), and then click to specify the</td>
</tr>
<tr>
<td>to the left of the</td>
<td>starting point for the component.</td>
</tr>
<tr>
<td>baseline when drawn</td>
<td></td>
</tr>
<tr>
<td>vertically</td>
<td></td>
</tr>
<tr>
<td>position the component</td>
<td>enter r (for Right), and then click to specify the</td>
</tr>
<tr>
<td>to the right of the</td>
<td>starting point for the component.</td>
</tr>
<tr>
<td>baseline when drawn</td>
<td></td>
</tr>
<tr>
<td>vertically</td>
<td></td>
</tr>
<tr>
<td>center the component</td>
<td>enter c (for Center), and then click to specify the</td>
</tr>
<tr>
<td>on the baseline when</td>
<td>starting point for the component.</td>
</tr>
<tr>
<td>drawn in any direction</td>
<td></td>
</tr>
</tbody>
</table>

3. Click the desired endpoint to insert the component.
Backfill Components

Use this procedure to insert backfill detail components, such as gravel or soil, that are positioned within a boundary provided by existing linework or an existing object. In this example, the tool for inserting Undisturbed Soil has the View property set to Section, which is the only view available for this type of component.

1. Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.
2. Select the object you want to be the boundary for the backfill.
3. Click within the boundary of the selected object to insert the backfill component.

Backfill component inserted within polyline boundary
Bookends Components

Use this procedure to insert detail components, such as louvers and vents, that consist of a pattern repeated as a linear array but bounded by unique items at each end. In this example, the tool for inserting louvers has the View property set to Section, which is the only view available for this type of component.

1 Activate the detail component insertion tool for a particular component.

2 Click a start point in the drawing area to insert the component at the default orientation, or select one of the following options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>flip the component along its X axis</td>
<td>enter x (for Xflip), and then click to specify the starting point for the component.</td>
</tr>
<tr>
<td>flip the component along its Y axis</td>
<td>enter y (for Yflip), and then click to specify the starting point for the component.</td>
</tr>
</tbody>
</table>

3 Specify the desired endpoint to insert the component.
Use this procedure to insert detail components that need to be depicted multiple times in a linear array, such as bricks. In this example, the tool for inserting bricks has the View property set to Section. The same prompts are displayed if the View setting is Plan. If the setting is Elevation, the prompts described under Stamp Components on page 3529 are used. If the setting is Elevation (Pattern), the prompts described under Backfill Components on page 3532 are used.

1. Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.
2. Click an insertion point in the drawing area.
3 Orient the component image, and then click to insert it, or select one of the following options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>flip the component along its $X$ axis</td>
<td>enter $x$ (for Xflip), and then click to specify the insertion point for the component.</td>
</tr>
<tr>
<td>flip the component along its $Y$ axis</td>
<td>enter $y$ (for Yflip), and then click to specify the insertion point for the component.</td>
</tr>
<tr>
<td>insert a specific number of components</td>
<td>enter $c$ (for Count), enter the number of units to insert, and click to specify the starting point for the array. Note that the $x$ and $y$ options are still available at this point.</td>
</tr>
</tbody>
</table>

4 Orient the component or the array of components, and then click to complete the insertion.

Course of bricks inserted in section view

specify start point

specify number of courses and pick direction point

result
Surface Components

Use this procedure to insert rectangular detail components of a specific depth that have a hatch, such as base courses. In this example, the tool for inserting the base course has the View property set to Section, which is the only view available for this type of component.

1. Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.

2. Specify a start point in the drawing area to insert the component at the default orientation, or select one of the following options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>flip the component along its X axis</td>
<td>enter x (for Xflip), and then click to specify the starting point for the component.</td>
</tr>
<tr>
<td>flip the component along its Y axis</td>
<td>enter y (for Yflip), and then click to specify the starting point for the component.</td>
</tr>
<tr>
<td>position the component to the left of the baseline when drawn vertically</td>
<td>enter l (for Left), and then click to specify the starting point for the component.</td>
</tr>
<tr>
<td>position the component to the right of the baseline when drawn vertically</td>
<td>enter r (for Right), and then click to specify the starting point for the component.</td>
</tr>
<tr>
<td>center the component on the baseline when drawn in any direction</td>
<td>enter c (for Center), and then click to specify the starting point for the component.</td>
</tr>
</tbody>
</table>

3. Click the desired endpoint to insert the component.
Dynamically Sized Surface Components

Use this procedure to insert rectangular detail components, such as concrete joists or slabs with metal decking, for which you determine the dimensions. In this example, the tool for inserting a concrete slab with metal decking has the View property set to Plan. If the setting is Section or Elevation, the prompts described under Linear Array Components on page 3531 are used.

1 Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.
2 Specify the first corner of the rectangle.
3 Specify the opposite corner to insert the component.
Bolt Components

Use this procedure to insert bolt components when you need to specify the distance between the bolt head and the nut. In this example, the tool for inserting the bolt has the View property set to Side. If the setting is Head or Nut, you are not prompted to perform the first two steps.

1. Activate the detail component insertion tool for the component using any of the methods described under Inserting Detail Components on page 3528.

2. Specify the center bearing point for the bolt head.

3. Orient the component image, and then specify the center bearing point for the nut to insert the component.
4 If desired, you can “stamp” additional components into the drawing at the same orientation, or you can change the orientation for subsequent insertions:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a different base point</td>
<td>enter b (for Base point), select the new base point, and press ENTER to insert the component using the new base point.</td>
</tr>
<tr>
<td>change the default orientation angle of the component</td>
<td>enter r (for Rotate), and then either enter the number of degrees to rotate the component in a counterclockwise direction, or manually rotate the component to the desired angle and click to set the new orientation. Click again to insert the component at the specified angle.</td>
</tr>
<tr>
<td>flip the component along its X axis</td>
<td>enter x (for Xflip), and click to insert the component.</td>
</tr>
<tr>
<td>flip the component along its Y axis</td>
<td>enter y (for Yflip), and click to insert the component.</td>
</tr>
</tbody>
</table>

Bolt inserted in side view

**Editing Detail Components in a Drawing**

Once a detail component has been inserted into a drawing, you can edit the component using the tools found on the Modify panel of the Home tab, or the AEC Modify Tools option on the detail component’s context menu. (For detailed instructions on using these tools, see Detail Drafting Tools on page 3539.)
Using these tools on block-based detail components creates unique block definitions for edited inserts, so that the edits will not affect inserts of the same block in other locations. However, if you use the context menu option Edit Block in-place to edit a block definition used in multiple locations, you can use the Copy Block Definition and Assign option (also on the context menu) to create a unique block definition for the block insert you want to edit.

You can view and modify certain properties of a detail component by clicking Home tab ➤ Build panel ➤ Tools drop-down ➤ Properties . The following illustrations show examples of the Design and Extended Data tabs of the Properties palette for a detail component. You can modify many of the settings on the Design tab by inserting text or through an associated drop-down list. On the Extended Data tab, you can specify hyperlinks, insert text notes, or set references using the worksheet icons under Documentation. The Component data is read-only, as it displays live data from the detail components database.

**NOTE** When either the Add Selected or Replace Selected context menu option is selected, the Component data is displayed on the Design tab of the Properties palette (instead of the Extended Data tab) and is modifiable. For more information on these two options, see *Inserting Detail Components* on page 3528.
The following image shows the Design tab of the Properties palette for a concrete masonry unit detail block.
The following image shows the Extended Data tab of the Properties palette for a concrete masonry unit detail block.

Using Detail Component Tools

Like other AutoCAD Architecture tools, the tools for inserting detail components offer great flexibility in the ways you can create, customize, store, and apply them. This section includes topics that pertain to the configuration and management of these tools. For descriptions of the various ways to insert detail components using these tools, refer to Inserting Detail Components on page 3528.

Adding Detail Component Tools to a Tool Palette

Tools for inserting specific detail components can be added to a tool palette from three main sources: the Detail Component Manager, the Content Browser, and linework in a drawing.
Creating Tools from the Detail Component Manager

Use this procedure to drag and drop a selected detail component from the Detail Component Manager to a tool palette in the workspace, thus instantiating the basic detail component insertion tool for that component.

1. Open the tool palette to which you want to add a detail component tool.

2. Click Home tab ➤ Details panel ➤ Detail Components.

**NOTE** Alternatively, you can right-click any detail component tool, and click Detail Component Manager.

The Detail Component Manager

3. Navigate the tree view or use the Filter mechanism to display the desired detail component in the table at the bottom of the dialog box. (To view the entire contents of large component tables, you can use the vertical scroll bar to the right of the table.)
4 Click the selector column to the left of the desired table row, and
drag the selected component to the tool palette.
You can now use the tool to insert the component into a drawing.
For more information, see Inserting Detail Components on page
3528.

Copying Tools from the Content Browser

Use this procedure to copy a detail component insertion tool or a palette of
tools from the Sample Palette Catalog in the Content Browser to your tool
palettes set in the workspace. Most of these palettes are also included on the
sample tool palettes set available in the workspace, but this catalog in the
Content Browser serves as a backup tool repository and a source of tools you
can customize without changing tools that are already on a workspace palette.
Generally these tools are preset to insert a particular type and size of
component, but once they are on a palette in the workspace, they can be
customized to insert a different size of component, or even a component in
a different category. For more information, see Modifying Detail Component
Tools on page 3545. The same basic procedure can be used to copy tools or
palettes from catalogs you create to hold tools that are preconfigured and
grouped for particular projects.

Content Browser showing Details palettes in Sample Palette Catalog
1 Confirm that your tool palettes set is open in the workspace. If you want to copy a particular tool to a particular palette, make sure that palette is open.

2 Click Home tab ➤ Build panel ➤ Tools drop-down ➤ Content Browser.

3 Double-click the Sample Palette Catalog in your catalog library.

4 Double-click the Detailing folder.

5 Click the i-drop® icon for the palette (or double-click the palette, and click the i-drop icon for a tool on that palette), and then drag the palette or tool onto the open palette in the workspace.

   If you are copying an entire palette from the Content Browser, a new palette is added to the set.

Creating Tools from Linework in a Drawing

You can create a detail component insertion tool from linework in a drawing simply by dragging and dropping the linework onto a tool palette. The linework can be a detail you have drawn using two-dimensional (2D) AutoCAD commands, or it can be a detail component inserted from a tool or from the Detail Component Manager. Once added to the tool palette, the new tool can be renamed or otherwise modified through its Tool Properties worksheet. For more information, see Modifying Detail Component Tools on page 3545.

Modifying Detail Component Tools

Detail component tools on a tool palette in the workspace can be modified through the Tool Properties worksheet. You access the Tool Properties worksheet by right-clicking the tool and clicking Properties. To modify a tool in a catalog in the Content Browser, you must first copy the tool to a palette in the workspace.

The appearance of the Tool Properties worksheet varies depending on the type of component and the current configuration of property settings. The following illustrations show two configurations of the Tool Properties worksheet for the 04 - Masonry tool that is included on the sample Basic tool palette. The tool is set to add standard 3/8” joint brick in both cases, but the first configuration has the View property set to Section, while the second has this property set to Elevation (Pattern). For detail components that can be oriented differently in different views, the View setting determines the particular drawing routine used to insert the image into the drawing. Note that the different View settings
result in different orientation illustrations on the worksheet. Note also that the Mortar specifications are not applicable for the Elevation (Pattern) setting and are not displayed for that configuration. The properties displayed under Specifications may also vary depending on other settings. For example, if the Show Mortar property is No when the View setting is Section, no other Mortar properties are displayed. For some detail components, no Specifications apply, and the heading is not displayed.

**Detail component Tool Properties worksheet configurations**

The following table describes the Tool Properties worksheet categories and settings that are common to most detail component insertion tools.

<table>
<thead>
<tr>
<th>Property/Category Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image</td>
<td>Displays the image specified for the component in its table in the database. If no image is specified, then the image for the table is displayed. You can right-click the image and click Refresh Image to recall the stock image for the tool from the database, or you can right-click and click Specify Image to browse for a different image.</td>
</tr>
<tr>
<td>Property/Category Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the tool. This may be the name originally assigned to one of the tools on the sample palettes, or, if you have copied the tool from the Detail Component Manager, it is the name specified in the Description column of its parent size table. Note that the name is not updated if you change the Category, Type, or Size properties under Component. However, you can edit the name.</td>
</tr>
<tr>
<td>Description</td>
<td>This is the tool description used if the tool is published to a catalog. You can change this description by clicking the worksheet icon to open a Description editing box.</td>
</tr>
<tr>
<td>Component</td>
<td>Clicking the worksheet icon on this line accesses the Detail Component Manager through the Select Component dialog box and allows you to change the settings for the Description, Description and Type, or Description, Type, and Category. Note that if you change the Category setting, the Name, Description, and Image properties are not updated automatically.</td>
</tr>
<tr>
<td>Category</td>
<td>Specifies the group or subgroup that is the parent of the table containing the component specified by the Description property. If other groups or subgroups exist at the same hierarchical level within the same parent group, they are selectable from a drop-down list.</td>
</tr>
<tr>
<td>Type</td>
<td>Specifies the table containing the particular component specified by the Description property. A drop-down list lets you select other tables within the same parent group or subgroup.</td>
</tr>
<tr>
<td>Description</td>
<td>Specifies a particular component of the specified Type and Category. Other components within the same table can be selected from the drop-down list.</td>
</tr>
</tbody>
</table>
| View                   | Specifies the type of view for which the component is oriented. Possible values are Section, Plan, Elevation, and Elevation (Pattern). For components such as bolts, component-specific terminology is used, such as Head, Side, Bolt, or Nut. A drop-down list is present if more than one view
is applicable for the specified component. This setting determines the drawing routine and the command line prompts for the insertion process. For more information, see Inserting Detail Components on page 3528.

Clicking the icon on this line displays of an image depicting the orientation at which the detail component will be inserted (determined by the View property). Other properties displayed here provide the top-level parameters required to insert the component with the specified View setting. For components with only one possible View setting, no Specification properties are displayed.

Applying Detail Component Properties to Linework

Linework that you have drawn using two-dimensional (2D) AutoCAD commands can be keynoted using a keynoting tool to select a keynote from the database. If you have multiple occurrences of the linework, and you want them to have the same keynote, you can specify a keynote by applying the properties of the detail component for which the desired keynote is already specified. If a tool for inserting the component already exists, you can apply the tool properties to the linework. If no such tool exists, you can use the DtlComp command to select a component from the Detail Component Manager, and its ASsign id command line option to assign its properties to the linework.

Applying Detail Component Properties to Linework from a Tool

Use this procedure to apply the properties of a detail component insertion tool to linework in a drawing so that the linework can be keynoted with the keynote of the component the selected tool inserts.

1 Draw the linework.
2 Right-click a tool on a tool palette, and click Apply Detail Component Data to Linework.
3 Select the linework, and press ENTER.

The linework can now be keynoted just as if it were a component inserted using the selected tool.
Applying Detail Component Properties to Linework from the Detail Component Manager

Use this procedure to apply the properties of a selected detail component to linework in a drawing so that the linework can be keynoted with the keynote for that component.

1. Draw the linework.
2. On the command line, enter `DtlComp`.
3. Enter `as` (for ASsign).
4. Select the linework, and press `ENTER`.
5. In the Select Component dialog box, select the component whose properties you want to assign to the linework, and click Select Component. For more information, see Locating a Detail Component on page 3550.

The linework can now be keynoted just as if it were a component inserted directly from the Detail Component Manager.

Using the Detail Component Manager

Using the Detail Component Manager dialog box, you can navigate among different detail component databases. A hierarchical tree view and a filter feature make it easy to locate individual components within a database. Once you find the component you need, you can insert it into a drawing, or you can drag and drop it onto a tool palette for repeated use. Note that the five buttons arranged vertically in the middle of the dialog box are unavailable unless you have edit privileges for the selected database. For more information, see Creating and Modifying Detail Component Databases on page 3553.

You can access the Detail Component Manager in the following ways:

- Click Home tab ➤ Details panel ➤ Detail Components
- Right-click any detail component insertion tool on a tool palette in the workspace, and then click Detail Component Manager.
- On the Tool Properties worksheet for a detail component tool, click the Select a Component icon on the Component line.
NOTE When accessed from the Tool Properties worksheet, the Detail Component Manager is displayed in read-only mode, and the dialog box is titled “Select Component.” The hierarchical tree view is expanded to highlight the component currently specified for the tool, and the component table is open at the bottom of the dialog box. Note also that the Insert Component button is replaced by a Select Component button.

The Detail Component Manager dialog

Locating a Detail Component

Use this procedure to locate a detail component.

1 Use any of these methods to open the Detail Component Manager (sometimes also called the Select Component dialog box):

<table>
<thead>
<tr>
<th>To start the command</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>the ribbon</td>
<td>click Home tab ➤ Details panel ➤ Detail Components ➤ .</td>
</tr>
<tr>
<td>To start the command from...</td>
<td>Then...</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>a tool on a tool palette</td>
<td>right-click the tool, and choose Detail Component Manager.</td>
</tr>
<tr>
<td>a tool properties worksheet</td>
<td>open the Tool Properties worksheet for a tool, and click the Select a Component icon on the Component title bar.</td>
</tr>
<tr>
<td>the command line</td>
<td>enter <code>DtlComp</code> and then enter <code>as</code> (for ASsign).</td>
</tr>
</tbody>
</table>

2 For Current detail component database, select a database from the drop-down list. The database provided with the software is the AEC Detail Component database (`AecDtlComponents(US).mdb`), which is based on the CSI MasterFormat 2004 standard. You may also access other locally installed databases. For more information, see Configuring Detail Component Database Availability on page 3583.

3 Navigate to the detail component table level of the hierarchy for the selected database using either of the following methods:

- Expand nodes in the hierarchical tree view until you reach the table level, then select a table name to display its contents in the grid at the bottom of the dialog box.
Type a word or character string in the Filter box, and then click , or press Tab, or press ENTER. This expands all nodes under any node whose name includes the string you entered, and displays the component table for the first table name that contains that string. This is a quick way to navigate to a component whose name you know, but it may expand multiple groups or subgroups in multiple divisions. If you know the division or group containing the component table you want, it is faster to expand the nodes yourself.
Using the Detail Component Manager filter

4 Once the components for the selected table are displayed in the bottom panel of the dialog box, you can use the vertical scroll bar or your mouse scroll wheel to locate a particular component. Clicking anywhere on a row selects that component. Note that the number of column headings varies from one component table to another. For some tables, you need to expand the window or use the horizontal scroll bar to view all columns.

Creating and Modifying Detail Component Databases

AutoCAD Architecture uses Microsoft® Access for its detail component databases. You can create and modify detail component databases using Microsoft Access directly if you are familiar with that product and with the structure of detail component databases. (For more information, see Customizing and Adding New Content for Detail Components on page 3945.) If you have edit privileges, you can also create and modify detail component databases through the Detail Component Manager, without using Microsoft Access. Nonetheless, before attempting advanced edits using the Detail Component Manager, you should be familiar with the schema for detail component databases, as described in the above-referenced topic.
NOTE If you are working in a multi-user environment, it is recommended that you modify a keynote database only when no other users are accessing it.

Editing Detail Component Database Properties

Use this procedure to edit a component in a detail component database.

1 Click Home tab ➤ Details panel ➤ Detail Components ➤ .
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 Right-click the root node in the tree view, and click Edit. The Details Database Properties dialog box is displayed for the selected database.

5 Edit the following database properties as applicable.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image</td>
<td>Right-click the Image box, and click Specify Image to browse images available for the selected group in the location specified by its Path Key value. The image you select will be displayed</td>
</tr>
</tbody>
</table>
### Editing Groups in a Detail Component Database

Use this procedure to edit a component group in a detail component database.

1. Click Home tab ➤ Details panel ➤ Detail Components.
2. Select a database from the Current detail component database list.
3. Click to enter edit mode.
4. Expand the root node and group/subgroup nodes as necessary to locate the group you want to edit.
5. Right-click the group, and click Edit.

---

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property Name</td>
<td>Description/Instructions</td>
</tr>
<tr>
<td>Display Name</td>
<td>The name from the database Fingerprint table.</td>
</tr>
<tr>
<td>Description</td>
<td>The description displayed for this database on the Information tab in the Detail Component Manager. This is an optional field.</td>
</tr>
<tr>
<td>Author/Manufacturer</td>
<td>The name of the person or other entity responsible for this database. This is an optional field.</td>
</tr>
<tr>
<td>Web Address</td>
<td>The URL for the author/manufacturer. This is an optional field.</td>
</tr>
</tbody>
</table>

6. Click OK.
The Group Properties dialog box is displayed.

6 Edit the following properties as applicable:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image</td>
<td>The image displayed on the Image tab of the Detail Component Manager when this group is selected. To change the image, right-click the Image box, and click Specify Image to browse images available for the selected group in the location specified by its Path Key value. This is an optional field.</td>
</tr>
<tr>
<td>Group Name</td>
<td>The name from the database Groups table displayed for this group in the Detail Component Manager.</td>
</tr>
<tr>
<td>Path Key</td>
<td>An entry from the database DirKeys table, this value is a shortcut alias identifying the location of drawing and image files external to the database for this group.</td>
</tr>
<tr>
<td>Filter Keywords</td>
<td>A comma-delimited list of keywords to be used when searching for components within this group in the Detail Component Manager. This is an optional field.</td>
</tr>
</tbody>
</table>

7 Click OK.
Editing Components in a Detail Component Database

Use this procedure to edit the properties of individual components within a detail component database. The properties on the General and Parameters tabs of the Component Properties dialog box are the basis for one or more recipes the software uses to draw the component in different views. Each recipe specifies the type of jig, or drawing routine, for placing the component in a specific view. The recipe may also contain information pertaining to layer and hatch pattern (for more information, see Recipe Specifications on page 3954). You can also use this procedure to customize components in the default imperial and metric detail component databases supplied with the software, or to edit components in databases that you create.

1 Click Home tab ➤ Details panel ➤ Detail Components .
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 Expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 Right-click the component, and click Edit.

The Component Properties dialog box is displayed. The read-only ID field shows the database identifier for the group to which the component belongs. In most cases, you can edit values on the General tab and the Parameters tab within this dialog box. For components that use a jig other than one of the six supported types (Stamp, Bookends, Linear Array, Surface, Surface Linetype, and Surface Top), no parameters are displayed on the Parameters tab. For information on editing this type of component, see
6 On the General tab, edit the following values as applicable:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image</td>
<td>The image displayed on the Image tab of the Detail Component Manager when this component is selected. To change the image, right-click the Image box, and click Specify Image to browse images available for the selected group in the location specified by its Path Key value. This is an optional field.</td>
</tr>
<tr>
<td>Display Name</td>
<td>The name displayed for this component in the Detail Component Manager.</td>
</tr>
<tr>
<td>Table Name</td>
<td>The name of the size table for this component, as specified in the TableName field in the database Components table.</td>
</tr>
<tr>
<td>Units</td>
<td>The unit of measurement for this component.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Description/Instructions</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>Recipe</td>
<td>The name of the RecipeSpec XML file containing the recipes for drawing this component.</td>
</tr>
<tr>
<td>Description</td>
<td>The description displayed for this component on the Information tab in the Detail Component Manager.</td>
</tr>
<tr>
<td>Keynote</td>
<td>The default keynote key for this component. Click Select Keynote to browse for or create a different keynote. This is an optional field.</td>
</tr>
<tr>
<td>Filter Keywords</td>
<td>A comma-delimited list of keywords to be used in searching for this component. This is an optional field.</td>
</tr>
<tr>
<td>Author/Manufacturer</td>
<td>The name of the person or other entity responsible for this component, as specified in the Author field in the database Fingerprint table. This is an optional field.</td>
</tr>
<tr>
<td>Web Address</td>
<td>The address specified in the URL field in the Fingerprint table for the database containing this component. This is an optional field.</td>
</tr>
<tr>
<td>Date Created</td>
<td>This read-only property shows the creation date for the component if it was created using the Detail Component Manager.</td>
</tr>
<tr>
<td>Date Modified</td>
<td>This read-only property shows the date of the last modification for this component if it was modified using the Detail Component Manager.</td>
</tr>
</tbody>
</table>

If the Parameters tab is available for the selected component, you can change the jig type, if desired, and then edit parameter values according to the instructions following the illustration below.

You can also change the specified view by renaming it (click ), or you can create additional views by clicking . Any views you create or rename are then available from the drop-down list.
NOTE You can specify only one jig type for each view.

To define a recipe using this jig type...

<table>
<thead>
<tr>
<th>Jig Type</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stamp</td>
<td>Parameters for Recipes Using Stamp Jigs on page 3573.</td>
</tr>
<tr>
<td>Bookends</td>
<td>Parameters for Recipes Using Bookends Jigs on page 3574.</td>
</tr>
<tr>
<td>Linear Array</td>
<td>Parameters for Recipes Using Linear Array Jigs on page 3577.</td>
</tr>
<tr>
<td>Surface</td>
<td>Parameters for Recipes Using Surface Jigs on page 3579.</td>
</tr>
<tr>
<td>Surface Linetype</td>
<td>Parameters for Recipes Using Surface Linetype Jigs on page 3581.</td>
</tr>
<tr>
<td>Surface Top</td>
<td>Parameters for Recipes Using Surface Top Jigs on page 3582.</td>
</tr>
</tbody>
</table>
Deleting Groups or Components from a Detail Component Database

Use this procedure to delete a group, subgroup, or component from a detail component database. Note that deleting a group also deletes any subgroups and components within that group.

1. Click Home tab ➤ Details panel ➤ Detail Components.
2. Select a database from the Current detail component database list.
3. Click to enter edit mode.
4. In the tree view, select the node representing the group, subgroup, or component you want to delete.
5. Click .
The selected node and all its children are deleted from the hierarchical tree view in the Detail Component Manager.

Moving Groups or Components in a Detail Component Database

Use this procedure to move a group, subgroup, or component to a different group or level within the database hierarchy. Note that moving a group also moves any subgroups and components within that group.

1. Click Home tab ➤ Details panel ➤ Detail Components .
2. Select a database from the Current detail component database list.
3. Click to enter edit mode.
4. Select the node (group, subgroup, or component) to move, and drag it to the desired location in the hierarchical tree view.
Editing Component Size Tables

A component size table is displayed in the pane at the bottom of the Detail Component Manager whenever a component is selected in the tree view. If you have edit privileges for the currently selected database, you can add rows to the table, remove rows, or edit individual cells. You can also add or remove columns and change column names.

Adding a Row to a Component Size Table

Use this procedure to add a row to the size table for a selected component in the Detail Component Manager.

1. Click Home tab ➤ Details panel ➤ Detail Components.
2. Select a database from the Current detail component database list.
3. Click to enter edit mode.
4. In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5. If necessary, scroll to the bottom of the table, and then click anywhere in the blank row that has an asterisk (*) in the first column.
The row is selected.

![Image of a component size table with rows selected and editable columns]

6 Enter text as required for cells in the row. As you begin to edit a cell, an edit symbol appears in the first column, and the blank row is displayed again below the row you are editing.

![Image of an editable cell with edit symbol]

**NOTE** The Keynote column is not directly editable. Right-click in the cell, and click Edit to open the Select Keynote dialog box. For more information, see Specifying Keynotes for Detail Components on page 3633.

7 Click ![Image of a leave edit mode icon] to leave edit mode (or click Close), and then click OK when prompted to save the changes to the table. If you forgot to enter a required value, you are prompted to go back and enter it.

### Removing a Row from a Component Size Table

Use this procedure to remove a row from the size table for a selected component in the Detail Component Manager.

Creating and Modifying Detail Component Databases | 3563
1 Click Home tab ➤ Details panel ➤ Detail Components.
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 If necessary, resize the window or use the vertical scroll bar to find the row that you want to remove from the table. Then click the gray cell in the first column of the row, and click DELETE to remove the row.
6 Click to leave edit mode (or click Close), and then click OK when prompted to save the changes to the table.

**Editing Values Within a Component Size Table Row**

Use this procedure to edit individual cells in the size table for a selected component in the Detail Component Manager.

1 Click Home tab ➤ Details panel ➤ Detail Components.
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 If necessary, resize the window or use the scroll bars to find the cell that you want to edit in the table. You can add or change existing text within a cell, or you can click a cell and press Delete to clear the cell and then add new text.

**NOTE** To edit the Keynote column, right-click in the cell, and click Edit to open the Select Keynote dialog box. For more information, see Specifying Keynotes for Detail Components on page 3633.
Adding a Column to a Component Size Table

Use this procedure to add a column to the size table for a selected component in the Detail Component Manager.

1 Click Home tab ➤ Details panel ➤ Detail Components ➤ .
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 In the table, right-click any column title, and click Add Column.
6 In the Add New Column dialog box, enter a name for Field Name. If the name you enter matches one of the GlobalName values in the ColumnDisplay table for this database, the LocalName value associated with that global name will be displayed when you click in the Display Name field. You can use this as the display name for the new column, or you can enter a different name, in which case a new entry will be added to the ColumnDisplay table to reflect the new LocalName value you have created for an existing GlobalName value. (A new ColumnDisplay table entry will also be created if the name you enter for Field Name does not match an existing GlobalName value.)
7 Select a data type (String, Memo, Integer, or Real), specify a length (up to 255 characters), and click OK.
   The specified column is added to the right of any existing columns.

Removing a Column from a Component Size Table

Use this procedure to remove a column from the size table for a selected component in the Detail Component Manager.
1 Click Home tab ➤ Details panel ➤ Detail Components ➤ Detail Components.
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 In the table, right-click the title of the column you want to remove, and click Delete Column.
6 Click OK when prompted to confirm that you want to delete the column.

**Editing a Column in a Component Size Table**

Use this procedure to edit the name of a column in the size table for a selected component in the Detail Component Manager.

1 Click Home tab ➤ Details panel ➤ Detail Components ➤ Detail Components.
2 Select a database from the Current detail component database list.
3 Click to enter edit mode.
4 In the hierarchical tree view, expand the root node and group/subgroup nodes as necessary to locate the component you want to edit.
5 In the table, right-click the title of the column you want to edit, and click Rename Column.
6 In the Rename Column dialog box, enter a new name for the column in the Display Name field, and click OK. Note that the Field Name displays the GlobalName value for this column from the ColumnDisplay table for this database. When you change the display name, a new entry is added to the ColumnDisplay table to reflect the new display name you have created for an existing GlobalName value.
Creating a Detail Component Database

Using the Detail Component Manager to create a new detail component database requires the following basic steps:

1. Create a blank Microsoft® Access database by copying and renaming the detail component database template (AecDtlComponents-Template.mdb) located in C:\ProgramData\Autodesk\ACA 2012\enu\Template\Details and Keynotes.

2. Add the renamed database to the list of available databases. (For detailed instructions, see Adding a Detail Component Database to Available Databases on page 3583.)

3. Using the Detail Component Manager, add groups and subgroups to reflect the major and minor divisions within the detailing scheme. (For detailed instructions, see Adding Groups to a Detail Component Database on page 3568.)

4. Add individual components within groups and subgroups as applicable. (For detailed instructions, see Adding Components to a Detail Component Database on page 3569.)

5. Add rows to the size tables as applicable for each group/subgroup, editing table columns as desired. (For detailed instructions, see Adding a Row to a Component Size Table on page 3562.)

When you exit the Detail Component Manager, the new database is available to other users with access privileges.

Creating a Blank Detail Component Database

Use this procedure to create a blank Microsoft® Access database with all required tables and queries for detail component storage and retrieval. This is the first step in the process of creating a new detail component database using the Detail Component Manager.

1. Navigate to C:\ProgramData\Autodesk\ACA 2012\enu\Template\Details and Keynotes.

2. Copy the file AecDtlComponents-Template.mdb and rename it as desired.

3. Add the new blank database to the list of active databases, as described under Adding a Detail Component Database to Available Databases on page 3583.
Adding Groups to a Detail Component Database

Use this procedure to add a group to a detail component database. You can use the same basic procedure to add various subgroups within a group.

1 Click Home tab ► Details panel ► Detail Components.

2 Click to enter edit mode.

3 Select a database from the Current detail component database list.

4 Select the root node for the selected database if you want to add a top-level group, or expand the root node and group/subgroup nodes as necessary until you can select the node to which you want to add a subgroup.

5 Click .

The Add Component Group dialog box is displayed with the read-only ID field showing the value assigned to this group in the database.

6 For Group Name, enter the name you want displayed in the Detail Component Manager for this group. This value will be added to the database Groups table entry.

7 If you are using the standard database, select a Path Key from the drop-down list to specify a shortcut alias identifying the location of drawing and image files for this group. Path Key values are retrieved from the database DirKeys table. You can add new key values to this table manually using Microsoft® Access. If you are creating a new database from the template file, no Path Key values will be available for selection in this dialog box unless you have first populated the DirKeys table using Microsoft® Access. For
more information, see Customizing and Adding New Content for Detail Components on page 3945.

8 For Filter Keywords, enter a comma-delimited list of keywords to be used when searching for components in this group.

9 Click OK.

The group or subgroup you have defined is displayed as a new node in the hierarchical tree view.

Adding Components to a Detail Component Database

Use this procedure to add a component to a detail component database and create a blank size table to which you can then add rows representing the sizes in which the component is available. When you add a component, the values you specify on the General and Parameters tabs of the New Component dialog box are used to create one or more recipes for drawing the component in different views. Each recipe specifies the type of jig, or drawing routine, for placing the component in a specific view. The recipe may also contain information pertaining to layer and hatch pattern (for more information, see Recipe Specifications on page 3954). Note that this procedure can be used to add components to the default imperial and metric detail component databases supplied with the software, or to populate databases that you create.

1 Click Home tab ➤ Details panel ➤ Detail Components .

2 Click to enter edit mode.

3 Select a database from the Current detail component database list.

4 Expand the root node and group/subgroup nodes as necessary until you can select the node to which you want to add a component table.

5 Click .
The New Component dialog box is displayed.

6 On the General tab, specify the following values as applicable for the component you are adding:

<table>
<thead>
<tr>
<th>Value Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Image</strong></td>
<td>Right-click the Image box, and click Specify Image to browse images available for the selected group in the location specified by its Path Key value. The image you select will be displayed on the Image tab of the Detail Component Manager when this component is selected.</td>
</tr>
<tr>
<td><strong>Display Name</strong></td>
<td>Enter the name you want displayed for this component in Detail Component Manager.</td>
</tr>
<tr>
<td><strong>Table Name</strong></td>
<td>Enter the name of the size table for this component.</td>
</tr>
<tr>
<td><strong>Units</strong></td>
<td>Select a unit from the drop-down list.</td>
</tr>
<tr>
<td>Value Name</td>
<td>Description/Instructions</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Recipe</td>
<td>Enter a name for the RecipeSpec XML file to contain the recipes you specify for drawing this component.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter the description you want to display for this component on the Information tab in the Detail Component Manager.</td>
</tr>
<tr>
<td>Keynote</td>
<td>Click Select Keynote to browse for or create a keynote to be the default for this component.</td>
</tr>
<tr>
<td>Filter Keywords</td>
<td>Enter a comma-delimited list of keywords to be used in searching for this component.</td>
</tr>
<tr>
<td>Author/Manufacturer</td>
<td>Enter the name of the person or other entity responsible for this component.</td>
</tr>
<tr>
<td>Web Address</td>
<td>Enter the URL for the author/manufacturer.</td>
</tr>
</tbody>
</table>

**NOTE** The ID property on the General tab is a read-only value identifying a particular Groups table in the selected database. These values are assigned automatically as groups are added to a database.

7 On the Parameters tab, if desired, select a jig type other than the default (Stamp) for the default Section view, and then specify parameter values to define the component according to instructions referenced in the table following the illustration below. You can also change the default view by renaming it (click 🍒), or you can create additional views by clicking 🛡. Any views you create or rename are then available from the drop-down list.
NOTE You can specify only one jig type for each view.

To define a recipe using this jig type... See...

<table>
<thead>
<tr>
<th>Jig Type</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stamp</td>
<td>Parameters for Recipes Using Stamp Jigs on page 3573.</td>
</tr>
<tr>
<td>Bookends</td>
<td>Parameters for Recipes Using Bookends Jigs on page 3574.</td>
</tr>
<tr>
<td>Linear Array</td>
<td>Parameters for Recipes Using Linear Array Jigs on page 3577.</td>
</tr>
<tr>
<td>Surface</td>
<td>Parameters for Recipes Using Surface Jigs on page 3579.</td>
</tr>
<tr>
<td>Surface Linetype</td>
<td>Parameters for Recipes Using Surface Linetype Jigs on page 3581.</td>
</tr>
</tbody>
</table>
8 Click OK.
You can now add a table row for each available component size.
You can also add, edit, or delete columns as needed. For detailed instructions, see Editing Component Size Tables on page 3562.

Parameters for Recipes Using Stamp Jigs
Stamp jigs are used to insert components that consist of a single block. Refer to the following table if you are adding a new detail component (or editing one that was created using the New Component option) and you want to define a recipe that uses a stamp jig to insert the component in the specified view.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description/Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer key</td>
<td>Specifies the layer key for the layer to which the component will be assigned in the specified view. To specify a layer key or change the existing one, click the worksheet icon ( ) to access the Select Layer Key dialog box.</td>
</tr>
<tr>
<td>Block drawing location</td>
<td>The name of the drawing file (a DWG, DWT or DWS file) containing the blocks for the component table.</td>
</tr>
<tr>
<td>Block type</td>
<td>A drop-down list lets you specify either Fixed value or Database. If you select Fixed value, the value you enter will apply to every row in the size table for this component. If you select Database, a column will be added to the table allowing values to be entered for individual sizes.</td>
</tr>
<tr>
<td>Block</td>
<td>Displayed only if Block type is Fixed value, this parameter specifies the block definition to be inserted for this component.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description/Instructions</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Block field</td>
<td>Displayed only if Block type is Database, this parameter specifies the name of the component table column in which the block to be inserted is specified for each size.</td>
</tr>
<tr>
<td>Scaling type</td>
<td>A drop-down list lets you specify either Fixed value or Database. If you select Fixed value, the value you supply will apply to every row in the size table for this component. If you select Database, a column will be added to the table allowing values to be entered for individual sizes.</td>
</tr>
<tr>
<td>Scale</td>
<td>Displayed only if Scaling type is Fixed value, this parameter specifies the scaling value for the block.</td>
</tr>
<tr>
<td>Scale field</td>
<td>Displayed only if Scaling type is Database, this parameter specifies the name of the component table column in which the scaling value for the block is specified for each size.</td>
</tr>
<tr>
<td>Allow scaling</td>
<td>Specifies whether the command-line option for specifying scaling is displayed for this component.</td>
</tr>
<tr>
<td>Allow Rotation</td>
<td>Specifies whether the command-line option for specifying rotation is displayed for this component.</td>
</tr>
<tr>
<td>Allow X flip</td>
<td>Specifies whether the command-line option for flipping the block on its X axis is displayed for this component.</td>
</tr>
<tr>
<td>Allow Y flip</td>
<td>Specifies whether the command-line option for flipping the block on its Y axis is displayed for this component.</td>
</tr>
<tr>
<td>Allow Base point</td>
<td>Specifies whether the command-line option for specifying an alternate base point is displayed for this component.</td>
</tr>
</tbody>
</table>

**Parameters for Recipes Using Bookends Jigs**

Bookends jigs are used to insert components that consist of a pattern repeated as a linear array but bounded by unique items at each end. Thus, the recipe must define a start block, a repeat block, and an end block. Refer to the following table if you are adding a new detail component (or editing one that
was created using the New Component option) and you want to define a recipe that uses a bookends jig to insert the component in the specified view. **NOTE** Parameters preceded by an asterisk (*) are specified separately for the start block, the repeat block, and the end block.

<table>
<thead>
<tr>
<th>Parameter Name</th>

<td>Displayed only if Scaling type is Fixed value, this parameter specifies the scaling value for the block.</td>
</tr>
<tr>
<td>Scale field</td>
<td>Displayed only if Scaling type is Database, this parameter specifies the name of the component table column in which the scaling value for the block is specified for each size.</td>
</tr>
<tr>
<td>Width type</td>
<td>A drop-down list lets you specify Fixed value, Database, or Block extents. If you select Fixed value, the value you enter for the corresponding Width parameter will apply to every row in the size table for this component. If you select Database, a column (with the name specified for the corresponding Width field parameter) will be added to the component table, allowing values to be entered for individual sizes. If you select Block extents, then block width is calculated dynamically as the block is inserted.</td>
</tr>
<tr>
<td>Width</td>
<td>Displayed only if Width type is Fixed value, this parameter specifies the width for the block.</td>
</tr>
<tr>
<td>Width field</td>
<td>Displayed only if Width type is Database, this parameter specifies the name of the component table column in which the block width is specified for each size.</td>
</tr>
<tr>
<td>Gap</td>
<td>Specifies the distance between repeat blocks. A negative value causes blocks to overlap.</td>
</tr>
<tr>
<td>Start prompt</td>
<td>Specifies the string to display for the start point prompt.</td>
</tr>
<tr>
<td>End prompt</td>
<td>Specifies the string to display for the endpoint prompt.</td>
</tr>
<tr>
<td>Block orientation</td>
<td>Specifies whether the block is oriented along the X axis or the Y axis.</td>
</tr>
</tbody>
</table>
### Parameters for Recipes Using Linear Array Jigs

Linear Array jigs are used to insert multiple copies of a block in a line along the $X$ or $Y$ axis. Refer to the following table if you are adding a new detail component (or editing one that was created using the New Component option) and you want to define a recipe that uses a linear array jig to insert the component in the specified view.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description/Instructions</th>
</tr>

<td>Specifies the string to display for the endpoint prompt.</td>
</tr>
<tr>
<td>Allow X flip</td>
<td>Specifies whether the command-line option for flipping the block on its X axis is displayed for this component.</td>
</tr>
<tr>
<td>Allow Y flip</td>
<td>Specifies whether the command-line option for flipping the block on its Y axis is displayed for this component.</td>
</tr>
</tbody>
</table>
Parameters for Recipes Using Surface Linetype Jigs

Surface linetype jigs are similar to surface jigs in that they are used to insert components that have a specified depth and a rectangular boundary with user-specified start points and endpoints. Instead of a hatch-filled boundary, however, the surface linetype jig fills the boundary with a wide polyline of a specified linetype. Refer to the following table if you are adding a new detail component (or editing one that was created using the New Component option) and you want to define a recipe that uses a surface linetype jig to insert the component in the specified view.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>Allow Y flip</td>
<td>Specifies whether the command-line option for flipping the block on its Y axis is displayed for this component.</td>
</tr>
</tbody>
</table>

### Parameters for Recipes Using Surface Top Jigs

Surface top jigs are similar to surface jigs in that they are used to insert components with a specified depth and a hatch-filled rectangular boundary. However, the surface top jig is designed for components such as concrete topping that are poured onto or bounded by another entity, which provides the bottom edge of the rectangle. Thus, the surface top jig draws only the top and side edges of the rectangle. Refer to the following table if you are adding a new detail component (or editing one that was created using the New Component option) and you want to define a recipe that uses a surface top jig to insert the component in the specified view.

<table>
<thead>

Configuring Detail Component Database Availability

AutoCAD Architecture provides a detail component database (AecDtlComponents.mdb), which is based on the CSI MasterFormat 2004 standard. You can add other detail component databases to accommodate your office standards or other project-specific requirements. You can also remove databases from the active list, depending on whether you want them available to a particular project. For a given project, you can also control whether users can see and access all detail component databases or only those associated with the project. For more information, see Specifying the Project Detail Component Databases for a Project on page 343.

Adding a Detail Component Database to Available Databases

Use this procedure to add a database to the list of active detail component databases from which components can be selected for insertion, copied to a tool palette, or used to modify an existing tool.

<table>

<tr>
<td>Hatch alias</td>
<td>Displayed only if Hatching type is Fixed value, this parameter specifies the hatch alias (from the Hatches table for this database) for all sizes of the component.</td>
</tr>
<tr>
<td>Hatching</td>
<td>Displayed only if Hatching type is Database, this parameter specifies the name of the component table column in which the hatch is specified for each size.</td>
</tr>
<tr>
<td>Start prompt</td>
<td>Specifies the string to display for the start point prompt.</td>
</tr>
<tr>
<td>End prompt</td>
<td>Specifies the string to display for the endpoint prompt.</td>
</tr>
<tr>
<td>Allow X flip</td>
<td>Specifies whether the command-line option for flipping the block on its X axis is displayed for this component.</td>
</tr>
<tr>
<td>Allow Y flip</td>
<td>Specifies whether the command-line option for flipping the block on its Y axis is displayed for this component.</td>
</tr>
</tbody>
</table>
1 Click ➤ Options.
2 In the Options dialog box, click the AEC Content tab.
3 On the AEC Content page, click the Add/Remove button for Detail Component Databases.
4 In the Configure Detail Component Databases dialog box, click Add.

![Configure Detail Component Databases dialog box]

5 In the Select Component Database browser window, locate the database you want to add, and click Open.

![Select Component Database window]

The selected database is added to the bottom of the list in the Configure Detail Component Databases dialog box.

6 Click OK twice.
Removing a Detail Component Database from Available Databases

Use this procedure to remove a database from the list of active detail component databases.

1. Click Options.
2. In the Options dialog box, click the AEC Content tab.
3. On the AEC Content page, click the Add/Remove button for Detail Component Databases.
4. In the Configure Detail Component Databases dialog box, select the database you want to remove from the list, and click Remove.
5. Click OK twice. Note that if you remove the top database in the list, the next database listed becomes the current selection in the Detail Component Manager dialog box.

Setting Detail Component Database Permissions in a Multi-User Environment

If you are working in a multi-user network environment with keynote and detail content on a remote server, you may want to allow some users to edit databases and others to have read-only access. For this to work properly, all users must have write permission to the folder where the databases are installed. Without write permission to the folder, a user will not be able to open any database within the folder, because the necessary lock file cannot be generated on that user’s behalf, regardless of whether the user has write permission to the database itself. Once all users have write permission to the
folder, permissions for individual databases (*.mdb files) can then be set on a per-user basis. Note, however, that this arrangement allows users to access and edit other content within the folder, such as drawing, image, and XML recipe files, unless you set permissions on these files individually to prevent it. For this reason, you may want to keep the folders containing keynote and detail content separate from other content installed with AutoCAD Architecture so that write permission is not available to all users for all content.

**Merging Old and New Detail Component Databases**

If you have modified one of the default detail component databases supplied with a previous release of AutoCAD Architecture, and you want to migrate your modifications to the corresponding database in the current release, you can do so using the Detail Component/Keynote Database Migration utility. For detailed instructions, see Migrating Detail Component and Keynote Databases on page 4001.

**IMPORTANT** Beginning with AutoCAD Architecture 2012, the US detail component and keynote databases supplied with the software use the CSI MasterFormat 2004 standard. Using the Detail Component/Keynote Database Migration utility to migrate your customizations from a database that uses the CSI MasterFormat 95 standard (as in Autodesk Architectural Desktop 2007 and previous releases) is not supported. The utility will not properly migrate custom records from the older database and may errantly overwrite records in the new database with MasterFormat 95 data. If you want to use a MasterFormat 95 database with the current release of AutoCAD Architecture, you can load it as described under Adding a Detail Component Database to Available Databases on page 3583 or Adding a Keynote Database on page 3635. Note that the older database must be located with the previous release content and must maintain that content folder structure to function properly. An older detail component database will not function with 2008 or later US details content. Likewise, an older keynote database will not automatically keynote 2008 or later US details content; it will only keynote detail components inserted using previous version details or details in previous version drawings. The Detail Component/Keynote Database Migration utility can still be used to migrate records from one CSI MasterFormat 95 database to another.
Annotation and Keynoting Tools

Annotation tools let you easily insert multiline text annotations with or without leaders, keynotes that scale and layer key automatically, and cut lines with single or double breaks that can mask or trim underlying objects. You can edit multiline attributes used in multi-view blocks. You can create and manipulate many kinds of multiline leaders. Annotation scaling allows you to plot annotation at the same height or size at different specified annotation scales. You can link display configurations to specific annotation scales as well, and carry participating annotation scales from one AEC object to another. The keynote tools support both reference keynoting and sheet keynoting. You can manually select keynotes to insert, or you can apply pre-specified keynotes at various levels: object, object component, two-dimensional (2D) section/elevation linework, or detail component.

The Basic Annotation Tool

AutoCAD Architecture uses the same basic customizable tool for adding the following types of annotations to drawings:

- Multiline text notes with single or multiline leaders
- Symbol-based notes with attributes
- Reference keynotes
- Sheet keynotes
- Break marks

The specific type of annotation, its appearance, and other characteristics are determined by editable values on the Tool Properties worksheet, which is accessed from the context menu of the tool. Annotation objects are created at a scale based on the specified annotation scale.
Several default versions of this annotation tool are provided with the software, each representing a different configuration of the Tool Properties worksheet. Depending on how your system is set up, you may find one or more of these tools (or locally customized versions of them) on the sample Annotation tool palette in the workspace. These tools are also available from the Stock Tools Catalog and the Documentation Tool Catalog in the Content Browser. Using the i-drop® feature, you can copy any of these tools to a tool palette in the workspace and customize it to meet your needs.

The basic annotation tool lets you insert either text-based or block-based annotations. In both cases, the annotation can be created with or without a leader that connects it visually to a particular object or point in the drawing. The annotation tool also supports keynoting, where a predefined keynote is retrieved from a database, either through direct selection or automatically, based on a selected object within the drawing. Generally, text-based annotations are used for reference keynoting, and block-based annotations are used for sheet keynoting. However, the annotation tool accommodates many different styles of drawing annotation, such as break marks.

**Annotation Tool Properties**

The following illustrations show the Tool Properties worksheet settings for two of the default versions of the annotation tool: the text-based Text (Straight Leader) tool and the block-based Square (Straight Leader) tool. Note the different values for Content type under the General category. When the content type is multiline text (Mtext), additional settings are displayed under the Text category. Likewise, when the content type is Block, settings are displayed for Symbol and Symbol location. The settings available under the Leader category also vary based on the current value for Leader type.
MText annotation tool properties

Block annotation tool properties
The following table lists and describes the annotation tool properties that can be configured through the Tool Properties worksheet. Once an annotation is inserted into a drawing, properties of the annotation or its leader can be modified using the associated Properties palette. For more information on modifying the text of an existing annotation, see Editing a Text-Based Annotation on page 3606.

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which annotation is assigned. To change, click the current value (default is ANNOBJ) to access the Select Layer Key dialog box.</td>
</tr>
<tr>
<td>General/Layer override</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides dialog box.</td>
</tr>
<tr>
<td>Multileader style</td>
<td>Specifies the multileader style for the annotation. Possible styles include Text, Block, and Standard.</td>
</tr>
<tr>
<td>General/Content type</td>
<td>Possible values are Mtext (for basic multiline text notes and reference keynotes) or Block (for symbols with attributes and sheet keynotes). When inserting an Mtext object using default settings, you are prompted to specify text width.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>Displayed only if Content type is Block, this property specifies the block-based symbol to be used for the annotation. For sheet keynotes, the block contains an automatically updatable field value that determines keynote format and either specifies a particular keynote or serves as a placeholder. The placeholder value is then replaced by whatever keynote is associated with the selected object or component or by a keynote selected manually during the insertion process. For more information, see Configuring the Annotation Tool for Keynoting on page 3609.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (−), then only those blocks in the current drawing file are listed.</td>
</tr>
<tr>
<td>Leaders/Leader type</td>
<td>Possible values are None, Straight, or Spline.</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Leaders/Leader dimension style</td>
<td>By default, this property is unspecified (--), and the dimension style for the current drawing is used. Or you can click the property and select a style from the drop-down list. The style controls the leader arrow head as well as the text options as set on the Text tab of the style.</td>
</tr>
<tr>
<td>Leaders/Leader dimension style location</td>
<td>Specifies the location of the dimension style if different from the current drawing dimension style. Click the property and use the Browse option from the drop-down list to locate and enter the path to the selected style. If this property is unspecified (--), then only those styles in the current drawing are used.</td>
</tr>
<tr>
<td>Leaders/Limit points</td>
<td>Displayed only if a leader type is specified, this property indicates whether there is a limit to the number of points in the leader. If unspecified (--), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Leaders/Maximum points</td>
<td>Displayed only if the Limit points setting is yes, this property specifies the maximum number of points allowed in the leader before the text or symbol is inserted. If unspecified, the corresponding leader setting for the current drawing is used, if applicable.</td>
</tr>
<tr>
<td>Text/Default text</td>
<td>Displayed only if Content type is Mtext. For basic text notes, this value is unspecified (--), and you enter the text upon insertion. For reference keynotes, the value should be a placeholder keynote field. The placeholder value is then replaced by whatever keynote is associated with the selected object or component, or by a keynote selected manually during the insertion process. For more information, see Configuring the Annotation Tool for Keynoting on page 3609.</td>
</tr>
<tr>
<td>Text/Angle</td>
<td>Specifies the angle for multiline text or attribute text. The default is Force horizontal. Other drop-down list options are As inserted (which sets text rotation at the angle of the last leader segment) and Right reading (which keeps the text right-side up regardless of rotation angle).</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Text/Attribute style</td>
<td>Displayed only if Content type is Block, this property specifies whether attribute text within the symbol uses the target drawing text style or the style defined by the attribute tag.</td>
</tr>
<tr>
<td>Text/Prompt for width</td>
<td>Indicates whether you are prompted to specify a width for the annotation. If unspecified (-), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Text/Always left justify</td>
<td>Displayed only if Content type is Mtext and Leader type is other than None, this property specifies whether each word in the annotation text is always left-justified. If unspecified (-), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Text/Left side attachment</td>
<td>Displayed only if Content type is Mtext and Leader type is other than None, this property specifies where text attaches to a leader positioned to its left. This setting can be selected from a drop-down list. If unspecified (-), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Text/Right side attachment</td>
<td>Displayed only if Content type is Mtext and Leader type is other than None, this property specifies where text attaches to a leader positioned to its right. Setting can be selected from drop-down list. If unspecified (-), the corresponding setting for the current drawing is used.</td>
</tr>
<tr>
<td>Text/Underline bottom line</td>
<td>Displayed only if Content type is Mtext and Leader type is other than None, this property specifies whether a leader attaches to text as an underline below the bottom line of text. If unspecified (-), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Text/Frame</td>
<td>Displayed only if Content type is Mtext and Leader type is other than None, this property specifies whether text is enclosed in a frame. If unspecified (-), the corresponding leader setting for the current drawing is used.</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Text/Mask background</td>
<td>Displayed only if Content type is Mtext, this property specifies whether text has an opaque background to mask out objects below it. The default setting is No.</td>
</tr>
</tbody>
</table>

**Editing Multiline Attributes in Multi-View Blocks**

You can edit multiline attributes in multi-view blocks using grips to reposition or reconfigure text. Change the width and justification of multiline attributes to refine your annotation text layout on your drawings. For example, you can edit a Room tag’s attributes to fit text inside a room boundary.

**Displaying Edit Attribute Justification Grips**

Follow this procedure to display a multiline attribute’s width and justification grips, as well as its standard location, rotation, and exit edit grips.

1. Select an existing tag.
   The attribute Location and Edit Attributes grips are displayed.
2. Select the Edit Attributes grip.
   Alternatively, you can click Tag tab ➤ Modify panel ➤ Edit Attributes .
   The attribute Rotation, Width, Edit attribute justification, and Exit Edit Attribute grips are displayed.
3. Select the Edit attribute justification grip.
   The eight available text box justification and Exit attribute justification grips are displayed.
After you edit the attribute width or justification, select Exit attribute justification, and then select Exit Edit Attributes to save your changes.

The following illustration shows the attribute Location and Width grips, and well as the multiline attribute's bounding box. By default, the attribution width is 0 (zero). You specify a width value to resize the extents of the bounding box.
The following illustration shows the available bounding box justification and Exit edit attribute justification grips. By default, the Bottom Middle justification is current.

The following illustration shows the results of specifying the 3 top grips as the current multiline attribute justification. The text in green shows how the multiline attribute would be repositioned.
The following illustration shows the results of specifying the 3 middle grips as the current multiline attribute justification. The text in green shows how the multiline attribute would be repositioned.

Middle Left

Middle Center

Middle Right

The following illustration shows the results of specifying the 3 bottom grips as the current multiline attribute justification. The text in green shows how the multiline attribute would be repositioned.

Bottom Left

Bottom Center (default)

Bottom Right

**Editing the Width of a Multiline Attribute**

Use this procedure to change the width of a multiline attribute.

1. Select the room tag.
2 Select the Edit Attributes grip.
3 Select one of the Width grips.
4 Specify a new grip location.

Using grips to change the width of a multiline attribute
Break Mark Tool Properties

Block-based break mark tools are used to mask or trim underlying objects with a polyline and an AEC Polygon. The default break mark tool is the Cut Line tool provided on the Annotation tool palette. Additional types of break marks are available from the Stock Tool and Documentation Catalogs of the Content Browser. For more information about working with AEC Polygons, see AEC Polygon Styles on page 1858.

The following table lists and describes tool properties for break marks that can be configured through the Tool Properties worksheet. Once a break mark is inserted into a drawing, its properties can be modified using the associated Properties palette.

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer key</td>
<td>Specifies the layer key for the layer to which the break mark is assigned. To change, click the current value (default is ANNSYMOBJ) to access the Select Layer Key dialog box.</td>
</tr>
<tr>
<td>Layer override</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides dialog box.</td>
</tr>
<tr>
<td>Symbol</td>
<td>Specifies the block-based symbol to be used for the break mark. For sheet keynotes, the block contains an automatically updatable field value that determines keynote format</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>and either specifies a particular keynote or serves as a placeholder. The placeholder value is then replaced by whatever keynote is associated with the selected object or component or by a keynote selected manually during the insertion process. For more information, see Configuring the Annotation Tool for Keynoting on page 3609.</td>
<td></td>
</tr>
<tr>
<td>Symbol location</td>
<td>The location of the drawing file containing the specified break mark symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (--), then only those blocks in the current drawing file are listed.</td>
</tr>
<tr>
<td>Symbol behavior</td>
<td>Specifies whether the break mark inserts as Scaled or Stretched. If Stretched is selected, the cut line is stretched to correspond with the start point and endpoint, but the graphic of the cut remains the same. If Scaled is selected, the graphic in the cut line is scaled to correspond with the start point and endpoint of the cut line.</td>
</tr>
<tr>
<td>AEC Polygon style</td>
<td>Specifies whether the break mark has masking properties. If this property is unspecified (--), the style defaults to the standard style.</td>
</tr>
<tr>
<td>AEC Polygon style location</td>
<td>Specifies the location of the drawing file containing the AEC Polygon. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (--), then only those AEC Polygons in the current drawing file are listed.</td>
</tr>
<tr>
<td>Break mark behavior</td>
<td>Specifies whether the break mark masks or trims the underlying object. An AEC Polygon and a polyline together represent the mask behavior of a break mark and do not modify the underlying object. A polyline represents the trim behavior of a break mark and clips the underlying object.</td>
</tr>
<tr>
<td>Type</td>
<td>This property specifies whether the cut line is represented by a single edge of an AEC Polygon (single break) or two parallel edges of an AEC Polygon (dual break).</td>
</tr>
</tbody>
</table>
Creating a Text-Only Annotation

Use this procedure to add a multiline text object (without a leader) anywhere in the drawing area. The annotation does not have to be associated with any object or linework.

**NOTE** These instructions are based on one of the annotation tool configurations provided with the software. Depending on customization, the same tool may or may not appear on your Annotation tool palette. However, the same basic procedure applies to any annotation tool configuration in which the Content type is set to Mtext, the Leader type is set to None, and the Default text is unspecified (--). A basic Text Tool is also included in the Stock Tool Catalog in your Content Browser.

1. On the Annotation tool palette, click the Text Tool.
   Alternatively, you can click Annotate tab ➤ Text panel ➤ Text.
2. In the drawing area, specify the point where you want the annotation to begin.
3. Press `ENTER` to accept the default width for the annotation, or specify a width either by entering a value or by specifying a second point.
4. Enter the first line of text, and press `ENTER` to indicate the end of the line.
5. Press `ENTER` again to indicate the end of the annotation, or repeat Step 3 for each subsequent line of text.
   Each line of text is displayed on the command line as you enter it. The completed annotation is displayed horizontally in the drawing area when you press `ENTER` twice in succession.

Creating Text with Single Leader Annotation

Use this procedure to add a multiline text object with a single leader that points to any point you specify in the drawing area. Leaders are drawn in the same manner as polylines: you specify two points to insert a straight line segment. Or, depending on the setting for the Limit points property, you can specify additional points to insert an angled leader consisting of two or more segments.
NOTE These instructions are based on one of the annotation tool configurations provided with the software. Depending on customization, the same tool may or may not appear on your Annotation tool palette. However, the same basic procedure applies to any annotation tool configuration in which the Content type is set to Mtext, the Leader type is set to Straight, and the Default text is unspecified (--). Leader properties can be modified on the Tool Properties worksheet of the annotation tool. Any unspecified properties use the leader settings in effect for the current drawing, which can be modified using the Leader Settings dialog box. A basic Text Tool is also included in the Stock Tool Catalog in your Content Browser.

1 On the Annotation tool palette, click the Text (Straight Leader) tool.
   Alternatively, you can click Annotate tab ➤ Keynoting panel ➤ Text drop-down ➤ Text (Straight Leader).

2 Specify the starting point for the leader. (This determines where the leader arrow is displayed.)

3 Specify one or more additional points to create the desired leader, and then press ENTER.

4 Press ENTER to accept the default width for the annotation, or specify a width either by entering a value or by specifying a second point.

5 Enter the first line of text, and press ENTER to indicate the end of the line.

6 Press ENTER again to indicate the end of the annotation, or repeat Step 4 for each subsequent line of text.
Drawing annotation text with leaders

Each line of text is displayed on the command line as you enter it. When you press ENTER twice in succession, the completed annotation is displayed in the drawing area.

Adding and Removing Leader Lines from Leaders

Use this procedure to add and remove leader lines from the following Annotation tools:

- Text (Straight Leader)
- Square (Straight Leader)
- Reference Keynote (Straight Leader)
- Sheet Keynote

Adding a Leader Line

1. Select an existing leader.
2. Right-click and click Add Leader.
A new leader is added starting from the nearest point on the leader line or symbol that you specify.

3 Specify the new leader arrowhead location.

**Adding a leader line**

1. Select an existing multiline leader.
2. Right-click and click Remove Leader.
3. Select the leader to remove.

**Removing Leader Line**

1. Select an existing multiline leader.
2. Right-click and click Remove Leader.
3. Select the leader to remove.
Removing a leader line

Creating a Break Mark

Use this procedure to add a new break mark that has the properties specified in the break mark tool that you select.

NOTE These instructions are based on the default Cut Line tool provided with the software. Depending on customization, the same tool may or may not appear on your Annotation tool palette. However, the same basic procedure applies to any break mark tool.

1 On the Annotation tool palette, click the Cut Line Tool.
2 In the drawing area, specify the point where you want the cut line to begin.
3 Specify the point where you want the cut line to end.
4 Specify the extents of the break.
Creating a Block-Based Annotation with a Leader

Use this procedure to add a block-based symbol with a leader that points to any point you specify in the drawing area.

**NOTE** These instructions are based on one of the annotation tool configurations provided with the software. Depending on customization, the same tool may or may not appear on your Annotation tool palette. However, the same basic procedure applies to any annotation tool configuration in which the Content type is set to Block, the Leader type is set to Straight, and the Symbol and Symbol location properties specify a block-based symbol that is accessible to the tool. Leader properties can be modified on the Tool Properties worksheet of the annotation tool. Any unspecified properties use the leader settings in effect for the current drawing, which can be modified using the Leader Settings dialog box.

1. On the Annotation tool palette, click the Square (Straight Leader) tool.
   - Click Annotate tab ➤ Keynoting panel ➤ Text drop-down ➤ Square (Straight Leader).

2. Specify the starting point for the leader. (This determines where the leader arrow is displayed.)

3. Specify one or more additional points to create the desired leader, and then press **ENTER**.
   - The symbol and its default attribute value are inserted at the end of the leader, and the Edit Attributes dialog box is displayed. (If a limit has been set for the number of leader points, this happens as soon as you specify the last point within the limit.)

4. In the Edit Attributes dialog box, edit the ID attribute text as desired, and then click **OK**.
   - The edited attribute text is displayed within the symbol.
Drawing block-based annotation with a leader

1. Double-click the annotation to display the Multiline Text Editor.

   Multiline Text Editor dialog box

2. Edit the text as desired in the text editing box, or change the text style, font, height, color, or other characteristics using the drop-down lists and buttons on the toolbar.

3. Click OK on the toolbar or click anywhere in the drawing area to close the Multiline Text Editor and implement your changes.

   NOTE The Multiline Text Editor also lets you add automatically updatable fields (such as a date and time stamp or other project information) to an annotation by right-clicking the annotation and clicking Insert Field (or Edit Field, if the annotation already includes such a field). This will display the Field dialog box. For more information, see “Use Fields in Text” in AutoCAD Help.
Editing a Masking Break Mark

Use this procedure to hide or show the boundary of a break mark that masks an underlying object. A masking break mark is defined by an AEC Polygon style and a polyline.

**NOTE** To see these options you must select the AEC Polygon, not the polyline (which defines the cut line).

- Select the break mark.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>show an edge</td>
<td>click AEC Polygon tab ➤ Modify panel ➤ Show Edge ➔. The boundary edge of the break mark (represented by the AEC Polygon) highlights. Select the edge to show, and press ENTER.</td>
</tr>
<tr>
<td>hide an edge</td>
<td>click AEC Polygon tab ➤ Modify panel ➤ Hide Edge ➔. The boundary edge of the break mark (represented by the AEC Polygon) highlights. Select the edge to hide, and press ENTER.</td>
</tr>
</tbody>
</table>

Since the masking behavior of a break mark depends on an AEC Polygon, many of the same editing options available for AEC Polygons can also be applied to masking break marks. For more information, see Editing AEC Polygons on page 1835 and Masking Underlying Objects with AEC Polygons on page 1861.

Editing a Block-Based Annotation

Use this procedure to edit a block-based annotation or change its typographical characteristics and other properties using the Edit Attributes dialog.

1 Double-click the annotation to display the Edit Attributes dialog.

**NOTE** Alternatively, you can click Insert tab ➤ Attributes panel ➤ Edit Attribute drop-down ➤ Single ➔.
Specify the changes you want to make to the annotation:

3 Click OK to dismiss the Edit Attributes dialog and implement any changes you have made to the annotation.

Keynoting Tools

Keynoting is a consistent way of annotating the different types of drawings in a set of construction documents to identify building materials or to provide special instructions or explanations. AutoCAD Architecture provides a flexible tool-based method of inserting keynotes that are linked to a keynote database and thus can be modified globally as well as individually. This method supports both reference keynoting (where the keynote key corresponds to a section in an accompanying specification and may appear on different drawings) and sheet keynoting (where keynote keys are sequentially numbered for each drawing).

AutoCAD Architecture supplies pre-specified keynotes for its size-specific default detail components and for architectural objects that represent assemblies with multiple components (for example, 8” CMU wall). For variable-size objects and material definitions, a keynote classification group is pre-specified, and you specify a size when the keynote is inserted. For detail components, these keynotes and groups are based on the widely used MasterFormat 2004 standard maintained by the Construction Specifications Institute (CSI). For assemblies, the CSI Uniformat standard is used. However, because the software accommodates multiple keynote databases, it also supports other common or locally developed keynoting systems, so your localized version of AutoCAD Architecture may vary. Whatever the source of the
keynote, you can also associate it with a particular object style or material definition (see Specifying Keynotes on page 3631). This lets you use the keynote insertion tools on individual components of an object or on linework in two-dimensional (2D) sections or elevations. In cases where no keynotes are pre-specified, you select a keynote from the available database(s). You can also configure a keynote insertion tool to insert a particular keynote, regardless of the insertion point (see Inserting or Editing an AEC Keynotes Field on page 3612).

In addition to tools for inserting keynotes (derived from the basic annotation tool), the software includes tools for generating keynote legends that list selected keynotes from one or more drawing sheets and help you to quickly locate all instances of a particular keynote. You can also generate a keynote legend for a drawing prior to inserting keynotes; in this case the legend would include all keynotes that are likely to be used.

Other keynoting features include the ability to toggle the format for all keynotes within a drawing to display keys only, notes only, or both keys and notes. Moving the cursor over a keynote in the drawing lets you view keynote text without having to toggle the format or zoom in.

**NOTE** The keynoting feature supports automatic updating of keynotes to reflect changes to the corresponding entry in the keynote database. However, automatic updating of a keynote to reflect changes to a keynoted object is not currently supported. Changes in objects can be addressed using the re-keynoting option described in Viewing and Editing Keynotes in a Drawing on page 3626.

### Configuring the Annotation Tool for Keynoting

AutoCAD Architecture provides several default tools for inserting keynotes into a drawing. If your software has not been customized locally, these tools can be found on the sample Annotation tool palette. They are also accessible from the Documentation Tool Catalog in the Content Browser and can be copied to any tool palette using the i-drop® feature. These keynote insertion tools are derived from the basic annotation tool and can be further customized through the Tool Properties worksheet available from their context menus.

The mechanism that allows the annotation tool to insert keynotes is the AEC Keynotes field. This is an Mtext object that specifies the type and format of the keynote annotation to be inserted and includes an automatically updatable field value that serves as a placeholder for the actual keynote. The keynote itself is obtained from a database, and can be pre-specified for a selected object or selected manually from the Select Keynote dialog box. For more information, see Using Keynote Insertion Tools on page 3613. In cases where the same keynote
needs to be inserted frequently, you can configure the AEC Keynotes field to specify a particular keynote rather than serve as a placeholder.

For reference keynote insertion tools, the AEC Keynotes field value is specified as the Default text property on the Tool Properties worksheet. For a sheet keynote insertion tool, the AEC Keynotes field value is specified as an attribute definition within the block identified by the Symbol and Symbol location properties. In either case, you can insert an AEC Keynotes field or edit an
existing one using the Field dialog box. For specific instructions, see Inserting or Editing an AEC Keynotes Field on page 3612.
Inserting or Editing an AEC Keynotes Field

Use this procedure to insert an AEC Keynotes field or edit an existing one for a reference keynote tool or a sheet keynote tool.

1. Open the Tool Properties palette for the tool.
2. Open the Field dialog box:

<table>
<thead>
<tr>
<th>If...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>the Content type is Mtext</td>
<td>double-click the Default text property. If the property is unspecified, right-click and click Insert Field.</td>
</tr>
<tr>
<td>the Content type is Block</td>
<td>open the drawing specified by the Symbol location property and select the symbol. Click Insert tab ➤ Reference panel ➤ ➤ Edit Reference. In the Reference Edit dialog box, click OK. Double-click the KEY tag in the symbol to open the Edit Attributes Definition dialog box, and then double-click the Default value. If the value is not an updatable field, right-click and click Insert Field.</td>
</tr>
</tbody>
</table>

3. In the Field dialog, confirm that the Field category is AEC Keynotes.

Field dialog
4 From the Field names list, select the type and form of keynote you want to insert.

5 If the selected Field name is Reference Key and Note or Sheet Key and Note, select a Keynote Format to determine how the key and the note are separated typographically.

6 Select a Format to determine case and capitalization for the keynote text.

7 Confirm that Insert as placeholder is selected if you want to insert pre-specified keynotes or prompt for manual keynote selection, as applicable. Otherwise, the keynote indicated by the Key and Note values is inserted. You can select a particular keynote by clicking Select Keynote.

8 Click OK to close the Field dialog box and implement the AEC Keynotes field you have specified.

Using Keynote Insertion Tools

The keynote insertion tools provided on the sample Annotation palette (also available from the Documentation Tool Catalog in the Content Browser) represent two basic kinds of keynotes: reference and sheet. The tool for sheet keynotes is configured to let you draw a leader that connects the keynote to the selected object or point. For reference keynotes, two tools are provided: one that inserts a leader and one that inserts only the keynote.

For both sheet and reference keynotes, you have the option of keynoting either a particular object or “nothing” (that is, a point within an empty region of the drawing area). Both tools insert any keynote that is pre-specified for a selected object, unless there is ambiguity, as when keynotes are specified for the components of an object. In that case, you must select a component or use the keynote that is pre-specified for the object as a whole. You can also choose a different keynote from the Select Keynote dialog box. This dialog box is presented if no keynote is pre-specified for a selected object or its components.

The Select Keynote Dialog Box

The Select Keynote dialog box provides a hierarchical tree view of a keynote database. You can select a keynote to insert into a drawing or to associate with an object style, a material definition, or a detail component. This dialog box is displayed if you attempt to keynote an object for which no keynote is specified. You can also select it from the Field dialog box and from the dialog boxes used to specify keynotes for architectural objects or their components.
When generating a keynote legend, you can access the Select Keynote dialog box during the insertion process by right-clicking and clicking from Database, or by entering d (for database) at the command line.

You select a keynote database at the top of the dialog box. The AEC Keynote database is the default for keynoting detail components, while the AecKeynote-Assemblies database is the default for keynoting architectural objects that are assemblies of multiple components.

You can expand nodes in the tree view to find individual components, or you can type text into the Filter box below the tree view. Clicking the Filter button, pressing TAB, or pressing ENTER expands all nodes under any node whose name includes the text you enter. When a keynote is highlighted, clicking OK completes the selection.

NOTE The Save button at the bottom of the dialog box and the 5 buttons arranged vertically along the right side are displayed only if you have read-write privileges for the currently selected keynote database. These buttons let you modify a database by adding, editing, or deleting keynotes and keynote groups. The buttons function in the same manner as they do in the Keynote Editor dialog box. For detailed information, see Creating and Modifying Keynote Databases on page 3639.
Inserting a Keynote

Use this procedure to annotate a drawing with either a sheet keynote or a reference keynote. If using a tool configured to insert a leader, you can select an object for the leader to point to, or you can specify a point in an empty region of the drawing.

1 On the Annotation tool palette, click the tool for the type of keynote you want to include. The tools included on the sample palette include Reference Keynote, Reference Keynote w/Straight Leader, and Sheet Keynote (which also inserts a leader).

Alternatively, you can click one of the keynote tools on the Annotate tab ➤ Keynoting panel ➤ Keynotes drop-down.

**NOTE**  The default leader is a straight line. You can change the leader type and other properties using the Tool Properties palette, which is accessed from the context menu of the tool.

2 Select the object/component/linework you want to keynote, or press **ENTER** and specify a point in the drawing area.

If a keynote is already associated with your selection, you can finish drawing the leader as explained in Step 4. Otherwise, a dialog is displayed.

3 Specify the keynote you want to insert:

<table>
<thead>
<tr>
<th>If…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>no keynote is associated with the selected object (or if you specified a point rather than selecting an object)</td>
<td>the Select Keynote dialog box is displayed. Make sure the currently selected database is the one you want. Then navigate the hierarchical tree view to find the keynote you want, select it, and click OK.</td>
</tr>
<tr>
<td>one or more keynotes are already associated with the object style or with the material definitions of the selected objects components</td>
<td>the Select Element to Keynote dialog box is displayed.  ■ If you want to keynote an object component, select it in the Component column, and click OK.  ■ If you want to keynote the object as a whole, and a keynote is specified for the object style, select Style, and then click OK.</td>
</tr>
</tbody>
</table>
If you do not see the keynote you want, click Select Keynote to display the Select Keynote dialog box. Select a keynote and click OK. The keynote is now displayed in the Select Element to Keynote dialog box. Click OK to complete the selection process.

Select Element to Keynote dialog box

4 To insert a leader, specify one or more additional points to create the desired leader, and then press ENTER.

The pre-specified keynote (or the keynote you specified in Step 3) is displayed. If you also inserted a leader, the keynote is attached to the leader.

NOTE Sheet keynotes are not resolved at the time of insertion. The attribute to be displayed inside the symbol is determined when a sheet keynote legend is generated. Until then, sheet keynotes display a question mark as shown in the following illustration. The sequential numbering for resolved keynotes is based on group order and keynote order within the source keynote database.
Repeating a Keynote Insertion

After you have inserted a keynote into a drawing with a keynote insertion tool, you can activate the same tool again by pressing ENTER, pressing the spacebar, or right-clicking and clicking Repeat. If you have used other tools since the one you want to repeat, you can activate the tool by right-clicking any keynote it inserted and then clicking Add Selected.

Using Keynote Legends

AutoCAD Architecture lets you insert or view keynotes in three formats: key only, note only, or both key and note. By using keys only, you can reduce the amount of annotation in a drawing. However, keys alone are not likely to be useful unless the reader also has access to the corresponding notes. The keynote legend tool enables you to easily annotate a drawing with a keynote legend that lists keys along with their corresponding notes. All keys and column headings in the keynote legend can be validated at any time through a simple context menu selection. Moreover, when viewing a drawing in model space or paper space, you can select a keynote in the legend and quickly locate all instances of that keynote in the drawing.
**Keynote Legend Tool Properties**

The following illustrations show the Tool Properties worksheet settings for two versions of the keynote legend tool (sheet and reference) that are included on the sample Annotation tool palette. Under the General category, note the different settings for Table style, Legend type, Table title, Grouping level, and Blank rows.
The following table describes the keynote legend tool properties that can be configured through the Tool Properties worksheet. For information on modifying an existing keynote legend, see Editing a Keynote Legend on page 3622.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer key</td>
<td>Specifies the layer key for the layer to which the legend is assigned. To change, click the current value (default is ANNOBJ) to access the Select Layer Key dialog box.</td>
</tr>
<tr>
<td>Layer override</td>
<td>Specifies one or more layer key overrides. Click the field to access the Select Layer Overrides dialog box.</td>
</tr>
<tr>
<td>Table style</td>
<td>Specifies the AutoCAD table style for the keynote legend. Possible values are Reference Keynote Legend, Sheet Keynote Legend, and Standard. When this property is unspecified (--), the current table style for the drawing is used.</td>
</tr>
<tr>
<td>Table style location</td>
<td>Specifies the location of the drawing file containing the table style. Click the property and use the Browse option from the drop-down list to locate and enter the path to locations other than the default.</td>
</tr>
<tr>
<td>Legend type</td>
<td>Possible values are Reference Keynote Legend, Sheet Keynote Legend, and Basic Table.</td>
</tr>
<tr>
<td>Display symbol</td>
<td>Specifies whether the symbol inserted for block-based sheet keynotes also appears in the keynote legend. (Not displayed if Legend type is Basic Table).</td>
</tr>
<tr>
<td>Table title</td>
<td>The title that appears for keynote legend in the drawing. You can edit the default value as needed.</td>
</tr>
<tr>
<td>Grouping level</td>
<td>Specifies the number of keynoting standard organizational levels (such as division, group, and subgroup) for which headings will appear in the legend. For example, if three levels are specified for a legend containing keynotes for metal studs from the Aec Keynote Database, the metal stud keynotes are listed under three headers: DIVISION 9 - FINISHES, 09100 METAL SUPPORT ASSEMBLIES, and 09110 NONLOADBEARING WALL FRAMING. For the Sheet...</td>
</tr>
<tr>
<td>Property Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Blank rows</td>
<td>Specifies the number of blank rows, if any, to be inserted between headers in the keynote legend. (Not displayed if Legend type is Basic Table).</td>
</tr>
<tr>
<td>Data delimiter</td>
<td>Unspecified (--) by default. You can add a delimiter to appear between the name of the group and its description. Use of a delimiter adds a column to the table. (Not displayed if Legend type is Basic Table.)</td>
</tr>
<tr>
<td>Group delimiter</td>
<td>Specifies a delimiter to appear between the key and the note. The default for both reference and sheet keynote legends is a dash (-). Use of a delimiter adds a column to the table. (Not displayed if Legend type is Basic Table.)</td>
</tr>
</tbody>
</table>

### Generating a Keynote Legend

Use this procedure to generate and position a keynote legend within the current drawing. Keynotes to include in the legend can be selected individually from the current drawing, or you can specify one or more sheets from which all keynotes of the selected type (sheet or reference) will be included. You can also generate a legend containing keynotes that have not yet been inserted. In this case, you select the keynotes from a database.

1. On the Annotation tool palette, click either the Sheet Keynote Legend tool or the Reference Keynote Legend tool.

   **NOTE** Alternatively, you can click Annotate tab ➤ Keynoting panel ➤ Sheet Keynote Legend drop-down ➤ Sheet Keynote Legend or Annotate tab ➤ Keynoting panel ➤ Sheet Keynote Legend drop-down ➤ Reference Keynote Legend.
2 Specify the keynotes to be included in the keynote legend:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>include only selected keynotes from the current drawing</td>
<td>select each keynote you want to include, and press \textit{ENTER}.</td>
</tr>
<tr>
<td>include all keynotes from other sheets</td>
<td>right-click, and click Sheets to display the Select Sheets for Keynote Legend dialog box. The left pane lists sheets in the current project. Select sheets as desired and move them to the right pane by clicking Add. You can also click Browse to find and retrieve sheets from other projects or drawings that have not been saved as sheets. When the right pane shows all the drawings/sheets from which you want to include keynotes, click OK.</td>
</tr>
<tr>
<td>include selected keynotes from a keynote database</td>
<td>right-click, and click from Database to display the Select Keynote dialog box. To select multiple keynotes, press \textit{CTRL} while you click consecutive keynotes. You can repeat this technique in different groups within the hierarchy. When all selections are made, click OK.</td>
</tr>
</tbody>
</table>

\textbf{NOTE} If you select keynotes of a type other than the type specified for the keynote legend, they will be filtered from the resulting keynote legend.

Selecting sheets to include in keynote legend

![Select Sheets to Keynote dialog box](image)
NOTE If your selections include keynotes from databases that do not share the same group hierarchy, you are prompted to select one database. Only keynotes from that database are included in the resulting legend. To include other keynotes, you can create additional legends by rerunning the keynote legend command and specifying different databases.

3 Specify an insertion point for the upper-left corner of the keynote legend table.

   The keynote legend is displayed in the drawing area, automatically layer keyed and scaled to 1:1 in paper space, or to the scale of the current drawing in model space.

Editing a Keynote Legend

Although keynote legends are actually AutoCAD® tables, they are similar to other AutoCAD Architecture schedule tables in that the size, location, color, and other aspects of the keynote legends appearance can be modified using the Properties palette or the Basic Modify Tools option on the context menu. Individual rows, columns, and cells can also be edited through their context menus. The topics in this section describe editing functions that apply to the keynote legend as a whole and are available from its context menu.

Reselecting Keynotes for a Keynote Legend

Use this procedure to regenerate a keynote legend with a different selection of keynotes. You might like this method better than adding or removing keynotes individually, or deleting the legend and generating a new one, especially if you have modified the size, location, or appearance of the existing one.

   1 Select the keynote legend, right-click, and click Selection ➤ Reselect.

   2 Specify the keynotes to include in the keynote legend.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>include only selected(keynotes from the current drawing)</td>
<td>select each keynote you want to include, and press ENTER.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
include all keynotes from other sheets | right click, and click Sheets to display the Select Sheets to Keynote dialog box. The left pane lists sheets in the current project. Select sheets as desired and move them to the right pane by clicking Add. You can also click Browse to find and retrieve sheets from other projects or drawings that have not been saved as sheets. When the right pane shows all the drawings/sheets from which you want to include keynotes, click OK.
include selected keynotes from a keynote database | right-click, and click from Database to display the Select Keynote dialog box. You can select multiple keynotes by pressing *TRL* key while clicking consecutive keynotes. You can repeat this technique in different groups within the hierarchy. When all selections are made, click OK.

The keynote legend is regenerated to include only your new selections. It may be larger or smaller, depending on whether keynotes were added or removed, but the location and other characteristics remain unchanged.

**NOTE** If your selections include keynotes from databases that do not share the same group hierarchy, you are prompted to select one database. Only keynotes from that database are included in the resulting legend. To include other keynotes, you can create additional legends as necessary by rerunning the keynote legend command and specifying different databases.

### Updating a Keynote Legend

Use this procedure to validate a keynote legend against the database on which it was based. (All keynotes in a keynote legend must be from the same database.) Any keynotes not found in the database are invalid and are removed from the keynote legend.

1. Select the keynote legend.
2. Right-click, and click Update Keynote Legend.
The keynote legend is updated to include only valid keynotes, and the number of rows removed is reported on the command line.

**Adding Keynotes to a Keynote Legend**

Use this procedure to add keynotes to a keynote legend. The procedure is similar to generating a keynote legend, but the prompts vary depending on whether the legend was created from selected drawings/sheets or from selected keynotes.

1. Select the keynote legend, right-click, and click Selection ➤ Add.
2. Specify the keynotes to include in the keynote legend.
   
<table>
<thead>
<tr>
<th>If …</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>the keynote legend was based on keynotes selected only from the current drawing</td>
<td>select each keynote you want to include, and press ENTER.</td>
</tr>
<tr>
<td>the keynote legend was based on keynotes from other sheets</td>
<td>right-click, and click Sheets to display the Select Sheets to Keynote dialog box. The left pane lists sheets in the current project. Select sheets as desired and move them to the right pane by clicking Add. You can also click Browse to find and retrieve sheets from other projects or drawings that have not been saved as sheets. When the right pane shows all the drawings/sheets from which you want to include keynotes, click OK.</td>
</tr>
<tr>
<td>the keynote legend was based on keynotes selected from a database.</td>
<td>right-click, and click from Database to display the Select Keynote dialog box. To select multiple keynotes, press CTRL while you click consecutive keynotes. You can repeat this technique in different groups within the hierarchy. When all selections are made, click OK.</td>
</tr>
</tbody>
</table>
NOTE If your selections include keynotes from databases that do not share the same group hierarchy, you are prompted to select one database. Only keynotes from that database are included in the resulting legend. To include other keynotes, you can create additional legends by rerunning the keynote legend command and specifying different databases.

Removing Keynotes from a Keynote Legend

You can remove keynotes from a keynote legend simply by selecting them and pressing DELETE. Likewise, you can select and delete the rows/cells that contain keynote division and group names.

Using a Keynote Legend to Locate Keynotes

Use this procedure to locate all instances of a selected sheet or reference keynote in a drawing for which a keynote legend has been generated.

1 Select the keynote legend, right-click, and click Selection ➤ Show.
2 Hover the cursor above the row containing the keynote you want to locate.

All instances of the selected keynote are highlighted in the drawing and a tooltip displays the total number of instances. Only those keynotes of the same type as the selected keynote legend (sheet or reference) are highlighted or included in the count.

Alternatively, press CTRL and click a row in the legend to zoom to a magnification that bounds all instances of the selected keynote.

Editing Keynote Legend Table Styles

Keynote legends use AutoCAD table styles. Use this procedure to modify the available table styles.

1 Click Home tab ➤ Annotation panel ➤ Table Style.
2 In the Styles list, select the style you want to modify, and then click Modify.
3 Adjust the settings under the Data, Column Heads, and Title tabs as desired, and then click OK. For more detailed explanations of style settings, see “New and Modify Table Style Dialogs” in AutoCAD help.

### Table Style and Modify Table Style dialogs

![Table Style and Modify Table Style dialogs](image)

#### Viewing and Editing Keynotes in a Drawing

This section describes editing operations that can be performed on keynotes once they have been inserted in a drawing.
Re-Keynoting

Use this procedure to change a keynote so that it references a different keynote. The new keynote can be from the same database as the original or from a different one.

1 Select the keynote, right-click, and click Re-Keynote.
2 Select the keynoted object, or press ENTER if the keynote does not apply to a specific object.
3 In the Select Keynote dialog box, select the keynote you want to use, and then click OK.

The new keynote is added to the drawing in place of the old one. Note that the change is not reflected in keynote legends that include the original keynote. If the new keynote is from the same database as the original one, you can update any associated keynote legends by adding and deleting individual entries. However, if different databases are involved, you must regenerate keynote legends for each of them. In any case, if you have performed more than a few re-keynotings, it may be preferable to use the Reselect option on the keynote legend context menu, or to regenerate the keynote legend. See Generating a Keynote Legend on page 3620 and Reselecting Keynotes for a Keynote Legend on page 3622.

Editing Keynotes

Use the following procedure to edit a keynote after it has been inserted into a drawing. You cannot directly edit the key or the note, but you can add text before or after the keynote using the Multiline Text Editor, and you can change the keynote or its format using the Field dialog box.

1 Double-click the keynote to display the Multiline Text Editor.

Multiline Text Editor

2 Add text before or after the keynote, or double-click the keynote to change the format or specify a different keynote using the Field dialog box (see Inserting or Editing an AEC Keynotes Field on page 3612).
3 Click OK to close the Field dialog box, if necessary.
4 Click OK on the toolbar or click anywhere in the drawing area to close the Multiline Text Editor and implement your changes.

NOTE You can also add automatically updatable fields (such as a date and time stamp or other project information) before or after the keynote by right-clicking and clicking Insert Field.

Changing Keynote Formats

Keynotes can be displayed in three formats: key only, note only, or both key and note. When using both keys and notes, you can also specify the typographical device used to separate the key from the note (for example, key - note as opposed to key:note).

You can change keynote formats individually or globally within a single drawing. For example, you may want to display both keys and notes while you are keynoting a drawing, but display only keys when you finish.

Changing Individual Keynote Formats

Use this procedure to change the format of a keynote that has been inserted in a drawing.

1 Double-click the keynote to display the Multiline Text Editor.
2 In the Text Formatting box, right-click the selected keynote.
3 In the Field dialog box, make sure the current Field category is Aec Keynotes, and then select a keynote format under Field names. If one of the key-and-note options is selected, you can select an option under Keynote Format. You can also change the setting under Format, if desired.
Globally Changing Keynote Formats

Use this procedure to change the format of all keynotes of a given type (reference or sheet) within a drawing.

1 Click Annotate tab ➤ Keynoting panel ➤ ➤ Reference Keynote Display or click Annotate tab ➤ Keynoting panel ➤ ➤ Sheet Keynote Display.

2 In the Select Reference Keynote Display or Select Sheet Keynote Display dialog box, select an option for Field names. If you select the Key and Note option, you can also select an option for Keynote Formats. You can change the Format setting regardless of the Field name selection.

4 Click OK twice.
The selected keynote is reformatted.
Select Reference Keynote Display dialog (identical for sheet keynotes)

3 Click OK to implement the format changes for all keynotes of the selected type within the drawing.

Changing Databases for Existing Keynotes

AutoCAD Architecture keynoting functionality includes a tool that lets you globally change database references for existing keynotes within a drawing, provided the same keys exist in both the currently referenced database and the one you want to use instead. When you run the tool, it identifies all currently referenced databases for selected keynotes in the drawing, and then prompts you to identify the database you want to switch from and the database you want to switch to. This capability is useful in situations where it is discovered that project team members have inadvertently used two different databases to keynote a drawing, or when you decide to switch from an office standard keynote database to a project standard keynote database. The tool can be run from the command line by entering `AecKeynoteDatabaseReselect`, or you can set it up as a menu selection, as in the following procedure.

1 Click Annotate tab ➤ Keynoting panel ➤ ➤ Select Database.

2 Select the keynotes you want to run the tool against and press ENTER.

All databases referenced by the selected keynotes are listed on the command line.

3 Enter the full path or the Globally Unique ID (GUID) for the database currently referenced by the keynotes you want to change.
Enter the full path or the Globally Unique ID (GUID) for the database you want to be referenced.
The number of keynotes updated by the tool is displayed on the command line.

Specifying Keynotes

AutoCAD Architecture provides pre-specified keynotes for detail components and many architectural objects that are included with the software. You can change these associations to specify different keynotes from either the AecKeynotes or AecKeynotes-Assemblies databases or from a database that you have loaded. You can also specify keynotes for individual components of architectural objects by associating keynotes with material definitions. Because material definitions supplied with the software are not size-specific, individual keynotes are not pre-specified. Instead, each material definition is pre-associated with a particular group from the MasterFormat 2004 scheme. This streamlines the process of locating the appropriate keynote when you want to specify one for the material.

The method used to specify a keynote depends on the type of object. For architectural objects and their components, you associate keynotes with individual styles and material definitions using the Style or Material Definition Properties dialog box, which can be accessed through the Style Manager or from the context menu of the object. For detail components, you use the Detail Component Manager to access and edit the Keynote field values.

Specifying Keynotes for Object Styles

Use this procedure to specify a keynote for an architectural object by associating the keynote with the object style. The same procedure applies whether you are specifying a keynote association for the first time or changing an existing one. Note, however, that if you change the keynote association for an object style, it does not affect previously inserted keynotes for objects created using that style. Those objects must be re-keynoted if you want them to reflect the newly specified keynote.

If you are establishing keynote associations for a number of the object styles that are included with AutoCAD Architecture, you may find it most efficient to work from the Styles drawing files (located at C:\ProgramData\Autodesk\ACA 2012\enu\Styles).

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .

Specifying Keynotes | 3631
2 In the left pane of the Style Manager, expand Architectural Objects and any subcategories as necessary to locate the object style for which you want to specify a keynote.

3 Select the desired object style.

4 On the General tab of the Style Properties dialog box, click Select Keynote.

5 In the Select Keynote dialog box, make sure the correct database is displayed in the Keynote Database field (if you are using the default keynote databases, it should be AecKeynote-Assemblies), and then select the desired keynote from the hierarchical tree view.

6 Click OK twice.

The keynote is specified for the selected object style and will be used for subsequent keynote insertions for objects using that style.

**Specifying Keynotes for Object Components**

Use this procedure to specify a keynote for a particular component of an architectural object by associating the keynote with the material definition for that component. The same procedure applies, whether you are specifying a keynote association for the first time or changing an existing one. Note, however, that if you change the keynote association for a material definition, it does not affect previously inserted keynotes for object components using that material definition. Those object components must be re-keynoted if you want them to reflect the newly specified keynote.

If you are establishing keynote associations for a number of material definitions that are included with AutoCAD Architecture, you may find it most efficient to work from the material definitions drawing file (located at C:\ProgramData\Autodesk\ACA 2012\enu\Styles).

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .

2 In the left pane of the Style Manager, expand Multi-Purpose Objects, and expand Material Definitions. Locate the material definition for which you want to specify a keynote.

3 Select the desired material definition.

4 On the General tab of the Material Definition Properties dialog box, click Select Keynote.

5 In the Select Keynote dialog box, make sure the correct database is displayed in the Keynote Database field (if you are using the
default keynote databases, it should be Aec Keynote), and then select the desired keynote from the hierarchical tree view.

6 Click OK twice.

The keynote is specified for the selected material definition and will be used for subsequent keynote insertions for object components with that material definition.

Specifying Keynotes for Detail Components

Use this procedure to specify a keynote for a detail component. The same procedure applies, whether you are specifying a keynote association for the first time or changing an existing one. Note, however, that if you change the keynote association for a detail component, it does not affect previously inserted keynotes for that detail component. Those detail components must be re-keynoted if you want them to reflect the newly specified keynote.

1 Click Home tab ➤ Details panel ➤ Detail Components ➤.

2 In the Detail Component Manager, make sure the Current detail component database field displays the correct database.

3 In the hierarchical tree view, select the group that contains the detail component for which you want to specify a keynote, and then select the detail component in the size table at the bottom of the window.

4 Resize the Detail Component Manager window, or use the scroll bar at the bottom of the window as necessary so that the Keynote column is visible.

5 Select the Keynote field for the selected detail component, right-click, and click Edit.

6 In the Select Keynote dialog box, make sure the correct database is displayed in the Keynote Database field, and then select the desired keynote from the hierarchical tree view.

7 Click OK.

The key for the selected keynote is displayed in the Keynote field.

8 Click Close, and click Yes when prompted to save changes.

The keynote is specified for the selected detail component and will be used for subsequent keynote insertions for that component.
NOTE If no keynote is specified for the detail component, the Select Keynote dialog box is displayed. If a keynote is specified for the components table or group to which the detail component belongs, the node representing that group is highlighted within the tree view. Keynotes cannot be specified at the table level using AutoCAD Architecture functionality. This requires customization of the detail component database using Microsoft® Access.

Working with Keynote Databases

Keynotes used in AutoCAD Architecture are stored in Microsoft® Access databases. There are two default keynote databases:

- **AecKeynotes**: This database is used for keynoting individual detail components and materials according to the Construction Specifications Institute (CSI) MasterFormat 2004 standard.

- **AecKeynotes-Assemblies**: This database is used for keynoting architectural objects that are assemblies of multiple components. These keynotes are based on the CSI Uniformat standard.

To accommodate proprietary office standards and other project-specific keynoting schemes, you can modify the default databases or you can create your own databases using either Microsoft® Access or the editing functionality provided with the software. You can also configure keynote databases to control which ones are available for assigning to individual projects and to specify the order in which they are searched.

Configuring Keynote Databases

AutoCAD Architecture supports multiple keynote databases, which you can assign to individual projects (see Specifying the Project Detail Component Databases for a Project on page 343). When you are working within a given project, only those databases assigned to that project are accessible through the Select Keynote dialog box.

Before a database can be assigned to a project, however, it must be on the list of available databases. Both keynote databases provided with the software (AecKeynotes and AecKeynotes-Assemblies) are included on this list by default. You can add databases to the list or remove them. If a particular keynote exists in multiple databases, you can specify the order in which the databases are
searched to find a keynote that has been specified for an object. (Only the key is stored with the object style; the corresponding note must be retrieved from a database at the time of insertion.)

Adding a Keynote Database

Use this procedure to add a database to the list of available keynote databases.

1 Click ➤ Options.
2 In the Options dialog box, click the AEC Content tab.
3 On the AEC Content page, click the Add/Remove button for Keynote Databases.
4 In the Add/Remove Keynote Databases dialog box, click Add.

5 In the Select Component Database browser window, locate the database you want to add, and click Open.
The selected database is added to the bottom of the list in the Add/Remove Keynote Databases dialog box. You can specify the order in which databases are searched by clicking the Move Up and Move Down buttons to change the position of a selected database within the list. Moving a database to the top of the list makes it the default selection for the Select Keynote dialog box.

6 Click OK twice.

Removing a Keynote Database

Use this procedure to remove a database from the list of available keynote databases.

1 Click ➤ Options.
2 In the Options dialog box, click the AEC Content tab.
3 On the AEC Content page, click the Add/Remove button for Keynote Databases.
4 In the Add/Remove Keynote Databases dialog box, select the database you want to remove from the list, and click Remove.
5 Click OK twice. Note that if you remove the top database in the list, the next database listed becomes the default selection in the Select Keynote dialog box.

**Merging Old and New Keynote Databases**

If you have modified one of the default keynote databases supplied with a previous release of AutoCAD Architecture, and you want to migrate your modifications to the corresponding database in the current release, you can do so using the Detail Component/Keynote Database Migration utility. For detailed instructions, see [Migrating Detail Component and Keynote Databases](#) on page 4001.
IMPORTANT  Beginning with AutoCAD Architecture 2012, the US detail component
and keynote databases supplied with the software use the CSI MasterFormat 2004
standard. Using the Detail Component/Keynote Database Migration utility to
migrate your customizations from a database that uses the CSI MasterFormat 95
standard (as in Autodesk Architectural Desktop 2007 and previous releases) is not
supported. The utility will not properly migrate custom records from the older
database and may errantly overwrite records in the new database with
MasterFormat 95 data. If you want to use a MasterFormat 95 database with the
current release of AutoCAD Architecture, you can load it as described under Adding
a Detail Component Database to Available Databases on page 3583 or Adding a
Keynote Database on page 3635. Note that the older database must be located with
the previous release content and must maintain that content folder structure to
function properly. An older detail component database will not function with 2008
or later US details content. Likewise, an older keynote database will not
automatically keynote 2008 or later US details content; it will only keynote detail
components inserted using previous version details or details in previous version
drawings. The Detail Component/Keynote Database Migration utility can still be
used to migrate records from one CSI MasterFormat 95 database to another.

Setting Keynote Database Permissions in a Multi-User
Environment

If you are working in a multi-user network environment with keynote and
detail content on a remote server, you may want to allow some users to edit
databases and others to have read-only access. For this to work properly, all
users must have write permission to the folder where the databases are
installed. Without write permission to the folder, a user will not be able to
open any database within the folder, because the necessary lock file cannot
be generated on that user’s behalf, regardless of whether the user has write
permission to the database itself. Once all users have write permission to the
folder, permissions for individual databases (*.mdb files) can then be set on
a per-user basis. Note, however, that this arrangement allows users to access
and edit other content within the folder, such as drawing, image, and XML
recipe files, unless you set permissions on these files individually to prevent
it. For this reason, you may want to keep the folders containing keynote and
detail content separate from other content installed with AutoCAD Architecture
so that write permission is not available to all users for all content.
Creating and Modifying Keynote Databases

You can create and modify keynote databases using Microsoft® Access directly if you are familiar with that product and with the structure of keynote databases in AutoCAD Architecture (for more information, see Keynote Database Schema on page 3649). However, the preferred method is to use the Keynote Editor provided with the software. For databases to which you have read/write access, most of the Keynote Editor functions are also available from the Select Keynote dialog box.

NOTE If you are working in a multi-user environment, it is recommended that you modify a keynote database only when no other users are accessing it.

The Keynote Editor

The Keynote Editor is a standalone application that lets you create and modify keynote databases. Accessed from the CAD Manager menu, the Keynote Editor dialog box provides a hierarchical tree view of the currently selected database, which displays as a root node. For an existing database, you can expand the root node to display groups, and then expand group nodes to display sub-groups or individual keynotes. Alternatively, you can enter text into the Filter box below the tree view. Clicking the Filter button, pressing TAB, or pressing ENTER expands all nodes under any node whose name includes the text you enter.

If you are creating a new database, you add the root node using the New Database button, and then add groups and keynotes using the buttons along the right side of the dialog box. These buttons (Add Group, Delete, Add Keynote, Edit, and Specify Keysort) are also available from the Select Keynote dialog box for databases to which you have read-write access.
Creating a Keynote Database

Using the Keynote Editor to create a new keynote database entails the following basic steps:

1. Create a blank database by specifying a name and location. (For detailed instructions, see Creating a Blank Keynote Database on page 3641.)

2. Add groups and subgroups to reflect the major and minor divisions within the keynoting scheme. (For detailed instructions, see Adding Groups to a Keynote Database on page 3642.)

3. Add individual keynotes within groups and subgroups as applicable. (For detailed instructions, see Adding Keynotes to a Keynote Database on page 3643.)

4. Save the new database.
After saving the new database, you can add it to the list of available databases (see Adding a Keynote Database on page 3635) and assign it to projects (see Specifying the Project Detail Component Databases for a Project on page 343).

Creating a Blank Keynote Database

Use this procedure to create a blank Microsoft® Access database with all required tables and queries for keynote storage and retrieval. This is the first step in creating a new keynote database using the Keynote Editor.

1. Click Annotate tab ➤ Keynoting panel ➤ Keynote Editor.  
2. At the bottom of the Keynote Editor dialog box, click New Database.  
The Create a new keynote database browser window is displayed.

3. In the browser window, navigate to the location for the new database.
4. Enter a name for the new database in the File name field.
5. Click Save.  
A node named New Keynote Database is displayed in the Keynote Editor.

6. Select the new database node, and click .
7 In the Keynote Database Properties dialog box, enter the Display Name, Description, and Author for the new database, and click OK.

![Keynote Database Properties dialog box](image)

A blank Microsoft® Access database is created with all required tables and queries for keynote storage and retrieval. The new database has the global unique identifier shown in the GUID field and is displayed in the Keynote Editor as a root node with the display name you provided.

8 Click Save.

You can now begin populating the database by using the Keynote Editor to add groups and individual keynotes.

### Adding Groups to a Keynote Database

Use this procedure to add a group to a keynote database. You can use the same basic procedure to add as many levels of subgroups as you want within a group.

1 Click Annotate tab ➤ Keynoting panel ➤ Keynote Editor.

   **NOTE** The rest of this procedure can also be performed from the Select Keynote dialog box.

2 Select a database from the Keynote Database list.

3 Select the root node for the database if you want to add a top-level group, or expand the root node and group/subgroup nodes as
necessary until you can select the node to which you want to add a subgroup.

4 Click .

The Add Group dialog box is displayed with the read-only ID field showing the database identifier for the group you are adding.

5 Enter a Group Name and a Description, and click OK.

The group or subgroup you have defined is displayed as a new node in the hierarchical tree view.

---

**Adding Keynotes to a Keynote Database**

Use this procedure to add a keynote to a group or subgroup within a keynote database.

1 Click Annotate tab ➤ Keynoting panel ➤ ➤ Keynote Editor .

**NOTE** The rest of this procedure can also be performed from the Select Keynote dialog box.

2 Select a database from the Keynote Database list.

3 Expand the root node and group/subgroup nodes as necessary until you can select the node to which you want to add a keynote.

4 Click .
The Add Keynote dialog box is displayed with the read-only ID field showing the database identifier for the keynote you are adding.

![Add Keynote dialog box](image)

5 Enter a key and a note, and click OK.
The keynote you have defined is displayed as a new node in the hierarchical tree view.

**TIP** If you need to add a series of keynotes within a group or subgroup, you can save time by adding the first keynote, right-clicking it, and clicking Copy Series. You then specify the number of copies to make and click OK. The specified number of sequentially numbered keys are added to the group. For example, if you create key A1001 and then use the Copy Series option to add 10 copies, keys A1002 through A1011 are added. You can then edit keynote nodes individually to add the notes, as explained under Adding Components to a Detail Component Database on page 3569.

**Editing Groups in a Keynote Database**

Use this procedure to change the name or description of a group within a keynote database.

1 Click Annotate tab ➤ Keynoting panel ➤ ➤ Keynote Editor .

**NOTE** The rest of this procedure can also be performed from the Select Keynote dialog box.

2 Select a database from the Keynote Database list.
3 Expand the root node and group/subgroup nodes as necessary, and select the group/subgroup you want to edit.

4 Click \(\text{edit} \).

The Group Properties dialog box is displayed with the read-only ID field showing the database identifier for the group you are editing.

5 Edit the Group Name and Description values as desired, and click OK.

**Editing Keynotes in a Keynote Database**

Use this procedure to change the key or the note for a keynote within a database.

1 Click Annotate tab ➤ Keynoting panel ➤ ➤ Keynote Editor \(\text{edit} \).

   **NOTE** The rest of this procedure can also be performed from the Select Keynote dialog box.

2 Select a database from the Keynote Database list.
3 Expand the root node and group/subgroup nodes as necessary, and select the keynote you want to edit.

4 Click \(\text{edit} \).
The Keynote Properties dialog box is displayed with the read-only ID field showing the database identifier for the keynote you are editing.

5 Edit the Key and Note values as desired, and click OK.

Deleting Keynotes or Groups from a Keynote Database

Use this procedure to delete one or more groups, subgroups, or keynotes from a keynote database. Note that deleting a group also deletes any subgroups and keynotes within that group.

1 Click Annotate tab ➤ Keynoting panel ➤ Keynote Editor.

NOTE The rest of this procedure can also be performed from the Select Keynote dialog box.

2 Select a database from the Keynote Database list.
3 Select the nodes representing keynote groups, subgroups or keynotes you want to delete.

TIP To select multiple nodes, hold down the CTRL key while clicking the nodes.

4 Click .

The selected nodes are deleted from the hierarchical tree view in the Keynote Editor.
Moving Keynotes or Groups in a Keynote Database

Use this procedure to move a keynote, group, or subgroup to a different group or level within the database hierarchy. Note that moving a group also moves any subgroups and keynotes within that group.

1. Click Annotate tab ➤ Keynoting panel ➤ Keynote Editor.

   NOTE The rest of this procedure can also be performed from the Select Keynote dialog box.

2. Select a database from the Keynote Database list.
3. Select the node (group, subgroup, or keynote) to move and drag it to the desired location in the hierarchical tree view.

Specifying Sort Order for Keynotes

Use this procedure to specify the order in which keynotes in a given database are listed when displayed in the Keynote Editor, the Select Keynote dialog box, or keynote legends. To specify the sort order, you enter one or more masks that correspond to the patterns used for keys in the database. Keynotes are sorted on a field-by-field basis within each pattern. In other words, all keynotes having the same key pattern as the first mask you enter will be listed before any keynotes having the second pattern you enter.

When entering a mask, use the following conventions to represent the fields, characters, and delimiters that comprise the key pattern:

■ Enclose sortable fields in brackets [ ] and delimiters in curly brackets { }. Example: [field][delimiter][field].

■ Delimiters can be any character except a backslash (\) or any character string that does not begin with a backslash. (The backslash is reserved for system use.)

■ Use a pound sign (#) to indicate a numeric character and a question mark (?) to indicate an alphanumeric character (digit, letter, or punctuation mark).

■ For fixed-length fields, use the specified number of characters. Example: [###] indicates a 3-digit fixed-length field.
Use [#...#] to indicate a variable-length numeric field, and [?...?] for a variable-length alphanumeric field.

A variable-length field is always followed by a delimiter unless it is the final field in the mask.

As an example, the AecKeynotes database uses keys that consist of a 5-digit field, followed by a delimiter (.), a 1-character alphanumeric field, and a variable-length numeric field (for example, 09250.A101). The mask representing this pattern would be [#####][.][?][#...#]

1 Click Annotate tab ➤ Keynoting panel ➤ Keynote Editor ➤ .

2 Select a database from the Keynote Database list.

3 Click to display the Specify Key Sort dialog box.

4 In the Specify Key Sort dialog box, enter a key sort mask for each key pattern in the selected database. Use a different line for each mask.

5 Click OK.
Keynote Database Schema

To create or modify a keynote database by using Microsoft® Access (rather than using the Keynote Editor), you need to be familiar with the database schema used in AutoCAD Architecture.

A keynote database contains four tables:

- Fingerprint
- Groups
- Keynotes
- KeySort

Fingerprint Table

The Fingerprint table uniquely identifies a keynote database and contains the following fields:

- **GUID:** The GUID is the global unique identifier for a particular keynote database. When you insert an AEC Keynotes field to specify a keynote, a link to the keynote database is established using this GUID and the row ID of the keynote in the Keynotes table. If you leave this field empty when creating a database, a GUID is generated when the database is loaded using the Add/Remove Keynote Databases dialog box.

- **Type:** For a keynote database, this field must contain the string “Keynote.” (For a detail component database, the string must be “Component.”)

- **Author, Display Name, and Description:** The values for these fields are displayed in the corresponding fields in the Add/Remove Keynote Databases dialog box.
The Groups table defines the hierarchical organization of keynotes within the database. This hierarchy determines the order in which divisions, groups, subgroups and individual keynotes are displayed in the Keynote Editor, the Select Keynote dialog box, and keynote legends. The following fields apply to each row in the table:

- **ID**: A sequential number identifying a particular row in the table. This number should never change.
- **Parent**: Identifies the parent of the group identified in the Group field.
- **Group**: Identifies a particular division, group, or subgroup. Note that the root parent group (\-\*) is special and its ID is zero.
- **Description**: Provides the descriptive name of the group.
- **Modified**: When the box is checked, it indicates that the row has been modified and prevents the row from being overwritten if the database is migrated when new content is released by Autodesk. You must click the box to enable this protection for any row you modify.
### Keynotes Table

This table defines the individual keynotes for all the groups identified in the Groups table. The following fields are included:

- **ID**: A sequential number identifying a particular row in the table. This number should never change. This ID, combined with the GUID of the database, is tracked by the AEC Keynotes field when you insert a keynote into a drawing. This enables keynotes in a drawing to be updated when changes are made to the keynote database.

- **Parent Group**: Identifies the parent of the keynote, displaying the Group and Description field values from the Groups table.

  **TIP** If you want a flat (non-hierarchical) keynote list, you can assign the root parent group (\-*\) to all keynotes in this table.

- **Key**: Specifies the key for the keynote. If you are creating a database and have already created the Groups table, this field displays the value from the Group field. The delimiter and suffix are user-definable.

- **Note**: Provides the note for the specified key.

- **Modified**: When the box is checked, it indicates that the row has been modified and prevents the row from being overwritten if the database is migrated when new content is released by Autodesk. You must click the box to enable this protection for any row you modify. For more information on database migration, see [Migrating Detail Component and Keynote Databases](#) on page 4001.
KeySort Table

This table contains key sort masks that represent the different key patterns used in the database. The order in which the masks are listed in this table determines the order in which key patterns are listed in the Keynote Editor, the Select Keynote dialog box, and keynote legends; that is, all keynotes with keys using the pattern identified by the mask in record 1 are listed before keynotes with key patterns identified by subsequent records in the table. The illustration above shows the key sort mask for the AecKeynotes database provided with AutoCAD Architecture. The following conventions are used for key sort masks:

- Enclose sortable fields in brackets [ ] and delimiters in curly brackets { }. Example: [field]{delimiter}[field].
- Delimiters can be any character except a backslash (\) or any character string that does not begin with a backslash. (The backslash is reserved for system use.)
- Use a pound sign (#) to indicate a numeric character and a question mark (?) to indicate an alphanumeric character (digit, letter, or punctuation mark).
- For fixed-length fields, use the specified number of characters. Example: [###] indicates a 3-digit fixed-length field.
- Use [#...#] to indicate a variable-length numeric field, and [?...?] for a variable-length alphanumeric field.
- A variable-length field is always followed by a delimiter unless it is the final field in the mask.

Examples of keys using the pattern defined by the [#####]{.}[?][#...#] mask in the illustration above would include 03250.A1, 07250.B102, and 09250.C1007.

You can also specify key sort masks using the Keynote Editor, as explained in Specifying Sort Order for Keynotes on page 3647.
North Arrow and Datum Point Tools

North arrow and datum point annotations are used for defining directions in a drawing. Formerly available as content blocks in DesignCenter, these annotations are now available through tools on the tool palettes and in Content Browser.

In this release of AutoCAD Architecture, north arrows and datum points are converted from DesignCenter content blocks to true tools with tool properties.

**North arrow and datum point symbols**

By default, all north arrow and datum point tools are set to be annotative, which means that the annotations you insert with these tools are controlled by annotative scaling. For more information, see Annotation Scaling on page 3675.

**IMPORTANT** If you have legacy drawings with old DesignCenter-based annotation symbols in them, then the old block definition will continue to be used for new tool-based blocks if the blocks are identically named. (This is the case for the datum point tool, but not the north arrow tools which have been renamed.) In such a case, either change the Annotative setting manually by using BEDIT, or rename the old block before inserting new tool-based annotation symbols into the drawing.

You can find north arrow tools and a datum point tool in these locations in a default US install of AutoCAD Architecture:

- In the Annotation tool palette
In Content Browser in these catalogs:

- Stock Tool Catalog
- Sample Palette Catalog (Imperial or Metric), under \Document\Annotation
- Documentation Tool Catalog (Imperial or Metric), under \Miscellaneous

**TIP** You can also search for these types of tools by name in Content Browser.

These properties of north arrow and datum point tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the north arrow or datum point is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer key for north arrows is ANNOBJ; the default value for the datum point is ANNSYMOBJ.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>Specifies the block-based symbol to be used for the north arrow or datum point.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified north arrow or datum point symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (--), then only those blocks in the current drawing file are listed. Symbol blocks shipped with AutoCAD Architecture are by default located in %AECCONTENT_DIR%\Styles\Imperial\AEC Annotation Symbols (Imperial).dwg or %AECCONTENT_DIR%\Styles\Metric\AEC Annotation Symbols (Metric).dwg.</td>
</tr>
<tr>
<td>Text/Attribute text style</td>
<td>This property specifies whether attribute text within the symbol uses the text style of the current drawing (Target drawing text style) or the style defined by the attribute tag (As defined by content).</td>
</tr>
</tbody>
</table>
## Inserting a North Arrow or Datum Point in the Drawing

Use this procedure to insert a north arrow or datum point into the drawing.

1. Select a north arrow or datum point tool on a tool palette. (A north arrow tool and a datum point tool are located on the Annotation palette.)
2. Specify the insertion point of the north arrow or datum point in the drawing area.
3. Specify the rotation.

For information about editing the properties of north arrows and datum points in the drawing, see [Editing Block-Based Annotation Symbols](#) on page 3669.

**NOTE** North arrows and datum points that have been inserted with a north arrow or datum point tool can be modified in the drawing and saved back as a tool on a tool palette. By default, a north arrow or datum point tool created that way will have the same layer key, layer overrides, and symbol as the original tool that was used to create the annotation symbol in the drawing. The symbol location will be the current drawing.

## Fire Rating Line Tools

Fire rating annotations are used for adding fire rating information a drawing. Formerly available as content blocks in DesignCenter, these annotations are now available through tools on the tool palettes and in Content Browser.

### Property Category/Name | Description
---|---
Text/Attribute text angle | Specifies the angle for attribute text. The choices are Right reading (which keeps the text right-side up regardless of rotation angle), As inserted (which sets text rotation at the angle of the last leader segment), and Force horizontal (which keeps the text horizontal regardless of the match line rotation angle.)

**NOTE** The north arrow and datum point tools shipped with AutoCAD Architecture do not have attributes in their block definitions, so that these settings are set to Undefined (-).

Inserting a North Arrow or Datum Point in the Drawing | 3655
In this release of AutoCAD Architecture, fire rating lines are converted from DesignCenter content blocks to true tools with tool properties. Fire rating lines are polylines and are not controlled by annotative scaling.

**Fire rating line tools**

![Fire rating line examples](Image)

You can find fire rating line tools in these locations in a default US install of AutoCAD Architecture:

- In the Annotation tool palette
- In Content Browser in these catalogs:
  - Stock Tool Catalog
  - Sample Palette Catalog (Imperial or Metric), under `\Document\Annotation`
  - Documentation Tool Catalog (Imperial or Metric), under `\Miscellaneous\Fire Rating`

**TIP** You can also search for these types of tools by name in Content Browser.

These properties of Fire Rating Line tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the fire rating line is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer key is WALLFIRE.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Line width</td>
<td>Specifies the line width of the fire rating polyline.</td>
</tr>
</tbody>
</table>
### Property Category/Name

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the linetype of the fire rating line. In the fire rating line tools shipped with AutoCAD Architecture there is a specific linetype for each fire rating level - for example, the 1 Hr fire rating line tool has the Aec_Rating_1Hr linetype specified. The linetypes for rating line tools have been added to the acad.lin and acadISO.lin files.</td>
</tr>
</tbody>
</table>

---

**Inserting a Fire Rating Line in the Drawing**

Use this procedure to insert a fire rating line into the drawing.

1. Select a fire rating line tool on a tool palette.
   (A fire rating line tool is located on the Annotation palette.)
2. Specify the start point of the wall you want to annotate with a fire rating line.
3. Specify the wall endpoint in the direction you want the line to be drawn.
4. Continue specifying wall points to extend the line as needed.
5. Press ENTER to end the command.

**Adding a fire rating line to a wall segment**

For information about editing the properties of fire rating lines in the drawing, see *Editing Polyline-Based Annotation Symbols* on page 3672.
NOTE  Fire rating lines that have been inserted with fire rating tools can be modified in the drawing and saved back as tools on a tool palette. By default, a fire rating line tool created that way will have the same layer key, layer overrides, linetype, and line width as the original tool that was used to create the annotation symbol in the drawing.

Match Line Tools

Match line annotations are used for annotating a drawing. Formerly available as content blocks in DesignCenter, these annotations are now available through tools on the tool palettes and in Content Browser.

In this release of AutoCAD Architecture, match lines are converted from DesignCenter content blocks to true tools with tool properties.

Match line tools

MATCH LINE
—— — — — — — — — —
Match Line

MATCH LINE
—— — — — — — — — —
Match Line (Swiss)

By default, all match line tools are set to be annotative, which means that the annotations you insert with these tools are controlled by annotative scaling. For more information, see Annotation Scaling on page 3675.

IMPORTANT  If you have legacy drawings with old DesignCenter-based annotation symbols in them, then the old block definition will continue to be used for new tool-based blocks if the blocks are identically named. In such a case, either change the Annotative setting manually by using BEDIT, or rename the old block before inserting new tool-based annotation symbols into the drawing.

You can find match line tools in these locations in a default US install of AutoCAD Architecture:

■ In the Annotation tool palette
■ In Content Browser in these catalogs:
  ■ Stock Tool Catalog
  ■ Sample Palette Catalog (Imperial or Metric), under \Document\Annotation
TIP You can also search for these types of tools by name in Content Browser.

These properties of match line tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the match line is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer key is ANNOBJ.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>Specifies the block-based symbol to be used for the match line.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified match line symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (--), then only those blocks in the current drawing file are listed. Symbol blocks shipped with AutoCAD Architecture are by default located in %AECCONTENT_DIR%\Styles\Imperial\AEC Annotation Symbols (Imperial).dwg or %AECCONTENT_DIR%\Styles\Metric\AEC Annotation Symbols (Metric).dwg.</td>
</tr>
<tr>
<td>General/Line width</td>
<td>Specifies the line width of the match line. NOTE This setting uses paper size, not model size.</td>
</tr>
<tr>
<td>General/Linetype</td>
<td>Specifies the linetype of the match line. For the match line tools shipped with AutoCAD Architecture, linetype Aec_Match_Line is specified. This linetype has been added to the acad.lin and acadISO.lin files.</td>
</tr>
<tr>
<td>Text/Attribute text style</td>
<td>This property specifies whether attribute text within the symbol uses the text style of the current drawing (Target</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>

<tr>
<td>Drawing text style</td>
<td>(As defined by content).</td>
</tr>
<tr>
<td>Text/Attribute text angle</td>
<td>Specifies the angle for attribute text. The choices are Right reading (which keeps the text right-side up regardless of rotation angle), As inserted (which sets text rotation at the angle of the last leader segment), and Force horizontal (which keeps the text horizontal regardless of the match line rotation angle.)</td>
</tr>
</tbody>
</table>

**Inserting a Match Line in the Drawing**

Use this procedure to insert a match line into the drawing.

1. Select a match line tool on a tool palette.
   (A match line tool is located on the Annotation palette.)
2. Specify the first point of the match line in the drawing area.
3. Specify the next points of the match line, and press ENTER when the line is complete.
4. In the Edit Attributes dialog, enter the text you want displayed on the match line, and click OK.

For information about editing the properties of match lines in the drawing, see Editing Block-Based Annotation Symbols on page 3669 and Editing Polyline-Based Annotation Symbols on page 3672.

**NOTE** Match lines that have been inserted with match line tools can be modified in the drawing and saved back as tools on a tool palette. By default, a match line tool created that way will have the same layer key, layer overrides, symbol, line width, linetype, attribute text style, and attribute text angle as the original tool that was used to create the annotation symbol in the drawing. The symbol location will be the current drawing.

**Revision Cloud Tools**

Revision cloud annotations are used for marking up-to-be-revised areas in a drawing. Formerly available as content blocks in DesignCenter, these
annotations are now available through tools on the tool palettes and in Content Browser.

In this release of AutoCAD Architecture, revision clouds are converted from DesignCenter content blocks to true tools with tool properties.

**Revision cloud tools**

If a revision cloud has a tag, the tag symbol is a block reference which can be controlled by annotative scaling. The polyline representing the cloud shape does not participate in annotation scaling. For more information, see Annotation Scaling on page 3675.

**IMPORTANT** If you have legacy drawings with old DesignCenter-based annotation symbols in them, then the old block definition will continue to be used for new tool-based blocks if the blocks are identically named. In such a case, either change the Annotative setting manually by using BEDIT, or rename the old block before inserting new tool-based annotation symbols into the drawing.

You can find revision cloud tools in these locations in a default US install of AutoCAD Architecture:

- In the Annotation tool palette
- In Content Browser in these catalogs:
  - Stock Tool Catalog
These properties of Revision Cloud tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the revision cloud is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer key is ANNREV.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>If the revision cloud tool contains a tag, this line specifies the block-based symbol to be used for the tag. If the revision cloud tool does not contain a tag, the symbol is undefined.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified tag symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (–), then only those blocks in the current drawing file are listed. Symbol blocks shipped with AutoCAD Architecture are by default located in %AECCONTENT_DIR%\Styles\Imperial\AEC Annotation Symbols (Imperial).dwg or %AECCONTENT_DIR%\Styles\Metric\AEC Annotation Symbols (Metric).dwg.</td>
</tr>
<tr>
<td>General/Line width</td>
<td>Specifies the line width of the cloud polyline. <strong>NOTE</strong>: This setting uses paper size, not model size.</td>
</tr>
<tr>
<td>Property Category/Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>General/Arc length</td>
<td>Specifies the arc length of each cloud segment.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE</strong> This value is in paper space units.</td>
</tr>
<tr>
<td>Text/Attribute text style</td>
<td>This property specifies whether attribute text within the symbol uses the text style of the current drawing (Target drawing text style) or the style defined by the attribute tag (As defined by content).</td>
</tr>
<tr>
<td>Text/Attribute text angle</td>
<td>Specifies the angle for attribute text. The choices are Right reading (which keeps the text right-side up regardless of rotation angle), As inserted (which sets text rotation at the angle of the last leader segment), and Force horizontal (which keeps the text horizontal regardless of the match line rotation angle.)</td>
</tr>
</tbody>
</table>

**Inserting a Revision Cloud in the Drawing**

Use this procedure to insert a revision cloud into the drawing.

1. Select a revision cloud tool on a tool palette.  
   (A revision cloud tool with a tag symbol is located on the Annotation palette.)

2. Specify the first point of the cloud shape in the drawing area.  
   **NOTE** Revision clouds are drawn counter-clockwise.

3. Specify the cloud shape, and click once when the cloud is closed.  
   If the revision cloud tool contains a tag, the Edit Attributes dialog opens.

4. Enter the text you want displayed in the tag, and click OK.

For information about editing the properties of revision clouds in the drawing, see Editing Block-Based Annotation Symbols on page 3669 and Editing Polyline-Based Annotation Symbols on page 3672.
NOTE Revision clouds that have been inserted with revision cloud tools can be modified in the drawing and saved back as tools on a tool palette. By default, a revision cloud tool created that way will have the same layer key, layer overrides, symbol, line width, arc length, attribute text style, and attribute text angle as the original tool that was used to create the annotation symbol in the drawing. The symbol location will be the current drawing.

Bar Scale Tools

Bar scale annotations are used for annotating a drawing. These annotations are now available through tools on the tool palettes and in Content Browser.

**Bar scale tool**

![Bar Scale Tool Example](image)

By default, all bar scale tools are set to be non-annotative, which means that the annotations you insert with these tools are not controlled by annotative scaling. You can make them annotative if desired. For more information, see [Annotation Scaling on page 3675](#).

**IMPORTANT** If you have legacy drawings with old DesignCenter-based annotation symbols in them, then the old block definition will continue to be used for new tool-based blocks if the blocks are identically named. In such a case, either change the Annotative setting manually by using BEDIT, or rename the old block before inserting new tool-based annotation symbols into the drawing.

**IMPORTANT** The bar scale tool has been set to be non-annotative by default because the numerical values created on insertion are static and will not update automatically when the annotation scale of the symbol is changed.

You can find a bar scale tool in these locations in a default US install of AutoCAD Architecture:

- In the Annotation tool palette
- In Content Browser in these catalogs:
  - Stock Tool Catalog
  - Sample Palette Catalog (Imperial or Metric), under \Document\Annotation
  - Documentation Tool Catalog (Imperial or Metric), under \Miscellaneous
**TIP** You can also search for these types of tools by name in Content Browser.

These properties of bar scale tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the bar scale is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer key is TITTEXT.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>Specifies the block-based symbol to be used for the bar scale.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (–), then only those blocks in the current drawing file are listed. Symbol blocks shipped with AutoCAD Architecture are by default located in %AECCONTENT_DIR%\Styles\Imperial\AEC Annotation Symbols (Imperial).dwg or %AECCONTENT_DIR%\Styles\Metric\AEC Annotation Symbols (Metric).dwg.</td>
</tr>
<tr>
<td>Text/Attribute text style</td>
<td>This property specifies whether attribute text within the symbol uses the text style of the current drawing (Target drawing text style) or the style defined by the attribute tag (As defined by content).</td>
</tr>
<tr>
<td>Text/Attribute text angle</td>
<td>Specifies the angle for attribute text. The choices are Right reading (which keeps the text right-side up regardless of rotation angle), As inserted (which sets text rotation at the angle of the last leader segment), and Force horizontal (which keeps the text horizontal regardless of the match line rotation angle.)</td>
</tr>
</tbody>
</table>
Inserting a Bar Scale in the Drawing

Use this procedure to insert a bar scale into the drawing.

1. Select a bar scale tool on a tool palette.
   (A bar scale tool is located on the Annotation palette.)
2. Specify the insertion point of the bar scale.
3. Specify the rotation of the bar scale.

For information about editing the properties of bar scales in the drawing, see Editing Block-Based Annotation Symbols on page 3669.

**NOTE** Bar scales that have been inserted with a bar scale tool can be modified in the drawing and saved back as a tool on a tool palette. By default, a bar scale tool created that way will have the same layer key, layer overrides, symbol, attribute text style, and attribute text angle as the original tool that was used to create the annotation symbol in the drawing. The symbol location will be the current drawing.

Column Grid Bubble Tools

Column grid bubble annotations are used for annotating column grids in a drawing. These annotations are available through tools on the tool palettes and in Content Browser. The column grid bubble is a true tool with tool properties.

**Column grid bubble tool**

The default column grid bubble tool is set to be annotative, which means that the annotations you insert with the tool are controlled by annotative scaling. For more information, see Annotation Scaling on page 3675.

**IMPORTANT** If you have legacy drawings with old DesignCenter-based annotation symbols in them, then the old block definition will continue to be used for new tool-based blocks if the blocks are identically named. In such a case, either change the Annotative setting manually by using BEDIT, or rename the old block before inserting new tool-based annotation symbols into the drawing.

The column grid bubble tool is based on a multi-view block. To make changes to the annotative behavior, you must change the referenced block within the multi-view block with BEDIT.
You can find a column grid bubble tool in these locations in a default US install of AutoCAD Architecture:

- In the Annotation tool palette
- In Content Browser in these catalogs:
  - Stock Tool Catalog
  - Sample Palette Catalog (Imperial or Metric), under \Document\Annotation
  - Documentation Tool Catalog (Imperial or Metric), under \Miscellaneous

TIP You can also search for these types of tools by name in Content Browser.

These properties of Column Grid Bubble tools can be customized:

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General/Layer key</td>
<td>Specifies the layer key for the layer to which the column grid bubble is assigned. To change, click the current value to access the Select Layer Key worksheet. The default layer is GRIDBUB.</td>
</tr>
<tr>
<td>General/Layer overrides</td>
<td>Specifies one or more layer key overrides. Click the worksheet icon to access the Select Layer Overrides worksheet.</td>
</tr>
<tr>
<td>General/Symbol</td>
<td>Specifies the block-based symbol to be used for the column grid bubble.</td>
</tr>
<tr>
<td>General/Symbol location</td>
<td>The location of the drawing file containing the specified symbol. Click the property and use the Browse option from the drop-down list to locate and enter the path to the file. If this property is unspecified (---), then only those blocks in the current drawing file are listed. Symbol blocks shipped with AutoCAD Architecture are by default located in %AECCONTENT_DIR%\Styles\Imperial\AEC Annotation Symbols (Imperial).dwg or %AECCONTENT_DIR%\Styles\Metric\AEC Annotation Symbols (Metric).dwg.</td>
</tr>
<tr>
<td>Label prefix</td>
<td>Specifies the default bubble text. The last character of the prefix will be incremented if multiple column grid bubbles...</td>
</tr>
</tbody>
</table>
are inserted within one command sequence. For example, if the label prefix is A1, then subsequent bubbles will be named A2, A3, and so on.

**NOTE** When the command is ended, and later the tool is started again, it will start incrementing from 1 again.

<table>
<thead>
<tr>
<th>Property Category/Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label both ends</td>
<td>Specifies whether a bubble is applied to only the selected node (No) or to the node on the opposite end of the grid as well (Yes).</td>
</tr>
<tr>
<td>Extension length</td>
<td>Specifies the length of the extension line from the column grid node to the bubble.</td>
</tr>
<tr>
<td><strong>NOTE</strong></td>
<td>These values are defined in model space units.</td>
</tr>
<tr>
<td>Text/Attribute text style</td>
<td>This property specifies whether attribute text within the symbol uses the text style of the current drawing (Target drawing text style) or the style defined by the attribute tag (As defined by content).</td>
</tr>
<tr>
<td>Text/Attribute text angle</td>
<td>Specifies the angle for attribute text. The choices are Right reading (which keeps the text right-side up regardless of rotation angle), As inserted (which sets text rotation at the angle of the last leader segment), and Force horizontal (which keeps the text horizontal regardless of the match line rotation angle).</td>
</tr>
</tbody>
</table>

**Inserting a Column Grid Bubble in the Drawing**

Use this procedure to add a column grid bubble to a column grid in the drawing.

1 Select a column grid bubble tool on a tool palette. (A column grid bubble tool is located on the Annotation palette.)

2 Select the desired node on the column grid you want to label.

3 In the Create Grid Bubble dialog, you can either choose to confirm the tool settings for label prefix, extension line length, and one-
or two-sided labelling, or you can overwrite them. Click OK when
the settings are according to your wishes.

4 To label more nodes on the column grid, select them and repeat
the previous step.

5 To end the bubble creation, press ENTER.

The column grid bubble tool shipped with AutoCAD Architecture is a
multi-view block referencing a bubble definition in a block. To edit the block,
you must run the BEDIT command.

NOTE Column grid bubbles that have been inserted with a column grid bubble
tool can be modified in the drawing and saved back as a tool on a tool palette.
By default, a column grid bubble tool created that way will have the same layer
key, layer overrides, symbol, label prefix, extension line length, attribute text style,
and attribute text angle as the original tool that was used to create the annotation
symbol in the drawing. The symbol location will be the current drawing.

---

**Editing Annotation Symbols in the Drawing**

Depending on whether you are using a block-based or polyline-based
annotation tool, different properties of the inserted annotation symbols can
be edited.

**Editing Block-Based Annotation Symbols**

The annotation symbols for north arrows, datum points, match lines, bar
scales, and revision clouds (with tag) contain block references. To edit the
properties of the block, select the desired tool in the drawing, and change the
following properties on the Properties palette:

**TIP** Match lines and revision clouds with tags are composed of a block reference
and a polyline. To confirm that you have selected the block reference part of
the symbol, verify that the drop-down list in the Properties palette reads “Block
Reference.”

<table>
<thead>
<tr>

<td>The currently active annotation scale (visible only for symbols that are controlled by annotation scaling.)</td>
</tr>
<tr>
<td>Misc/Match orientation to layout</td>
<td>Indicates whether the symbol is aligned to the spatial orientation of the drawing layout. The default setting is No. To change the orientation behavior, you must change the orientation of the referenced block by running BEDIT.</td>
</tr>
<tr>
<td>Category/Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Misc/Block Unit</td>
<td>Specifies the insertion units. To change this setting, you must change the insertion units of the referenced block by running BEDIT.</td>
</tr>
<tr>
<td>Misc/Unit factor</td>
<td>Specifies the conversion factor between block units and drawing units. To change this value, you must change the unit factor of the referenced block by running BEDIT.</td>
</tr>
<tr>
<td>Attributes/&lt;Attribute Name&gt;</td>
<td>If the block reference of the annotation symbol contains one or more editable attributes, you can directly edit them in the Properties palette. By default, match lines and bar scales contain editable attributes.</td>
</tr>
</tbody>
</table>

**Editing Polyline-Based Annotation Symbols**

The annotation symbols for fire rating lines, match lines, and revision clouds contain polylines. To edit the properties of the polyline, select the desired tool in the drawing, and change the following properties on the Properties palette:

**TIP** Match lines and revision clouds with tags are composed of a block reference and a polyline. To confirm that you have selected the polyline, verify that the drop-down list in the Properties palette reads “Polyline.”

<table>
<thead>
<tr>

</tr>
<tr>
<td>General/Plot style</td>
<td>The plotstyle is defined by the plot style table defined for the drawing. To change the plot style, you must select a different plot style table.</td>
</tr>
<tr>
<td>General/Linewidth</td>
<td>By default, the linewidth of an annotation symbol is defined by the layer the symbol is inserted on. You can manually select a different linewidth.</td>
</tr>
<tr>
<td>General/Hyperlink</td>
<td>You can attach a hyperlink to a polyline in the drawing.</td>
</tr>
<tr>
<td>General/Thickness</td>
<td>The thickness setting lets you add a 3D thickness to a 2D polyline. By default this is set to 0 as annotation symbols and their linework components normally do not require a 3D extrusion.</td>
</tr>
<tr>
<td>3D Visualization/Material</td>
<td>By default, the material used when displaying the drawing in a 3D visualization style is defined by the layer the symbol is on. Normally this setting does not need to be changed, as annotation symbols are rarely used in rendered views of a drawing.</td>
</tr>
<tr>
<td>Geometry/Vertex</td>
<td>The Vertex option displays the number of the vertex that is currently editable. Use the arrows to scroll between vertices.</td>
</tr>
<tr>
<td>Geometry/Vertex X/Y</td>
<td>Here, you can edit the vertex coordinates of the vertex selected in the line above.</td>
</tr>
<tr>
<td>Category/Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Geometry/Start segment width</td>
<td>This setting defines the width of the polyline segment at the start of the selected vertex.</td>
</tr>
<tr>
<td>Geometry/End segment width</td>
<td>This setting defines the width of the polyline segment at the end of the selected vertex.</td>
</tr>
<tr>
<td>Geometry/Global width</td>
<td>Here, you can enter a global width for the overall polyline. By default the line width setting defined in the tool is used.</td>
</tr>
<tr>
<td>Geometry/Elevation</td>
<td>This setting specifies the elevation of the polyline relative to the z-axis of the polyline's object coordinate system. Annotation symbols are by default inserted at elevation 0.</td>
</tr>
<tr>
<td>Geometry/Area</td>
<td>This value is set only if the polyline has been set to have a width.</td>
</tr>
<tr>
<td>Geometry/Length</td>
<td>This value displays the overall length of the polyline.</td>
</tr>
<tr>
<td>Misc/Closed</td>
<td>This setting displays whether the polyline in the annotation symbol is closed or open. Typically, fire rating lines and match lines are open polylines; a revision cloud is a closed polyline.</td>
</tr>
<tr>
<td>Misc/Linetype generation</td>
<td>This setting allows you to use a smaller linetype scale than the regular selected linetype scale on very short polyline segments. This can be useful when the linetype has a pattern (for example dashed) and certain segments are too short to display the pattern. In this case, enabling linetype generation generates the pattern on those segments with a scale small enough to display.</td>
</tr>
</tbody>
</table>
Annotation Scaling

Annotation scaling allows you to plot annotation at the same height or size regardless of the viewport zoom scale. Annotation scales can be associated with annotative objects in AutoCAD Architecture so that these objects can be sized properly for specific annotation scales in model space and displayed correctly in paper space. You can also toggle on or off the display of annotation objects that do not participate in the current annotation scale.

The following illustration shows a door tag displayed at two different annotation scales. The door tag was created in the drawing at the first annotation scale, then the annotation scale was changed.

The following illustration shows an AEC dimension displayed at two different annotation scales. The AEC dimension was created in the drawing at the first annotation scale, then the annotation scale was changed.

Annotation Tools with Annotative Properties

Use annotation tools to create annotation objects that respond to specific annotation scales. An annotation tool is a customizable AutoCAD Architecture tool for adding the following types of annotations to drawings:

- Multi-line text notes
- Symbol-based notes with attributes
- Reference keynotes
- Sheet notes
- Callouts

The annotation tools appear on the Annotation tab of the Document tool palette:

For more information about working with annotation tools, see The Basic Annotation Tool on page 3587.

**NOTE** DesignCenter tools do not generate objects that respond to annotation scaling.

An annotation object is any object that participates in annotation scaling.

The following are annotation objects created by AutoCAD Architecture:

- Multi-view blocks
- AEC dimensions

Multi-view blocks derive their annotative properties from their block definition. AEC dimensions derive their annotative properties from their dimension style.

For more information, refer to AutoCAD help.

The following are annotation objects created by AutoCAD:

- Text
The following AutoCAD styles are also annotative:
- Text
- Dimensions
- Block Definitions
- MLeaders

The specific type of annotation, its appearance, and other characteristics are determined by user-editable values on the Tool Properties worksheet, which is accessed from the context menu of the particular tool.
Specifying Annotation Scale

When you use AutoCAD Architecture tools to generate AutoCAD objects such as leaders and callouts, these objects become annotative objects that respond to annotation scaling. When you generate Multi-view blocks and AEC dimensions, these objects are also annotative and respond to annotation scaling with respect to scale and location based on the current annotation scale.

The annotation scale is a setting associated with the model tab and paper space viewports and is also saved with model views. It is controlled by the CANNOSCALE system variable value which sets the current annotation scale. Different annotation scales can be assigned to model views and paper space viewports.

Specify the current annotation scale by selecting one from the Annotation Scale flyout menu.

Annotation Scales and Viewports

When working in a paper space viewport, the annotation scale of the viewport controls the scale of the annotative objects created in the viewport. If multiple scale representations are supported, the annotative objects in the viewport are drawn and scaled based on the annotation scale without affecting the scale or display in the model tab or in other paper space viewports.

The viewport and annotation scales are synchronized when the annotation scaling controls are used. For example, when you change the viewport scale, the annotation scale updates to match the new viewport scale. However, as you zoom in or out of a viewport with your mouse wheel or by using the...
Zoom commands, the viewport scale updates while the annotation scale will remain unchanged.

Scale representations allow for the display of the same annotative object differently in different paper space viewports at the same time. Scale representations allow annotative objects to be drawn at different sizes based on the annotation scale. Each scale representation may also have different values for positional properties, such as a text string base point. The properties that can vary per scale representation depend on the object type.

The following illustration shows a door tag shown at two different annotation scales and different locations based on the annotation scale and base point.

Whenever an annotation object is identified as annotative as you add it to a drawing, the current annotation scale is added to the object as a participatory scale. AutoCAD Architecture objects identified as annotative will scale to match the current annotation scale. The scale point is the insertion point of the block definition.

**NOTE** Any annotation settings within all nested text or dimension styles referred to by an AutoCAD Architecture object, such as materials or component hatching, schedule tables, or stairs, will be ignored. Display properties for these objects do not respect annotation scaling.

Annotative objects such as door tags now have a Scale Representation Location Grip. Use this grip to relocate the current scale representation instance. Use the Location grip to relocate all of the scale representations at once. If there is only one scale representation supported for a particular tag, only the Location grip is displayed.
The model space or paper space text height is the height at which text will be plotted for a given scale. The following formula determines object scaling:

**Object Height \( \times \) Annotation Scale \( \times \) Annotation Plot Size = Model Space or Paper Space Height**

For example, the model space text height for a text string when displayed in a viewport scaled to \( \frac{1}{4}'' = 1' - 0'' \) is 12''. Assuming an object height of 1 unit, the formula applies as follows:

\[ 1 \times 48 \times \frac{1}{4}'' = 12'' \]

Blocks used by AutoCAD Architecture callouts, title marks, and other kinds of annotation must be created relative to a single AutoCAD unit (either an inch or a millimeter, depending upon whether your working in imperial or metric units). Documentation content files, regardless of whether they are based on blocks or multi-view blocks have the additional requirement that they be inserted at a scale relative to your anticipated plot scale, and taking into account the “Annotation Plot Size” setting in the drawing setup dialog box. As a baseline, you can use one AutoCAD unit, and anything in the content file that is one unit in size will be the annotation plot size when plotted at the specified annotation scale. Everything in the block, including geometry and text, must be created relative to the single AutoCAD unit. The entire block is scaled proportionally.

### Updating Legacy Annotative Objects

When you are working with previous versions of Architectural Desktop, you can update appropriate objects in AutoCAD Architecture so that they are annotative. This sections outlines the procedure for updating three types of objects: AutoCAD objects (text, dimensions, and hatching, for example), AutoCAD Architecture blocks, and AutoCAD Architecture multi-view blocks and AEC dimensions.

If you choose only one occurrence of an object to make annotative, only that instance of the object will be annotative. To apply an annotative property to all of the objects in a particular style, edit that style and assign an annotative property to all instances of that style. You can also enter ANNOUPDATE on the Command line to update the selected text objects. Leaders, MText, dimensions, and other objects are assigned an annotative property by this same procedure.
Updating Legacy AutoCAD Text to Annotative

Use this procedure to edit a legacy AutoCAD text style and add an annotative property. You can also use this procedure to update AutoCAD dimensions.

1. Open the legacy Architectural Desktop drawing in AutoCAD Architecture.
2. Specify the same annotation scale in the new AutoCAD Architecture drawing as in the legacy Architectural Desktop drawing.
3. From the Format menu, click Text Style.
4. In the Text Style dialog, from the Styles list, select the appropriate text style.
5. Under Size, select Annotative.
6. Click Apply.
7. On the Command Line, enter ANNOUPDATE to update all annotative objects.

Any text strings of the selected text style are now annotative.

Updating Legacy Architectural Desktop Blocks to Annotative

Use this procedure to edit legacy Architectural Desktop blocks, such as callouts or titlemarks, and add an annotative property.

1. Open the legacy Architectural Desktop drawing in AutoCAD Architecture.
2. Specify the same annotation scale in the new AutoCAD Architecture drawing as in the legacy Architectural Desktop drawing.
3. Click Insert tab ➤ Block panel ➤ Edit Block.
4. In the Edit Block Definition dialog, select the block to edit, and then click OK.
5. On the Properties Palette, under Block, select Yes for Annotative.
On the Block Editor toolbar, click Close Block Editor and then save your changes.

Any blocks of the selected block style are now annotative.

**Updating Legacy Architectural Desktop Multi-view Blocks to Annotative**

Use this procedure to edit a legacy Architectural Desktop multi-view block and add an annotative property to each block for each view. You can also use this procedure to update legacy AEC dimensions.

1. Open the legacy Architectural Desktop drawing in AutoCAD Architecture.
2. Specify the same annotation scale in the new AutoCAD Architecture drawing as in the legacy Architectural Desktop drawing.
3. Click Insert tab ➤ Block panel ➤ Edit Block.
4. In the Edit Block Definition dialog, select the first block to edit, and then click OK.
5. On the Properties Palette, under Block, select Yes for Annotative.
6. On the Block Editor toolbar, click Close Block Editor and then save your changes.
7. Repeat these steps for the remaining blocks of the remaining views of the multi-view block.
8. On the Command Line, enter **ANNOUPDATE** to update the selected blocks.

The selected blocks now have an annotative property.

**Copying Participating Annotation Scales from One AEC Object to Another**

You can copy annotation scales from annotative multi-view blocks and AEC dimensions as source AEC objects to other AEC objects. A prerequisite is that your drawing must contain an annotative AEC object that participates in at least 2 annotation scales. For example, you can copy annotation scales from one door tag to another.

1. Add 2 doors to your drawing.
2. Add a door tag to the first door.
This is the source object.

3 Select the door tag, and click Annotate tab ➤ Annotation Scaling panel ➤ Add/Delete Scales.

You can also specify a new current annotation scale by selecting one from the Annotation Scale flyout menu.

4 In the Annotation Object Scale dialog, click Add.

5 Select additional scales to add to the source object and click OK.

6 Verify the new scales added to the source object in the Annotation Object Scale dialog, and click OK.

7 Select the door tag, right-click and click Add Selected.

8 Select the second door.

9 Add the new door tag to your drawing.

10 Select the new door tag, and click Annotate tab ➤ Annotation Scaling panel ➤ Add/Delete Scales.

11 In the Annotation Object Scale dialog, verify that the new door tag has the same assigned scales as the source door tag.
Linking Display Configurations to Annotation Scales

You can specify which display configuration is associated with a particular annotation scale in your drawing. For example, you can link a Low Detail Reflected Ceiling Plan display configuration with a 1/8" = 1'-0" annotation scale and a Medium Detail Reflected Ceiling Plan display configuration with a 1/4" = 1'-0" annotation scale.

This relationship exists for the following display configuration conditions:

Model Tab: Annotation scale and display configuration changes

Current Paper Space Viewport: Annotation scale changes, zoom scale changes, and display configuration changes

Selected Paper Space Viewports: Annotation scale changes for all unlocked viewports, zoom scale changes for all unlocked viewports, and display configuration changes for all unlocked viewports

Derivation of Annotative Properties

The following table lists objects, their associated AutoCAD Architecture tool that creates them, and the source of their annotative properties, if any.

<table>

* AutoCAD object created by AutoCAD Architecture tool
**Callouts**

Details, sections, and elevations are views of the building model and part of the construction documentation. They can be created with callouts. Callout tools create a callout that is referenced to a model space view containing a user-defined part of the building model, such as a section, an elevation or a detail. They are coordinated across the complete construction document set with the help of projects and sheet sets.

**Working with Callouts**

Callout tools allow you to define portions of the building model as details, sections, and elevations. These portions are placed in model space views created for the callout.

A model space view is a portion of a view drawing that may be displayed in its own viewport on a layout tab of a drawing. A model space view has its own name, description, display configuration, layer snapshot, drawing scale, layer state, and view direction. Model space views are an evolution of the Named Views concept of AutoCAD, but as opposed to Named Views, model spaces views have a defined boundary.

You can place a model space view containing a detail, section, or elevation in the current view drawing, an existing project view drawing, or a new project view drawing.

**The New View Drawing Types**

View drawings have been enhanced for AutoCAD Architecture. In addition to the existing general view drawings, users may now access some specialized drawing types designed for saving details, sections, and elevations in a project. All of these view types are organized in the Project Navigator.
These are the types of view drawings in the Drawing Management feature:

- **General view drawings**: A general view drawing contains referenced constructs from the project, representing a specific view on the building model. General view drawings are based on the general view template defined in the project settings.
  
  *3D view of entire building*

- **Detail view drawings**: A detail view drawing can contain one or more model space views that show a defined portion of the building model. This could be a detail or an enlarged part of a plan. You can specify the level of detail with the help of the display configuration and the 2D Section/elevation style. A model space view containing a detail can be created with a callout. Detail view drawings are based on the detail view template defined in the project settings.
  
  *Detail view in callout*
Section/Elevation view drawings: A section/elevation view drawing can contain one or more model space views that show a section/elevation of the building model. A model space view containing a section or elevation can be created with a callout. Specific callout tools have been added to make the creation of four-way exterior and interior elevations easier and better. Section/elevation view drawings are based on the section/elevation view template defined in the project settings.

4 model space exterior elevations

For more information on the view system in AutoCAD Architecture, see Views on page 446.

Using Fields in Callout Tools

Fields enhance the documentation capabilities within a drawing file. A field is updatable text that is set up to display data that may change during the life cycle of the drawing. When the field is updated, the latest value of the field is displayed. Fields can be inserted into attribute definitions and can be used to create callout tools.

For more information, see Fields on page 3487 and Creating New Callout Tools on page 3732.
Callouts and Projects

Callouts and their referenced model space views are closely linked to projects in the Drawing Management feature. Although you can use callouts to some degree outside a project, to use them optimally, you need to be working within a project. For information on working outside a project, see Working with Callouts Outside a Project on page 3728.

Callout Tools

Plans, sections, elevations, and details are typically referenced to a callout. AutoCAD Architecture provides a number of predefined callout tools for the various view types. You can also place a callout that is not referenced to a view, and reference it later.

Callout tools in AutoCAD Architecture

The default tool palettes in the workspace contain sample callout tools that you can use and customize as needed. In addition, the following catalogs provided with the software contain callout tools that you can add to your tool palettes:

- Stock Tool catalog
- AutoCAD Architecture Sample Palette catalog
- Documentation Tool Catalog
Custom palettes created by your CAD manager or other users may also contain callout tools with properties that are customized for your projects or office standards.

The following callout tools are provided with the software:

<table>
<thead>
<tr>
<th>Tool</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Circle Callout" /></td>
<td>A detail callout tool with a circular boundary that can optionally insert a title mark. The callout symbol has field placeholders for the sheet number and the detail number, which are resolved when the detail is placed on a sheet.</td>
</tr>
<tr>
<td><img src="image" alt="Rectangle Callout" /></td>
<td>A detail callout tool with a rectangular boundary that can optionally insert a title mark. The callout symbol has field placeholders for the sheet number and the detail number, which are resolved when the detail is placed on a sheet.</td>
</tr>
<tr>
<td><img src="image" alt="Freeform Callout" /></td>
<td>A detail callout tool with a freeform boundary that can optionally insert a title mark. The callout symbol has field placeholders for the sheet number and the detail number, which are resolved when the detail is placed on a sheet.</td>
</tr>
<tr>
<td><img src="image" alt="Leader Callout" /></td>
<td>A detail tool with a leader line. The callout symbol has a field placeholder for the detail number that gets resolved when the detail is placed on a sheet.</td>

**Workflow for Annotating Drawings with Callouts**

1. **Open a drawing**
   - Open the drawing in which you want to add a callout.
   - If you are working in a structured AutoCAD Architecture project, open a view on page 461 drawing from the Project Navigator.

2. **Identify the type of callout to add**
   - Select a callout tool on page 3690, and add the callout to the drawing.
The Properties of a Callout Tool

You can use callout tools to create section views, elevation views, and detail views that are referenced to a callout. Depending on the view type you want to create, you need to set different options in the callout tool.
Properties of a detail callout
Properties of an elevation callout
Properties of a title mark tool

The following table lists the properties you can set for the individual tool types.

<table>
<thead>
<tr>
<th>Property</th>
<th>Tool Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General Category</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Layer Key</td>
<td>General (all callout types)</td>
<td>Here, you specify the layer key in which the callout symbol should be inserted.</td>
</tr>
<tr>
<td>Layer Overrides</td>
<td>General</td>
<td>If necessary, you can specify a layer key override for the callout symbol here.</td>
</tr>
<tr>
<td>Callout type</td>
<td>General</td>
<td>Here, you define the type of callout tool you want to insert. You can choose between these types:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detail Boundary: a tool consisting of a detail boundary and a detail mark</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detail Mark: a tool consisting of only a detail mark</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Elevation Single: a tool consisting of a single elevation mark</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Elevation Four-Way: a tool consisting of four elevation marks and lines</td>
</tr>
<tr>
<td>Property</td>
<td>Tool Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Callout boundary type</td>
<td>Detail Boundary</td>
<td>You can choose the shape of the detail boundary. Available options are circular, rectangular, and freeform.</td>
</tr>
<tr>
<td>Four way elevation type</td>
<td>Elevation Four Way</td>
<td>You can select the type of four-way elevation the tool should create. Available options are interior and exterior elevations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE</strong> For an interior elevation, you can select spaces as the elevation region.</td>
</tr>
<tr>
<td>Tag name</td>
<td>General</td>
<td>Here, you define the block that is used as the callout tag.</td>
</tr>
<tr>
<td>Tag and arrow location</td>
<td>General</td>
<td>Defines the location of the available callout symbol tags, and, if applicable, the location of the available tag arrows.</td>
</tr>
<tr>
<td>Arrow</td>
<td>Section/ Elevation</td>
<td>Define the block for the section/elevation mark arrow.</td>
</tr>
<tr>
<td>Attribute text style</td>
<td>General</td>
<td>Here you select if the text style for attributes in the callout should be the text style of the callout tag (Content) or the current text style of the drawing (Target).</td>
</tr>
<tr>
<td>Attribute text angle</td>
<td>General</td>
<td>Here, you select the text angle of the attribute text. You can choose to insert the attribute text at the same angle as the callout symbol (As Inserted), horizontal in the drawing (Horizontal), or to be read from the right side (Right Reading).</td>
</tr>
</tbody>
</table>

**Dimensions Category**
<table>
<thead>
<tr>
<th>Property</th>
<th>Tool Type</th>
<th>Description</th>

<td>General</td>
<td>Sets a default name for model space views that are created by this tool. You can override the name set in the tool when inserting a callout in the drawing.</td>
</tr>
<tr>
<td>Increment</td>
<td>General</td>
<td>Sets a default incrementing method for naming multiple model space views created with this callout tool. Available options are Integer and Character.</td>
</tr>
<tr>
<td>Place a title mark</td>
<td>General</td>
<td>Here, you can select if a title mark should be attached to model space views created with this tool.</td>
</tr>
</tbody>
</table>

### Title mark Category

| Layer Key                    | General   | By default, a title mark that is associated to a callout tool is inserted on the same layer as the model space view generated. You can however define a different layer for the title mark by selecting a different layer key here. |

3700 | Chapter 49  Callouts
Setting the Properties of a Callout Tool

Use this procedure to set the properties of a callout tool.

1 On the Tool Palettes, click  (Properties), and click Document.
2 Click the Callouts palette.
3 Select the callout tool for which you want to change properties, right-click, and click Properties.
4 Change the properties as necessary. For a description of the available properties, see The Properties of a Callout Tool on page 3694.

### Table: Properties of a Callout Tool

<table>
<thead>
<tr>
<th>Property</th>
<th>Tool Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer Overrides</td>
<td>General</td>
<td>If necessary, you can specify a layer key override for the title mark here.</td>
</tr>
<tr>
<td>Justify</td>
<td>General</td>
<td>This setting specifies the justification of the title mark in relation to the title mark line. Available options are Left and Right.</td>
</tr>
<tr>
<td>Tag</td>
<td>General</td>
<td>In this list, you select the block used for the title mark symbol.</td>
</tr>
<tr>
<td>Tag location</td>
<td>General</td>
<td>Sets the drawing or template file from in which the available blocks reside.</td>
</tr>
<tr>
<td>Title</td>
<td>General</td>
<td>Here, you define the title symbol.</td>
</tr>
<tr>
<td>Title location</td>
<td>General</td>
<td>Sets the drawing or template file from in which the available title symbols reside.</td>
</tr>
<tr>
<td>Attribute Text Style</td>
<td>General</td>
<td>Here you select if the text style for attributes in the title should be the text style of the title tag (Content) or the current text style of the drawing (Target).</td>
</tr>
<tr>
<td>Polyline width</td>
<td>General</td>
<td>This setting specifies the width of the polyline separator. The value is measured in plotting units and scaled appropriately based on the current annotation scale.</td>
</tr>
</tbody>
</table>
5 Click OK.

Placing Title Marks

You can place title marks in a drawing. A title mark can contain fields for information about model space views and sheet views. A title mark cannot be used to create a model space view, but it can be connected to an existing one. This is useful when working with legacy drawings or when annotating drawings at a later stage. You can connect title marks to any type of model space view, like details, sections, and elevations.

Placing a Title Mark

Use this procedure to place a title mark in a drawing.

NOTE The title marks shipped with AutoCAD Architecture contain fields for (model) view number, (model) view title, and (model) viewport scale. To display that information, they need to be associated with a model space view.

1 Open the view drawing containing the model space view to which you want to add the title mark.

2 On the Tool Palettes, click (Properties), and click Document.

3 Click the Callouts palette.

4 Select a title mark tool.

   Alternatively you can click Annotate tab ➤ Callouts panel ➤ Title drop-down ➤ Title .

5 Select the model space view you want to associate the title mark to.

   NOTE When you hover over the a model space view, its boundaries are highlighted.

6 Click to place the start point of the title mark.

7 Click to specify the end point of the title mark.

   The title mark is inserted with the view fields filled in. If your title mark contains fields for sheet information, the model space view might need to be associated with a sheet before resolving these fields.
Placing Detail Callouts

You can use callouts to create specific, enlarged views of the building model. Typically, you detail components to a detail to call out items that are not included as part of the building model, like bolts and connectors, or detailed brick hatches. You can also use callouts to generate sections or elevations of an existing section or elevation. For example, you could create a section of the building model, and then create an enlarged detail from part of the section. To that detail, you could then add detail components for the construction document.

For more information about detail components, see Detail Components on page 3527.

Door head detail example

Creating a Detail in the Current View Drawing

Use this procedure to place a callout that creates a detail in the current view drawing.
Viewing building section detail boundary

1. On the Quick Access toolbar, click Project Navigator (Properties) and click Document.
2. Click the Views tab.
3. Select the view drawing in which you want to place the detail callout, right-click, and click Open.
4. On the Tool Palettes, click (Properties), and click Document.
5. Click the Callouts palette.
6. Select a detail callout tool.

<table>
<thead>
<tr>
<th>If you want to ...</th>
<th>Then ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a callout with a</td>
<td>select one of the detail boundary tools. AutoCAD Architecture provides</td>
</tr>
<tr>
<td>detail boundary and a</td>
<td>tools for circular, rectangular, and freeform detail boundaries.</td>
</tr>
<tr>
<td>detail mark</td>
<td></td>
</tr>
<tr>
<td>create a callout without a</td>
<td>select one of the detail mark tools. AutoCAD Architecture provides tools</td>
</tr>
<tr>
<td>detail boundary</td>
<td>for regular detail marks, detail marks with a tail, and detail marks</td>
</tr>
<tr>
<td></td>
<td>with a sheet number attribute.</td>
</tr>
</tbody>
</table>

Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Detail Boundary drop-down for callouts with a detail boundary,
or Annotate tab ➤ Callouts panel ➤ Detail drop-down for callouts without a detail boundary.

7 If you selected a detail boundary tool, specify the extents of the detail boundary.

8 Specify the detail leader line, and press ENTER.

9 Under New Model Space View Name, enter a name for the new model space view containing the detail.

10 If necessary, select Generate Section/Elevation.

11 If you want to add a title mark to the model space view, select Place Titlemark.

12 Select the scale for the model space view.

13 Click Current Drawing.

14 If you selected to create a detail with a section/elevation, specify the insertion point of the 2D section/elevation result.

15 If you selected to create a detail without a section/elevation, specify the extents of the model space view containing the area being detailed.

The extents of the model space view will dictate the default sheet view size, so if the model space boundary is too small, you may have problems placing annotations in it.

Once the model space view has been placed in the drawing, the field placeholders in the callout change to a question mark. To resolve them, the model space view needs to be placed onto a
sheet, as described in Resolving Fields in Callout Symbols on page 3727.

The model space view is displayed in the Project Navigator under the view drawing in which you have created it.

Creating a Detail in an Existing Drawing

Use this procedure to place a callout that creates a detail in an existing project view drawing.

1 On the Quick Access toolbar, click Project Navigator ➔.
2 Click the Views tab.
3 Select the view drawing in which you want to place the detail callout, right-click, and click Open.

4 On the Tool Palettes, click ➔ (Properties), and click Document.
5 Click the Callouts palette.
6 Select a detail callout tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a callout with a detail boundary and a detail mark</td>
<td>select one of the detail boundary tools. AutoCAD Architecture provides tools for circular, rectangular, and freeform detail boundaries.</td>
</tr>
<tr>
<td>create a callout without a detail boundary</td>
<td>select one of the detail mark tools. AutoCAD Architecture provides tools for regular detail marks, detail marks with a tail, and detail marks with a sheet number attribute.</td>
</tr>
</tbody>
</table>

Alternatively, you can click Annotate tab ➔ Callouts panel ➔ Detail Boundary drop-down for callouts with a detail boundary, or Annotate tab ➔ Callouts panel ➔ Detail drop-down for callouts without a detail boundary.

7 If you selected a detail boundary tool, specify the extents of the detail boundary.
8 Specify the detail leader line, and press ENTER.
9 Under New Model Space View Name, enter a name for the new model space view containing the detail.
10 If necessary, select Generate Section/Elevation.
11 If you want to add a title mark to the new model space view, select Place Titlemark.
12 Select the scale for the model space view.
13 Click Existing View Drawing.

Select a drawing to place the detail

14 Select the project view drawing in which to place the model space view, and click OK.
15 If you selected to create a detail with a section/elevation, specify the insertion point of the 2D section/elevation result.
16 If you selected to create a detail without a section/elevation, specify the extents of the model space view containing the area being detailed.

The extents of the model space view will dictate the default sheet view size, so if the model space boundary is too small, you may have problems placing annotations in it.

Once the model space view has been placed in the drawing, the field placeholders in the callout change to a question mark. To resolve them, the model space view needs to be placed onto a
sheet, as described in Resolving Fields in Callout Symbols on page 3727.

17 To display the model space view in the Project Navigator, navigate to the target drawing, and expand it. The model space view is listed under the drawing. For information on opening the model space view, see Opening a Model Space View on page 3726.

Creating a Detail in a New Drawing

Use this procedure to place a callout that creates a detail in a new project view drawing.

You can place each detail in its own detail drawing. The Detail View template set in the project is used to create the new drawing. For more information, see Creating a New Project on page 328.

When you create a new drawing for a detail, it contains by default the same constructs, levels, and divisions as the drawing from which the detail is taken. You can change that assignment, if necessary.

1 On the Quick Access toolbar, click Project Navigator .
2 Click the Views tab.
3 Select the view drawing in which you want to place a detail callout, right-click, and click Open.
4 On the Tool Palettes, click (Properties), and click Document.
5 Click the Callouts palette.
6 Select a detail callout tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a callout with a detail boundary and a detail mark</td>
<td>select one of the detail boundary tools. AutoCAD Architecture provides tools for circular, rectangular, and freeform detail boundaries.</td>
</tr>
<tr>
<td>create a callout without a detail boundary</td>
<td>select one of the detail mark tools. AutoCAD Architecture provides tools for regular detail marks, detail marks with a tail, and detail marks with a sheet number attribute.</td>
</tr>
</tbody>
</table>
Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Detail Boundary drop-down for callouts with a detail boundary, or Annotate tab ➤ Callouts panel ➤ Detail drop-down for callouts without a detail boundary.

7 If you selected a detail boundary tool, specify the extents of the detail boundary.

8 Specify the detail leader line, and press ENTER.

9 Under New Model Space View Name, enter a name for the new model space view containing the detail.

10 If necessary, select Generate Section/Elevation.

11 If you want to add a title mark to the new model space view, select Place Titlemark.

12 Select the scale for the model space view.

13 Click New View Drawing.

14 Define the properties of the new view drawing, as described in Creating a New View Drawing on page 453.

15 Click Finish.

Once the model space view has been placed in the new view drawing, the field placeholders in the callout change to a question mark. To resolve them, the model space view needs to be placed onto a sheet, as described in Resolving Fields in Callout Symbols on page 3727.

**Placing Section Callouts**

You can use callouts to create sections of the building model. A section can be used as the basis for a detail, containing information about components such as insulation, materials, and finishes.
Creating a Section in the Current Drawing

Use this procedure to place a callout that creates a 2D section in the current project view drawing.

NOTE The 2D section style and the display set for the model space view containing the section are set in the callout tool. For more information, see Setting the Properties of a Callout Tool on page 3701.

1. On the Quick Access toolbar, click Project Navigator.
2. Click the Views tab.
3. Select the view drawing in which you want to place the section callout, right-click, and click Open.
4. On the Tool Palettes, click (Properties), and click Document.
5. Click the Callouts palette.
6. Select a section callout tool.
   
   For a description of the section callout tools included with the software, see Callout Tools in AutoCAD Architecture on page 3690.

   Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Sections drop-down, and select one of the section tools.

7. In the drawing area, specify the first point of the section line.
8 Continue to add points to the section line. When you have finished the shape of the section line, press ENTER.

9 Specify the direction of the section mark arrow.

10 Under New Model Space View Name, enter a name for the new model space view containing the section.

11 Verify that Generate Section/Elevation is selected.

12 If you want to add a title mark to the new model space view, select Place Titlemark.

13 Select the scale for the model space view.

14 Click Current Drawing.

15 In the drawing area, select the insertion point for the model space view.

Once the model space view has been placed, the field placeholders in the section callout change to a question mark. To resolve them, the model space view needs to be placed onto a sheet, as described in Resolving Fields in Callout Symbols on page 3727.
Creating a Section in an Existing Drawing

Use this procedure to place a callout that creates a 2D section in an existing project view drawing.

Sections are often placed into a designated section drawing. Whenever a new section is created, it is added to that drawing.

1. On the Quick Access toolbar, click Project Navigator.
2. Click the Views tab.
3. Select the view drawing in which you want to place a section callout, right-click, and click Open.
4. On the Tool Palettes, click (Properties), and click Document.
5. Click the Callouts palette.
6. Select a section callout tool.
   For a description of the section mark tools included with the software, see Callout Tools in AutoCAD Architecture on page 3690.
   Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Sections drop-down, and select one of the section tools.
7. In the drawing area, specify the first point of the section line.
8. Continue to add points to the section line. When you have finished the shape of the section line, press ENTER.
9 Specify the direction of the section mark arrow.

10 Under New Model Space View Name, enter a name for the new model space view containing the section.

11 Verify that Generate Section/Elevation is selected.

12 If you want to add a title mark to new model space view, select Place Titlemark.

13 Select the scale for the model space view.

14 Click Existing View Drawing.
Select a drawing to place the section

15 In the Add Model Space View dialog, select the project view drawing in which the model space view should be placed, and click OK.

16 In the drawing area, select the insertion point of the generated section.

NOTE Although you select the insertion point in the current drawing, it will be used in the target drawing where the section result is placed. That way, you have control over the insertion point of the 2D section without opening the target drawing. You can change the location of the 2D section later, when you open the drawing in which the 2D section was placed, and change it there.

Once the model space view has been placed, the field placeholders in the section callout change to a question mark. To resolve them, the model space view needs to be placed onto a sheet, as described in Resolving Fields in Callout Symbols on page 3727.

17 To display the section view in the Project Navigator, navigate to the target drawing, and expand it.

The model space view is listed under the drawing.
For information on opening the model space view, see Opening a Model Space View on page 3726.

Creating a Section in a New Drawing

Use this procedure to place a callout that creates a 2D section in a new project view drawing.

When you create a section view in a new drawing, the building model is referenced into the new drawing. A 2D section is based on the geometry of the objects cut by the section line. If you place a callout in your First Floor Plan view drawing, and create a 2D section in that drawing, then the section will only contain the first floor geometry - only those building model objects that are present either as drawing objects or external references in the current drawing. When you create a new section view drawing for the 2D section, you can control which levels, divisions, and constructs are included in the section. This affords you enhanced control over what objects will be included in the section. You could, for example, deselect the Furniture construct from the First Floor Plan view drawing, to avoid cluttering up the section with unnecessary building components. In the same way, you can add constructs, levels or divisions not present in the current view drawing, for example, to create background graphics.

Floors plan (top) and building section (bottom)

1 On the Quick Access toolbar, click Project Navigator .
2 Click the Views tab.
3 Select the view drawing in which you want to place a section callout, right-click, and click Open.

4 On the Tool Palettes, click (Properties), and click Document.

5 Click the Callouts palette.

6 Select a section mark tool.

   For a description of the section mark tools provided with the software, see Callout Tools in AutoCAD Architecture on page 3690.

   Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Sections drop-down, and select one of the section tools.

7 In the drawing area, specify the first point of the section line.

8 Continue to add points to the section line. When you have finished the shape of the section line, press ENTER.

9 Specify the direction of the section mark arrow.

10 Under New Model Space View Name, enter a name for the new model space view containing the section.

11 Verify that Generate Section/Elevation is selected.

12 If you want to add a title mark to the new model space view, select Place Titlemark.

13 Select the scale for the model space view.

14 Define the properties of the new view drawing, as described in Creating a New View Drawing on page 453.

   **NOTE** By default, all constructs, levels, and divisions are preselected here.

15 Click Finish.

16 In the drawing area, select the insertion point of the generated section.

   **NOTE** Although you select the insertion point in the current drawing, it will be used in the target drawing where the section result is placed. That way, you have control over the insertion point of the 2D section without opening the target drawing. You can change the location of the 2D section later, when you open the drawing in which the 2D section was placed, and change it there.

   Once the model space view has been placed in the new view drawing, the field placeholders in the section callout change to...
Placing Elevation Callouts

You can use callouts to create elevations of the building model. With the callout tools of AutoCAD Architecture, you can create interior and exterior elevations. When you create an interior elevation, you can select spaces as the elevation boundary.

Placing a Single Elevation Callout

Use this procedure to place a callout that creates a single elevation.

**NOTE** The 2D section/elevation style and the display set for the model space view containing the elevation are set in the elevation callout tool. For more information, see Setting the Properties of a Callout Tool on page 3701.
1 On the Quick Access toolbar, click Project Navigator.
2 Click the Views tab.
3 Select the view drawing in which you want to place an elevation callout, right-click, and click Open.

4 On the Tool Palettes, click (Properties), and click Document.
5 Click the Callouts palette.
6 Select a single elevation callout tool.
   Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Elevations drop-down ➤ Elevation (Single) ➤, or
   Annotate tab ➤ Callouts panel ➤ Elevations drop-down ➤ Elevation (Single, Inverted Text) ➤.
7 Select the location for the elevation mark in the drawing.
8 Specify the direction of the elevation.

9 Under New Model Space View Name, enter a name for the new model space view containing the elevation.
10 Verify that Generate Section/Elevation is selected.
11 If you want to add a title mark to the new model space view, select Place Titlemark.
12 Select the scale for the model space view.
13 Select where to place the elevation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>place the elevation in the view drawing in which you placed the callout</td>
<td>click Current Drawing.</td>
</tr>
<tr>
<td>place the elevation in an existing elevation view drawing</td>
<td>click Existing View Drawing and follow the instructions in Creating a Section in an Existing Drawing on page 3712.</td>
</tr>
<tr>
<td>place the elevation in a new elevation drawing</td>
<td>click New View Drawing and follow the instructions in Creating a Section in a New Drawing on page 3715.</td>
</tr>
</tbody>
</table>

14 In the drawing, select the first corner of the elevation region.

15 Select the opposite corner of the elevation region.

16 Define the insertion point of the elevation result.

**NOTE** If you chose to place the elevation in a different drawing, you still select the insertion point in the current drawing. The elevation view however, will be inserted in the drawing you have specified.

Once the model space view has been placed, the field placeholders in the elevation tool change to a question mark. To resolve them, the model space view needs to be placed onto a sheet, as described in Resolving Fields in Callout Symbols on page 3727.

---

**Placing a Four-Way Interior Elevation Callout**

Use this procedure to place a callout that creates a four-way interior elevation.

When you create a four-way interior elevation, you can define the elevation region either by specifying its corner points in the drawing, or by selecting spaces as the elevation boundary.

**NOTE** The 2D section/elevation style and the display set for the model space views containing the elevations are set in the elevation callout tool. For more information, see Setting the Properties of a Callout Tool on page 3701.

1 On the Quick Access toolbar, click Project Navigator .
2 Click the Views tab.
3 Select the view drawing in which you want to place an elevation callout, right-click, and click Open.

4 On the Tool Palettes, click (Properties), and click Document.
5 Click the Callouts palette.
6 Select a four-way interior elevation callout tool. Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Elevations drop-down ➤ Elevation (Interior. 1, 2, 3, 4)
   or Annotate tab ➤ Callouts panel ➤ Elevations drop-down ➤ Elevation (Interior. N, S, E, W).
7 Select the location for the elevation mark in the drawing.
8 Specify the direction of the first elevation number.

9 Under New Model Space View Name, enter a name for the model space view containing the first of the four elevations.
10 Verify that Generate Section/Elevation is selected.
11 If you want to add a title mark to the new model space view, select Place Titlemark.
12 Select the scale for the model space view.
13 Select where to place the elevation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>place the elevation in the view drawing in which you placed the callout</td>
<td>click Current Drawing.</td>
</tr>
<tr>
<td>place the elevation in an existing elevation view drawing</td>
<td>click Existing View Drawing and follow the instructions in Creating a Section in an Existing Drawing on page 3712.</td>
</tr>
<tr>
<td>place the elevation in a new elevation drawing</td>
<td>click New View Drawing and follow the instructions in Creating a Section in a New Drawing on page 3715.</td>
</tr>
</tbody>
</table>

14 In the drawing, select the elevation region:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>define the elevation region with a space</td>
<td>select the space, and press ENTER.</td>
</tr>
<tr>
<td>define the elevation region by picking two boundary points</td>
<td>press ENTER. Then, select the two boundary points of the elevation region.</td>
</tr>
</tbody>
</table>

15 Specify the depth of the elevations.

16 Specify the height of the elevations.

17 Specify the insertion point of the elevations.

**NOTE** If you chose to place the elevations in a different drawing, you still select the insertion point in the current drawing. The elevations, however, will be inserted in the drawing you specified.

18 Specify the distance between the elevations and their orientation.

   Once the model space views have been placed, the field placeholders in the elevation callouts change to a question mark. To resolve them, the model space views need to be placed onto sheets, as described in Resolving Fields in Callout Symbols on page 3727.
Placing a Four-Way Exterior Elevation Callout

Use this procedure to place a callout that creates a four-way exterior elevation.

NOTE The 2D section/elevation style and the display set for the model space views containing the elevations are set in the elevation mark tool. For more information, see Setting the Properties of a Callout Tool on page 3701.

1 On the Quick Access toolbar, click Project Navigator .
2 Click the Views tab.
3 Select the view drawing in which you want to place an elevation callout, right-click, and click Open.
4 On the Tool Palettes, click (Properties), and click Document.
5 Click the Callouts palette.
6 Select a four-way exterior elevation callout tool.
   Alternatively, you can click Annotate tab ➤ Callouts panel ➤ Elevations drop-down ➤ Elevation (Exterior) .
7 Specify the first corner of the elevation region.
8 Specify the opposite corner of the elevation region.

9 Under New Model Space View Name, enter a name for the model space view containing the first elevation.
10 Verify that Generate Section/Elevation is selected.
11 If you want to add a title mark to the new model space views, select Place Titlemark.

12 Select the scale for the model space view.

13 Select where to place the elevation:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>place the elevation in the view drawing in which you placed the callout in</td>
<td>click Current Drawing.</td>
</tr>
<tr>
<td>place the elevation in an existing elevation view drawing</td>
<td>click Existing View Drawing and follow the instructions in Creating a Section in an Existing Drawing on page 3712.</td>
</tr>
<tr>
<td>place the elevation in a new elevation drawing</td>
<td>click New View Drawing and follow the instructions in Creating a Section in a New Drawing on page 3715.</td>
</tr>
</tbody>
</table>

14 Specify the height of the elevations.

15 Specify the insertion point of the elevations.

**NOTE** If you chose to place the elevations in a different drawing, you still select the insertion point in the current drawing. The elevations however, will be inserted in the drawing you specified.

16 Specify the distance between the elevations and their orientation.

Once the model space views have been placed, the field placeholders in the callout change to a question mark. To resolve them, the model space views need to be placed onto sheets, as described in Resolving Fields in Callout Symbols on page 3727.

---

**Placing a Callout Without a Model Space View**

Use this procedure to place a callout that is not connected to a model space view.

Placing a callout that is not referenced to a model space view might be useful if you have legacy view drawings that are not yet referenced to a callout. You can create a standalone callout in a building model, and then reference it to an existing model space view or sheet view in the project.
When you insert a callout without a referenced model space view in a drawing, the field placeholders in the callout are not connected to a view. Therefore, the field placeholders are displayed in the callout by their names; for example “Viewnumber,” or “Sheetnumber.”

1. On the Quick Access toolbar, click Project Navigator  
2. Click the Views tab.
3. Select the view drawing in which you want to place a callout, right-click, and click Open.
4. On the Tool Palettes, click (Properties), and click Document.
5. Click the Callouts palette.
6. Select a callout tool.
   For a description of the callout tools shipped with AutoCAD Architecture, see Callout Tools in AutoCAD Architecture on page 3690.
   Alternatively, you can click Annotate tab ➤ Callouts panel, and select a callout tool.
7. Add the callout tool to the drawing, following the instructions for the type of tool you selected.

8. Click Callout Only.
   An unconnected callout symbol is inserted in the drawing.
Referencing a Callout to an Existing View

Use this procedure to reference a callout to an existing model space view or to an existing sheet view in the project. For information on creating model space views, see Creating a Model Space View on page 468. For information on creating sheet views, see Creating a Sheet View on page 497.

1 On the Quick Access toolbar, click Project Navigator .
2 Click the Views tab.
3 Select the view drawing that contains the callout, right-click, and click Open.
4 Select the callout.
5 In the Project Navigator, navigate to the model space view or sheet view you want to reference to the callout:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference the callout to an existing model space view</td>
<td>click the Views tab, and navigate to the view drawing containing the model space view. Then, expand the view drawing.</td>
</tr>
<tr>
<td>reference the callout to an existing sheet view</td>
<td>click the Sheets tab, and click . Navigate to the sheet containing the sheet view, and expand the sheet.</td>
</tr>
</tbody>
</table>

**NOTE** If a sheet view already exists, you can reference the callout to either the sheet view or the model space view.

6 Drag the callout from the drawing onto the model space view or the sheet view in the Project Navigator.

If you referenced the callout to a model space view, the field placeholders in the callout change to question marks. For information on resolving field placeholders in callouts, see Resolving Fields in Callout Symbols on page 3727.

If you have connected the callout to a sheet view, the field placeholders in the callout are resolved with the sheet information.
Opening a Model Space View

Use this procedure to open a model space view.

When you create a model space view that is referenced to a callout, the model space view can be placed in the drawing in which the callout was placed, into an existing project view drawing, or in a new project view drawing.

Model space views are displayed and opened in the Views tab of the Project Navigator.

Exterior elevation model space views in Project Navigator

1. On the Quick Access toolbar, click Project Navigator.
2. In the Project Navigator, navigate to the view drawing containing the model space view.
   It is not important whether the drawing is already open.
3. If necessary, expand the view drawing to display the model space views contained in it.
4. Select the model space view you want to open, and double-click it.
   Alternatively, you can select the model space view in the Project Navigator, right-click, and click Open.
Deleting a Model Space View

Use this procedure to delete a model space view.

When you delete a model space view, any callout symbols and title marks associated with the view are not deleted automatically. After deleting the model space view, you need to manually delete the callout symbol and title mark from the source drawing.

1. On the Quick Access toolbar, click Project Navigator. 
2. Click the Views tab. 
3. Select the view drawing that contains the model space view you want to delete, and expand it. 
4. Select the model space view to delete, right-click, and click Delete.

Resolving Fields in Callout Symbols

Use this procedure to place a model space view on a sheet and resolve its field placeholders.

The predefined callout tools in AutoCAD Architecture contain field placeholder information about the sheet number and the view number. This information can be resolved only when the model space view created by the callout is referenced into a sheet. As long as the model space view is not placed on a sheet, the information is unresolved, and a question mark is displayed.

Unresolved (left) and resolved (right) elevation callout symbols

Once the model space view is placed on a sheet, and the sheet information in the callout is resolved, a link is created between the field information in the model space view and the sheet on which it is placed. When you CTRL-click the sheet number, the corresponding sheet drawing is opened.

1. Create a model space view referenced to a callout, as described in Placing Detail Callouts on page 3703, Placing Section Callouts on page 3709, or Placing Elevation Callouts on page 3717.
In the Project Navigator, click the Sheets tab, and click 🍃.  
3 In the Sheet Set View, locate the sheet onto which you want to place the model space view.  
4 Open the sheet in one of these ways:  
   ■ Select the sheet, right-click, and click Open.  
   ■ Double-click the sheet.  

The drawing containing the sheet is opened in the drawing area of AutoCAD Architecture. The sheet you selected is the active layout.  
5 In the Project Navigator, click the Views tab.  
6 Select the model space view you want to place onto the sheet, and place it in one of these ways:  
   ■ Select the model space view, and drag it from the Project Navigator to the drawing area of the sheet.  
   ■ Select the model space view, right-click, and click Place on Sheet. Then, select an insertion point on the sheet.  

When you open the model space view, you can see that the sheet information has been updated.

**Working with Callouts Outside a Project**

Model space views are based on the concepts of the Drawing Management feature. A model space view normally is created from a project view drawing and referenced into a project sheet drawing.

You can use a part of the callout functionality outside a project, in a standalone DWG file, with the following limitations:

■ You can place model space views only within the current drawing.

■ You can access model space views only from the Named Views dialog of AutoCAD.

■ You cannot templates for details, sections, or elevations.

■ Field placeholders containing information about views and sheets are not automatically resolved. You must enter values manually.
Placing a Callout in a Non-Project Drawing File

Use this procedure to place a callout in a drawing that does not belong to a Drawing Management project.

1 On the Tool Palettes, click (Properties), and click Document.
2 Click the Callouts palette.
3 Select a callout tool.
   Alternatively, you can click Annotate tab ➤ Callouts panel, and select a callout tool.
4 Insert the callout into the drawing.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>place a detail callout</td>
<td>insert the tool as described in Creating a Detail in the Current View Drawing on page 3703.</td>
</tr>
<tr>
<td>place a section callout</td>
<td>insert the tool as described in Creating a Section in the Current Drawing on page 3710.</td>
</tr>
<tr>
<td>place a single elevation callout</td>
<td>insert the tool as described in Placing a Single Elevation Callout on page 3717.</td>
</tr>
<tr>
<td>place a four-way interior elevation callout</td>
<td>insert the tool as described in Placing a Four-Way Interior Elevation Callout on page 3719.</td>
</tr>
</tbody>
</table>
If you want to…  Then…

place a four-way exterior elevation callout  insert the tool as described in Placing a Four-Way Exterior Elevation Callout on page 3722.

5 Under New Model Space View Name, enter a name for the new model space view.
6 If you want to add a title mark to your model space view, select Place Titlemark.
7 Select the scale for the model space view.
8 Under Create in, select Current Drawing.
A model space view is placed in the current drawing.

Opening Model Space Views in a Non-Project Drawing File

Use this procedure to open a model space view in a drawing that does not belong to a Drawing Management project.

1 Place a callout in the drawing, as described in Placing a Callout in a Non-Project Drawing File on page 3729.
2 Click View tab ➤ Appearance panel ➤ Views drop-down ➤ View Manager.

In the View Manager, the model space view you created is listed under Views.

3 Select the model space view you want to open, and click Set Current.

4 Click OK.

Deleting Model Space Views in a Non-Project Drawing File

Use this procedure to delete a model space view from a drawing that does not belong to a Drawing Management project.

1 Open the drawing containing the model space view you want to delete.

2 On the command line, enter `view`.

   The model space views contained in the drawing are listed under Model Views.

3 Select the model space view you want to delete, right-click, and click Delete.

4 Click OK.
Creating New Callout Tools

AutoCAD Architecture provides a number of predefined callout tools. You can also create callout symbols with user-defined visuals and content.

Using Fields in Callout Tools

Fields enhance the documentation capabilities within a drawing file. A field is updatable text that is set up to display data that may change during the life cycle of the drawing. When the field is updated, the latest value of the field is displayed. Usually, you use property set data for this type of updatable information about the building model. However, property set data can be used only in MV-blocks. Fields can be inserted into manual properties in property set definitions, text, MText, attribute definitions and AutoCAD table cells.

For detailed information about fields, see “Use Fields in Text” in AutoCAD Help.

There are a number of predefined fields for sheet set information. Most of the fields refer to the current sheet, and should be inserted only in a sheet drawing.

When you are creating a callout tool, you will often use a field from the Sheet Set Placeholder category: These fields let you define a field as a placeholder in a callout for a referenced sheet. The fields are resolved when the callout is referenced into a sheet. For more information, see Resolving Fields in Callout Symbols on page 3727.

- Current Sheet Custom: You can select an AutoCAD custom property defined for the current sheet here.
- Current Sheet Description
- Current Sheet Number
- Current Sheet Number and Title
- Current Sheet Set
- Current Sheet Set Custom: You can select an AutoCAD custom property defined for the current sheet here.
- Current Sheet Set Description
- Current Sheet Subset
- Current Sheet Title
Sheet Set: You can select any sheet from a sheet set as the field content; available properties are sheet title, sheet number and sheet description.

Sheet Set Placeholder: You can insert a placeholder representing information of a sheet. This placeholder is resolved when the callout is referenced into a sheet. The following fields are available as placeholders:

- Sheet Number and Title
- Sheet Title
- Sheet Number
- Sheet Description
- Sheet custom: You can select an AutoCAD custom property defined for the referenced sheet here.
- (Model Space) View Number and Title
- (Model Space) View Title
- (Model Space) View Number
- (Model Space) Viewport Scale

**NOTE** The fields for sheet title, sheet number, sheet description, view title, and view number can be associated with a hyperlink that jumps to the sheet or model space view referenced.

Sheet View: You can select any sheet view from a sheet set as the field content here; available properties are sheet view number, sheet view title, and sheet view viewport scale.

**NOTE** The fields for sheet view number and sheet view title can be associated with a hyperlink that jumps to the sheet view referenced.

### Creating a Callout Tool

You can create callout tools that display information specific to the sheet set. Callouts can be referenced to model space views and can contain fields that point to a sheet or sheet view. When the model space view is placed onto into a sheet, the field is resolved and displays the sheet information.
For a list of available project and sheet set related fields, see Using Fields in Callout Tools on page 3732.

**Process Overview: Creating a Callout Tool**

Creating a callout tool consists of these basic steps:

1. Open the drawing in which you want to store the callout block.
   - **NOTE** By default, callout blocks are placed in `C:\ProgramData\Autodesk\ACA2012\enu\Styles\Imperial\Callouts (Imperial).dwg`. You can save your callout blocks there, or create your own callout drawings.

2. Add callout attributes to the drawing.
3. Create a block from the attributes.
4. Create a callout tool on a tool palette.

**Adding Callout Attributes**

Use this procedure to create attributes for a callout tool.

1. Click Insert tab ➤ Attributes panel ➤ Define Attributes.
2. Define the first attribute for the callout tool.
3. Enter a name in the Tag field.
4. Under Value, click .
5. Under Field category, select the desired category.
6 Under Field names, select the field you want to insert. Some fields require additional information, like a file name or property information.

7 Select the text format for the field text.

8 Click OK.

9 Proceed to adding the attribute as described in “Attribute Definition Dialog Box” in AutoCAD help.

**NOTE** An attribute can contain only one sheet set field. If you want to create a callout line that reads, for example, *View Number - View Title*, you must define two separate attributes.

10 Repeat steps 1–3 for each attribute to add to the callout tool.

11 Complete the attribute block with lines, borders, and other desired components.

The result is have a number of attributes and graphic elements in your drawing. Your callout attributes might look like this:
Creating a Callout Block

Use this procedure to create a block that contains the attributes you added in the previous step.

1. Click Insert tab ➤ Block panel ➤ Create Block $\text{ CREATE BLOCK }$.
2. Enter a name for the block.
3. Click Select Objects, and select the attributes and additional graphics to include in the title block.
4. From the Drag-and-drop units list, select Unitless.
5. Proceed to creating the block as described in “Block Definition Dialog Box” in AutoCAD help.
6. Save the drawing containing the callout block.

NOTE If you are creating a callout tool that will be used by multiple users, make sure that the drawing is located in a folder all users have access to. Otherwise, the tool won’t be able to be used by all users.

Creating a Callout Tool on a Tool Palette

Use this procedure to create the callout tool on a tool palette.

1. On the Tool Palettes, click $(\text{ Properties })$, and click Document.
2. Click the Callouts palette.
3. Select the callout tool most similar to the tool you want to create.
   For example, if you want to create a detail tool, select one of the existing detail tools.
4. Right-click, and click Copy. Then, right-click, and click Paste.
   A copy of the selected tool is placed on the Callouts palette.
5 Select the copied tool, right-click, and click Properties.
6 Rename the tool as desired.
7 Under Tag location, select the drawing you have saved the callout block in.
8 Under Tag name, select the block you created.
9 Change other properties as needed; for example, add a new title mark or change the 2D section/elevation style.
10 Click OK.
Schedules and Display Themes

Schedules can be inserted in your drawings to display information about selected components in your building. The information is extracted from objects in the drawing based on information attached to objects and object styles.

Display themes provide another way to present data by using color, fills, and hatches. For example, you can specify that all 2-hour fire-rated walls appear with a red fill. A display theme legend identifies the correlation.

Data for display themes is also extracted from information attached to objects or object styles. Display themes and schedule tables are style-based annotation objects, for which styles can be created and modified in the Style Manager. For more information, see Style Manager Overview on page 870.

Schedules

Schedules are tables you can insert in drawings to list information about selected objects in your building model. Objects are made up of properties that contain data. Schedule tags provide an efficient tool of collecting the property data attached to the objects for display in a schedule table. You can create schedules with varying levels of detail by defining and attaching sets of properties to object styles or to individual objects and then extracting and displaying the data in a schedule table.

You can produce basic schedule tables using the default tools provided with the software. Before you perform more complex tasks such as creating your own schedule tables, classifications, or working with formulas in your project, it is important to understand how property data, property sets, and property set definitions interact. We recommend the following topics:

- Property Sets and Property Set Definitions on page 3743
Property Data Formats on page 3802
Property Set Data on page 3810
Property Set Definitions on page 3823

If you want to add simple tags and schedules for common objects like doors using one of the default tools, refer to the following topics:

- Basic Schedules on page 3747
- Schedule Tags on page 3754

If you want to manage the format and other display properties of schedules, refer to the following topics about schedule table styles:

- Working with Schedule Table Styles on page 3769
- Specifying the Display Properties of a Schedule on page 3793

If you want to work with more advanced scheduling tasks, such as adding classifications and formulas, refer to the following topics for information about identifying and collecting detailed information from your objects:

- Property Set Data on page 3810
- Understanding Formulas on page 3830
- Classification Definitions on page 3872

Each section gives you conceptual as well as procedural information for the tasks you want to accomplish. Cross-references to additional supporting information are provided throughout. For answers to various questions about working with schedules, see Troubleshooting Schedule Tables on page 3898 and Troubleshooting Schedule Table Styles on page 3901.

**Schedule Table Terminology in AutoCAD Architecture**

You can add basic schedules to your drawings using tools provided with the software. These tools have predefined styles and properties. You can schedule additional details about objects, such as door hardware, by customizing an existing schedule table style or creating a new style. The following terms apply to creating and managing schedules:
Schedule Tags

You can use project-based or standard schedule tags in your drawings to graphically display the property data of an object. By linking the schedule tag to a property in a property set, such as the width of a door, you report property data of the object, such as 3'-0". When you anchor the tag to an object to which the property set is applied, the value of the property displays in the tag. The information in the tag is updated if the object or property change. For more information, see Schedule Tags on page 3754.

Schedule Tools

The software provides default tools for project-based and standard wall, door, and window schedules on the Scheduling tool palette and in the Content Browser. Selecting one of these tools that has a style and other properties predefined, lets you quickly place a schedule table in your drawing. You can also apply the properties of a schedule table tool to existing schedule tables. You can create schedule table tools from schedule table styles. For more information, see Adding Schedules Using Schedule Table Tools on page 3747.

Schedule Styles

A schedule table style specifies the properties that can be included in a table for a particular object type. The style also controls the table formatting, such as text height and spacing, columns, and headers. Display properties in the style control the visibility, layer, color, linetype, linewidth, and linetype scale of table components. For more information, see Working with Schedule Table Styles on page 3769.

Options in schedule table styles let you create both regular and matrix schedules (also called dot schedules). You can also specify a matrix format for individual columns in a regular schedule.

Property Data

Property data is information about properties of an object. For example, width and height are typical properties of a door. The data collected on these properties might reflect 3'-0" for width and 7'-0" for height. This property data is contained within a property set. For more information, see Property Sets and Property Set Definitions on page 3743.

NOTE Property data values are not contained in the schedule or schedule tag, but on the object itself. The schedule and schedule tag simply displays values retrieved directly from the object to which it is anchored.
Property Sets

A property set is a user-definable group of related object properties. When you attach a property set to an object or a style, the property set becomes the container for the property data associated with the object. Property sets are specified using property set definitions (see below). For more information, see Property Set Definitions on page 3823 and Property Set Data on page 3810.

Property Set Definitions

A property set definition is a documentation object that specifies the characteristics of a group of properties that can be tracked with an object or style. For example, you could create a property set definition named DoorProps that contains property definitions for DoorNumber, DoorWidth, and FireRating. Each property has a name, description, data type, data format, and default value. For more information, see Property Set Definitions on page 3823.

Property Data Formats

A property data format is specified for each property definition within a property set definition to control how the data for that property displays in a schedule table, in a schedule tag, or on the property palette. For example, you can use property data formats to display a door that is three feet wide, with a raw value of 36 units in a drawing, with inch units as 3'-0", or 3', or 3 ft. Property set definitions and schedule table styles use property data formats to control the display format of values for each property. For more information, see Property Data Formats on page 3802.

Workflow to Annotate Drawings with Tags and Schedules

If you use the annotation tools provided with the software, the definitions and formats are already created for you.

Open a drawing

Open the Document tool palette on page 70 set or the Documentation Tool Catalog in the Content Browser on page 129 to find the tag.

Find the schedule tag needed

Open a drawing.
If you are working in a structured AutoCAD Architecture project, open a view on page 461 from the Project Navigator.

3742 | Chapter 50  Schedules and Display Themes
Add tags on page 3756 that are not designated as project-based to objects in the drawing. If you are working in a structured AutoCAD Architecture project, you can add project-based tags on page 530 which collect additional information for the objects.

Attach property set data on page 3810 to objects on page 3811 in the drawing. If you are working in a structured AutoCAD Architecture project, creating property set definitions on page 536 allows you to group specific property data from objects for a schedule on page 532.

Edit the fields on page 3813 on the tag.

Add a schedule table on page 3747 to display property data collected from objects in your drawing or from objects in an externally-referenced drawing on page 3796.

**Property Sets and Property Set Definitions**

The data reported in a schedule table is collected from property sets that you attach to the objects or object styles you are scheduling. The properties contained in a property set are determined by the property set definition, which also specifies the object type, style, and definition to which the property set can be applied.
NOTE If you are using both AutoCAD Architecture and Revit MEP, locks may appear on some property set definitions and property definitions when you open legacy engineering drawings. Data that is programmatically set cannot be modified and is protected and identified by locks:

- selections on the Applies To tab and names for property set definitions
- anything that affects the value of underlying data and names for property definitions

A property set definition is a group of related properties of the objects and object styles to be reported in the schedule. Once attached to an object or its style, a property set becomes the container for the property data associated with the object. Values for properties are obtained directly from the object or are entered manually for the object or the style.

A property set definition for a door object

Automatic and Manual Properties

Properties for AEC object types fall into two categories:

- Automatic properties are built into objects and styles when you create the object. Examples are width, length, height, and data retrieved from other sources, such as the project or the object’s material. For more information, see Understanding Automatic Properties on page 3826.

- Manual properties are those that you enter explicitly, such as fire rating, manufacturer, or finish. For more information, see Adding a Manual Property Definition to a Property Set Definition on page 3845.

Automatic properties are available to include in your property set definitions. You create and enter values for manual properties.
Applying Property Set Definitions to Objects and Styles

You can create a property set definition for either objects or styles and definitions (like multi-view block definitions). Manual properties that are likely to be different for each instance of an object belong in an object-based property set definition that is applied by object.

Property set definition that applies to door objects

Manual properties that will be the same for all instances of a style belong in a style-based property set definition that is applied to a style (such as a wall style) or a definition (such as a multi-view block definition).

Property set definition that applies to multi-view block definition
Automatic properties are dynamically retrieved from the object. Most automatic properties should be put in a style-based property set definition, even if values may vary for each instance of the object. For example, the properties “Door Width” and “Door Height” are extracted automatically from door objects. Placing these properties in a style-based property set definition provides a value for each door object of that style, and is more efficient than putting them in an object-based property set definition that you then attach to each door.

**NOTE** A mismatch of data can occur if, after you create a schedule table with property set data added, you change from an object-based property set definition to a style-based definition. To correct this, remove the property sets and update the schedule table. For more information, see Removing Property Set Data from an Object on page 3814 and Removing Property Set Data from a Style or Definition on page 3820.

**Fields in Property Set Data**

You can enter AutoCAD fields in a manual property attached to an object or style. Fields enhance the documentation capabilities within a drawing file because the values they display update whenever the associated property changes. Fields can also be associated with hyperlinks. For example, if you insert a field pointing to a drawing using a hyperlink in a manual property, and create a schedule table that contains that property, you can jump from the table cell with the field property in it to the drawing to which it is linked.

For more information, see Entering Manual Properties and Fields for Objects on page 3812 and Adding a Field to a Property Set Definition on page 3847.

**Lists in Property Set Data**

List items are created in a list definition and are attached to a manual property definition. With a predefined list of valid items, you can select an item from the list for a manual property either in the property set definition or on the Extended Data tab of the Properties palette. This reduces the redundancy of entering values that are commonly used. For more information, see Creating a List Definition for a Manual Property Definition on page 3869 and Adding a Field to a Property Set Definition on page 3847.

**Predefined Content for Schedules**

There are predefined styles and properties for schedule table tools, schedule tag tools, and property set definitions provided with the software. The tools are located on the Scheduling tool palette in the Document tool palette set,
and the property set definitions are in Style Manager under Documentation Objects.

You can also access default schedule table styles, schedule tags, and property set definitions in C:\ProgramData\Autodesk\ACA 2012\enu\Styles\<Imperial or Metric>\Schedule Tables.dwg. You can use any of this content to create additional schedules or as the basis for creating custom schedules, tags, and property set definitions.

**Basic Schedules**

You have everything you need to add schedule tables and perform common documentation tasks, such as tagging objects, when you open the software. Schedule tables are objects. As with other objects in your drawing, properties of schedule tables are displayed on the Properties palette when you add a schedule or if you select a schedule. For more information, see The Properties Palette on page 107.

Schedule table tools with predefined styles and properties are provided with the software. Using these tools you can add door, window, space, and room schedules to your drawing. They are located on the Scheduling tool palette in the Document tool palette set.

Additional schedule table tools are located in the Documentation Tool Catalog in the Content Browser. You can add tools from the Content Browser to any tool palette. For more information, see Content Browser on page 129.

**IMPORTANT** The contextual tab for schedule tables includes a Convert to Table option, which creates a copy of your AutoCAD Architecture schedule table that can be inserted as an AutoCAD® table. AutoCAD Architecture commands, such as Update or Add All Property Sets cannot be used on the converted table. Also be aware that you may get unexpected results if you use special characters in your schedule headings, such as equal signs (=). Avoid this problem by adding an apostrophe (’) in front of the character before doing the conversion. For more information about working with AutoCAD® tables, see “Create and Modify Tables” in AutoCAD Help.

**Adding Schedules Using Schedule Table Tools**

Use this procedure to add a schedule table to a drawing with a schedule table tool. You can specify properties on the Properties palette when you add a schedule table, or you can modify the schedule table later.
When you use default tools, it is not necessary to make changes to the style before you begin to capture data in your drawing. Property set data is already attached to objects. For more information, see Working with Schedule Table Styles on page 3769 and Property Set Data on page 3810.

1 Open the tool palette that contains the schedule table tool you want to use, and select the tool.
   Alternatively, you can click Annotate tab ➤ Scheduling panel, and select one of the schedule table tools there.

2 Select the objects to include in the schedule table, or press ENTER to schedule an external drawing.
   For more information, see Changing External Source Properties of a Schedule on page 3796.
   You can use a selection window or a crossing window to select objects. Objects that are not of the type specified for the schedule table are filtered out.

3 In the drawing area, specify the insertion point for the upper-left corner of the schedule table.

4 Specify the lower-right corner of the table, or press ENTER to scale the schedule table to the current drawing scale.
   - If the schedule table contains question marks in any cells, the property set containing that property is not attached to an object or style.
   - Empty cells or dashes in cells indicate that the property set is attached, but data is not available or is not entered for that object or style.

   For more information about attaching property sets for property set data, see Property Set Data on page 3810.

Creating a Schedule Table Tool

Use this procedure to create a schedule table tool and add it to a tool palette. You may want to create your own schedule table tools if you are placing multiple schedule tables of specific styles that have the same properties.

1 Open the tool palette on which you want to create a tool.
2 Create the tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a tool from a schedule</td>
<td>select the object, and drag it to the tool palette.</td>
</tr>
<tr>
<td>table in the drawing</td>
<td></td>
</tr>
<tr>
<td>create a tool from a schedule</td>
<td>click Manage tab ➤ Style &amp; Display panel ➤ Style Manager. Locate the</td>
</tr>
<tr>
<td>table style in the Style Manager</td>
<td>style you want to copy, and drag it to the tool palette. Click OK</td>
</tr>
<tr>
<td>copy a tool in the current tool</td>
<td>right-click the tool, and click Copy. Right-click, and click Paste.</td>
</tr>
<tr>
<td>palette</td>
<td></td>
</tr>
<tr>
<td>copy a tool from another tool</td>
<td>open the other tool palette, right-click the tool, and click Copy. Re-</td>
</tr>
<tr>
<td>palette</td>
<td>open the palette where you want to add the tool, right-click, and click</td>
</tr>
<tr>
<td></td>
<td>Paste.</td>
</tr>
</tbody>
</table>

3 Right-click the new tool, and click Properties.

4 Enter a name for the tool.

5 Click the setting for Description, enter a description of the tool, and click OK.

6 Expand General, and specify general properties for the schedule table:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add a description</td>
<td>enter text for Description.</td>
</tr>
<tr>
<td>specify the layer key</td>
<td>select Layer Key.</td>
</tr>
<tr>
<td>specify layer overrides</td>
<td>select Layer Overrides.</td>
</tr>
<tr>
<td>specify the schedule table style</td>
<td>select Style.</td>
</tr>
<tr>
<td>specify an external drawing file</td>
<td>select Style Location or Browse to specify a location.</td>
</tr>
<tr>
<td>source for the style</td>
<td></td>
</tr>
<tr>
<td>change the schedule table scale</td>
<td>enter a value for Scale.</td>
</tr>
</tbody>
</table>
If you want to... Then...

automatically update the schedule table when data in the drawing changes select Yes for Update automatically.

manually update the schedule table when the drawing changes select No for Update automatically.

**NOTE** Turning on the automatic update feature may slow drawing performance, especially in large drawings. For information about updating schedules manually, see Property Set Data on page 3810.

7 Expand Selection, and specify how to add objects to the schedule table:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>automatically add new objects to the schedule table as they are added to the drawing</td>
<td>select Yes for Add new objects automatically.</td>
</tr>
<tr>
<td>manually add new objects to the schedule table</td>
<td>select No for Add new objects automatically.</td>
</tr>
<tr>
<td>include objects from xref drawings in the schedule table</td>
<td>select Yes for Scan xrefs.</td>
</tr>
<tr>
<td>exclude objects from xref drawings in the schedule table</td>
<td>select No for Scan xrefs.</td>
</tr>
<tr>
<td>include objects from block references in the schedule table</td>
<td>select Yes for Scan block references.</td>
</tr>
<tr>
<td>exclude objects from block references in the schedule table</td>
<td>select No for Scan block references.</td>
</tr>
<tr>
<td>apply a layer filter to the table</td>
<td>specify a layer wild card.</td>
</tr>
</tbody>
</table>
NOTE When adding a schedule table that must scan xrefs or blocks, use a layer filter that includes both the name of the layer that contains the xref or block and the name of the layer of the object inside the xref or block. You can separate multiple layer wild cards with a comma. You cannot select individual objects within an xref drawing or a block reference. For more information, see Working with Layer Groups on page 733.

8 Click OK.

Adding Objects to a Schedule

Use this procedure to add objects to an existing schedule table.

1 Select the schedule.
2 Click Schedule Table tab ➤ Scheduled Objects panel ➤ Add .
3 In the drawing, select the objects to add to the schedule, and press ENTER.

Use a window or a crossing window to select multiple objects. Objects that are already in the table are not added.

NOTE You cannot add objects to a schedule table through RefEdit. Although the command appears to work during the RefEdit session, as soon as changes are saved back, the rows disappear from the schedule table. This is because you are actually selecting temporary copies of the objects in the file. In order to have objects that are in an xref or block display in a schedule table, select the xref. To include only selected objects from the xref or block, use a layer filter with the schedule table. For more information, see Editing Style-Based Property Sets Attached to Objects in External References on page 3818.

Removing Objects from a Schedule

Use this procedure to remove objects from a schedule table.

1 Select the schedule table.
2 Click Schedule Table tab ➤ Scheduled Objects panel ➤ Remove .
3 In the drawing, select the objects to remove from the table, and press ENTER.
Reselecting Objects for a Schedule

Use this procedure to reselect objects to include in a schedule table. After reselection, the table contains only the newly-selected objects.

1. Select the schedule table.
2. Click Schedule Table tab ➤ Scheduled Objects panel ➤ Reselect.
3. In the drawing, select the objects to include in the table, and press ENTER.

Turning Off the Out-of-Date Marker

Use this procedure if you do not want the out-of-date marker to display when an object, object style, or attached property set data has changed but the schedule is not updated. This appears by default.

With the out-of-date marker display component turned on in the General schedule display representation of your drawing, a line is drawn through the schedule to indicate that the information tracked by the schedule has changed. For example, a line is drawn through the schedule if an object tracked in the schedule is moved or deleted, or if its dimensions are edited. The line is removed when you update the schedule. For more information about display components, see Display System Structure on page 801.

Displaying an out-of-date schedule

NOTE If this display component is on, it can slow drawing performance, especially in large drawings.

1. Select the schedule table, right-click, and click Edit Object Display.
2. Click the Display Properties tab.
3. Select the General display representation.
4. If necessary, click .
5. Scroll to display the Out-of-Date Marker component, and click Visible.
6 Click OK twice.

Updating a Schedule Manually

You can update a schedule table at any time by selecting it, and clicking Schedule Table tab ➤ Modify panel ➤ Update . This updates the values in a schedule table when the automatic update option is turned off. Always update schedule tables before plotting the drawings that contain them.

When you update a table manually, the table is refreshed to reflect any changes to objects or to property set data attached to objects or object styles. Objects added to the drawing after creating the schedule table are not included in the table unless Add Objects Automatically is specified in the table properties. To add objects manually, see Adding Objects to a Schedule on page 3751. To change the numbering in a schedule table, see Renumbering Property Set Data on page 3765. To ensure that the table contains accurate information, close and re-open your drawing before plotting schedule tables. Certain changes to drawings, such as reference editing, are reflected in schedule tables only when a drawing is reopened.

NOTE You can specify that a schedule table updates automatically whenever changes are made to data for scheduled objects. This is managed on the Properties palette. For more information, see Changing General Schedule Properties on page 3794.

Locating and Viewing Scheduled Objects in a Drawing

Use this procedure to highlight objects in the drawing that are included in a schedule table.

1 Select the schedule table.

2 Click Schedule Table tab ➤ Scheduled Objects panel ➤ Show .

3 Select the border of the schedule table to show all the objects in the table, or select a specific cell to show only the object contained on that row.

The selected objects are highlighted in the drawing.
Schedule Tags

Schedule tags are symbols that connect building objects with lines of data in a schedule table. Schedule tags display data about the objects to which they are attached. There are schedule tag tools with predefined properties provided with the software on the Scheduling tool palette in the Document tool palette set and in the Documentation Tool Catalog in the Content Browser. For more information, see Tools on page 85 and Content Browser on page 129.

You can also create schedule tags to display specific property set data for objects in the building. After you create a schedule tag, you can drag it to any tool palette to create a schedule tag tool. For more information, see Creating a Schedule Tag on page 3757 and Creating a Schedule Tag Tool on page 3760.

Tags in an AutoCAD Architecture Project Environment

It is recommended that you tag objects in view drawings if you are working in a project environment. You can use one of the default project-based schedule tags, or you can create project-specific tags that display the project information you define. A project-based schedule tag recognizes the location of the object (the level in the building project). A standard schedule tag does not. When you want this additional information captured, work in a project environment and use a project-based schedule tag. For more information about working in AutoCAD Architecture projects, see Workflow for a Project Environment on page 303.

Tags as Multi-View Block Definitions

Tag tools have predefined properties. Each tag is a multi-view block with attributes. Values from the property set data of the object can be transferred to the tag attributes if, when the tag is added, the tag attributes include the names of the property set definition and the property definition. An example of an attribute definition tag for a door is DoorStyles:DoorHeight. Attribute definition tags cannot have extended names (names that contain spaces). If you use extended names for your property set or property definitions, you cannot display those objects automatically through the use of a tag anchor.

Because tag attributes are linked to property set data, the tag attributes change when the property set data changes. For example, the number displayed in a door tag associated with a door is updated when the number property of the door is renumbered. To edit the information that displays in the tag, edit the property set data. For more information, see Entering Manual Properties and Fields for Objects on page 3812.
Schedule tags are organized as multi-view block definitions under Multi-Purpose Objects in the Style Manager. For more information, see Style Manager Overview on page 870.

**Connection Between Tags and Objects**

Tags are constrained (anchored) to objects by default. This is controlled in the properties for the tag tool. It is possible to turn on the graphic that displays the connection between tags and objects. The Anchor Tag To Entity graphic controls the display for tags that are not constrained to objects, and the Anchor Extended Tag to Entity graphic controls the display for tags that are constrained to objects. For more information, see Viewing the Connection Between Tags and Objects on page 3764.

**Tags for Multiple Objects**

Select one object at a time when using the multiple tag option in order to control the numbering sequence of the tags. The sequence of auto-incrementing is undefined if you use a crossing window or another multiple selection tool.

When you use the same schedule tag tool to tag multiple objects, it ensures that the same property set is attached to each object. When adding schedule tags to objects in an external reference (xref), you can avoid broken links by selecting Attach as the Reference Type instead of Overlay. For more information, see “Reference Other Drawing Files” in AutoCAD Help.

**Placement and Position of Tags**

When you are tagging multiple objects, tag a single object first. The placement of the first tag relative to the object you are tagging is used to determine the placement of subsequent tags. Tags are positioned relative to the objects being tagged.

- For walls, the tag (or the end of its leader) is positioned relative to the midpoint of the wall.
- For spaces, the tag (or the end of its leader) is positioned relative to the center of the geometric extents of the space.
- For all other objects, a tag with a leader is placed with the end of the leader at the geometric center of the object. Tags without leaders are placed at the same distance and direction as the first tag, relative to the center of the object.
Adding Tags Using Schedule Tag Tools

One of the most frequent uses of annotation in a project is tagging the individual objects. Adding schedule tags to your drawings can be done simply and quickly with schedule tag tools that are provided with the software.

**NOTE** When you insert schedule tags into drawings, use the appropriate base units for the tag to match the drawing scale properly. For more information, see Units in Property Data Formats on page 3804.

Adding Tags to Objects

Use this procedure to add schedule tags to objects, a block reference, or a multi-view block reference, such as equipment or furniture. You can use one of the predefined tag tools provided with the software, or you can create a new tool for a tag you define. For more information, see Creating a Schedule Tag on page 3757.

If you are working in a structured project environment in AutoCAD Architecture, project-based tags recognize additional information about the objects if you tag objects in view drawings. There are predefined, project-based tags provided.

1. Open the tool palette that contains the tag tool you want to use, and select it.
   Alternatively, you can click Annotate tab ➤ Scheduling panel, and select one of the tag tools there.
   Additional predefined tag tools are located in the Documentation Catalog in the Content Browser. You can add these tools to any tool palette.

2. Select the object to which to attach the tag.

3. Specify the location of the tag.

   **NOTE** Different object tags may have different prompts. The steps below may not correspond exactly to those for the object tag you are placing.

4. If prompted, enter property set data on the Edit Property Set Data worksheet, and click OK.
For information about preventing the worksheet from displaying each time you add a tag, see Turning Off the Edit Property Set Data Worksheet on page 3757.

If property set data is not yet attached to the object, you can attach an appropriate property set from the current drawing or the Schedule Tables.dwg file in C:\ProgramData\Autodesk\ACA 2012\enu\Styles\<Imperial or Metric> For more information about property sets, see Property Set Definitions on page 3823.

5 Enter m, press ENTER, and select multiple objects to tag.
6 Alternatively, press ENTER, and add schedule tags one at a time.

Turning Off the Edit Property Set Data Worksheet

Use this procedure to prevent the Edit Property Set Data worksheet from displaying each time you add a schedule tag.

Depending on the property set definitions that are attached to the object, you can edit or enter new property set data when this worksheet displays. This option is turned on in the software by default. If you are adding tags that contain only automatic properties, it is more efficient to turn off this option.

1 Click ➤ Options.
2 Click the AEC Content tab.
3 Clear Display Edit Property Data Dialog During Tag Insertion, and click OK.

Creating a Schedule Tag

Use this procedure to create a schedule tag that captures and displays property set data for a particular object in your drawing.

The property set attached to the object must contain the property or properties for the information that you want to display in the tag. For more information, see Property Set Data on page 3810.

You can create the schedule tag by drawing a symbol and adding text as a placeholder for attributes or by exploding and customizing an existing schedule tag. When you create a schedule tag, each attribute is assigned a unique name (called an attribute tag), which is formed by combining the names of the
associated property set definition and property definition. When the schedule tag is anchored to objects to which the property set definition applies, the tag displays the value of the property identified by the attribute tag.

For example, you have a property set definition named DoorProps, which contains a property definition named FireRating. The FireRating property contains fire rating information for door objects. To create a door tag that displays the fire rating of a door to which the tag is anchored, you must first create a schedule tag that contains an attribute definition whose attribute tag is DoorProps:FireRating.

1. Draw a symbol for the tag, and add text as necessary to designate the property data you want displayed as an attribute of the tag. Tags may have multiple attributes and be linked to multiple property definitions.

2. Create the schedule tag:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a schedule tag from your</td>
<td>click Annotate tab ➤ Scheduling panel ➤ ➤ Create Tag 🛡️. Select the</td>
</tr>
<tr>
<td>custom graphic and text</td>
<td>objects from which to create the tag, and press ENTER.</td>
</tr>
<tr>
<td>create a schedule tag from an</td>
<td>click Home tab ➤ Modify panel ➤ Explode 📋. Select the object, and press</td>
</tr>
<tr>
<td>existing tag</td>
<td>ENTER. Repeat until all nested blocks are exploded, and click Annotate</td>
</tr>
<tr>
<td></td>
<td>tab ➤ Scheduling panel ➤ ➤ Create Tag 🛡️. Select the objects from which</td>
</tr>
<tr>
<td></td>
<td>to create the tag, and press ENTER.</td>
</tr>
</tbody>
</table>
3 On the Define Schedule Tag worksheet, enter a name to identify the new tag.

![Image of Define Schedule Tag dialog box]

4 Click to select additional objects.

5 Select the attributes of the tag:

<table>
<thead>
<tr>
<th>If you want the label to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>collect property data from the objects tagged</td>
<td>select Property for Type, select a Property Set and a Property Definition, and click OK.</td>
</tr>
<tr>
<td>display as the text you entered</td>
<td>select Text for Type and click OK.</td>
</tr>
</tbody>
</table>

![Image of Define Schedule Tag dialog box with additional attributes selected]
Specify a point on the tag as the insertion point.

**Creating a Schedule Tag Tool**

Use this procedure to create a schedule tag tool and add it to a tool palette. You may want to create tools that display different information as attributes for different types of objects.

For example, your floor plan has space allocated to specific functions. To efficiently view the total area of space used by the different functions, you can create a schedule tag that displays the property data of the base area of each space. For more information, see Property Sets and Property Set Definitions on page 3743.

1. Open the tool palette on which you want to create a tool.
2. Create the tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a tool from a schedule tag in the drawing</td>
<td>select the schedule tag, and drag it to the tool palette.</td>
</tr>
<tr>
<td>copy a tool in the current tool palette</td>
<td>right-click the tool, and click Copy. Right-click, and click Paste.</td>
</tr>
<tr>
<td>copy a tool from another tool palette</td>
<td>open the other tool palette, right-click the tool, and click Copy. Re-open the palette where you want to add the tool, right-click, and click Paste.</td>
</tr>
</tbody>
</table>

3. Right-click the new tool, and click Properties.
4 Enter a name for the tool.

5 Click the value for Description, enter a description of the tool, and click OK.

6 Click More Info to add keywords for the tool, and click OK.

7 Expand General, and specify general properties for the schedule tag:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>identify the type of tool</td>
<td>click Type, and select Tag to identify the tool as a schedule tag, or select Property set data to specify that the tool attaches property data without displaying a tag. When property set data is attached to an object, properties display in the schedule and on the Properties palette without displaying a tag on the object.</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------</td>
</tr>
<tr>
<td>attach property set data</td>
<td>click the value for Property Data, select the property set definitions, and click OK.</td>
</tr>
<tr>
<td>specify an external drawing file source for the property definition location</td>
<td>select Property def location, and Browse to specify a location.</td>
</tr>
</tbody>
</table>

8 If you selected Tag as the tool type, expand Tag to edit the tag properties.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an alternative layer key</td>
<td>click the value for Layer key, select the layer key, and click OK.</td>
</tr>
<tr>
<td>specify layer key overrides</td>
<td>click the value for Layer key overrides, select overrides, and click OK.</td>
</tr>
<tr>
<td>select a different name for the schedule tag</td>
<td>click Tag name, and select the name.</td>
</tr>
<tr>
<td>specify a source file location from which to import the property set definition</td>
<td>select Tag location, and Browse to specify a location.</td>
</tr>
<tr>
<td>specify that the tag moves with the object to which it is anchored</td>
<td>select Yes for Constrain to object.</td>
</tr>
<tr>
<td>specify that the tag does not move when the object to which it is anchored moves</td>
<td>select No for Constrain to object.</td>
</tr>
<tr>
<td>specify that the rotation of the tag is oriented to the object to which it is anchored</td>
<td>select Yes for Rotate to object.</td>
</tr>
<tr>
<td>specify that the rotation of the tag is not oriented to the object to which it is anchored</td>
<td>select No for Rotate to object.</td>
</tr>
</tbody>
</table>
9 If you selected Tag as the tool type, expand Leader to edit the leader properties.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>add the schedule tag without a leader</td>
<td>click Leader type, and select None.</td>
</tr>
<tr>
<td>add the schedule tag using a straight line as the leader</td>
<td>click Leader type, and select Straight.</td>
</tr>
<tr>
<td>add the schedule tag using a spline as the leader</td>
<td>click Leader type, and select Spline.</td>
</tr>
</tbody>
</table>

10 If you selected Tag as the tool type, expand Text to edit the text properties.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>add text in the schedule tag as defined in the source drawing</td>
<td>click Attribute text style, and select As defined by content.</td>
</tr>
<tr>
<td>add text in the schedule tag as it is defined in the target drawing</td>
<td>click Attribute text style, and select Target drawing text style.</td>
</tr>
<tr>
<td>determine the angle of the text when you insert the schedule tag</td>
<td>click Attribute text angle, and select As inserted.</td>
</tr>
<tr>
<td>consistently display the text in the schedule tag horizontally</td>
<td>click Attribute text angle, and select Force horizontal.</td>
</tr>
<tr>
<td>consistently display the text in the schedule tag right justified</td>
<td>click Attribute text angle, and select Right reading.</td>
</tr>
</tbody>
</table>

11 Click OK.

**Anchoring an Existing Schedule Tag to an Object**

Use this procedure to anchor an existing schedule tag to an object or re-anchor a tag to a new object.

If you copy a tag from one object to another, the tag remains anchored to the original object. Use this procedure to re-anchor the tag to the new object.
NOTE You can view the current relationship between schedule tags and objects. For more information, see Viewing the Connection Between Tags and Objects on page 3764.

1 Select the tag.
2 Click Tag tab ➤ Anchor panel ➤ Set .
3 Select an object to which to anchor the tag.

Releasing an Anchored Schedule Tag

Use this procedure to release a tag that is anchored to an object. After you release the tag, you can anchor it to another object.

1 Select the tag.
2 Click Tag tab ➤ Anchor panel ➤ Release .

Viewing the Connection Between Tags and Objects

Use this procedure to view the current link between a schedule tag and an object. If you have many tags and are not sure how they are attached, it is useful to see this link displayed. This procedure turns on the General display representation for Anchor Tag To Entity and Anchor Extended Tag to Entity in the current view.

1 Click Manage tab ➤ Style & Display panel ➤ Display Manager .
2 Expand Sets.
3 Select the current display set, which appears in bold in the list under Sets.
4 Click the Display Representation Control tab.
5 In the Objects list, locate Anchor Tag To Entity and Anchor Extended Tag To Entity, and select the General display representation for both.

6 Click OK.

7 Regenerate the drawing, if necessary.

The link between the schedule tag and the object is displayed as an arc. The tag and object are attached from insertion point to insertion point.

### Renumbering Property Set Data

Use this procedure to renumber objects that are included in a schedule or linked to schedule tags. You may want to do this if you moved them in the building model or if you have deleted objects. Only those property definitions with a Type of Auto Increment—Integer can be renumbered with this procedure. For more information, see Adding Tags Using Schedule Tag Tools on page 3756.

1 Open the tool palette that you want to use, and select the Renumber Data tool.

A Renumber Data tool is located with the Scheduling and Reporting Tools in the Stock Tool Catalog. You can add this tool to any tool palette. For more information, see Content Browser on page 129.

2 In the Data Renumber dialog, select the property set to renumber.

You select the property set that contains the number property. For example, if you renumber doors, you select the DoorObjects property set.

3 Select the start number.

4 Select an increment value.

Each number in the drawing is increased by this amount in the drawing when the property set data is renumbered. For example, if the start number is 1 and the increment is 3, the sequence would number 1, 4, 7, 10, and so on.

5 Select Attach New Property Set to add a new property set to the numbering sequence.

6 Click OK.
Select the object or schedule tag to which you want to assign the new start number, continue renumbering, and press ENTER.

NOTE Under certain circumstances, such as after Renumber Data during RefEdit, you may see duplicate property set definition names. For example, the property set definition name may be preceded by “$1$.” Modify these property set definitions by opening the attached drawing and making the changes. For more information, see “Edit Selected Objects in Referenced Drawings and Blocks” in AutoCAD Help.

Managing Schedule Tables

You can customize the content and appearance of schedule tables. You can also export schedule table data.

IMPORTANT The contextual tab for schedule tables includes a Convert to Table option, which creates a copy of your AutoCAD Architecture schedule table that can be inserted as an AutoCAD® table. AutoCAD Architecture commands, such as Update or Add All Property Sets cannot be used on the converted table. Also be aware that you may get unexpected results if you use special characters in your schedule headings, such as equal signs (=). Avoid this problem by adding an apostrophe (‘) in front of the character before doing the conversion. For more information about working with AutoCAD® tables, see “Create and Modify Tables” in AutoCAD Help.

Using Schedule Table Styles

Schedule table styles control the content and appearance of schedule tables. A drawing must contain a schedule table style for the type of schedule table you want to create. When you copy a schedule table style into a drawing, property set definitions and data formats specified in the style are also copied. For more information, see Working with Schedule Table Styles on page 3769.

 Updating Schedules

Because the property set data is attached to objects and styles, you can create and update schedules at any stage of a project. Rather than waiting until the end of a project to create schedules, you can create preliminary schedules and update them to reflect changes in your drawings. For more information, see Updating a Schedule Manually on page 3753.
Attaching Property Set Data

Before creating schedule tables, you attach the property sets referenced in the schedule table style to the objects and object styles. The attached property sets become the containers for data. For more information, see Property Set Data on page 3810.

NOTE A schedule table extracts data from objects and displays the data in the table. No data is saved in the table itself.

Updating Property Set Data

When you add a schedule table to a drawing, you specify whether new objects are added to the table as they are added to the drawing and whether the data in the schedule table is updated when objects or styles are modified. If you do not select these automatic updating options, you can update a schedule manually at any time. For more information, see Adding Property Set Data to All Objects on page 3801.

You can also directly edit the data in individual cells and columns for any manual properties included in the table. After you add, remove, or change objects in a schedule, you can renumber the objects and their schedule tags. For more information, see Renumbering Property Set Data on page 3765.

Exporting Property Set Data

You can export data directly to external files in the following formats:

- Microsoft® Excel spreadsheet (XLS) files (2 formats)
- Comma-separated values (CSV) files
- Tab-delimited text (TXT) files

For more information, see Exporting a Schedule on page 3791 and Exporting Schedule Data for Selected Objects on page 3792.

Workflow to Customize Schedule Tables

You can specify property set definitions and property data formats to customize the information collected from objects and how it displays in the schedule.
You can also create schedule tables with the schedule tools that are provided. For more information, see Basic Schedules on page 3747.

- Adjust the information collected and displayed from objects
  - Create or modify schedule table styles on page 3769 to determine the types of objects listed in a schedule table, what data is displayed, and how the data is organized.

- Specify the object's information to display
  - Identify the property set definitions on page 3823 to be listed for each object in the schedule table.

- If you are not using predefined schedule tools, modify information to display in the schedule table
  - Create or modify the property data format on page 3802 to specify how data is displayed in a schedule table.

- Add a schedule table
  - Create a new schedule table on page 3748 or use a predefined schedule table tool on page 3747 to display construction data collected from objects in your drawing.

- Add or modify object information
  - Attach property set data on page 3810 to objects on page 3811 in the drawing.

- Edit the schedule as needed
  - Changes you make to objects, styles, and object data are reflected in the schedule table. You can also edit on page 3799 schedule tables on page 3765 directly.
Working with Schedule Table Styles

Schedule table styles determine the content and appearance of schedule tables you add to drawings. You can customize a schedule table by adding headings, organizing columns, or specifying the sort order. The schedule table tools provided with the software have predefined styles and properties. You can customize these styles or create new ones.

Content and Format of Schedule Tables

Use schedule table styles to specify the following characteristics of schedule tables:

- Objects that can be included
- Property data to be tracked
- Sequence and format of columns
- Property data format of schedule values
- Format of table titles, column headers, and table cells
- Sorting sequence of rows
- Display properties of tables

Flagging Out-of-Date Schedules

In a schedule table style, you can specify whether a schedule is updated when objects included in the schedule change. If you turn off the automatic update option, you can still determine whether data in the schedule reflects changes in the drawing. The display properties of the schedule style include an out-of-date marker. When this marker is turned on, a diagonal slash is drawn through the table when the schedule has not been updated. Updating the schedule removes the out-of-date marker.

NOTE You should always update your schedules before plotting and not rely completely on the out-of-date-marker.
What You Need to Create a Schedule Table Style

Your drawings must contain the following information for you to create a new schedule table style:

- Property set definitions for any property data to be included in the tables created from the style. Each column in a schedule table corresponds to one property in a property set for an object or an object style. For more information, see Property Set Definitions on page 3823.

- Property data formats to control the format of values in each column of a schedule table. Typically, you use the same data format specified in property set definitions. However, you can override those formats in the schedule table style. For more information, see Property Data Formats on page 3802.

The content and tools include schedule table styles for typical schedules, such as door and window schedules or room finish schedules. You can customize these styles for your projects.

Creating Styles for Matrix Schedules

In AutoCAD Architecture, a matrix schedule is a table in which column headings identify object properties. A symbol, such as a dot or a cross, is displayed in cells to indicate that an object has the property identified. Matrix schedules are also called dot schedules.

You can define schedule table styles to include matrix columns for specific properties. In addition, you can control the following characteristics of matrix schedules or matrix columns in regular schedules:

- The symbol used in each cell containing the property listed in the column header

- The maximum number of columns for each matrix property. If the unique property values in the column exceed this maximum number, the column is displayed as a normal column.

If the property data displayed in a matrix column is a string containing a semicolon-delimited list of values, each value in the list will be displayed separately. You can use this format to assign multiple values to the same property, such as multiple floor materials in the same space.
Creating Tools from Schedule Table Styles

You can create a schedule table tool from a schedule table style by dragging the style from the Style Manager onto a tool palette. You can then specify settings for the tool properties. For more information, see Creating a Schedule Table Tool on page 3748.

Managing Schedule Table Styles

To create, edit, copy, or purge schedule table styles, you access the Style Manager. The Style Manager provides a central location for working with styles from multiple drawings and templates. For more information, see Style Manager Overview on page 870.

Creating a Schedule Table Style

Use this procedure to create a schedule table style. You can either use the default style properties or copy an existing style and then customize the properties. After creating the style, you can create a schedule table tool, and use the tool to add the schedule to your drawing. For more information, see Adding Schedules Using Schedule Table Tools on page 3747.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Create a new schedule table style:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a style with default properties</td>
<td>right-click Schedule Table Styles, and click New.</td>
</tr>
<tr>
<td>create a style from an existing style</td>
<td>right-click the schedule table style you want to copy, and click Copy. Right-click, and click Paste.</td>
</tr>
</tbody>
</table>

4 Enter a name for the new style, and press ENTER.

5 Click the General tab, and enter a description.
6 Edit the options for the new schedule table style:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the default format for the style</td>
<td>see Specifying the Default Format of a Schedule Table Style on page 3773.</td>
</tr>
<tr>
<td>specify the objects to be tracked in schedules using this style</td>
<td>see Specifying Objects for a Schedule Table Style on page 3774.</td>
</tr>
<tr>
<td>use classifications to filter the objects in a schedule</td>
<td>see Filtering Scheduled Objects by Classification in a Schedule Table Style on page 3776.</td>
</tr>
<tr>
<td>add columns for properties to be reported for tracked objects</td>
<td>see Adding Columns to a Schedule on page 3777.</td>
</tr>
<tr>
<td>add formula columns to display calculations</td>
<td>see Including a Formula Column in a Schedule Table on page 3781.</td>
</tr>
<tr>
<td>add headings that span columns</td>
<td>see Spanning Schedule Table Columns with a Heading on page 3784.</td>
</tr>
<tr>
<td>edit column placement settings and formats for column data</td>
<td>see Editing Columns in a Schedule Table on page 3785.</td>
</tr>
<tr>
<td>specify the sort order of rows</td>
<td>see Specifying the Sort Order in a Schedule Table Style on page 3787.</td>
</tr>
<tr>
<td>specify the formats of the table title, column headings, and matrix column headings</td>
<td>see Specifying Title Formats in a Schedule Table Style on page 3788.</td>
</tr>
<tr>
<td>specify visibility, layer, linetype, and other display properties</td>
<td>see Specifying Display Properties in a Schedule Table Style on page 3789.</td>
</tr>
<tr>
<td>enter notes and attach, edit, or delete reference files</td>
<td>see Attaching Notes and Files to a Schedule Table Style on page 3790.</td>
</tr>
</tbody>
</table>

7 Click OK.
Specifying the Default Format of a Schedule Table Style

Use this procedure to specify the default text format and placement for table columns and their contents. You can also specify the default symbol used in matrix schedules and for true/false values in regular schedules.

If necessary, you can override these settings for individual columns and table titles.

**NOTE** Most schedule table styles provided by AutoCAD Architecture have overrides applied to their titles and column headers. You can access these settings on the Layout tab in the Schedule Table Style Properties dialog.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Documentation Objects, and expand Schedule Table Styles.
3. Select the schedule table style that you want to change.
4. Click the Default Format tab.
5. For Text Appearance, specify the following:
   - For Style, select an AutoCAD® text style already defined in the drawing. To use a font other than those available from the drop-down list, you must first define an AutoCAD text style that uses the font. For more information, see “Overview of Text Styles” in AutoCAD Help.
For Alignment, select positioning for the text. For more information about aligning text using the Multiline Text Editor, see “Justify Multiline Text” in AutoCAD Help.

For Height, enter the text height that you want. Height is normally specified as the size you want to use when plotting the drawing containing the schedule.

For Gap, enter the space between the text and the schedule table lines that you want. Gap is normally specified as the size you want to use when plotting the drawing containing the schedule.

For Rotation, select the desired orientation for text within cells. For the table title and group titles, Rotation also controls the orientation of these cells relative to the rest of the table.

6 Select a symbol (Check, Dot, Cross, or Slash) for use in matrix columns and, optionally, for true/false values.

7 Select or clear Use for True/False to control whether matrix symbols or the text in the property data format is used for true/false values.

8 Enter a fixed width for all columns, or enter 0.0 if you want columns to adjust to fit the data within them. Fixed Width is normally specified as the size you want to use when plotting the drawing containing the schedule table.

NOTE Cell Size Height is a read-only field. Its value is calculated from the Height and Gap values.

9 Click OK.

Specifying Objects for a Schedule Table Style

Use this procedure to specify which objects to track in schedules created from a schedule table style. You can specify more than one object type. For example, you can create a schedule table style for windows that tracks both individual windows and window assemblies.

The property sets must apply to all object types specified in the style. For example, in a schedule table style for windows and window assemblies, the window assembly styles property set is not available because it does not apply
to windows. In addition, limiting the number of object types in a schedule table style improves drawing performance.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Applies To tab.

5 Select the object types to be tracked for schedule tables using this style.
   You can select any objects on the list. The area above the list displays the objects that are currently selected. If you click Select All or Clear All, you can include any object in this schedule table style.

   The right pane lists all classification definitions that apply to any of the selected object types. You can select multiple classifications in multiple classification definitions. If classifications are selected, schedule tables of this style can include objects selected on the left only if they have been classified with the selected classifications. For more information, see Classification Definitions.
on page 3872 and Filtering Scheduled Objects by Classification in a Schedule Table Style on page 3776.

6 Click OK.

Filtering Scheduled Objects by Classification in a Schedule Table Style

Use this procedure to specify the classification criteria that an object must satisfy to be included in schedules created from a schedule table style. You can specify more than one classification for an object type.

For example, if you want to schedule only doors with a New construction classification and a vendor with preferred classification, you can specify those criteria in the schedule table style. Only doors that meet both criteria can be included in the schedule table. For more information, see A Classification Use Case on page 3874.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Applies To tab, and select the object types to be tracked for schedule tables using this style.

5 To specify classification criteria, expand a classification definition, and select one or more classifications.

For example, you can select a construction classification of New and 2 preferred vendors. For an object to be included in schedules of this style, its object style must specify New for the construction classification, and the classification for Vendor must be 1 of the 2 vendors selected.
Adding Columns to a Schedule

Use this procedure to add columns for each property to be reported in schedule tables created from a schedule table style.

Each column contains the values for one property in a property set. The property set definitions for the properties you specify must exist in the drawing before you can create columns for them. For more information, see Property Set Definitions on page 3823.

You must also specify the objects that the schedule table style applies to before you add columns. For more information, see Specifying Objects for a Schedule Table Style on page 3774.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Columns tab.

5 Click Add Column to add a column to the right of the last column.
The Add Column worksheet opens.

6 Select the property to track for the new column from the pane on the left. Properties that have already been designated for another column are unavailable in the properties list.
7 Enter the heading for the column.

The property description is the default text for the column header.

8 Select the property data format, or use the default format from the property set definition.

The data format selected here takes precedence if it does not match the format specified in the property set definition for this property, and any formatted value stored in the property set definition is converted to display in the data format selected for this column. For more information, see Property Data Formats on page 3802.

9 Specify additional settings for the column:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a format and orientation for cells in this column</td>
<td>click Override Cell Format, and specify format settings that apply only to data cells in this column.</td>
</tr>
</tbody>
</table>
If you want to… Then…

**specify a format and orientation for the column heading**
- click Override Header Format, and specify format settings that apply only to data cells in this column.

**use a matrix format for the values in the column**
- select Matrix, and enter the maximum number of columns used to report the values for the selected property.

**report a total value from all the values in this column**
- select Total.

**hide the column from view in the drawing**
- select Hide.

When you edit property data to be displayed in a matrix column, you can assign multiple values by using a text data type and separating the values with semicolons. Each value is displayed in a separate column in the matrix column.

10 Specify the placement of the new column relative to existing columns.
   You can change the location of a column by dragging it to a new location in the schedule table. For more information, see Editing Columns in a Schedule Table on page 3785.

11 Click OK twice.

**Including a Quantity Column in a Schedule**

Use this procedure to include a quantity column in schedules created from a schedule table style. If you include a quantity column, the objects in the table with the same values in every column are displayed in one row, with the number of objects displayed in the Quantity column. Quantity columns are inserted as the first column in the schedule table by default. For more information, see Adding Columns to a Schedule on page 3777. For information about repositioning quantity columns, see Editing Columns in a Schedule Table on page 3785.
Include Quantity Column must be selected if you want to use quantities in a formula column. For more information, see Including a Formula Column in a Schedule Table on page 3781.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Schedule Table Styles.
3 Select the schedule table style that you want to change.
4 Click the Columns tab, and select Include Quantity Column.
   The Quantity column is inserted as the first column in your schedule table style.
5 Click OK.

Repeating the First Column of a Schedule

Use this procedure to insert a copy of the first column in a schedule as the last column in the schedule table style. This is helpful if you have a very wide schedule table, and you want the information in the first column repeated at the end for ease of use. For more information, see Adding Columns to a Schedule on page 3777.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Schedule Table Styles.
3 Select the schedule table style that you want to change.
4 Click the Columns tab, and select Repeat First Column.
5 Click OK.

Including a Formula Column in a Schedule Table

Use this procedure to include a formula column in schedules created from a schedule table style. Property definitions in the formula dialog are limited to the objects or styles to which the schedule table applies. For more information,
see Adding Columns to a Schedule on page 3777 and Understanding Formulas on page 3830.

Use the formula column to create an expression based on the quantity or any other property set definition included in the schedule table style. For example, you can use a formula column to multiply a unit cost for an object by the number of objects to get a total cost. For more information, see Understanding Formulas on page 3830.

**NOTE** There is no conversion made between units for a formula result.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤. The Style Manager is displayed with the current drawing expanded in the tree view.

2. Expand Documentation Objects, and expand Schedule Table Styles.

3. Select the schedule table style that you want to change.

4. Click the Columns tab, and click Include Quantity Column if you want to insert quantities in your formula column.

5. Click Add Formula Column.

6. On the Add Formula Column worksheet, specify properties for the formula:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>identify the formula column with a heading</td>
<td>enter text for Heading.</td>
</tr>
<tr>
<td>specify a data format for the formula result</td>
<td>select a data format.</td>
</tr>
<tr>
<td>change the format and orientation for cells in the column</td>
<td>click Override Cell Format, and specify format settings that apply only to data cells in this column.</td>
</tr>
<tr>
<td>change the format and orientation for the column heading</td>
<td>click Override Header Format, and specify format settings that apply only to data cells in this column.</td>
</tr>
<tr>
<td>report a total value from all the values in this column</td>
<td>select Total.</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------</td>
</tr>
<tr>
<td>hide the column from view in the drawing</td>
<td>select Hide.</td>
</tr>
<tr>
<td>create a formula that calculates a total using property data from all columns</td>
<td>click Apply Formula to Total.</td>
</tr>
</tbody>
</table>

**NOTE** Hiding a column does not change the data displayed in it or any other column in the table. It only affects the display of the data.

7 Enter the formula:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>use a value that you supply</td>
<td>click in the Formula pane, and enter the value.</td>
</tr>
<tr>
<td>use the value of another property definition in the formula</td>
<td>locate and double-click (or right-click and click Insert) the definition in the Insert Property Definitions list. You can also select the definition, and press <strong>INSERT</strong>.</td>
</tr>
<tr>
<td>use a VBScript function</td>
<td>locate and double-click (or right-click and click Insert) the function in the Insert VBScript code list. You can also select the function, and press <strong>INSERT</strong>.</td>
</tr>
<tr>
<td>evaluate the formula as a VBScript function</td>
<td>enter <strong>RESULT</strong> anywhere in the formula.</td>
</tr>
</tbody>
</table>

The property definitions available for use in the formula must be applied to the same objects as the property set definition containing the formula.

The names of property definitions used in the formula are displayed within brackets, such as [Width]. If a property definition belongs to a property set definition other than the one containing the formula, that name is displayed as well, such as [DoorObjects:Height].
The formula property definition cannot be used in the formula it defines, as indicated by the ❌ and the addition of [Self] after its name. Property definitions that end up using the value of the formula cannot be used in the formula, as indicated by the ❌ and the addition of [Circular Reference] after their names.

**NOTE** If you enter the name of a property definition directly in the formula string, or copy and paste between formulas, the property definition is displayed as normal text. For property values of property definitions to be inserted correctly, they must be selected from the list in the Insert Property Definitions pane.

For more information, see Adding a Formula Property Definition to a Property Set Definition on page 3830 and Use Case for the Formula Property Definition Worksheet on page 3835.

**8** Enter a value in the Enter Sample Values pane.

The property value you enter displays in the current format specified.

**9** Select a property data format to specify how the property value is formatted in the formula.

The format you select becomes the default format in a formula when this property is added to a schedule table style. It can be changed at any time. The Example column on the Definition tab shows how the default value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

**10** Click OK.

### Spanning Schedule Table Columns with a Heading

Use this procedure to add a heading that spans multiple adjacent columns in a schedule table style. For example, you can create a Hardware heading to span the columns for hinges, handles, and locks in a door schedule.

You can also remove a heading that spans multiple columns.

**1** Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤. The Style Manager is displayed with the current drawing expanded in the tree view.
Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Columns tab.

5 Select the first column you want to include under a heading, and press **CTRL** while you select the other columns. Columns must be adjacent.

6 Click Add Header.

7 Enter a title for the heading, and press **ENTER**.

8 To remove a heading, select it, and click Delete.

9 Click OK twice.

### Editing Columns in a Schedule Table

Use this procedure to change placement and formats for columns in schedule tables created from a schedule table style. You can also delete a column. When you modify columns within a schedule table style, changes apply to all schedule tables of the same style and override the default format settings.

To change the format of all column headings, see *Specifying Title Formats in a Schedule Table Style* on page 3788.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .

   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Columns tab.

5 Select a column, and click Modify.

6 Specify properties for the column:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the column heading</td>
<td>enter the new column heading for Heading.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
change the format and orientation for cells in the column | click Override Cell Format, and specify format settings that apply only to data cells in this column.
change the format and orientation for the column heading | click Override Header Format, and specify format settings that apply only to data cells in this column.
use a matrix format for the values in this column | select Matrix, and enter the maximum number of columns used to report the values for the selected property.
report a total value from all the values in this column | select Total.
hide the column from view in the drawing | select Hide.

**NOTE** Hiding a column does not change the data displayed in it or any other column in the table. It only affects the display of the data.

7 Click OK.
8 Change the order of columns:

| If you want to… | Then… |
---|---|
move an individual column | select the column heading, and drag the column to a new location.
move a group of columns that have a common heading that spans the columns | select the common heading, and drag the column group to a new location.
remove a column from a column group | select the heading for the column group, and click Delete. Hold down `SHIFT` or `CTRL` to select multiple columns. In the Remove Columns/Headers dialog, select the columns or headers to be deleted, and click OK.
If you want to… | Then…
---|---
add a column in a column group | Select the columns to include in the column group, and click Add Header. Hold down SHIFT or CTRL to select multiple columns. In the Add Header dialog, enter the heading name. If you want to change the header format, click Override Header Format. For more information, see Specifying Title Formats in a Schedule Table Style on page 3788.

9 To delete a column, select the column, and click Delete.
10 To use a different property in a column, delete the column, and add a new column with the property you want to use.
11 Click OK.

NOTE Property data format styles, property set definitions, and schedule table styles cannot be changed through RefEdit. Changes seem to work, but will revert to the previous settings when saved back to the xref file. Open the xref drawing directly, and make the changes there.

Specifying the Sort Order in a Schedule Table Style

Use this procedure to specify the sort order of rows in a schedule table style. You can sort rows in ascending or descending order of the values in one or more columns.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
   The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Schedule Table Styles.
3 Select the schedule table style that you want to change.
4 Click the Sorting tab.
5 Specify the sort order of the rows:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add a property to sort by</td>
<td>click Add, select a property to sort by, and click OK. The Select Property dialog lists all properties defined on the Columns tab but not already selected for sorting.</td>
</tr>
<tr>
<td>specify the sorting method for a property</td>
<td>select the property, and select Ascending or Descending for Sort Order.</td>
</tr>
<tr>
<td>remove a property from the sorting list</td>
<td>select the property, and click Remove.</td>
</tr>
<tr>
<td>change the location of a property in the sort order</td>
<td>select the property, and click Move Up or Move Down, as needed.</td>
</tr>
</tbody>
</table>

6 Click OK.

**Specifying Title Formats in a Schedule Table Style**

Use this procedure to enter the title of a schedule table, and to specify the formats of the table title, column headings, and matrix column headings. The formats that you specify in this procedure for regular and matrix column headings override the default format settings. Value overrides display in red in the Cell Format Override dialog.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ . The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Schedule Table Styles.

3 Select the schedule table style that you want to change.

4 Click the Layout tab.

5 Enter the title of the schedule table for Table Title.

6 Select Override Cell Format next to the type of title format you want to change.

7 In the Cell Format Override dialog, select a text style.
For Style, select an AutoCAD® text style already defined in the drawing. To use a font other than those available from the drop-down list, you must first define an AutoCAD text style that uses the font. For more information, see “Overview of Text Styles” in AutoCAD Help.

8 For Alignment, select positioning for the text. For more information about aligning text using the Multiline Text Editor, see “Justify Multiline Text” in AutoCAD Help.

9 For Height, enter the text height that you want. Height is normally specified as the size you want to use when plotting the drawing containing the schedule table.

10 For Gap, enter the space between the text and the schedule table lines that you want. Gap is normally specified as the size you want to use when plotting the drawing containing the schedule table.

11 For Rotation, select the desired orientation for text within cells. For the table title and group titles, Rotation also controls the orientation of these cells relative to the rest of the table. For the table title and group titles, this option also controls the location of the cell relative to the rest of the table.

NOTE Cell Size Height is a read-only field. Its value is calculated from the Height and Gap values.

12 Click OK.

13 To remove an override, clear the check box next to the title format you want to restore to the default format.

14 Click OK.

Specifying Display Properties in a Schedule Table Style

Use this procedure to change the following properties of the display components in a schedule table style:

- Visibility (display component is on or off)
- Layer
- Color
- Linetype
- Lineweight
Linetype scale

You can specify display properties for the table outer frame, lines between rows and columns, the table title, column headers, and the data in table cells. You can also turn on an out-of-date marker that indicates when the data in a schedule table created from the schedule table style does not show the latest changes. This component is turned off by default. Turning it on can slow drawing performance, especially in large drawings.

1. Select the schedule table style you want to change, right-click, and click Edit Object Display.
2. Click the Display Properties tab.
3. Select the display representation on which to display the changes, and select Style Override.
   The display representation in bold is the current display representation.
4. If necessary, click .
5. On the Layer/Color/Linetype tab, select the component to change, and select a different setting for the property.
   Use Data Major Row Lines for every fifth row and Data Minor Row Lines for all other rows to control the display properties for lines separating each row of data. This is useful for long schedule tables.
6. Click OK twice.

Attaching Notes and Files to a Schedule Table Style

Use this procedure to enter notes and attach reference files to a schedule table style. You can also edit notes and edit or detach reference files from a schedule table style.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Documentation Objects, and expand Schedule Table Styles.
3. Select the schedule table style that you want to change.
Click the General tab.

Click Notes.

To add a note, click the Notes tab, and enter the note.

Click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click Delete.</td>
</tr>
</tbody>
</table>

Click OK.

Exporting a Schedule

Use this procedure to export the contents of a schedule table to a separate file. You can export the data in the following file formats:

- Microsoft® Excel spreadsheet (XLS) files (2 formats)
- Comma-separated values (CSV) files
- Tab-delimited text (TXT) files

NOTE You must have Microsoft Excel installed to export a file to Excel format.

1 Open the drawing file that includes the table you want to export.
2 Select the schedule table.
3 Click Schedule Table tab ➤ Modify panel ➤ Export .
   The Export Schedule Table dialog opens.
4 Select a file type to Save As.
5 Enter a name for the file, or click Browse to select a file, and click OK.
The Format dialog opens if you selected an XLS file type for Save As Type.

6 Convert the schedule values in the exported file by selecting Use Unformatted Decimal Value or Convert to Formatted Text.

The format of values does not change in the drawing file. Selecting Convert to Formatted Text displays the architectural format (6'-0") in Microsoft Excel.

7 Click OK to format columns one at a time, or select Apply to All Columns, and click OK.

If a file already exists with the name you specified, a warning is displayed. Overwrite the existing file, specify a unique name, or cancel the export command.

Exporting Schedule Data for Selected Objects

Use this procedure to export selected property set data from a schedule table to a separate file. You can export the data in the following file formats:

- Microsoft® Excel spreadsheet (XLS) files (2 formats)
- Comma-separated values (CSV) files
- Tab-delimited text (TXT) files

NOTE You must have Microsoft Excel installed to export a file to Excel format.

Using this procedure, you can create a file with property set data for selected objects even if the schedule table does not exist in the drawing. To export all the data in a schedule table, see Exporting a Schedule on page 3791.

1 On the command line enter AecScheduleExport.

The Export Schedule Table dialog opens.

2 Select a file type to Save As.

3 Enter a name for the file, or click Browse to select a file.

4 Clear Use Existing Table.

5 Select the table style to use in the exported file.

Columns included in the schedule table style determine the property set data that is exported for the objects. For more information, see Creating a Schedule Table Style on page 3771.
6 Select the layer wild card to use as a filter in the exported file.
7 Specify whether to scan for xrefs or block references, and click OK.
8 Select the objects to include in the exported table, and press ENTER. The Format dialog opens if you selected an XLS file type for Save As Type.
9 Convert the schedule values in the exported file by selecting Use Unformatted Decimal Value or Convert to Formatted Text. The format of values does not change in the drawing file. Selecting Convert to Formatted Text displays the architectural format (6'-0") in Microsoft Excel.
10 Click OK to format columns one at a time, or select Apply to All Columns, and click OK.

If a file already exists with the name you specified, a warning is displayed. Overwrite the existing file, specify a unique name, or cancel the export command.

**Specifying the Display Properties of a Schedule**

Use this procedure to change the following properties of display components for a schedule table:

- Visibility (display component is on or off)
- Layer
- Color
- Linetype
- Lineweight
- Linetype scale

To change these display properties for all schedule tables of the same style, and to see additional information about schedule table style display components, see Specifying Display Properties in a Schedule Table Style on page 3789.

1 Select the schedule table you want to change, right-click, and click Edit Object Display.
2 Click the Display Properties tab.
3 Select the display representation on which to display the changes, and select Style Override. The display representation in bold is the current one.

4 If necessary, click \[\text{[button]}\] .

5 Click the Layer/Color/Linetype tab.

6 Select the component to change, and select a different setting for the property.

7 Click OK twice.

**Changing General Schedule Properties**

Use this procedure to change general properties of basic schedule table settings for a specific schedule table on the Design tab of the Properties palette.

1 Double-click the schedule table you want to change.

2 On the Properties palette, expand Basic, and expand General.

3 Specify general properties for the schedule table:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>change the description</td>
<td>enter text for Description.</td>
</tr>
<tr>
<td>change the layer</td>
<td>click Layer, and select a layer from the drop-down list.</td>
</tr>
<tr>
<td>change the schedule table style</td>
<td>click Style, and select a style from the drop-down list.</td>
</tr>
<tr>
<td>change the schedule title</td>
<td>click Title, and enter new text for Title.</td>
</tr>
<tr>
<td>change the schedule table scale</td>
<td>click Scale, and enter a value for Scale.</td>
</tr>
<tr>
<td>automatically update the schedule table when data in the drawing changes</td>
<td>select Yes for Update automatically.</td>
</tr>
<tr>
<td>manually update the schedule table when the drawing changes</td>
<td>select No for Update automatically.</td>
</tr>
</tbody>
</table>
NOTE Turning on the automatic update feature may slow drawing performance, especially in large drawings. For information about updating schedules manually, see Updating a Schedule Manually on page 3753.

Changing the Selection Criteria for a Schedule

Use this procedure to change how objects are added to the schedule table.

1 Double-click the schedule table you want to change.
2 On the Properties palette, expand Basic, and expand Selection.
3 Change how objects are added to the schedule table:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>automatically add new objects to the schedule table as they are added to the drawing</td>
<td>select Yes for Add new objects automatically.</td>
</tr>
<tr>
<td>manually add new objects to the schedule table</td>
<td>select No for Add new objects automatically.</td>
</tr>
<tr>
<td>include objects from xref drawings in the schedule table</td>
<td>select Yes for Scan xrefs.</td>
</tr>
<tr>
<td>exclude objects from xref drawings in the schedule table</td>
<td>select No for Scan xrefs.</td>
</tr>
<tr>
<td>include objects from block references in the schedule table</td>
<td>select Yes for Scan block references.</td>
</tr>
<tr>
<td>exclude objects from block references in the schedule table</td>
<td>select No for Scan block references.</td>
</tr>
<tr>
<td>apply a layer filter to the table</td>
<td>specify a layer wild card.</td>
</tr>
</tbody>
</table>

NOTE When adding a schedule table that must scan xrefs or blocks, use a layer filter that includes both the name of the layer that contains the xref or block, and the name of the layer of the object inside the xref or block. You can separate multiple layer wild cards with a comma.
Changing the Location of a Schedule Using Grips

Use this procedure to relocate a schedule table using the Location grip. For schedule tables, the Location grip is restricted to movement in the XY plane. You can enter specific values for distance for both the X and Y dimensions. You can also change the location of a schedule table using the Properties palette.

1. Select the schedule table you want to change.
2. Select the Location grip.
3. Move the schedule table to the desired location, and click; or enter a value, and press ENTER.
   If you want to enter a specific value for the second direction in any edit mode (for example, in the Y direction when editing along the XY plane), press \textit{TAB} to cycle to the second direction.
   You can also lock the movement of the schedule table along a specific direction. If you enter a value for either of the dimension directions in the current edit mode and then press \textit{TAB}, the movement of the schedule table is constrained to the second dimension direction. When editing along the XY plane, for example, you can enter a value for the X dimension, and then press \textit{TAB}. The X dimension is locked at that value, and movement of the schedule table is constrained to the Y dimension direction.
4. Right-click, and click Deselect All to turn off grips.

Changing External Source Properties of a Schedule

Use this procedure to create a schedule table that contains property data from an external drawing such as a project drawing.

Schedule tables can contain information from external references and block references if it exists in the same drawing as the schedule table. Optionally, schedule tables can specify an external drawing. The information is scheduled as if it were an external reference in the same drawing as the table. The advantage is that the graphics of the external drawing do not need to be generated in order to fill out the data in the table.

1. Double-click the schedule table you want to change.
2. On the Properties palette, expand Advanced, and expand External Source.
3 Specify the external drawing you want to schedule:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule an external drawing</td>
<td>select Yes for Schedule external drawing. The External drawing property is displayed.</td>
</tr>
<tr>
<td>not schedule an external drawing</td>
<td>select No for Schedule external drawing. The External drawing property is hidden.</td>
</tr>
<tr>
<td>specify the external drawing to schedule</td>
<td>click the value for External drawing, select a drawing, or click Browse, and in the Select a drawing file dialog, browse to select a drawing, and click OK.</td>
</tr>
</tbody>
</table>

The External drawing property is displayed with a drop-down list containing all drawings in the View directory of the current project. Each drawing corresponds to a view defined in the project. If no project is active, the list contains all drawings in the last directory browsed.

**TIP** If you want to schedule the entire project, you can set up one drawing as a container file, and xref in all project drawings. Then select the name of this drawing for the external drawing source.

## Adding Table Breaks to a Schedule

Use this procedure to split long tables into a series of shorter pages.

1 Double-click the schedule table you want to change.
2 On the Properties palette, expand Advanced, and expand Table Breaks.
3 Specify how you want to display the pages of tables:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>display pages horizontally to the right of one another</td>
<td>select Right for Direction.</td>
</tr>
</tbody>
</table>

Adding Table Breaks to a Schedule | 3797
<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>display pages vertically below one another</td>
<td>select Down for Direction.</td>
</tr>
<tr>
<td>display the title on each page</td>
<td>select Yes for Repeat title.</td>
</tr>
<tr>
<td>display the column headers on each page</td>
<td>select Yes for Repeat Headers.</td>
</tr>
<tr>
<td>hide the column headers on each page</td>
<td>select No for Repeat Headers.</td>
</tr>
<tr>
<td>control the height of each page individually</td>
<td>select Yes for Manual heights.</td>
</tr>
<tr>
<td>have all pages approximately the same height</td>
<td>select No for Manual heights.</td>
</tr>
<tr>
<td>specify the maximum height of each page when Manual heights is No</td>
<td>enter a value for Maximum height, or select and drag the Maximum Page Height grip at the bottom of the table.</td>
</tr>
<tr>
<td>specify the distance between each page</td>
<td>enter a value for Spacing.</td>
</tr>
</tbody>
</table>

You can control the height of all pages by setting one value if Manual heights is set to No. If the table contains more than one object, select and drag the Maximum Page Height grip at the bottom of the table.

You can control the height of each page individually if Manual heights is set to Yes. If the table contains more than one object, it will have one Insert Page grip at the bottom of the last page and one Page Height grip at the bottom of all other pages. Select the Insert Page grip, and drag it up to insert a new page. Select a Page Height grip, and drag it up or down to set the height of that page. Continuing to drag a Page Height grip down reduces the height of the last page, and could possibly remove it.
Adding Documentation Information to a Schedule

Use this procedure to add hyperlinks, notes, and reference documents to the schedule table.

1 Double-click the schedule table to which to add documentation.
2 On the Properties palette, expand Documentation.
3 Specify documentation information:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add a hyperlink</td>
<td>click , select the file, and click Open.</td>
</tr>
<tr>
<td>edit notes</td>
<td>click , and enter text.</td>
</tr>
<tr>
<td>change an attached reference document</td>
<td>click . Click Add, and select a file. Click Open, and click OK.</td>
</tr>
<tr>
<td>edit the reference document attached</td>
<td>click . Select the document, right-click, and click Edit. Select a new document, click Open, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>click . Select the description, enter the new description, and click OK.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>click . Select the file name, and click Remove.</td>
</tr>
</tbody>
</table>

Editing Table Cell Data

Use this procedure to highlight scheduled objects in a drawing and edit manual property set data in a schedule table.

Automatic property set data cannot be edited in a schedule table. You must edit the object, style, or other data to change the values of automatic property
data. For more information about property set data, see Property Set Data on page 3810.

You can use this procedure to troubleshoot problems between a table cell and a source object. If the object is not currently visible in your drawing area, press CTRL while selecting the cell to zoom to display the source object. The changes you make to the manual property set data in the table cell are saved with the object. If the schedule table cell references several objects in a quantity cell, making your selection while pressing CTRL displays an area that includes all the source objects. Holding the cursor over a quantity cell highlights the objects counted by that cell.

If you are working in a table that schedules a drawing from an external source, you cannot edit table cells.

1 Select the schedule table.
2 Click Schedule Table tab ➤ Modify panel ➤ Edit Table Cell.
3 Position the cursor over the cell.

The source object is highlighted if it is visible. A tooltip is displayed regardless of whether the cell can be edited, what type of data is presented in the table cell, or any potential problems with the data in that cell.

Viewing tooltips for editing table cell objects

An external reference icon is displayed if the cell data is from an object in an externally referenced drawing. If you edit this cell, the externally referenced drawing is modified. If the drawing is locked by another user, you cannot edit it.
4 Identify the different views:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>view all source objects associated with the schedule table cell</td>
<td>press (CTRL), and select the data in the schedule table cell. The drawing changes to show the source objects associated with the cell.</td>
</tr>
<tr>
<td>restore the previous view</td>
<td>click Zoom Previous.</td>
</tr>
</tbody>
</table>

5 Edit the data in the schedule table:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>edit the value in an individual table cell</td>
<td>select the individual cell, and enter a new value on the Edit Referenced Property Set Data worksheet.</td>
</tr>
<tr>
<td>edit the value for all instances of a property</td>
<td>select the border of the schedule table, and enter a value for the selected property on the Edit Referenced Property Set Data worksheet.</td>
</tr>
</tbody>
</table>

**NOTE** Cells that display property set data attached to styles may affect multiple objects. Editing one cell changes the value for all objects of that style in the schedule table.

---

**Adding Property Set Data to All Objects**

Use this procedure to add property set data to all objects for which a question mark (?) in a schedule table cell is displayed. This symbol indicates that the property set containing that required property data has not been attached to the object. You can attach these property sets individually, as described in Editing Table Cell Data on page 3799, or you can attach the property sets to all of the objects at once.

1. Select the schedule table.
2. Click Schedule Table tab ➤ Modify panel ➤ Add All Property Sets. 

---

Adding Property Set Data to All Objects | 3801
NOTE If you are working in a table that schedules an external drawing, you cannot add property sets to those objects. For more information, see Changing External Source Properties of a Schedule on page 3796.

Property Data Formats

Property data formats are style-based documentation objects that control how data is displayed in schedule tables, schedule tags, the Edit Property Set Data worksheet, and on the Properties palette. Property data formats are created and modified using the Style Manager. For information about overriding a format, see Units in Property Data Formats on page 3804.

Data Types

Each property data format contains separate settings for formatting each of the following data types:

- Text
- True/False values
- Integers
- Real numbers

When you apply a data format to schedule data, the value for each property is displayed using the specified settings for that property’s data type. For example, the same schedule data format can specify that a dimension value uses the real number settings, while a remark uses the settings for text.
Using Different Data Formats

You can specify different data formats for the same property in property set definitions, schedule table styles, and schedule tags. This enables you to display the same value differently in different contexts. For example, you may want to use a data format with greater precision for real numbers in a property set, and display fewer digits in a schedule table.

Managing Data Formats

To create, edit, copy, or purge data formats, you access the Style Manager. The Style Manager provides a central location for working with data formats from multiple drawings and templates. For more information, see Style Manager Overview on page 870.

Applying Property Data Formats

Property data is retrieved from an object as raw, unformatted values. Property set definitions, schedule table styles, schedule tags, and the Properties palette use data formats to display property data as formatted values. The Edit Property Set Data worksheet uses the data formats from property set definitions to format values.
You typically apply the same data format to similar properties and then select a data format that is appropriate for each property, such as the width, height, and thickness of a door. The software includes several default data formats. You can customize one of these, or you can create new data formats, to display units in a specific manner. For example, when you want to show the length of a wall in feet, you can select Length for Type, Feet for Units, and Architectural for Format. Real numbers for costing properties, however, require a monetary format. You can create different property data formats for these situations.

The data formats available for property set definitions, schedule table styles, and tags are those stored in the current drawing. When you copy property set definitions or schedule table styles into a drawing, data formats used in the definitions and styles are also copied into the drawing.

If you modify a data format, the display of the property data is affected in any property set, schedule table, or schedule tag that uses the format.

**Units in Property Data Formats**

Property data formats control how units display in schedule tables, schedule tags, the Edit Property Set Data worksheet, and on the Properties palette. Units behave differently with real numbers in manual properties than they do with automatic properties. For more information, see Applying Property Data Formats on page 3803.

**Units for Automatic Properties**

Units for automatic properties are collected directly from the objects. An automatic property, such as width, uses the units specified on the Units tab in the Drawing Setup dialog by default. Using different property data formats allows you to override the default format.

When you use a property data format, the AutoCAD units are converted to display as defined in the property data format. You can specify a property data format on the Definition tab of a property set definition.

**Units for Manual Properties**

Units specified for manual properties in the property set definition control what is stored in the drawing. The Extended Data tab of the Properties palette displays the units as defined in the property data format. When the type of unit is Real, you can select a format and type of unit in the property set definition to override the property data format when entering units. For more
Creating a Property Data Format

Use this procedure to create a property data format. You can create a format using default properties or by copying an existing data format. You can then edit the properties to customize the characteristics of the new data format.

**NOTE** Certain automatic properties cannot be formatted with property data formats because their values are formatted from within the automatic query.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager 📊. The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Documentation Objects, and expand Property Data Formats.
3. Right-click Property Data Formats, and click New.
4. Enter a name for the new property data format, and press ENTER.
5. Select the new property data format.
6. On the Formatting tab, specify general formatting values:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a prefix</td>
<td>enter a string to be placed in front of data for Prefix. For example, tolerances might require a preceding plus/minus symbol; a tolerance of 10 could be displayed as +10. A currency string could be prefixed with a dollar sign.</td>
</tr>
<tr>
<td>specify a suffix</td>
<td>enter a string to be placed after data for Suffix. For example, a door leaf thickness of 35 could have a millimeter suffix (35mm).</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------</td>
</tr>
<tr>
<td>specify text for a property that is undefined</td>
<td>enter a text string to be displayed when the requested property has not been attached to an object for Undefined. A typical undefined string is “?.”</td>
</tr>
<tr>
<td>specify text for a property that is not applicable</td>
<td>enter a text string to be displayed when the requested property does not apply to an object for Undefined. For example, the rise property does not apply to a door with a rectangular opening, but it does apply to one with an arched opening. A typical not applicable string is “NA.”</td>
</tr>
</tbody>
</table>

7 Specify the case for the schedule text:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>use no case formatting</td>
<td>select As Is for Case.</td>
</tr>
<tr>
<td>convert all text to uppercase</td>
<td>select Upper for Case.</td>
</tr>
<tr>
<td>convert all text to lowercase</td>
<td>select Lower for Case.</td>
</tr>
<tr>
<td>capitalize the first letter of the first word</td>
<td>select Sentence for Case.</td>
</tr>
<tr>
<td>capitalize the first letter of each word</td>
<td>select Title for Case.</td>
</tr>
</tbody>
</table>

8 Enter the maximum number of digits, including leading zeroes, for integers.
Zero padding is the expansion of integer values to include leading zeros. The value entered specifies the maximum length of a numeric value after it has been padded with leading zeros. For example, with Zero Padding at 3, the number 6 would become 006. This option primarily is intended for identity numbers, such as those used by door and window tags. For example, to number doors as D01 through to D99, the raw value of the data would be saved as a simple integer, but the prefix would be D and Zero Padding would be 2. Entering zero for Zero Padding applies no zero padding.

9 Enter the values for True and False.
For example, you can specify Yes for True and No for False.

10 Enter data to display a sample of your current settings for Result.

11 For formatting that can be specified by dimension style, click Set from Dimension Style, select a dimension style, and click OK. Undefined, Not Applicable, Case, Zero Padding, and True/False are not defined by dimension styles.

12 Select the unit type, format, numerical precision, fraction format, and scale for real numbers. Definitions of these items are as follows:

- **Unit Type**: The format in which to display the type of units, such as length, area, and volume.

- **Units**: The drawing units in which the unit is stored. For example, if you select Volume for Unit Type, options to select from include cubic inches, cubic feet, cubic millimeters, cubic centimeters, and cubic meters.

- **Unit Format**: The drawing unit format in which the value is displayed. The AutoCAD® conversion units (Architectural, Scientific, Decimal, Engineering, and Fractional) are used when converting numeric values into strings. For example, a value of 14.25 is displayed as 1’–2 1/4” in architectural units.

- **Precision**: The number of decimal places used to display floating point numbers (for example, 0, 0.0, 0.00, and so on).

- **Fraction Format**: If the unit format is Architectural or Fractional, set the format used to display fractions (Horizontal, Diagonal, or Not Stacked). Note that all fonts do not support all fraction formats.
- **Scale**: The value by which the real number is scaled before it is displayed. For example, if the current drawing units are inches, a scale of 2.54 converts a dimension to centimeters.

13 Select the Round Off value for real numbers:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>round to the nearest value</td>
<td>select Nearest.</td>
</tr>
<tr>
<td>round to the nearest greater value</td>
<td>select Up.</td>
</tr>
<tr>
<td>round to the nearest lesser value</td>
<td>select Down.</td>
</tr>
</tbody>
</table>

If you enter a value of 0.25, all numeric values are rounded to the nearest 0.25 unit. Similarly, if you enter a value of 1.0, all numeric values are rounded to the nearest integer. The number of digits displayed after the decimal point depends on the precision specified. No round-off occurs for a value of 0.0.

14 Specify the rules for suppression of leading and trailing zeros, and feet and inches of floating point numbers:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>suppress leading zeros in all decimal numeric values</td>
<td>select Leading for Zero Suppression. For example, 0.5000 becomes .5000.</td>
</tr>
<tr>
<td>suppress trailing zeros in all decimal numeric values</td>
<td>select Trailing for Zero Suppression. For example, 12.5000 becomes 12.5.</td>
</tr>
<tr>
<td>suppress the feet portion of a feet-and-inches numeric value when the value is less than one foot</td>
<td>select 0 Feet for Zero Suppression. For example, 0’–6 1/2&quot; becomes 6 1/2&quot;.</td>
</tr>
<tr>
<td>suppress the inches portion of a feet-and-inches numeric value when the value is an integral number of feet</td>
<td>select 0 Inches for Zero Suppression. For example, 2’–0” becomes 2’.</td>
</tr>
</tbody>
</table>

For more information, see “New, Modify, and Override Dimension Style Dialog Boxes” in AutoCAD Help.
TIP The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture 2012 Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

15 Select the decimal separator.
16 Select the whole number separator.
17 Click OK.

Attaching Notes and Reference Files to a Property Data Format

Use this procedure to enter notes and attach reference files to a property data format. You can also edit notes and edit or detach reference files from a property data format.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ‣ .
The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Data Formats.

3 Select the property data format that you want to change.

4 Click the General tab.

5 To add a description to the property data format, enter it for Description.

6 To add a note, click the Notes tab, and enter the note.

7 Click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, click Open, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
detach a reference file | select the file name, and click Delete.

8 Click OK.

**Expanding the Scope of Scheduled Data**

The data that can be collected and graphically presented in a schedule table is extensive. To effectively customize schedule tables to meet your needs, you need to understand the following elements which control how data is displayed and which data is collected.

- Property set data
- Property set definitions
- Automatic properties
- Manual properties
- Formula definitions
- Classification definitions
- Material definitions
- Project definitions
- Anchor definitions
- Graphic definitions

**Property Set Data**

Objects to be included in schedule tables or linked to tags must have property set data attached to them. Schedule tables and tags do not store any data, but extract and display property set data from the associated objects.

Property set data is collected from one or more property sets attached to an object or a style. Some property data, such as a dimension, comes from automatic properties of the object or the object style and cannot be manually entered, such as dimensions. Other property data consists of manual properties.
for which you must enter values for each object or object style, such as manufacturer’s name.

**IMPORTANT** If an entity or style containing a property set is copied from a source drawing into a target drawing that already contains a property set with the same name, the property set in the target drawing does not change. There is a potential for a loss of data in this case. For example, assume a property set in one drawing has a number of manual properties defined and is attached to a door style with manual property values set. This door style is then copied into another drawing that contains a duplicate property set that does not have the same manual properties defined. In the target drawing the door style will contain the target drawing’s property set, not the source drawing’s property set. Any data values associated with the source drawing’s manual properties will be lost.

### Attaching Property Set Data to Objects

Use this procedure to attach property set data to objects that you want to include in a schedule table or link to schedule tags.

You attach property set data to objects by attaching one or more property sets, defined by a property set definition. After property sets are attached, the values for automatic properties are determined from the object, and you can enter values for the manual properties.

For information about attaching property set data to an object style, see [Attaching Property Set Data to Styles and Definitions](#) on page 3814. For information about property sets and external references, see [Attaching Property Sets to Objects from External References](#) on page 537.

1. Double-click the object(s) for which you want to attach property set data.

   **NOTE** If you select more than one type of object, you can attach only the property set definitions that apply to all the selected objects. For example, if you select doors and windows, you can attach only those property sets that apply to both doors and windows.

2. On the Properties Palette, click the Extended Data tab.

3. Click 

4. Select the property set you want to attach, and click OK.
Entering Manual Properties and Fields for Objects

Use this procedure to enter values for manual properties for one or more objects. For example, to enter a remark that applies to several doors in a drawing, you can select the doors and enter the remark as data for Notes.

You can insert fields into manual properties. Fields enhance the documentation capabilities within a drawing file because the values they display update whenever the associated property changes. You can also enter AutoCAD fields into manual properties attached to objects or styles.

NOTE Fields can be associated with hyperlinks. For example, if you insert a field pointing to a drawing using a hyperlink in a manual property, and create a schedule table that contains that property, you can jump from the table cell with the field property in it to the drawing to which it is linked. For detailed information about fields, see “Use Fields in Text” in AutoCAD Help.

1 Select the object(s) for which you want to add a manual property or field, right-click, and click Properties.

2 On the Properties palette, click the Extended Data tab.

NOTE If no property set data appears, no property sets are attached to the objects. To attach property sets, see Attaching Property Set Data to Objects on page 3811.

3 Enter a value for a manual property.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an alphanumeric value</td>
<td>select the property, and enter the value.</td>
</tr>
<tr>
<td>insert a field</td>
<td>right-click in the current value for the property, and click Insert Field. Select a field from one of the available categories, specify the desired format, and click OK.</td>
</tr>
</tbody>
</table>
NOTE You can also define a default field for the manual property in the property set definition. For example, if you want all walls to have a field that displays the last save date of the drawing, you can enter the “SaveDate” field in the property set definition, so that it will be displayed for each object connected to the property set. For more information, see Adding a Field to a Property Set Definition on page 3847.

Editing or Updating Fields in Manual Properties

Use this procedure to update or edit field values in a manual property. When you edit a field, you can change the field formatting and other settings. For more information, see Entering Manual Properties and Fields for Objects on page 3812.

1 Double-click the object(s) for which you want to edit the fields.
2 On the Properties palette, click the Extended Data tab.
3 Place the cursor in the row containing the field to update.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>update the field value</td>
<td>right-click, and click Update Field.</td>
</tr>
<tr>
<td>change the field format or other settings</td>
<td>right-click, and click Edit Field.</td>
</tr>
</tbody>
</table>

Converting Fields in Manual Properties to Text

Use this procedure to convert fields in manual properties to text. When you convert a field to text, it loses its connection to the referenced information. For example, if the field had a hyperlink to a drawing, the hyperlink to the drawing will be lost. For more information, see Entering Manual Properties and Fields for Objects on page 3812.

1 Double-click the object(s) for which you want to convert field properties to text.
2 On the Properties palette, click the Extended Data tab.
3 Place the cursor in the row containing the field you want to convert to text, right-click, and click Convert Field to Text.
Removing Property Set Data from an Object

Use this procedure to remove one or more property sets from an object. If an object is included in a schedule table, any data in the table obtained from the removed property set displays question marks in the table.

1. Double-click the objects from which to remove property set data.
2. On the Properties Palette, click the Extended Data tab.
3. Click .
4. Select property sets to remove, and clear any property sets to remain attached to the object.
5. Click OK.

Attaching Property Set Data to Styles and Definitions

Use this procedure to attach data to object styles and definitions, such as space styles, curtain wall styles, door styles, and multi-view block definitions.

You attach data to a style or a definition by attaching one or more property sets to it. Objects that use the style or definition inherit its property set data. The values for automatic properties, which may be different for each instance of the style, are determined from the objects, and you can enter values for manual properties. For more information, see Property Set Data on page 3810. For information about attaching property set data to individual objects, see Attaching Property Set Data to Objects on page 3811.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Architectural Objects, and locate the style or definition to which to attach property set data.
3. Select the style or definition.
4. Click the General tab, and click Property Sets.
5. Click .
6. Select the property sets that you want to attach.
7. Click OK twice.
Entering Manual Properties and Fields for Styles and Definitions

Use this procedure to enter values for manual properties in the property set data for a style or definition. The values you enter apply to all instances of objects associated with the style or definition.

You can insert fields into manual properties. Fields enhance the documentation capabilities within a drawing file because the values they display update whenever the associated property changes. You can also enter AutoCAD fields into manual properties attached to objects or styles.

**NOTE** Fields can be associated with hyperlinks. For example, if you insert a field pointing to a drawing using a hyperlink in a manual property, and create a schedule table that contains that property, you can jump from the table cell with the field property in it to the drawing to which it is linked. For detailed information about fields, see “Use Fields in Text” in AutoCAD Help.

**TIP** The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture 2012 Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.

If the property you want to edit is not listed in the property set data for the style or definition, it may be in a property set attached directly to the objects. To enter values for manual properties attached to objects, see Entering Manual Properties and Fields for Objects on page 3812.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤. The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Architectural Objects, and locate the style or definition for which to add manual properties.
3. Select the style or definition.
4. Click the General tab, and click Property Sets.

**NOTE** If no data appears, no property sets are attached to the style or definition. To attach property sets, see Attaching Property Set Data to Styles and Definitions on page 3814.
Enter a value for a manual property.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a alphanumerical value</td>
<td>select the property, and enter the value.</td>
</tr>
<tr>
<td>insert a field</td>
<td>right-click the current value for the property, and click Insert Field. Select a field from one of the available categories, specify the desired format, and click OK.</td>
</tr>
</tbody>
</table>

NOTE You can also define a default field for the manual property in the property set definition. For example, if you want all walls of a specific style to have a field that displays the last save date of the drawing, you can enter the SaveDate field in the property set definition, so that it will be displayed for each wall of that style. For more information, see Adding a Field to a Property Set Definition on page 3847.

Click OK twice.

Editing Style-Based Property Sets

Use this procedure to edit values of manual, style-based property set data attached to objects in your drawing. For more information, see Attaching Property Set Data to Styles and Definitions on page 3814.

1 Double-click the object for which you want to edit property set data.

2 On the Properties palette, click the Extended Data tab.

If object-based and style-based property sets are attached to the object, both display on the Extended Data tab.
3 Click (Edit style property set data) next to Property Sets From Style.
4 On the Edit Property Set Data worksheet, enter new values for the property set data and click OK.

![Edit Property Set Data](image)

5 Click OK.

**Editing Style-Based Property Sets Attached to Objects in External References**

Use this procedure to edit values of manual, style-based property set data attached to objects that are referenced externally (xrefs) in your drawing. For more information on attaching property data across xrefs, see [Attaching Property Sets to Objects from External References](#) on page 537.
1 Double-click the xref in your drawing.

2 In the Reference Edit dialog, on the Identify Reference tab, select Prompt to select nested objects, and click OK.

3 Select the object in the xref, and press ENTER.

4 Double-click the object to make changes to the property set data.

5 On the Properties palette, click the Extended Data tab.

   If object-based and style-based property sets are attached to the object, both display on the Extended Data tab.

6 Next to Property Sets From Style, click (Edit style property set data).
7 On the Edit Property Set Data worksheet, enter new values for the property set data, and click OK.

![Edit Property Set Data](image)

8 Click Multiple Objects tab ➤ Edit Reference panel ➤ Save Changes or Multiple Objects tab ➤ Edit Reference panel ➤ Discard Changes.

9 Click OK to verify your selection.

**Removing Property Set Data from a Style or Definition**

Use this procedure to remove one or more property sets from a style or definition. If objects using the style or definition are included in a schedule table, the cells for data obtained from the removed property set display questions marks.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➔. The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Architectural Objects, and locate the style or definition from which to remove property set data.

3 Select the style or definition.

4 Click the General tab, and click Property Sets.

5 Click .
6 Select property sets to remove, and clear any property sets that should remain attached.
7 Click OK three times.

**Browsing Property Data**

Use this procedure to access and view the data for all property sets in a drawing. For more information about browsing property sets attached to objects scheduled from external references, or to override property sets for those objects, see *Attaching Property Sets to Objects from External References* on page 537.

1 Open the tool palette that contains the Browse Property Data tool, and select it. This tool is located with the Scheduling and Reporting Tools in the Stock Tool Catalog. You can add this tool to any tool palette. For more information, see *Content Browser* on page 129.

2 Specify view options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow an object to be highlighted in the drawing when you select a property set that is attached to the object or its style</td>
<td>select Highlight.</td>
</tr>
<tr>
<td>prevent an object from being highlighted in the drawing when you</td>
<td>clear Highlight.</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>select a property set that is attached to the object or its style</td>
<td>clear Hide objects without property set definitions.</td>
</tr>
<tr>
<td>display objects in the left pane regardless of whether the selected property set definition is attached</td>
<td>clear Hide objects without property set definitions.</td>
</tr>
<tr>
<td>display only objects that have the selected property set definition attached</td>
<td>select Hide objects without property set definitions.</td>
</tr>
<tr>
<td>view the raw, unformatted data in the property set</td>
<td>clear Format data.</td>
</tr>
</tbody>
</table>

3 View property sets and the objects or styles to which they are assigned:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>view the object or style type to which a property set applies</td>
<td>select the property set. The right pane lists the property values, if available, and the objects or the styles to which the property set can be attached.</td>
</tr>
<tr>
<td>view the list of objects or styles to which a property set is attached</td>
<td>apply the object filter to the property set. The left pane lists objects or styles to which the property set is attached. If Highlight is selected, any objects to which the property set is attached (directly or through a style) are highlighted in the drawing.</td>
</tr>
<tr>
<td>view the property values for a specific property set and a specific object or style</td>
<td>under the property set, select the object or style. The right pane shows the values for the selected object or style.</td>
</tr>
</tbody>
</table>
Select the object or style from the left pane to edit property sets and values, and click OK.

Remove property sets from objects or styles:

**WARNING** If you detach a property set from an object or style, any manually entered values are lost. If you mistakenly detach a property set, click OK, and then immediately click Undo on the Quick Access Toolbar.

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>detach a property set from an object or style</td>
<td>clear the selection of the object or style.</td>
</tr>
<tr>
<td>add a property set to objects or styles</td>
<td>select the object or style.</td>
</tr>
</tbody>
</table>

6 Click Zoom to view the selected object in the drawing.
7 Click OK.

**Property Set Definitions**

A property set definition specifies the characteristics of a group of properties that can be tracked with an object. For example, you could create a property set definition named DoorProps that contains property definitions for DoorNumber, DoorWidth, and FireRating. Each property has a name, description, data type, data format, and default value.
**Property Sets and Property Data**

A property set is an object created from a property set definition. It contains a user-definable group of related object properties. When you attach a property set to an object or a style, the property set becomes the container for the property data associated with the object.

**Creating Property Set Definitions for Objects or Styles**

When you create a property set definition, you specify whether the property set can be attached to objects or to styles, depending on which of the following kinds of properties you want to track:

- **Automatic properties** generally belong in style-based definitions. Automatic properties, even when attached to a style, can vary for each instance of the object. It is more efficient to include automatic properties in a style-based definition because the properties are immediately associated with any object that uses the style.

- **Manual properties** can belong to either style-based or object-based definitions. The value of a manual property associated with a style is the same for every object. For example, a Manufacturer property will probably be the same for every instance of a particular door style, so it should be in a style-based property. However, a Door Number property is different for each instance of a door, so it should be in an object-based property.

- **Fields** enhance the documentation capabilities within a drawing file. A field is updatable text that is set up to display data that may change during the life cycle of the drawing. When the field is updated, the latest value of the field is displayed. You can insert fields in a manual property in the property set definition or in a property attached to an object or style.

**NOTE** Fields can be associated with hyperlinks. For example, if you insert a field pointing to a drawing in a manual property, and create a schedule table that contains that property, you can jump from the table cell with the field property in it to the drawing it is linked to. For detailed information about fields, see “Use Fields in Text” in AutoCAD Help.

**TIP** The quickest way to locate and view an AutoCAD topic referenced in AutoCAD Architecture 2012 Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.
**Automatic and Manual Properties**

Property sets, whether attached to objects or to styles, can include both manual and automatic properties.

- **Automatic properties** cannot be edited directly because they are obtained from the object or other source. For example, the physical characteristics of an object, such as its dimensions or material, are automatic properties. To change the value of an automatic property, you must modify its source. The change then appears in the property set data for the object.

- **Manual properties** must be edited in the property set data for the object or style. For example, object numbers (for tagging) and notes or remarks are manual properties. The value entered for a manual property in an object-based property set is saved with the object. The value entered for a manual property in a style-based property set is saved with the style and is available to all objects using that style.

- **Fields** are used with manual properties and are selected from a list of available fields in the software. Fields contain values that update when the value changes and can also contain hyperlinks to other drawings or other files. For detailed information about fields, see “Use Fields in Text” in AutoCAD Help.

**Using Property Data Formats in Property Set Definitions**

Property data formats control how values for numbers and text display. Both property set definitions and schedule table styles use property data formats. For more information about creating property data formats, see Property Data Formats on page 3802.

**Managing Property Set Definitions**

To create, edit, copy, or purge property set definitions, you access the Style Manager. The Style Manager provides a central location where you can work with definitions and styles from multiple drawings and templates. For more information about using the Style Manager, see Style Manager Overview on page 870.
WARNING If you overwrite one property set definition with another, you may lose data. For example, a drawing might contain a property set definition with a number of manual properties. The property set is attached to doors with the manual properties entered, and is included in a schedule table. If you overwrite this property set definition with one that does not have the same properties, the values entered for the manual properties are lost. In addition, any columns in the schedule table that reference these manual properties are flagged as invalid. Changes to the schedule table that result from changes to the property set definition are displayed the next time the table is updated manually or automatically.

Understanding Automatic Properties

The data in an automatic property is obtained from individual objects or their styles and is not entered manually. For example, a number of doors might have the same style but different widths. The automatic property Width may be different for each door. However, those doors have the same thickness, because thickness is a property of the style. The automatic property Thickness has the same value for all doors of the same style. For more information, see Adding an Automatic Property Definition to a Property Set Definition on page 3849.

More than a 1,000 automatic properties are available in AutoCAD Architecture 2012. Most are self-explanatory, but a few need additional explanation.

Wall Area Properties

The following 4 automatic properties provide data for wall area calculations:

- Area—Right Gross
- Area—Right Net
- Area—Left Gross
- Area—Left Net

The right and left sides of a wall are determined as if you were standing on the start point of the wall and facing the endpoint. Gross area is the area of one side without allowing for holes for openings such as doors and windows. Net Area is the area of one side of a wall after holes are cut for openings. Gross Area might be used to determine the quantity of gypsum board needed for a wall, while Net Area might be used to determine the quantity of brick.
**WARNING** The area of a wall is determined by adding the union of the wall components (not including body modifiers or interferences) to the area of all faces that point to the right (for right areas) or the left (for left areas). If a particular wall style has multiple components with air space between them, the wall area may not be reported as expected. For example, a wall typically used in construction has a brick exterior, an air space, and a CMU interior. A style defined for this wall might have a component for the brick and a component for the CMU, but no component for the air space. If the wall was drawn with the brick on the left side, the wall area computed for the right side would include the right face of the CMU as well as the right face of the brick. The area reported would be twice the actual area. To avoid this situation, create components for interior air spaces in wall styles, so that no interior faces exist when the wall components are unioned.

The shape of a wall can be modified by adding or subtracting body modifiers. Automatically calculating appropriate areas for every possible wall shape is practically impossible. Because of this, body modifiers and interferences are not currently included in wall area calculations. Wall areas for unusually shaped walls must be computed manually.

**Wall Volume Properties**

The following 4 automatic properties provide data for wall volume calculations:

- **Volume—Gross**
- **Volume—Net**
- **Volume—Gross With Mods**
- **Volume—Net With Mods**

Gross volume is the volume of wall components without allowing for holes for openings such as doors or windows. Net volume is the volume after holes are cut for openings.

You can obtain the wall volume with or without wall body modifiers.

- Gross and net show the volume of the wall components as if no body modifiers exist.
- Gross With Mods and Net With Mods include body modifiers.
**Wall Length Property**

Like wall area, wall length is practically impossible to calculate automatically when body modifiers are present. Because of this, the Wall Length property returns only the distance between the start point and endpoint of the wall. To get a more accurate report for the length of a wall, you may have to reposition the endpoint of the wall.

The visible length of a wall may differ from the distance between the endpoints due to wall cleanups.

**Slab and Roof Slab Volume Properties**

Volumes for slabs and roof slabs do not include the volumes of fascias or soffits.

**Slab and Roof Slab Elevation Properties**

Slabs and roof slabs have the following elevation properties:

- **Elevation—High**
- **Elevation—Low**

These properties provide the highest and lowest elevation value of all slab and roof slab vertices, including fascias and soffits.

**Door Size Properties**

Values for the dimension properties of Width, Height, and Thickness can be combined in 3 additional Door Size properties. The table below shows how these properties appear for a number of different doors, each with a width of 3'-0", a height of 6'-8", and a thickness of 2", but differing in the number and size of individual door panels.

<table>
<thead>
<tr>
<th>Property</th>
<th>Single Door</th>
<th>Double Door</th>
<th>Uneven Door</th>
</tr>
</thead>
<tbody>
<tr>
<td>Door Size - W x H</td>
<td>3'-0&quot;x6'-8&quot;</td>
<td>3'-0&quot;x6'-8&quot;</td>
<td>3'-0&quot;x6'-8&quot;</td>
</tr>
<tr>
<td>Door Size - 2 @ W x H</td>
<td>3'-0&quot;x6'-8&quot;</td>
<td>2@1'-6&quot;x6'-8&quot;</td>
<td>2'-0&quot;(1'-0&quot;)x6'-8&quot;</td>
</tr>
</tbody>
</table>
Door Swing Direction Properties

Different countries have different conventions for specifying the swing direction of a door. For example, the door shown below is considered a left-swinging door in the United States and Great Britain, but a right-swinging door in Australia, Russia, and most of Europe. To accommodate these differences, AutoCAD Architecture includes a property called Swing Direction - Reverse. You can select the door swing property you want to use when you create or modify a property set definition.

Structural Member Properties

The length of a structural member is its logical length—the length between its grip points—rather than the actual length, which can be difficult to compute. To get the actual length, you can add the Length along Baseline property, which projects all parts of the member to its baseline for measurement. This property will give the actual length for members to which trim planes or offsets are applied or when interference conditions or body modifiers affect the overall length. Such members give a visible length that is different from the logical length.

The location properties of a structural member (X, Y, Z) give information about the coordinates on which a structural member has been inserted. This is important for downstream applications in the structural engineering field.
Understanding Formulas

Formulas are user-defined equations for calculating the value of a property. You can use a formula to add data about a selected group of objects or object styles to a schedule table after you define the formula property set definition. and then add the formula property definition to a property set definition. For more information about property sets and property set definitions, see Property Sets and Property Set Definitions on page 3743.

The worksheet you use to specify the formula also lets you evaluate sample results. Formulas can contain variables, operators, and functions allowed in VBScript. For more detailed information about VBScript, go to http://msdn.microsoft.com and search for “VBScript Language Reference.” Additionally, in the Formula Property Definition worksheet, links to online Help are available from the Insert VBScript code and Formula context menus for VBScript items used in the formula.

Adding a Formula Property Definition to a Property Set Definition

Use this procedure to add a formula property definition to a property set definition. Formula property values can be computed based on the values of other property data. (For more information about how a formula is evaluated, see Formula Evaluation on page 3834.) For example, width and height are automatic door properties, which you can use to compute the perimeter of the door. Defining \((2 \times \text{[Width]}) + (2 \times \text{[Height]})\) as a formula for a 36" x 84" door results in a value of 240. A formula property definition is a type of automatic property, because the value it displays is determined automatically, based on its definition, and cannot be edited directly.

**NOTE** There is no conversion made between units for a formula result.

Formulas can be simple mathematical expressions, such as \(2+2\). They can also contain variables, operators, and functions allowed in VBScript, as shown in the examples below.

<table>

</table>

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➡. The Style Manager is displayed with the current drawing expanded in the tree view.

2. Expand Documentation Objects, and expand Property Set Definitions.

3. Select the property set definition to change.

4. On the Definition tab, click ➡.
5 On the Formula Property Definition worksheet, enter a name for the formula property.

6 If you do not want to use the formula as the description of the property, clear Use formula for description.

7 Enter the formula:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>use a value that you supply</td>
<td>click in the Formula pane, and enter the value.</td>
</tr>
<tr>
<td>use the value of another property definition in the formula</td>
<td>locate and double-click (or right-click, and click Insert) the definition in the Insert Property Definitions list. You can also select the definition, and press INSERT.</td>
</tr>
<tr>
<td>use a VBScript function</td>
<td>locate and double-click (or right-click, and click Insert) the function in the Insert VBScript code list. You can also select the function, and press INSERT.</td>
</tr>
<tr>
<td>evaluate the formula as a VBScript function</td>
<td>enter RESULT anywhere in the formula.</td>
</tr>
</tbody>
</table>
The property definitions available for use in the formula must be applied to the same objects as the property set definition containing the formula.

The names of property definitions used in the formula are displayed within brackets, such as [Width]. If a property definition belongs to a property set definition other than the one containing the formula, that name is displayed as well, such as [DoorObjects:Height].

The formula property definition cannot be used in the formula it defines, as indicated by the ✗ and the addition of [Self] after its name. Property definitions that end up using the value of the formula cannot be used in the formula, as indicated by the ✗ and the addition of [Circular Reference] after their names.

**NOTE** If you enter the name of a property definition directly in the formula string, or copy and paste between formulas, the property definition is displayed as normal text. For property values of property definitions to be inserted correctly, they must be selected from the list in the Insert Property Definitions pane.

8 In the Enter Sample Values pane, enter a value.

The property value you enter displays with the current format specified in the Sample Result pane.

9 In the Enter Sample Values pane, select a property data format.

The format you select effects how the data in the Value column displays in the Sample Result pane and how the formula evaluates in the in the schedule table. It can be changed at any time. For more information, see Property Data Formats on page 3802.

10 Click OK twice.

**Formula Evaluation**

Use this procedure to evaluate the result of a formula. After you complete the formula property definition and add the property set to objects, you can use the result of the formula in schedule tables and schedule tags.
1 Confirm that for each property definition in the formula, the value of the property is:

- retrieved from the object or style.
- formatted using the property data format defined in the sample value format.
- inserted into the formula in place of the property definition name and the brackets surrounding it.

2 Evaluate the formula string:

<table>
<thead>
<tr>
<th>If the formula string…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains the word “RESULT”</td>
<td>it is evaluated as a VBScript function, and the value displayed for the property is the result of that evaluation.</td>
</tr>
<tr>
<td>does not contain the word “RESULT”</td>
<td>it is evaluated as a mathematical expression.</td>
</tr>
</tbody>
</table>

**NOTE** Make sure that all property sets used in the formula have been applied to the object or style. Otherwise, a question mark (?) is displayed in the schedule table.

For more information, see [Adding a Formula Property Definition to a Property Set Definition](#) on page 3830. There is access to online Help for VBScript code from the context menu in the Formula Property Definitions worksheet.

## Use Case for the Formula Property Definition Worksheet

Creating a formula that returns valid data can be a complex task. As the following example shows, you can simplify the process by using the Formula Property Definition worksheet to construct the formula with VBScript Code. You then insert sample values into the formula and evaluate the result.

### Example of Completed Formula

The space object has a single numeric value for its height, which is adequate for the majority of spaces in a room schedule. However, to get more control over how space heights are displayed for rooms without flat ceilings, you can
create a formula that returns a text override, such as “Vaulted” for a cathedral ceiling, or return the actual height. The completed worksheet for such a formula is shown below.

Process Used to Complete Example
Using primarily the default property set definitions in the Style Manager, the following process was completed.

Added SpaceStyles as a new property set definition
- Imported space styles from schedule table styles drawing.

On the Definition tab for the SpaceObjects property set definition
- Added a manual text property definition called HeightOverride.
Added a formula property definition called HeightDisplayed.

Edited the HeightDisplayed formula property definition on the Formula Property Definition worksheet

On the first line under Formula, entered strHeightOverride = "". As you make changes to the formula, you can view a sample result. For example, entering the formula "2+3" displays "5" in the Sample Result pane. This lets you correct a formula that fails to evaluate as expected.
Under SpaceObjects with the cursor between the double quotes, selected HeightOverride.

When a property definition is first inserted in a formula, its sample value is taken from an object in the current drawing that uses the formula’s property set definition or from a default object.

With the cursor after the second quotation mark, pressed ENTER twice to insert 2 lines.

From Statements under Insert VBScript code, added If…Then..Else (Block).
When you move the cursor over an item, a tooltip displays the text that appears in the formula when it is inserted.

After you add VBScript code to the formula, red or gray text may be inserted to help construct the formula. Red indicates fields where additional code must be added. To remove a red field, select it, and enter text, insert a property definition, or insert other VBScript code.

Gray fields surrounded by brackets indicate optional fields. Typing anywhere within the gray brackets, or deleting one bracket, will remove the brackets and convert the code from optional to required.

You can save a formula containing red and gray fields for future editing, but a warning dialog displays because the formula will not be evaluated correctly. You can access online Help for VBScript code in the formula for more information on its proper usage.

- Selected red condition field, and entered strHeightOverride = "."
- Selected red statements field, and entered RESULT = CDbl( ).
■ With the cursor between the parentheses, selected Height under SpaceStyles.

```csharp
strHeightOverride = "HeightOverride"
If strHeightOverride = "" Then
    RESULT = COI([SpaceStyles:Height])
Else
    RESULT = COI([SpaceStyles:Height])
End If
```

■ Deleted the ElseIf line and the line below it.

```csharp
strHeightOverride = "HeightOverride"
If strHeightOverride = "" Then
    RESULT = COI([SpaceStyles:Height])
Else
    RESULT = strHeightOverride
End If
```

■ Selected red “elseStatements” field, and entered RESULT = strHeightOverride.

```csharp
strHeightOverride = "HeightOverride"
If strHeightOverride = "" Then
    RESULT = COI([SpaceStyles:Height])
Else
    RESULT = strHeightOverride
End If
```

■ Entered Vaulted for sample value of HeightOverride. Every time a sample value is changed a new sample result displays.

■ Entered 108 for sample value of SpaceStyles:Height.

■ Selected Length - Long for Format.
Sample values are formatted and inserted into the formula in place of the corresponding property definition names with brackets surrounding them. The entire sample formula is evaluated, and the result displays in the Sample Result pane.

Because this formula contains the word RESULT, it is evaluated as a function instead of an expression, and the value of the formula property is the last value assigned to RESULT. The result of this valid formula is Vaulted.

Creating a Property Set Definition

Use this procedure to create a property set definition. You can create a new property set definition by copying an existing definition. You then edit the definition properties to customize the characteristics of the definition. For more information, see Editing a Property Set Definition on page 3863.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Create a property set definition:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>create an empty property set definition with default properties</td>
<td>right-click the style or definition, and click New. Enter a name for the new property set definition, and press ENTER.</td>
</tr>
<tr>
<td>create a property set definition from an existing property set definition</td>
<td>right-click the property set definition to copy, and click Copy. Right-click, and click Paste. Right-click the new property set definition, and</td>
</tr>
</tbody>
</table>
Attaching Notes or Reference Files to a Property Set Definition

Use this procedure to enter notes and attach reference files to a property set definition. You can also edit notes and edit or detach reference files from a property set definition.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤. The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition to which you want to attach notes or reference files.

4 Click the General tab.

5 To add a description to the property set definition, enter it for Description.

6 To add a note, click Notes, click the Notes tab, and enter the note.

7 Click Notes, click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
</tbody>
</table>
If you want to... | Then...
---|---
detach a reference file | select the file name, and click Delete.

8 Click OK twice.

Specifying How the Property Set Definition is Applied

Use this procedure to specify whether a property set definition applies to objects or to styles and definitions. You also select the objects or the styles and definitions that can use the property sets created from this definition.

If the property set that you define contains properties that are the same for all objects created using a specific style, select a style-based property set. This eliminates the need to attach data for each instance of the object that you create. Objects created using the style with the property set assigned have access to the associated style-based property set.

In general, use automatic properties only within property set definitions that are applied to styles or definitions.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Property Set Definitions.
3 Select the property set definition that you want to change.
4 Click the Applies To tab.
5 Specify how the property set definition is applied:

<table>
<thead>
<tr>
<th>If you want to apply it to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>objects</td>
<td>select Objects. The list of objects becomes available.</td>
</tr>
<tr>
<td>styles and definitions</td>
<td>select Styles and Definitions. The list of styles and definitions becomes available.</td>
</tr>
</tbody>
</table>
6 Select the objects or the styles and definitions to which the property set applies.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>define an object-based property set definition</td>
<td>select the objects from the list in the left pane.</td>
</tr>
<tr>
<td>define a style- or definition-based property set definition</td>
<td>select the styles or definitions from the list in the left pane.</td>
</tr>
<tr>
<td>select all objects or style and definitions</td>
<td>click Select All.</td>
</tr>
<tr>
<td>clear the current selection</td>
<td>click Clear All.</td>
</tr>
</tbody>
</table>

If all the objects or none of the objects are selected, your property set definition can be added to any object or style. The area above the list displays the objects that are currently selected.

7 To specify classification criteria, expand a classification definition, and select one or more classifications.

For example, you can select a construction status of New and two preferred vendors. To meet the criteria, the classification in the object style must be New for construction status and the Vendor classification must be one of the two vendors selected.

**Specifying multiple classification criteria in a property set definition**
All classification definitions that apply to the same objects to which the property set definition applies are displayed on the right with a list of their classifications. If classifications are selected, the property set definition can be applied only to those objects or styles and definitions selected on the left that have all the classifications selected on the right.

8 Click OK.

Adding a Manual Property Definition to a Property Set Definition

Use this procedure to add a manual property definition to a property set definition. Manual properties are those that must be entered rather than obtained directly from the object. You can define a list of manual property values to use in property definitions. For example, you could predefine the values for paint color or manufacturer to avoid repeatedly typing the information. For more information, see Creating a List Definition for a Manual Property Definition on page 3869.

When you use real numbers for Type in manual property definitions, you specify only how units are entered and stored for properties of the object or style. How units are displayed is controlled by the property data format. For more information, see Property Data Formats on page 3802.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition for which to add a manual property.

4 On the Definition tab, click ➤ .

5 Enter the Name for the property.

   NOTE If this property is for use with schedule tags, do not enter spaces in the property name.

6 To define a property by using existing properties, select a property from the Start With list.

7 Click OK, and continue working on the property set definition on the Definition tab of the Property Set Definition dialog.
8 Enter a description of the property, and click OK.
   The default description is the same as the property definition name. This text is for a column header in a schedule table that uses this property.

   **NOTE** The description does not change if you edit the property name. Edit the description separately.

9 Specify the type of data the property contains.
   Select List to associate a list definition with this manual property. For more information, see Creating a List Definition for a Manual Property Definition on page 3869.
   Changing the data type of a definition for property data already stored in the drawing will set the data to the default value, possibly removing data previously edited.
   For property definitions to be displayed in a matrix column in a schedule table, you can assign multiple values to the same property by using a text data type and separating the values with semicolons. Each value will be displayed in a separate matrix column.

10 Select a property data format to specify how the data included in the property set definition is displayed.
   The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format.

11 Select how units are entered.
   If you assign a type of unit other than the default for Format, an override is applied to the property data format. The type of units specifies how they are stored in the drawing. on the Extended Data tab of the Properties Palette.

12 Enter a default value.
   Values for Default are used in the example fields and as example data for schedule table columns. The Extended Data tab of the Properties palette displays units in the same format as they appear for Example.
NOTE: If you create a manual property, it is helpful to enter neutral characters, such as “–,” as the default value. When you create a schedule table, the characters fill the cells for which you have not entered values. You can edit the characters in each cell later. If you leave the default value blank in the property set definition, the corresponding cells are blank. You cannot select and edit blank cells.

13 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.
   For more information, see Hiding Properties on page 3862.

14 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.
   For more information, see Sequencing Property Definitions on page 3862.

15 Click OK.

NOTE: When you attach property set data to an xref drawing or block using RefEdit and the property set includes Auto Increment—Integer or Auto Increment—Character, then you must set the default value to the first number to be used in the xref or block to avoid creating duplicate numbers.

Adding a Field to a Property Set Definition

Use this procedure to add a field to a property set definition. Fields contain updatable values or hyperlinks, and are selected from a list.

You can create a manual property as a placeholder for a field. In that case, you enter the field in the property once it is attached to an object or style. If you enter a field as a default value for a manual property in the definition, all objects or styles that have the property attached already contain the field.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager  
   The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition to which you want to add a field.

4 On the Definition tab, click .
5 Enter the name for the property.

**NOTE** If this property will be used with schedule tags, do not enter spaces in the property name.

6 Select *DEFAULT* for Start with.

7 Click OK.

8 Enter a short description of the property.

The default description is the same as the property definition name. This text is for a column header in a schedule table that uses this property.

**NOTE** The description does not change if you edit the property name. You can edit the description.

9 Under Type, select Text.

10 If you want to create a field placeholder property that can be filled when the property set is attached to an object or style, do not enter a value for Default.

For information about adding fields to properties attached to objects, see Entering Manual Properties and Fields for Objects on page 3812.

11 If you want to set a default field used for every object or style attached to the property set, right-click the Default column, and click Insert Field.
12 Under Field Category, select the desired category.
13 Under Field names, select the field you want to enter.
   Some field names require additional information, like a file name or field property information.
14 Select the text format of the field text.
15 Click OK.

Adding an Automatic Property Definition to a Property Set Definition

Use this procedure to add an automatic property definition to a property set definition. The values for automatic properties are obtained directly from an object or its style. Selecting a format for this property definition controls how these values display. For general information about automatic properties and additional explanation about some properties for walls, slabs, roof slabs, doors, and structural members, see Understanding Automatic Properties on page 3826.

NOTE Ensure that the property data formats you want to use are stored in the current drawing. For more information, see Property Data Formats on page 3802.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition to which to add the automatic property.

4 Click the Definition tab.

5 Click .

6 Select one property for each object to which the property set definition applies.
   For example, if the definition applies to windows and window assemblies, you can select the Width property for windows and the Width property for window assemblies. A warning is displayed if you select different properties from different object types.

   **NOTE** If the property set definition applies to only one object, you can create multiple automatic property definitions at the same time by selecting multiple items on the Automatic Property Source worksheet. If the property set definition applies to more than one object, you can only create one property definition at a time. Typically, you would like to select items with the same name for every object the property set definition applies to. Selecting or clearing an item for one object selects or clears items with the same name for all other objects. You can control the selection of individual items by pressing CTRL.

7 Click OK.

8 Click on the value for Description, enter a short description of the property definition, and click OK.
   The default description is the same as the property definition name. This is the default text for a column header in a schedule table that uses this property.

   **NOTE** The description does not change if you edit the property name.

9 Select a format to specify the how the data displays.
   The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default
value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

10 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.
For more information, see Hiding Properties on page 3862.

11 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.
For more information, see Sequencing Property Definitions on page 3862.

12 Click OK.

Adding a Location Property Definition to a Property Set Definition

Use this procedure to add a location property definition to a property set definition. Location property values are obtained from property data on AEC polygons or spaces in or near an object. When a selected object has a property set that contains a location property, a Data Location grip is displayed along with its other grips. If the location property is defined to retrieve property data from a space object, for example, and the property data comes from the space underneath the grip, then the grip moves when the object is moved. If an MvBlock representing a piece of furniture is moved from one space to another, it has access to the space's property data, which might include the occupant of a room.

A location property definition is a type of automatic property, because the value it displays is determined automatically, based on its definition, and cannot be edited directly. To create a location property definition, you select a property definition contained in a property set definition that can be applied to AEC polygons or space objects.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition that you want to change.

4 On the Definition tab, click .
5 Enter a name for the location property.
6 Clear Use property name for description if you do not want to use the location property as the description of the property.
7 Expand AEC Polygon or Space.
8 Expand a property set definition.
9 Select the property data you wish to retrieve.
10 Click OK.
   To change the name of the property definition, click Name and double-click the property definition in the table, or select Edit Location. If Use property name for description is not set, edit the description.
11 Select a property data format to specify the method used to display the data included in the definition.
   The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format.
12 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.
   For more information, see Hiding Properties on page 3862.
13 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.
   For more information, see Sequencing Property Definitions on page 3862.
14 Click OK.

Adding a Classification Property Definition to a Property Set Definition

Use this procedure to add a classification property definition or its properties to a property set definition. Including classifications or classification properties in a property set definition for schedules enables you to report classification data for the objects in a schedule table.

For example, if you have a classification definition for vendors, you can specify the vendor for different object types. You can then include the vendor classification or its properties in a property set definition and use the
classification properties in a schedule table for the objects. For more information, see Attaching Property Set Definitions to a Classification Definition on page 3881.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2. Expand Documentation Objects, and expand Property Set Definitions.
3. Click the property set definition that you want to change.
   For example, if you want to include classifications in a door schedule, select a property set definition that applies to door styles.
4. Click the Definition tab.
5. Click .
   The Classification Property Definition dialog is displayed. The pane on the left lists classification definitions that apply to the object style for the current property set definition. For example, if the current property set definition applies to door styles, the Classification pane lists all the classification definitions that apply to door styles.
   The pane on the right lists all the properties that apply to the classification definitions.

Example of the Classification Property Definition dialog

6. Enter a name for the property.
   The name identifies the property in the property set definition.
7 Clear Use classification name for description if you do not want to use the classification name for the description of the property. By default, schedule table styles use the description for the column heading. The default description for classification properties comprises the names of the classification definition, the property set definition, and the property (such as Vendor - Vendor Class - Delivery Date).

8 Select the classification or the classification property to add to the property set:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>include the value specified for each object for a classification definition</td>
<td>in the left pane, select the classification definition.</td>
</tr>
<tr>
<td>include the value of a property that is attached to a classification</td>
<td>in the left pane, select the classification definition. In the right pane, select Classification Property, expand the property set, and select the property.</td>
</tr>
</tbody>
</table>

**Selecting a classification property**

9 Click OK, and continue working on the property set definition on the Definition tab of the Property Set Definition dialog.

10 If Use classification name for description was not selected, enter a description for the new property by selecting the empty value, entering text for Description, and clicking OK.
To change the name of the property definition, double-click the value for Name.

11 Select a format to specify the how the data displays.

The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

12 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.

For more information, see Hiding Properties on page 3862.

13 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.

For more information, see Sequencing Property Definitions on page 3862.

14 Click OK.

Add a Material Property Definition to a Property Set Definition

Use this procedure to add a material property definition to a property set definition. Material property values are obtained from an object's component materials or from property data specified for an object's component materials.

A material property definition is a type of automatic property, because the value it displays is determined automatically, based on its definition, and cannot be edited directly.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .

The Style Manager is displayed with the current drawing expanded in the tree view.

2 Expand Documentation Objects, and expand Property Set Definitions.

3 Select the property set definition that you want to change.

4 On the Definition tab, click .

5 Enter a name for the material property.
6 Clear Use material name for description if you do not want to use the material property as the description of the property.

7 Select a material:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>retrieve the name of a material specified for a component on an object or style</td>
<td>select a Material in the left pane.</td>
</tr>
<tr>
<td>retrieve property data for the material specified for a component on an object or style</td>
<td>select Material Property in the right pane.</td>
</tr>
</tbody>
</table>

8 Click OK, and continue working on the property set definition on the Definition tab of the Property Set Definition dialog.

9 If Use material name for description was not selected, enter a description for the new property by selecting the empty value, entering text for Description, and clicking OK.
   To change the name of the property definition, double-click the value for Name.

10 Select a format to specify the how the data displays.
    The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

11 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.
    For more information, see Hiding Properties on page 3862.

12 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.
    For more information, see Sequencing Property Definitions on page 3862.

13 Click OK.
Adding a Project Property Definition to a Property Set Definition

Use this procedure to add a project property definition to a property set definition. Project property values are obtained from the drawing management project in which an object is located. Project properties let you collect and display specific project details in a schedule table, such as:

- mobile, fax, and telephone numbers of the project principal, manager, and architect
- contact information for public services
- sources for site information

A project property definition is a type of automatic property. The values displayed are determined by the information previously entered in the project and cannot be edited directly in the property definition. If, while working in the project, you modify project details that are included in the property definition and a schedule, the schedule displays the out-of-date marker. For more information, see Turning Off the Out-of-Date Marker on page 3752.

In order for a project property definition to return correct project data, a drawing management project must be currently open, and the drawing containing the object must be part of that project. Not meeting either of these conditions has the following consequences:

- The data on the Extended Data tab of the Properties palette and on similar dialogs is displayed as “No Project.”

- Attributes of schedule tags that display project data are not updated. Attributes display data as updated from the last time the conditions were met and the drawing was saved. In this case, the data displayed may not be accurate.

- Schedule tables that display project data in one or more cells are not updated. Schedule tables display data as updated from the last time the conditions were met and the drawing was saved. In this case, the data displayed may not be accurate.

These conditions allow drawings that contain project data to be viewed and plotted when drawing management is not available.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .

   The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Property Set Definitions.
3 Select the property set definition that you want to change.

4 On the Definition tab, click.
5 Enter a name for the project property.
6 Clear Use project information for description if you do not want to use the project property as the description of the property.
7 Select the project information to include in the property definition.
8 Click OK, and continue working on the property set definition on the Definition tab of the Property Set Definition dialog.
9 If Use project information name for description was not selected, enter a description for the new property by selecting the empty value, entering text for Description, and clicking OK.
   To change the name of the property definition, double-click the value for Name.

10 Select a format to specify the how the data displays.
   The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

11 Clear Visible if you do not want this property definition to appear on the Extended Data tab of the Properties palette.
   For more information, see Hiding Properties on page 3862.

12 Enter a number for Order if you want this property definition to appear on the Extended Data tab in a particular order.
   For more information, see Sequencing Property Definitions on page 3862.

13 Click OK.

Adding an Anchor Property Definition to a Property Set Definition

Use this procedure to add an anchor property definition to a property set definition. Anchor property definitions allow one object to get data from
another object to which it is anchored. For example, an anchor property of a
door in a 2-hour fire-rated wall could display the 2-hour fire-rating of the wall
with an anchor property definition specified. The information displayed
cannot be edited directly.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Documentation Objects, and expand Property Set
Definitions.
3 Select the property set definition that you want to change.
4 On the Definition tab, click .
5 Enter a name for the anchor property.
6 If you do not want to use the property name for the description,
clear Use property name for description.
7 Select the property definition to be associated with this property
set.
8 Click OK, and continue working on the property set definition
on the Definition tab of the Property Set Definition dialog.
9 If Use property name for description was not selected, enter a
description for the new property by selecting the empty value,
entering text for Description, and clicking OK.
To change the name of the property definition, double-click the
value for Name.
10 Select a format to specify the how the data displays.
The format you select becomes the default format of a column
when this property is added to a schedule table style. It can be
changed at any time. The Example column shows how the default
value is displayed using the selected format. For more information,
see Property Data Formats on page 3802.
11 Clear Visible if you do not want this property definition to appear
on the Extended Data tab of the Properties palette.
For more information, see Hiding Properties on page 3862.
12 Enter a number for Order if you want this property definition to
appear on the Extended Data tab in a particular order.
For more information, see Sequencing Property Definitions on
page 3862.
13 Click OK.
Adding a Graphic Property Definition to a Property Set Definition

Use this procedure to add a graphic property definition to a property set definition. Graphic property values can be blocks in the current drawing or image files, such as BMP, GIF, JPG, PNG, or TIF. The image displayed cannot be edited directly.

Schedules display blocks as graphic properties only if the blocks exist in the current drawing and if the block is not annotative. If you copy a schedule or a schedule table style to a new drawing, make sure that you also copy all blocks.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Documentation Objects, and expand Property Set Definitions.
3. Select the property set definition that you want to change.
4. On the Definition tab, click ➤.
5. Enter a name for the graphic property.
6 Specify a source for the graphic property:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>select a block from the current</td>
<td>select Block, and select the block</td>
</tr>
<tr>
<td>drawing</td>
<td>name from the drop-down list.</td>
</tr>
<tr>
<td>select a block from outside of</td>
<td>select Block, click Browse, select a block, and click Open.</td>
</tr>
<tr>
<td>the current drawing</td>
<td>select Block, click Browse, select a block and click Open.</td>
</tr>
<tr>
<td>select a drawing file</td>
<td>select Block, click Browse, select a drawing, and click Open.</td>
</tr>
<tr>
<td>select an image file</td>
<td>select Image, and click Browse. In the Select Image File dialog, browse</td>
</tr>
<tr>
<td></td>
<td>to select the image, and click Open.</td>
</tr>
<tr>
<td></td>
<td>Select the path type from the drop-down list. Using relative paths</td>
</tr>
<tr>
<td></td>
<td>makes your project more portable.</td>
</tr>
</tbody>
</table>

7 If you want to enter a new description in the property set definition, clear Use block or image name for property description.

8 For Rotation, enter an angle for the graphic.

9 If you want to change the layer key, click Select Layer Key.

10 Click OK, and continue working on the property set definition on the Definition tab of the Property Set Definition dialog.

11 If Use graphic name for description was not selected, enter a description for the new property by selecting the empty value, entering text for Description, and clicking OK.

To change the name of the property definition, double-click the value for Name.

12 Select a format to specify the how the data displays.

The format you select becomes the default format of a column when this property is added to a schedule table style. It can be changed at any time. The Example column shows how the default value is displayed using the selected format. For more information, see Property Data Formats on page 3802.

NOTE Images and blocks are uniformly scaled to fit within the table cell. The cell dimension is determined by the row height and column width.
If you do not want this property definition to appear on the Extended Data tab of the Properties palette, clear Visible. For more information, see Hiding Properties on page 3862.

If you want this property definition to appear on the Extended Data tab in a particular order, enter a number for Order. For more information, see Sequencing Property Definitions on page 3862.

Click OK.

**Sequencing Property Definitions**

Use this procedure to specify the order in which properties are listed on the Extended Data tab of the Properties palette. When you have many object properties in a property set definition, it can be helpful to see the most important properties first rather than the default alphabetical order. Items with numbers appear before items without numbers.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Documentation Objects, and expand Property Set Definitions.
3. Select the property set definition that you want to change.
4. On the Definition tab, select the property, and enter a number value for Order to specify the sequence in which the property is to appear on the Properties palette.
5. Click OK.

**Hiding Properties**

Use this procedure to prevent properties from being listed on the Extended Data tab of the Properties palette. If the object has many properties associated with it, it could be helpful to exclude some of the less important properties from displaying on the Properties palette.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Documentation Objects, and expand Property Set Definitions.
3. Select the property set definition that you want to change.
4 Click the Definition tab, select the property, and clear Visible if you do not want the property to display on the Properties palette.
5 Enter a name for the graphic property.
6 Click OK.

Editing a Property Set Definition

Use this procedure to perform any of the following edits on a property set definition.

- change the objects or styles to which the property set can be attached.
- add and remove properties.
- change the name, description, and format of properties.
- change additional items for each type of property definition.
- change the visibility and the display order on the Properties palette.

Changes are immediately applied to any objects or styles attached to the property set that was created from the definition. If automatic update is specified for a schedule table, the changes also appear in the schedule table. If automatic update is not specified, you need to update the table.

NOTE If you remove a property that is used in a schedule table, INVALID is displayed for value in the table.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
The Style Manager is displayed with the current drawing expanded in the tree view.
2 Expand Documentation Objects, and expand Property Set Definitions.
3 To change how the property set is applied, click the Applies To tab, and specify objects or styles:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply the property set created from this definition to objects</td>
<td>select Objects, and select the objects to which the property set can be attached. For more information, see Specifying How the Property...</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>apply the property set created from this definition to styles or definitions</td>
<td>select Styles and Definitions, and select the styles and definitions to which the property set can be attached.</td>
</tr>
</tbody>
</table>

4 Click the Definition tab.

5 Edit the characteristics for each property definition:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>edit the name of a manual property definition</td>
<td>click Name. Enter a new name, and press ENTER. For more information, see Adding a Manual Property Definition to a Property Set Definition on page 3845.</td>
</tr>
<tr>
<td>edit a manual property definition description</td>
<td>select the description, enter new text, and click OK.</td>
</tr>
<tr>
<td>edit the type of data, default value, format, visibility, or order of a manual property definition</td>
<td>select type, default, format, visibility, or order and make your changes. If a property definition is not visible, you cannot enter a value for Order.</td>
</tr>
<tr>
<td>edit how the units display for a manual property definition</td>
<td>after the format is assigned, select a new value for Units.</td>
</tr>
<tr>
<td>edit an automatic property definition</td>
<td>select definition, source, format, visibility or order and make your changes. You cannot change the data type or default value of automatic properties. For more information, see Adding an Automatic Property Definition to a Property Set Definition on page 3849.</td>
</tr>
<tr>
<td>edit a formula property definition</td>
<td>double-click the formula property definition. Change the name, clear</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------</td>
</tr>
<tr>
<td>or select Use formula for description, and modify the formula by entering data or selecting property definitions. Click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding a Formula Property Definition to a Property Set Definition on page 3830.</td>
<td>double-click the location property definition. Change the name, clear or select Use property name for description, and select a property definition. Click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding a Location Property Definition to a Property Set Definition on page 3851.</td>
</tr>
<tr>
<td>edit a location property definition</td>
<td>double-click the classification property definition. Change the name, clear or select Use classification name for description, select from the classification definitions available in the left pane, and select a classification property from the right pane with Classification Property selected. Click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding a Classification Property Definition to a Property Set Definition on page 3852.</td>
</tr>
<tr>
<td>edit a classification property definition</td>
<td>double-click the material property definition. Change the name, clear or select Use material name for description, select from the materials available in the left pane, and select...</td>
</tr>
<tr>
<td>edit a material property definition</td>
<td></td>
</tr>
<tr>
<td>If you want to...</td>
<td>Then...</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>double-click the graphic property definition. Change the name, select a new block or image for Source, clear or select Use block (or image) name for description, change the scale and rotation, and click OK. Select the format, visibility, or order and make your changes. For more information, see Adding a Graphic Property Definition to a Property Set Definition on page 3858.</td>
<td></td>
</tr>
<tr>
<td>edit an anchor property definition</td>
<td>double-click the anchor property definition. Change the name, clear or select Use property name for description, select a property definition, and click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding an Anchor Property Definition to a Property Set Definition on page 3858.</td>
</tr>
<tr>
<td>edit a project property definition</td>
<td>double-click the project property definition. Change the name, clear or select Use project information name for description, select from the project information available, and click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding a Project Property Definition to a Property Set Definition on page 3857.</td>
</tr>
<tr>
<td>double-click the project property definition. Click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding a Material Property Definition to a Property Set Definition on page 3855.</td>
<td>a material property from the right pane with Material Property selected.</td>
</tr>
<tr>
<td>double-click the anchor property definition. Change the name, clear or select Use property name for description, select a property definition, and click OK. Select the source, format, visibility, or order and make your changes. For more information, see Adding an Anchor Property Definition to a Property Set Definition on page 3858.</td>
<td>edit a graphic property definition</td>
</tr>
</tbody>
</table>
If you want to… | Then…
---|---
| Property Definition to a Property Set Definition on page 3860.
| remove a property from the property set definition | select a property, and click .
For more information, see Removing All Property Sets from Objects and Styles on page 3867.

6 Click OK.

**NOTE** Property data format styles, property set definitions, and schedule table styles cannot be changed through RefEdit. Changes seem to work, but will revert to the previous settings when saved back to the xref file. Open the xref drawing directly, and make the changes there.

**Removing All Property Sets from Objects and Styles**

Use this procedure to remove a property set that no longer applies to the objects and object styles to which it is attached.

If you remove an object or style from the Applies To list in a property set definition after the property set based on the definition is attached to the object, the property set is not automatically removed. This allows you to retrieve data that might have been entered for manual properties.

1 On the command line, enter **PropertySetClean**, and press **ENTER**.
2 Enter the name of the property set that you want to remove, or press **ENTER** to remove all the property sets from all objects or styles.

**Merging Property Set Definitions**

Use this procedure to replace one property set definition with another for all objects or object styles.

1 On the command line, enter **PropertySetDefMerge**, and press **ENTER**.
2 Enter the name of the property set definition that you want to keep, and press **ENTER**.
3 Enter the name of the property set definition that you want to merge, and press ENTER.

4 Specify whether to purge the merged property set definition:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge the property set definition that you merged</td>
<td>enter y (yes), and press ENTER.</td>
</tr>
<tr>
<td>keep the merged property set definition in the drawing</td>
<td>press ENTER.</td>
</tr>
</tbody>
</table>

If you keep the merged property set definition in the drawing, it is not attached to any objects.

5 Specify whether to remove property sets:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove the property sets that do not apply after the merge</td>
<td>enter y (yes), and press ENTER.</td>
</tr>
<tr>
<td>keep the property sets attached to objects and styles even though they may not apply</td>
<td>press ENTER.</td>
</tr>
</tbody>
</table>

**List Definitions**

A list definition is a multi-purpose object that lets you create a list of items to use in a manual property definition. After you create a list definition, values can be selected from the list without having to enter them manually each time.

For example, if you create a predefined list of acceptable values for paint color or manufacturers, you remove the risk of forgetting a correct name or making a typographical error when setting up manual properties. Create the list once, copy it into the appropriate project files as needed, and then you can easily select values for manual properties when you add them to property definitions. For more information, see *Adding a Manual Property Definition to a Property Set Definition* on page 3845.
Creating a List Definition for a Manual Property Definition

Use this procedure to create a list definition with a list of items that can be used for manual properties.

**NOTE** List definitions can also be created for space and zone names. For more information, see Creating a List Definition on page 3111.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager .
   The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Multi-Purpose Objects, right-click List Definitions, and click New.
3. Create a list definition:
   - If you want to...
     - create a definition with default properties
       Then...
     - right-click List Definitions, and click New.
     - create a definition from an existing definition
       Then...
     - right-click the list definition you want to copy, and click Copy. Right-click, and click Paste.
4. Enter a name for the new list definition, and press ENTER.
5. On the General tab, enter a description for the list definition under Description.
6. Click the Applies To tab, and select Manual Property Definition.
You can clear the list definition from applying to a manual property definition only if it is not in use.

7 Click the Items tab.
8 Select Allow individual property values to vary from this list if you want to allow values other than those specified here to be displayed on the Properties palette.
9 Click Add, and enter a value for Name.

10 Enter a value for Description.
11 Continue to add values to this list definition.
12 Click OK.
Editing List Definitions

Use this procedure to edit or remove items in a list definition. You can remove only those items that are not currently in use.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2 Expand Multi-Purpose Objects, and expand List Definitions.
3 Select the list definition.
4 Click the Items tab, and edit the list:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>edit the name of the property</td>
<td>select the property and edit the text under Name.</td>
</tr>
<tr>
<td>edit the property description</td>
<td>select the property and edit the text under Description.</td>
</tr>
</tbody>
</table>

5 Click OK.
6 To remove an item from the list definition, select the item, and click Remove.
   If the Remove button is unavailable, you cannot delete the property because it is currently assigned to an object, or it is in a property set definition that is in use.

7 Click OK.

Changing the List Item for an Object

Use this procedure to change a list item on the Properties palette for an object. If you specified that property values for the item could vary from the list, you can enter a new value on the Properties palette.

1 Double-click the object to select a different list item.
2 On the Properties palette, click the Extended Data tab.
3 Select a different list item, or enter a new value.
   If entering a new value is not an option on the Properties palette, open the list definition and select Allow individual property values to vary from this list. For more information, see Creating a List Definition for a Manual Property Definition on page 3869.
Attaching Notes or Reference Files to a List Definition

Use this procedure to enter notes and attach reference files to a list definition. You can also edit notes and edit or detach reference files from a list definition.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager. The Style Manager is displayed with the current drawing expanded in the tree view.
2. Expand Multi-Purpose Objects, and expand List Definitions.
3. Select the list definition to which to attach notes or reference files.
4. On the General tab, enter a description for the list definition under Description.
5. To add a note, click Notes, click the Notes tab, and enter the note.
6. Click Notes, click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click Delete.</td>
</tr>
</tbody>
</table>

7. Click OK twice.

Classification Definitions

A classification definition is a group of named properties or characteristics that you can assign to building objects such as walls and doors. Classifications enable you to track objects by construction status, project phase, building element, vendor, or other criteria. A classification definition is applied to an object type. The definition contains classification names and descriptions. Each classification can have property sets attached to it.
Classifications and Schedule Tables
Classifications provide additional control over the content of schedule tables. You can include:

- only those objects that meet the classification criteria.
- classification definitions as columns.
- additional information from property sets you create and attach to individual classifications.

Uses for Classifications
Here are some examples of classification definitions:

- Classifications for multi-view blocks enable you to distinguish among blocks to use for furniture, appliances, fixtures, and equipment
- Classifications for project phases can call out changes specified for new or demolition work and existing structure to remain
- Classifications for door types let you filter partition doors in bathrooms from door schedules

Classifications and the Display System
You can modify display sets in a display configuration to show or hide objects based on their classification. For more information, see Displaying Objects by Classification on page 840.

Managing Classification Definitions
Classifications are organized in a hierarchical view in the Style Manager. Classification names must be unique within classification property definitions. To create, edit, copy, or purge classification definitions, you access the Style Manager. The Style Manager provides a central location for working with definitions and styles from multiple drawings and templates. For more information about using the Style Manager, see Style Manager Overview on page 870.

After classifications are applied to objects in the classification definition, they display on the Extended Data tab of the Properties palette when the object is selected. You can change the classification for an object from the Extended Data tab in the Select Classification worksheet. If the classification change results in an object not displaying in your drawing window, a warning dialog displays. You can also open the object style in the Style Manager and make
changes on the Classifications tab. For more information, see Changing the Classification of an Object on page 3884.

**Process Overview: Including Classification Data in Schedules**

The process of including classification data for objects in a schedule table has the following major steps:

1. Create a classification definition, and specify the object type to which it is applied. For more information, see Creating a Classification Definition on page 3877.

2. Create and attach property sets to the classifications in the classification definition. For more information, see Attaching Property Set Definitions to a Classification Definition on page 3881.

3. Specify the classification for each object type that you want to schedule. For more information, see Specifying the Object Types for a Classification Definition on page 3878.

4. Add the classification or its properties to a property set definition for the object type. For more information, see Adding a Classification Property Definition to a Property Set Definition on page 3852.

5. Add the classification or its properties as columns in a schedule table style that uses the property set definition you edited in step 4. For more information, see Adding Columns to a Schedule on page 3777.

6. If necessary, specify filtering options for classifications in the schedule table style. For more information, see Filtering Scheduled Objects by Classification in a Schedule Table Style on page 3776.

7. Create the schedule table. For more information, see Adding Schedules Using Schedule Table Tools on page 3747.

The classification information for each object is included in the columns you added to the schedule table style.

**A Classification Use Case**

You can create a classification definition that contains a classification for each construction status, such as Existing, Demo, and New.
Creating a classification definition for construction status

You also specify the objects to which the classification definition applies.

Specifying object types in the classification definition

The classification definition is listed on the Classifications tab in the object style properties. You select a classification, such as New, in the object style. For example, your drawing might contain certain door styles for existing doors, and different styles for new construction. All doors created from these styles have the classification specified in their style.
Door style with the classification specified

When you are ready to schedule doors, you can specify in the schedule table style that only those doors with the New classification will be included. Any other doors included in the selection set are filtered from the table.

Specifying classification criteria in a schedule table style

You can also include classifications as a column in your schedule tables. You can create and attach property sets to individual classifications to track additional data, and you can include this data in schedule tables. In addition, you can modify settings in the display system to filter the display of objects based on their classification.
You can change the classification of a specific object on the Extended Data tab of the Properties palette. If this change causes an object to not display, a warning dialog appears on your drawing screen.

Changing classification on the Extended Data tab

Creating a Classification Definition

Use this procedure to create a classification definition. You can create a definition using default properties or by copying an existing definition.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤ .
2 Expand Multi-Purpose Objects, and expand Classification Definitions.
3 Create a classification definition:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a definition with default properties</td>
<td>right-click Classification Definitions, and click New.</td>
</tr>
<tr>
<td>If you want to…</td>
<td>Then…</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>create a definition from an existing definition</td>
<td>right-click the classification definition you want to copy, and click Copy. Right-click, and click Paste.</td>
</tr>
</tbody>
</table>

4 Enter a name for the new classification definition, and press ENTER.
5 Edit the classification definition:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>enter a description of the classification definition</td>
<td>click the General tab, and enter the description.</td>
</tr>
<tr>
<td>specify the object types to which the definition applies</td>
<td>see Specifying the Object Types for a Classification Definition on page 3878.</td>
</tr>
<tr>
<td>enter classifications</td>
<td>see Adding Classifications to a Classification Definition on page 3879.</td>
</tr>
<tr>
<td>attach property sets to the individual classifications in the definition</td>
<td>see Attaching Property Set Definitions to a Classification Definition on page 3881.</td>
</tr>
<tr>
<td>add notes or files to the definition</td>
<td>see Attaching Notes and Files to a Classification on page 3884.</td>
</tr>
</tbody>
</table>

6 Click OK.

**Specifying the Object Types for a Classification Definition**

Use this procedure to specify the object types to which a classification definition applies. The classification will be listed on the style's Classification tab for all object types you specify.

For example, if you specify that a classification definition applies to doors and windows, the classification is listed on the Classifications tab for all door and window styles in the drawing. You can also select an individual classification appropriate for each door and window object on the Extended Data tab of the Properties palette. For more information about specifying a classification for a particular type of object, see the topic for that object type in the online Help and Displaying Objects by Classification on page 840.
1 Click Manage tab ➤ Style & Display panel ➤ Style Manager.
2 Expand Multi-Purpose Objects, and expand Classification Definitions.
3 Select the classification definition.
4 On the Applies To tab, select the object types to which the classification definition will apply.
5 Selecting object types to which a classification definition applies

6 Click OK.

**Adding Classifications to a Classification Definition**

Use this procedure to add classifications to an existing classification definition. Classifications are individual entries organized hierarchically within a classification definition. For example, a classification definition for construction status may contain the classifications existing, demo, and new. Lower-level classifications can be added to each of these classifications.

**NOTE** Be sure to specify the object types to which the classification definition applies. The classifications are not available until you specify the object types in the classification definition. For more information, see **Specifying the Object Types for a Classification Definition** on page 3878.

Due to the connection of classifications to the definition of display sets, classification definitions can only be purged from Style Manager if none of the classifications contained in them is used to filter out objects from a display set. If you encounter difficulty in purging a classification definition in Style
Manager, do the following: Open Display Manager, and for each display set, verify that on the Display Options tab, all classifications in that set are selected.

If one or several of the classifications are unchecked and therefore serve as a filter for a display set, the purge operation cannot be completed. For more information about Display Sets, see Display Sets on page 808.

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
2. Expand Multi-Purpose Objects, and expand Classification Definitions.
3. Select the classification definition.
4. On the Classifications tab, click Add.
5. Select the new classification, and enter a name under Item.
6. Under Description, enter a description of the classification.

Adding classifications to a classification definition

7. Continue adding classifications.
8 Select any of the classifications added, and drag and drop them to organize the hierarchy as desired.
9 Click OK.

**Attaching Property Set Definitions to a Classification Definition**

Use this procedure to add property set definitions to individual classifications in a classification definition. When you add property set definitions, you can track additional information.

For example, if you create a classification definition for vendors, you can attach a property set to each vendor classification. The property sets can contain any properties that you specify, such as a vendor-specific part number. The properties are then associated with each object to which the classification is applied. These properties can then be included in the schedule table when the objects are scheduled.

For more information about creating property sets, see Property Set Definitions on page 3823. For more information about adding classification property data to property set definitions, see Adding a Classification Property Definition to a Property Set Definition on page 3852.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
2 Expand Multi-Purpose Objects, and expand Classification Definitions.
3 Select the classification definition.
4 On the Classifications tab, select one or more classifications, and click Property Sets.

**Selecting a classification to which you attach property sets**
5 Click 🗂.

6 Clear property sets that you do not want to attach to the classification, and click OK.

**Clearing property sets you do not want to attach to classifications**

7 Enter values for the property data, and click OK.
You can enter or edit values later, if necessary.

**Entering data for a property set attached to a classification**

8 Continue attaching property sets to other classifications.
9 Click OK.

**Editing a Classification Definition**

Use this procedure to edit or remove classifications in a classification definition, to add or edit data in property sets attached to classifications, and to detach property sets from classifications.
NOTE You can remove only those classifications not currently applied to an object type. You cannot delete classifications that are in use.

1 Click Manage tab ➤ Style & Display panel ➤ Style Manager .
2 Expand Multi-Purpose Objects, and expand Classification Definitions.
3 Select the classification definition.
4 On the Classifications tab, edit classifications:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>edit the classification name</td>
<td>select the classification, edit the text under Item, and click OK.</td>
</tr>
<tr>
<td>edit the classification description</td>
<td>select the classification, edit the text under Description, and click OK.</td>
</tr>
<tr>
<td>add or edit property set data in property sets already attached to a classification</td>
<td>select the classification, and click Property Sets. Enter or edit property data, and click OK.</td>
</tr>
</tbody>
</table>

5 To detach property sets from a classification, select the classification, and click Property Sets.

6 Click .
7 Clear the property sets you do not want to remove, and click OK.

Removing property sets from a classification
8 Click OK.
9 To remove a classification, select the classification, and click Remove.
   If the Remove button is unavailable, you cannot delete the classification because it is currently assigned to an object type.
10 Click OK.

Changing the Classification of an Object

Use this procedure to change the classification of an object in your drawing. Only classifications defined for and applied to that specific object are available for selection. For more information, see Creating a Classification Definition on page 3877.

Classifications, but not their descriptions, are listed for objects and styles on the Classifications tab in the Style Manager. If descriptions have been entered, you can view them in the classification definition under Multi-Purpose Objects in the Style Manager.

   1 Double-click the object for which you want to change a classification.
   2 On the Properties palette, click the Extended Data tab.
   3 Select the classification you want to change.
   4 On the Select Classification worksheet, select a different classification, and click OK.

Attaching Notes and Files to a Classification

Use this procedure to enter notes and attach reference files to a classification definition. You can also edit notes and edit or detach reference files from a definition.

   1 Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤.
   2 Expand Multi-Purpose Objects, and expand Classification Definitions.
   3 Select the classification definition that you want to change.
   4 Click the General tab.
   5 To add a description to the definition, enter it for Description.
   6 Click Notes.
7 Enter the note on the Notes tab.
8 Click the Reference Docs tab, and attach, edit, or detach a reference file:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click Add, select a file, and click OK.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>select the file, and click Edit. Enter the description, and click OK.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click Delete.</td>
</tr>
</tbody>
</table>

9 When you finish making changes to the classification definition, click OK.

Display Themes

Display themes use color, fills, and hatches to present data that is not typically visible in a drawing. For example, you can specify that all 2-hour fire-rated walls appear with a red fill. The display theme legend activates the display theme in the drawing and identifies the meaning of the different colors, fills, or hatches used in the theme.

The data for display theme legends is collected from the property set data attached to the objects or object styles. Styles for display themes are specified in the Style Manager under Documentation Objects.

Process Overview: Creating Display Themes

Typically, manual properties of an object—such as a wall’s fire rating or a door’s manufacturer—are not visible in a drawing. Display themes let you incorporate such non-graphic data in your drawing by using certain colors, fills, or hatches to highlight objects that meet criteria (theme rules) you establish in a display theme style. For example, you might define a property named Function for room objects, and then set up a theme rule specifying that rooms with a Function value equal to “storage” will be displayed with a solid yellow fill.
You activate a display theme in a drawing by using a display theme tool to insert a display theme legend, which explains the meaning of color, fills, or hatches specified in the theme.

If you use display theme styles provided with AutoCAD Architecture 2012, the property set definitions and property data formats for the style are already created for you. You can begin the process of creating a display theme from Step 4.

Create and implement a display theme by following these basic steps:

1. Create property data formats (or modify existing ones as necessary) to specify formats for properties you want to include in the theme. For more information, see Creating a Property Data Format on page 3805. These formats determine how data is displayed in the display theme legend.

2. Create or modify property set definitions for objects or object styles incorporating formats from Step 1. For more information, see Creating a Property Set Definition on page 3841.

3. Create or modify a display theme style. For more information, see Creating a Display Theme Style on page 3894. The legend is a key that incorporates the property set definitions from Step 2 to specify which visual indicator will be applied to which objects in the drawing and what the content of the display theme legend will be.

4. Attach property set data to the objects and object styles to be included in your display theme. For more information, see Attaching Property Set Data to Objects on page 3811.

5. Activate the display theme by adding the display theme legend to the drawing or activating an existing legend. For more information, see Adding a Display Theme to a Drawing on page 3890.

### Creating and Editing Display Themes

When you use a display theme in a drawing, you can show data that is not typically visible. For example, you can use different hatches to designate different functional areas within a building. Typically, manual properties of an object—such as a wall’s fire rating or a door’s manufacturer—are not visible in a drawing. Display themes let you incorporate such non-graphic data in your drawing by using certain colors, fills, or hatches to highlight objects that
meet criteria (theme rules) you establish in a display theme style. For example, you might define a property named Function for room objects, and then set up a theme rule specifying that rooms with a Function value equal to “storage” will be displayed with a solid yellow fill.

You activate a display theme in a drawing by using a display theme tool to insert a display theme legend or by activating an existing legend. The legend explains the meaning of color, fills, or hatches specified in the theme.

Display themes are an effective way to present information during the conceptual design phase of a project, or when working with construction documents. With display themes you can identify changes to a project that are not in the contract, identify the staging of a project, and identify objects that meet or do not meet specific standards. For example, you may choose to specify that all fire-rated walls are displayed with red fills.

The criteria for the display theme are based on the property data attached to the objects or object styles. The property data overrides the display properties to produce the visual effects produced by inserting a display theme. For more information about how objects display and their property data, see Display Configurations on page 810 and Property Sets and Property Set Definitions on page 3743.

If you use the drawing as an external reference (xref) in a project, the display theme is imported into the host drawing by default. If the host drawing already contains a display theme, then the display theme in the host drawing overrides
the display theme in the xref. A marker appears over the disabled display theme legend.

**Attaching Property Set Data**

Before applying a display theme to a drawing, the property sets referenced in the display theme style must be attached to the objects or object styles in the drawing. The attached property sets are the source of the data for the display theme. For more information, see Property Sets and Property Set Definitions on page 3743.

**Using Display Theme Styles**

Display theme styles control the visual change to the objects as well as the content and appearance of the display theme legend in the drawing. A drawing must contain a display theme style to effect the visual changes or to add a display theme legend. When you copy a display theme style into a drawing, property set definitions and data formats specified in the style are also copied. For more information, see Display Theme Styles on page 3893.

**Creating a Display Theme Legend Using Display Theme Tools**

A display theme legend provides a key to the display theme, mapping specific colors, fills, or hatches to properties of objects in a drawing. You insert a display theme legend into a drawing to activate a display theme and visually change the appearance of objects by overriding the current display properties.

The tools provided let you quickly place display theme legends by selecting a display theme tool with a specific display theme style and other predefined properties. When you place display theme legends using display theme tools, you can use the default settings of the tool, or you can change settings for the display theme properties. You can also use display theme tools to apply the settings of a display theme tool to existing display themes.

The default Scheduling palette in the Tool palette set contains three sample display theme tools that you can use and customize as needed. Custom palettes created by your CAD manager or other users may also contain display theme tools with display theme styles and properties that are customized for your projects or office standards.

**Creating a Display Theme Tool**

Use this procedure to create a display theme tool and add it to a tool palette. You may want to create your own display theme tools if you are creating
multiple display themes of specific display theme styles. The display theme is activated when the display theme legend is inserted in the drawing with the display theme tool. For more information, see Creating a Display Theme Style on page 3894.

You can use any of the following methods to create a display theme tool:

■ Drag a display theme style from the Style Manager to a tool palette, and then customize the properties of the new tool.

■ Copy a tool from another palette to the current palette, and then customize the properties of the new tool.

■ Copy an existing tool in the current palette and then customize the properties of the new tool.

1 Open the tool palette on which you want to create a tool.
2 Create the tool:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>create a tool from a display theme style in the Style Manager</td>
<td>click Manage tab ➤ Style &amp; Display panel ➤ Style Manager ➤. Locate the style you want to copy, and drag it to the tool palette. Click OK to close the Style Manager.</td>
</tr>
<tr>
<td>copy a tool in the current tool palette</td>
<td>right-click the tool, and click Copy. Right-click, and click Paste.</td>
</tr>
<tr>
<td>copy a tool from another tool palette</td>
<td>open the other palette, right-click the tool, and click Copy. Reopen the palette where you want to add the tool, right-click, and click Paste.</td>
</tr>
</tbody>
</table>

3 Right-click the new tool, and click Properties.
4 Enter a name for the tool.
5 Click the setting for Description, enter a description of the tool, and click OK.
6 Expand General.
7 Specify general properties for the display theme:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>add a description</td>
<td>enter text for Description.</td>
</tr>
<tr>
<td>specify the layer key</td>
<td>click the setting for Layer key, select a layer key, and click OK.</td>
</tr>
<tr>
<td>specify layer overrides</td>
<td>click the setting for Layer overrides. Clear Do not specify Layer Over-</td>
</tr>
<tr>
<td></td>
<td>rides, select an override, and click OK twice.</td>
</tr>
<tr>
<td>specify the display theme style</td>
<td>click the setting for Style, and select a style.</td>
</tr>
<tr>
<td>specify an external drawing file source for the style</td>
<td>click the setting for Style location, and click Browse to specify a location.</td>
</tr>
<tr>
<td>change the scale of the display theme legend</td>
<td>enter a value for Scale.</td>
</tr>
</tbody>
</table>

8 Click OK.

**Adding a Display Theme to a Drawing**

Use this procedure to add a display theme to a drawing by inserting a display theme legend.

The display theme legend activates the display theme in the viewport and identifies the meaning of the different colors, fills, or hatches used in the theme. The data for the display theme legend is collected from the property set data attached to the objects or object styles, as specified in the display theme style. When you add new objects to a drawing, data is added to the legend if it meets the criteria you specified in the display theme style. For more information, see Display Theme Styles on page 3893.

If you insert a display theme legend while working in paper space, the legend is attached to a viewport. If you insert a display theme legend while working in model space, all model space viewports are affected.
To ensure that the display theme can be implemented, verify that:

- The drawing contains a display theme style that specifies theme settings and establishes conditions (theme rules) for those objects that you wish to display differently. For more information, see Creating a Display Theme Style on page 3894.

- Property set data is attached to the objects or object styles for objects to which you want the display theme style applied. For more information, see Attaching Property Set Data to Objects on page 3811.

1. Open the tool palette containing the Display Theme tool you want to use, and select the tool.
   Three sample Display Theme tools are located on the default Scheduling palette in the Tool palette set. There are additional Display Theme tools located in the Documentation Tool Catalog and with the Scheduling and Reporting Tools in the Stock Tool Catalog. You can add this tool to any tool palette. For more information, see Working with Tool Palettes on page 70.

2. In the drawing area, specify the insertion point for the upper-left corner of the display theme legend.

3. Specify the lower-right corner of the legend, or press ENTER to scale the display theme legend to the current drawing scale. The objects affected by the display theme visually change in the drawing as indicated by the legend.
Disabling Display Themes

Use this procedure if you want to manually disable a display theme. A disabled display theme is indicated by a marker through the legend. This does not prevent the display theme legend from plotting on your sheet. For more information about display properties for the legend, see Accessing the Default Display Properties of an Object on page 824.

If you attach or overlay a drawing as an external reference (xref) in a project, all display themes in the xref are imported into the host drawing by default. If the host drawing has existing display themes, then the active display theme in the host drawing overrides any active display theme in the xref.

1 Select an active display theme legend.
2 Click Display Theme tab ➤ Modify panel ➤ Disable Display Theme

Disabled display theme

Activating Display Themes

Use this procedure if you want to activate a different theme. Regardless of how many display themes you add to your drawing, only one theme at a time can be active. If you add a display theme to a drawing that has existing themes, the other themes are disabled. A disabled display theme is indicated by a marker through the legend.

If you attach or overlay a drawing as an external reference (xref) in a project, all display themes in the xref are imported into the host drawing by default. If the host drawing has existing display themes, then the active display theme in the host drawing overrides any active display theme in the xref.

1 Select a disabled display theme legend.
2 Click Display Theme tab ➤ Modify panel ➤ Apply Display Theme

3892 | Chapter 50  Schedules and Display Themes
The marker is removed from the selected legend and applied to any others in the drawing.

**Active display theme legend**

<table>
<thead>
<tr>
<th>Fire Rating Legend</th>
<th>1 HOUR</th>
<th>2 HOUR</th>
<th>UNRATED</th>
</tr>
</thead>
</table>

**Display Theme Styles**

A display theme style defines a particular display theme for incorporating non-graphic data in a drawing by highlighting objects that meet criteria you specify. The type of highlighting is controlled through one or more theme settings, each of which specifies a particular color fill, hatch, or linetype. For each theme setting, there are one or more theme rules that determine which objects will be highlighted using that setting.

The display theme style also specifies the format and display properties for the display theme legend that identifies the data represented by the highlighted objects.
As you work with different display theme styles within a project, you can synchronize the versions with your project standards. For more information, see Synchronizing Selected Styles and Display Settings with AEC Standards on page 659.

**What You Need to Create a Display Theme Style**

Your drawings must contain the following information to create a new display theme style:

- Property set definitions for any property data to be included in the display theme created from the style. For more information, see Property Set Definitions on page 3823.

- Property data formats to control the format of values of display theme rules. Typically, you use the data format for values that the property set definition uses. However, you can override data formats. For more information, see Property Data Formats on page 3802.

**Creating Tools from Display Theme Styles**

You can create a display theme tool from a display theme style by dragging the style from the Style Manager onto a tool palette. You can then specify properties for the tool. For more information, see Creating a Display Theme Tool on page 3888.

**Creating a Display Theme Style**

Use this procedure to create design rules for display theme styles and to specify the format for the legend of the display theme in the Style Manager. A display theme changes how objects or object styles display in your drawing based on the criteria you specify. For more information, see Creating and Editing Display Themes on page 3886. Property set definitions must already be defined in your drawing before you can specify one for a theme rule. For more information, see Property Set Definitions on page 3823.

**Specify the design rules for the display theme**

1. Click Manage tab ➤ Style & Display panel ➤ Style Manager ➤. The Style Manager is displayed with the current drawing expanded in the tree view.

2. Expand Documentation Objects, right-click on Display Theme Styles, and click New.
3 Enter a name for the new display theme style and press *ENTER*.
4 To add a description of the display theme style, enter it for Description.
5 Click the Design Rules tab.
6 Click ![icon] to create a new display theme setting.
   An unnamed display theme setting is created with the index number of 1.
7 Create the settings for the display theme.

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify a name for the display theme</td>
<td>select Unnamed and enter text for Name.</td>
</tr>
<tr>
<td>turn off the visibility of the identifying color or hatch for this display theme in the display theme legend</td>
<td>click the light bulb. If the light bulb is yellow, the identifying color or hatch and the name of the display theme are visible in the display theme legend.</td>
</tr>
<tr>
<td>add a color to the display theme</td>
<td>click BYBLOCK, and select a color from the Select Color worksheet. For more information, see “Choose Hatch Patterns and Solid Fills” in AutoCAD Help.</td>
</tr>
<tr>
<td>add a hatch pattern to the display theme</td>
<td>click SOLID, select a Type from the Hatch Pattern worksheet, and click OK. For more information, see “Choose Hatch Patterns and Solid Fills” in AutoCAD Help.</td>
</tr>
</tbody>
</table>

**TIP** The quickest way to locate and view an AutoCAD topic referenced in Autodesk AutoCAD Architecture Help is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type in the AutoCAD topic name, and click List Topics.
<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale a hatch pattern for the display theme</td>
<td>enter a value for Scale/Spacing. For more information, see “Hatch Tab (Hatch and Gradient Dialog Box)” in AutoCAD Help.</td>
</tr>
<tr>
<td>change the angle of the hatch pattern</td>
<td>enter a value for Angle. For more information, see “Hatch Tab (Hatch and Gradient Dialog Box)” in AutoCAD Help.</td>
</tr>
<tr>
<td>specify the orientation of the hatch pattern from global to object</td>
<td>click global.</td>
</tr>
<tr>
<td>specify the X offset of the hatch pattern</td>
<td>enter a value for X Offset.</td>
</tr>
<tr>
<td>specify the Y offset of the hatch pattern</td>
<td>enter a value for Y Offset.</td>
</tr>
<tr>
<td>specify a Linetype for the hatch pattern</td>
<td>click ByBlock, select a linetype, and click OK. For more information, see “Custom Hatch Patterns” in AutoCAD Help.</td>
</tr>
<tr>
<td>specify a Lineweight for the hatch pattern</td>
<td>click ByBlock, select a lineweight, and click OK. For more information, see “Overview of Lineweights” in AutoCAD Help.</td>
</tr>
<tr>
<td>specify a Linetype Scale for the hatch pattern</td>
<td>enter a value for Lt Scale. For more information, see “Work with Linetypes” in AutoCAD Help.</td>
</tr>
<tr>
<td>specify a Plot Style for the hatch pattern</td>
<td>click ByBlock, select a plot style, and click OK. For more information, see “Use Plot Styles to Control Plotted Objects” in AutoCAD Help.</td>
</tr>
</tbody>
</table>

8 Under Theme Rules for selected Theme Settings, click .
A display theme rule is created with the index number of 1.1. This corresponds with the display theme setting. You can create multiple rules for each display theme.

9 Select a property set definition.
Property set definitions that exist in the drawing appear in the drop-down list.

10 Select a property.
   The properties available are contingent upon the property set definition you selected.

11 Select a condition.
   The conditions available are contingent upon the property set definition and property you selected.

12 Enter a value appropriate to the condition you selected.
13 Select an operator appropriate to the formula you are creating for the display theme rules.

Specify the format for the design theme legend

14 Click the Legend Format tab.
15 For Title, enter the text you want to appear on the heading of the display theme legend.
16 Select the shape of the symbol for the legend key as either round or square.
17 Select a style for the text in the legend.
18 Enter the height for the text in the legend.
19 Enter the gap between words in the legend.

Specify the display properties for the display theme legend

20 Click the Legend Display Properties tab.
21 Select the display representation on which to display the changes, and select Style Override.
   The display representation in bold is the current display representation. For more information, see Display Representations on page 803.

22 If necessary, click .
23 Click the Layer/Color/Linetype tab.
24 Select the component to change, and select a different setting for the property.
25 Click OK twice.
Troubleshooting Schedule Tables

This topic provides answers to some common questions about schedule tables and their data:

Question Marks in Cells

I added a schedule table, but all the cells contain question marks. Why did this happen?

Question marks appear in table cells when property sets are not attached to the objects included in the table, or to the object styles for objects in the table. When attached to an object or a style, a property set becomes the container for the property data. The schedule table stores no data.

For more information about attaching property sets to objects and styles, see Property Set Data on page 3810.

To attach property sets to objects and styles individually, select the table, click Schedule Table tab ➤ Modify panel ➤ Edit Table Cell , and select the cell. For more information, see Editing Table Cell Data on page 3799.

To attach property sets to all objects and styles that need them, select the table, and click Schedule Table tab ➤ Modify panel ➤ Add All Property Sets . For more information, see Adding Property Set Data to All Objects on page 3801.

For more information about attaching property sets to objects and styles, see Attaching Property Set Data to Objects on page 3811 and Attaching Property Set Data to Styles and Definitions on page 3814.

Object not Listed

Why is an object I added to the drawing not listed in the schedule table?

Objects added to a drawing after you add a schedule table are not added to the table unless the Add New Objects Automatically option is selected in the table properties. However, you can manually add objects to a table schedule.

For more information, see Adding Objects to a Schedule on page 3751.

If the schedule table style uses classifications to filter objects, review the troubleshooting information in Troubleshooting Classification Definitions on page 3902.
Which Property Sets to Attach

How do I know which property sets to attach to objects or styles to remove question marks from columns in a schedule table?

You can find this information by viewing the column definitions in the schedule table style used to create the schedule table. Select the schedule table, and click Schedule Table tab ➤ General panel ➤ Edit Style drop-down ➤ Schedule Table Styles. Select the current style, and click the Columns tab. You can view the property assigned to each column and the property set from which the property is obtained. Click Cancel to return to the drawing.

The property sets provided use the words Object and Style in their names to identify how the property set can be attached. For example, you can attach the DoorObjects property set to doors. You can attach the DoorStyles property set to any door style.

To attach property sets to objects and styles individually, select the table, click Schedule Table tab ➤ Modify panel ➤ Edit Table Cell, and select the cell. For more information, see Editing Table Cell Data on page 3799.

To attach property sets to all objects and styles that need them, select the table, and click Schedule Table tab ➤ Modify panel ➤ Add All Property Sets. For more information, see Adding Property Set Data to All Objects on page 3801.

For more information about attaching property sets to objects and styles, see Attaching Property Set Data to Objects on page 3811.

Changing Data in the Schedule Tables

Why doesn't the data in the schedule table show the changes I made to objects in the drawing?

Changes that you make to objects—whether through graphically modifying the object, editing the object properties or style, or editing property data—automatically appear in a schedule table only when the Automatic Update option is specified in the schedule table properties. However, you can manually update a table to reflect the changes.

For more information, see Updating a Schedule Manually on page 3753.
Object Numbers Out of Order

After adding and removing objects, I updated the schedule table. Why are the object numbers still out of order?

Updating a schedule table does not change the numbers assigned to the objects.

To renumber objects in a schedule table, see Renumbering Property Set Data on page 3765.

Locating an Object

Is there an easy way to locate an object that is listed in a schedule table?

Yes. You can select a row in the schedule table to highlight the object that corresponds to the row.

For more information, see Locating and Viewing Scheduled Objects in a Drawing on page 3753.

Selecting an Empty Cell

Why can’t I select an empty cell in the schedule table to enter a value for a manual property?

A table cell must contain at least one character for you to be able to select an individual cell. If the property was defined without a default entry and no data for that property was entered before the table was created, the cell is blank.

You can enter the value by accessing the property data directly in the object or the object style, depending on where the property is attached. For more information, see Property Set Data on page 3810.

INVALID in a Table Cell

Why do all the cells of one column in a schedule table show a value of INVALID?

A property value appears as invalid in a schedule table if the property was deleted from a property set that is used in the schedule table.

To edit the schedule table style to remove the property from the table, see Editing Columns in a Schedule Table on page 3785. To edit the property set definition to restore the property, see Adding a Manual Property Definition to a Property Set Definition on page 3845 or Adding an Automatic Property Definition to a Property Set Definition on page 3849.
Troubleshooting Schedule Table Styles

This topic provides answers to the following questions:

Add Column Button Unavailable

Why is the Add Column button unavailable when I try to add columns to a schedule table style?
This button is unavailable if the drawing does not contain any property sets that apply to the same objects or styles that the schedule table style is applied to.

For more information, see Specifying Objects for a Schedule Table Style on page 3774 and Adding Columns to a Schedule on page 3777.

Property Sets Unavailable

Why are the property sets I want to use unavailable when I try to add a column?
Property sets are listed only if property set definitions are stored in the current drawing. Also, only property sets that apply to all the objects you selected on the Applies To tab are available to use in schedule table columns. A property set that applies only to some of the selected objects cannot be included in the schedule table. For example, a window schedule that applies to windows and window assemblies cannot contain columns for properties that apply only to window assemblies.

Quantity Column not Totalling

Why is the Quantity column in my schedule table style not totalling objects that are the same.
Objects that are the same, such as all doors of a certain style with identical dimensions, are not grouped and totaled if values for any cell are different. For example, the objects are not totalled if the table contains object numbers or if some objects have remarks and some do not.

Matrix Column Displaying Data Instead of a Matrix Symbol

Why does the matrix column I formatted for a property show data values instead of the matrix symbol?
If the property specified in the column can have multiple values, you need to add columns to the matrix format to accommodate all possible values. For example, in a finish schedule in which walls may be assigned one of four finishes, you need to enter a number greater than three for Max Columns to create a column for each finish. When you then create a table from the style, the matrix symbol appears in the finish column for the finish value entered in the property data for the walls of each space.

**Troubleshooting Classification Definitions**

This topic answers the following questions about troubleshooting classification definitions:

**Empty Classification Tab in Style Properties**

*Why does the Classifications tab in the style properties have nothing in it?*

The Classifications tab in the object style properties contains no data if no classification definitions are defined for styles of that object type. For example, if the drawing contains no classification definitions that apply to wall styles, the Classifications tab in the Wall Style Properties dialog does not contain any classification information. You specify the object styles to which a classification definition applies when you create the definition.

For more information, see [Specifying the Object Types for a Classification Definition](#) on page 3878.

**Long Title for a Classification Property**

*My schedule table contains an extremely long title for a classification property. How can I fix this?*

The default column header in schedule table styles is the description of the property selected in the property set definition. The default description for classification properties comprises the names of the classification definition, the classification property set, and the classification. In the schedule table style, you can edit the column header to create a shorter header.

For more information, see [Adding Columns to a Schedule](#) on page 3777.

If you clear Use classification name for description when you add or edit a classification property in the property set definition, you can enter a shorter description. For more information, see [Adding a Classification Property Definition to a Property Set Definition](#) on page 3852.
Classifications Property to a Property Set Definition

Why are no classification property sets listed when I try to add a classification property to a property set definition?
No classification property sets are listed if there are no classification property sets for the classification definitions that apply to the object or object style specified in the current property set definition.

Including Classifications in a Schedule Table

I want to include classifications in a schedule table. Why do I not see an option for them in the schedule table style?
The schedule table style must use property sets that contain classification properties. The classification properties are then available to include in a schedule table style.

Objects Not Included in the Schedule

Why were numerous objects in my drawing not included in a schedule table?
If you use classification filters in the schedule table style, only objects of the specified type that meet all the classification criteria are included in the schedule table.

For example, if you create a door schedule for doors that are classified new and exterior, only doors that meet both criteria are included in the schedule table. If an object meets only some of the classification criteria, it is not included in the schedule table.

Classifications Selected but Object Not Included

I selected all the classifications for a classification definition in the schedule table style, but many objects were not included in the schedule. Why did this happen?
If a classification was not selected in the object style for the classification definition used in the schedule table style, objects of that style are not included in the schedule. The classification for such objects is Unspecified, and they are filtered from the schedule table. To include all objects in a schedule table, regardless of classification, do not select any classifications on the Applies To tab in the schedule table style.
Troubleshooting Schedule Tags

This topic answers the following questions about troubleshooting schedule tags:

Difference Between Schedule Tags and Project Schedule Tags

When do I select a project-based schedule tag instead of basic schedule tag?
The difference between a standard schedule tag and a project-based schedule tag is that a project-based schedule tag recognizes the level in the project in which the object is located. When you want this additional information captured, use a project-based schedule tag.

For more information, see Adding Tags Using Schedule Tag Tools on page 3756 and Workflow for Annotating a Project on page 529.

Troubleshooting Units

This topic answers the following question about troubleshooting units:

Values on the Extended Data Tab

Why does the display change for the units of a manual property when I select the value on the Extended Data tab?
An override was applied in the property set definition that is attached to the object. Property data formats control how units are edited and displayed. If you assign a type of unit other than the default in the property set definition, an override is applied to the property data format. Units specified in the property set definition controls what is stored in the drawing. The Extended Data tab of the Properties palette displays the units as defined in the property data format.

For example, with units specified as inches and unit format specified as Architectural in the property data format for Length–Long, when you select Length–Long for Format in the property set definition, Inches displays for Units by default. You can select any other type of unit that is identified for Length–Long (such as feet and millimeters). If you select Feet in place of Inches in the property set definition, and select a door with a manual property called HeightOverride, and enter 84 on the Extended Data tab, the value displays 7'-0".
For more information, see Adding a Manual Property Definition to a Property Set Definition on page 3845 and Units in Property Data Formats on page 3804.
AEC Content and DesignCenter

Architectural, engineering and construction (AEC) content consists of drawing files, architectural symbols, object styles, and annotation routines that you add to drawings to design and document your project. Predefined AEC content can be accessed from the Content Browser and from the AEC Content tab in DesignCenter™. You can also create custom content using the AEC Content Wizard.

Overview of AEC Content

AEC (architectural, engineering and construction) content consists of drawing files, architectural symbols, object styles, and annotation routines. You use AEC content to create and annotate your drawings. Doors and windows are examples of design content, while schedule tables and keynotes are examples of documentation content. You can access AEC content from either the Content Browser or the AEC Content tab in DesignCenter™.
In some design situations, you may want to create custom content for a unique piece of construction, or you may want to create a custom command to insert AEC content by following a series of procedures. You can make your own content by modifying existing content or by constructing new content using the AEC Content Wizard. For more information, see Creating Custom AEC Content on page 3917.

In addition to AEC content, there are other types of predefined content, including layers, templates, and materials. This content is located in C:\ProgramData\Autodesk\ACA 2012\enu\.

Predefined AEC Content

With the AEC content provided in the software, you can begin the design process for imperial and metric drawings immediately. You can access AEC content from either the Content Browser or the AEC Content tab in DesignCenter™.

The Content Browser holds a collection of tool catalogs for predefined AEC content and sample object styles. Design, Documentation, and Stock Tool catalogs are available for both metric and imperial tools. The content in DesignCenter supplements AEC content in the Content Browser. In some situations, content such as elevation labels provides alternatives to tools in the Content Browser.

Each method of accessing AEC content is unique and has advantages and disadvantages. Some AEC content appears in both the Content Browser and DesignCenter. For example, there are schedule tag tools in the Content Browser.
and schedule tags in DesignCenter. For more information, see Adding AEC Content to Drawings on page 3912.

AEC Content in the Content Browser

The Content Browser has a comprehensive collection of content. You store, organize, share, exchange, and insert AEC content into drawings using tools. For example, because windows are governed by styles, the window tool specifies the location of the external drawing file from which to import the style of the window. For more information, see Exploring the Content Browser on page 131.

Tools in the Content Browser are organized within tool catalogs by category. There are imperial and metric Design, Documentation and Stock Tool catalogs in the Content Browser. When you first open the application, a collection of tools appears in the drawing area. The tools are organized on tool palettes by type. For example, the Walls Tool Palette contains a variety of commonly used wall styles. Tools on the tool palettes reference the content organized in the Content Browser. For more information, see Working with Tool Palettes on page 70.

The Content Browser is also the most flexible method of organizing and adding content to your drawing. You can easily customize your own tool palettes by dragging and dropping frequently used tools onto a palette. Because the Content Browser runs independently, you can exchange tools and tool palettes with other Autodesk applications. For more information, see Content Browser Overview on page 129.

AEC Content in DesignCenter

Like the Content Browser, DesignCenter™ also lets you store, organize, share, and exchange AEC content that can be inserted into drawings. Instead of being tool-based, however, AEC content in DesignCenter is organized in a hierarchical tree view, and once you select an AEC content item, you can preview it, edit it, or drag it onto a tool palette or directly into a drawing.

When you open the DesignCenter from the Palettes panel drop-down on the View tab, and click the AEC Content tab, the Custom Applications tree view is displayed in the left pane with AutoCAD Architecture as the root node. Within the Imperial and Metric folders under the root node, there are folders for categories that roughly approximate the CSI MasterFormat 2004 divisions. At the lowest level of the tree view, each folder points to one or more external
drawing files, each containing one piece of AEC content. You can toggle the tree view on and off by clicking at the top of the DesignCenter window.

There are 3 panes on the right side of the AEC Content tab.

- The top pane is the content area, which displays the contents of the folder currently selected in the tree view. The Views drop-down list at the upper-right corner of the window provides 4 content display options: Large Icons, Small Icons, List, and Details. The Large Icons option displays an image of the content item. All other options display the generic DWG icon. Regardless of whether the content item is displayed as an image or an icon, it can be dragged and dropped into a drawing or onto a tool palette.

- The middle pane displays a higher resolution preview of the AEC content item currently selected in the top pane and behaves like the Object Viewer. For more information, see Object Viewer on page 1111. You can toggle the preview pane on or off by clicking at the top of the window.

- The bottom pane displays a text description of the AEC content item currently selected in the top pane. You can toggle the description on or off by clicking at the top of the window.

The AEC Content tab in DesignCenter
Fixture Layouts in DesignCenter

Fixture layouts are located in the Plumbing Fixtures folder (under Imperial/Design/Mechanical). They are unique because you can drag them into your drawings and then edit the components of the layout by clicking Insert tab ➤ Reference panel ➤ Edit Reference. For more information, see Adding Fixture Layouts from DesignCenter on page 3914 and Modifying Fixture Layouts on page 3930.

NOTE Fixture layouts are intended to provide samples from which to create your own office standards for restroom design. All the components can be modified to meet project and code requirements, and then added to DesignCenter™ for access. The samples provided do not necessarily meet jurisdictional regulations or ADA (Americans with Disabilities Act) requirements.

The following notes and hints apply when working with the fixture layouts available in DesignCenter. For more information, see Modifying Fixture Layouts on page 3930.

- The layout files are custom content set to the Drawing content type.
- The layout files have no layer key because all objects have hard-coded layers within the file. You can change the layers as required.
- The layout files are not set to Explode on Insert because you can place them at only one rotation and orientation (not mirrored) when you drag them into a drawing, and it is easier to reposition them as unexploded blocks.
- To set rotation and mirroring before insertion, double-click the icon to display the standard AutoCAD Insert dialog box instead of dragging the content.
- The rotation angle and scale (for mirroring) can be set in the Insert dialog box or on the command line. If you use the command line, you can see the result of each option before actually inserting the content. You can apply multiple settings on the command line, even though the prompt says “Specify insertion point:” after the first one. You can still type another X, Y, or R.
- Use X = -1 or Y = -1 to mirror the content.
- Use the node object snap to position individual stall and urinal layouts next to each other. The toilet partitions and screens are inserted with centered baselines, so the node snap places them correctly.
After insertion, click Insert tab ➤ Reference panel ➤ Edit Reference to adjust the layout, extend partitions, or to move doors, fixtures, or grab bars.

Stall partitions are wall objects placed in the wall group “Toilet_Ptn.” They do not clean up with other walls. Urinal screens are in the “Standard” group, but set to “Do Not Cleanup.”

Each lavatory layout consists of a counter, made of a wall object with the cleanup group “Toilet_Counter” with lavatory MV Blocks anchored as follows:
- Lavs (1) Wall anchor; centered along curve
- Lavs (2) - (4) Layout Curve (on counter); even spacing (1'-6” start and end offset)
- Lavs (5) Layout Curve (on counter); repeat at 3'-0” (1'-6” start and end offset)

Use the endpoint object snap to position a counter against a stall or urinal screen.

After exploding, the lavatory counters can be trimmed or extended to the restroom walls. The lavatory counters adjust appropriately, depending on the anchoring mode.

The restroom files are preconfigured assemblies of individual layouts, arranged as typical men’s and women’s rooms.

For more information, see Detail Components on page 3527 and Layout Curves and Grids on page 2703.

**Adding AEC Content to Drawings**

You add AEC content to drawings from tools in the Content Browser or from files in the content area of the AEC Content tab in DesignCenter™. Although you can drag and drop content from DesignCenter onto a tool palette to create tools for the content, you cannot drag tools from the Content Browser into DesignCenter.

**Adding Content from the Content Browser**

Use this procedure to add AEC content to a drawing using tools from the Content Browser. When you drag a tool directly into the drawing area from
the Content Browser, the Properties palette opens so that you can enter properties for the new object. Tools can have preset parameters so that you can add an object with one click. There is no need to change properties before placement. For detailed information, see Content Browser Overview on page 129.

1 Click Home tab ➤ Build panel ➤ Tools drop-down ➤ Content Browser.
2 The Content Browser opens in a window outside the drawing area. To see both the drawing and the Content Browser, reduce the size of drawing and the Content Browser on your screen.
3 Click the catalog that contains the category of tools you want to use.
4 Click the category that contains the tool.
5 Drag the i-drop® icon for the tool into the drawing area to add the content to your drawing.
6 Define properties for the content on the Properties palette, if necessary.
   For more information, see Properties Palette on page 44.
7 Press ENTER.

Adding Content from DesignCenter

Use this procedure to add DesignCenter content to a drawing. You can also drag AEC content onto a tool palette for direct access or to create a custom tool. For more information see Moving Content Between DesignCenter and the Content Browser on page 3915.

1 Click Insert tab ➤ Content panel ➤ Content Browser drop-down ➤ Design Center.
2 Click the AEC Content tab.
3 Under Custom Applications, expand AutoCAD Architecture, and expand Imperial or Metric.
4 Expand the folder containing the content you want to place in the drawing.
5 Drag the desired image or file icon from the content area (the top right pane) to the desired location in the drawing area. (Alternatively, you can double-click the content item, or right-click...
it and click Insert, and then specify a location in the drawing area.)

The content is placed in your drawing using the current display configuration. For more information about display configurations, see Display System Structure on page 801.

**Adding Fixture Layouts from DesignCenter**

Use this procedure to place fixture layouts in your drawing. For more information, see Fixture Layouts in DesignCenter on page 3911 and Modifying Fixture Layouts on page 3930.

1. Click Insert tab ➤ Content panel drop-down ➤ Design Center.
2. Click the AEC Content tab.
3. Under Custom Applications, expand AutoCAD Architecture, and expand Imperial or Metric.
4. Expand Design, and expand one of the following layouts:
   - For imperial content, expand Mechanical\Plumbing Fixtures\Layouts.
   - For metric content, expand Bathroom\Layouts.
5. Double-click a layout.
6. Use the Insert dialog box to control the placement of the layout.
7. Specify a rotation angle or a scale to mirror the layout.
   Enter -1 for X or -1 for Y to mirror the content.
8. Click OK.
9. Specify a location for the fixture layout.

**NOTE** You can also add the layout by dragging it to the drawing, or by right-clicking and clicking Insert. You have the most control over the insertion if you use the double-click or right-click methods.
Moving Content Between DesignCenter and the Content Browser

When you want to create a tool from AEC content in DesignCenter™, you drag and drop the selected content item from the AEC Content tab in DesignCenter onto a tool palette. From the tool palette, you can drag and drop the newly created tool into a catalog in the Content Browser. You cannot drag AEC content from a DesignCenter folder directly into the Content Browser or drag tools from the Content Browser into DesignCenter.

For more information about creating your own tool palettes or working with content in catalogs, see Working with Tool Palettes on page 70.

Creating a Tool from AEC Content in DesignCenter

Use this procedure to create a tool by dragging an AEC content item from DesignCenter™ onto a tool palette.

NOTE You can also create tools from blocks in DesignCenter, but they have slightly different tool options.
Adding AEC DesignCenter content to a tool palette

1. Open the tool palette where you want to add a new tool.
2. Click Insert tab ➤ Content panel drop-down ➤ Design Center.
3. On the AEC Content tab, navigate to the folder for the AEC content from which you want to create a tool.
4. Drag the content onto the tool palette. A new tool is inserted on the tool palette. To change the icon of the tool, see Changing a Tool Icon on page 90.
5. Define additional properties for the tool, if necessary. For more information, see Changing the Tool Properties on page 89.
Creating Custom AEC Content

When you want to create custom content to represent unique or frequently used objects that are not currently included in either the Content Browser or DesignCenter™, use the AEC Content Wizard to construct the content. The AEC Content Wizard is designed specifically for working within DesignCenter. After you create the content in DesignCenter, you can move it onto a tool palette. For more information, see Adding AEC Content to Drawings on page 3912.

Using the AEC Content Wizard

The AEC Content Wizard helps you create custom content. You can create blocks, drawings, and commands from data existing in the current drawing.

AEC Content Wizard

To create custom content, you first select the content type. Next, you specify options to be used when content is inserted into a drawing. The final step is to specify the output file and other parameters that control how DesignCenter™ displays the content.

When creating content in an existing AEC file (that is, a drawing generated from the AEC Content Wizard), the default values for each page of the wizard are set to the value used to create the drawing. The default settings provide an easy way for you to make small modifications to existing content files.
Creating an AEC Content Block for DesignCenter

Use this procedure to create an AEC content block and add it to DesignCenter™. You create the new block from an existing block in the current drawing. The block is saved in a new drawing that can be accessed from DesignCenter.

1 On the command line, enter `AecCreateContent`.

2 Select Block for Content Type.
   All the defined blocks in the current drawing are displayed under Current Drawing.

3 Select a block for Current Drawing, and click Add.
   Only one block at a time can be selected for Current Drawing and added to Content File.

4 Click Next.

5 Specify an insertion method for Insert Options:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>explode the block when you add it to your drawing</td>
<td>select Explode on Insert.</td>
</tr>
<tr>
<td>have the block remain a block when you add it to your drawing</td>
<td>clear Explode on Insert.</td>
</tr>
<tr>
<td>specify an elevation for the block when you add it to your drawing</td>
<td>enter a value for Preset Elevation.</td>
</tr>
<tr>
<td>specify an anchor type to use when you add the block to your drawing</td>
<td>select a type of anchor for Anchor Type.</td>
</tr>
</tbody>
</table>

6 Specify an insertion scale factor for Scale:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale the block instance using a coordinate (X, Y, Z) direction</td>
<td>enter values for X, Y, and Z for Scale.</td>
</tr>
<tr>
<td>apply no additional scaling method to the block instance</td>
<td>select None for Additional Scaling.</td>
</tr>
<tr>
<td>If you want to...</td>
<td>Then...</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>scale the block instance by the annotation scale of the drawing you are adding the block to</td>
<td>select Annotation for Additional Scaling.</td>
</tr>
<tr>
<td>scale the block instance by the drawing units of the drawing you are adding the block to</td>
<td>select Drawing for Additional Scaling.</td>
</tr>
<tr>
<td>scale the block definition by the drawing units of the drawing you are adding the block to</td>
<td>select Enable AEC Unit Scaling.</td>
</tr>
</tbody>
</table>

7 If the block has attributes, specify a text style for Attribute Text Style:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the default text style of content in the current drawing</td>
<td>select As Defined by Content.</td>
</tr>
<tr>
<td>use the text style of the target drawing</td>
<td>select Target Drawing Text Style.</td>
</tr>
</tbody>
</table>

8 If the block has attributes, specify an angle for Attribute Text Angle:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the rotation angle of the block as the attribute text angle</td>
<td>select As Inserted.</td>
</tr>
<tr>
<td>set the angle of the attribute text to zero</td>
<td>select Force Horizontal.</td>
</tr>
<tr>
<td>be able to read the attribute text from the right direction</td>
<td>select Right Reading.</td>
</tr>
</tbody>
</table>

9 Click Select Layer Key, select a layer key, and click OK. You can also enter a layer name for Layer Key.

10 Click Next.

11 Enter a name for File Name, or click Browse.
If you want to save the current drawing as the content file, select Current Drawing.

12 Select an image for Icon to represent the block in DesignCenter:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an existing bitmap image</td>
<td>click New Icon, select an image, and click OK.</td>
</tr>
<tr>
<td>specify the default image of the block itself</td>
<td>click Default Icon.</td>
</tr>
</tbody>
</table>

13 Enter a description for Detailed Description.

14 If you want to save the drawing objects in the content file, select Save Preview Graphics.

15 Click Finish.

Creating an AEC Content Drawing for DesignCenter

Use this procedure to create an AEC content drawing and add it to DesignCenter™. The content drawing can then be inserted into a drawing with all of its content, including styles, blocks, layers, and linetypes.

1 On the command line, enter AecCreateContent.

2 Select Drawing for Content Type, and click Next.

3 Specify an insertion method for Insert Options:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an elevation</td>
<td>enter a value for Preset Elevation.</td>
</tr>
<tr>
<td>specify an anchor type</td>
<td>select a type of anchor for Anchor Type.</td>
</tr>
</tbody>
</table>

4 Specify an insertion scale factor for Scale:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale the drawing instance using a coordinate (X, Y, Z) direction</td>
<td>enter values for X, Y, and Z for Scale.</td>
</tr>
<tr>
<td>apply no additional scaling method to the drawing instance</td>
<td>select None for Additional Scaling.</td>
</tr>
</tbody>
</table>
### If you want to…  | Then…
---|---
scale the drawing instance by the annotation scale of the drawing you are adding the block to  | select Annotation for Additional Scaling.
scale the drawing instance by the drawing units of the drawing you are adding the block to  | select Drawing for Additional Scaling.
scale the drawing definition by the drawing units of the drawing you are adding the block to  | select Enable AEC Unit Scaling.

#### 5 Specify an angle for Attribute Text Angle:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>assign the angle of the attribute text to be the same as the rotation angle of the drawing</td>
<td>select As Inserted.</td>
</tr>
<tr>
<td>set the angle of the attribute text to zero</td>
<td>select Force Horizontal.</td>
</tr>
<tr>
<td>be able to read the attribute text from the right direction</td>
<td>select Right Reading.</td>
</tr>
</tbody>
</table>

#### 6 Click Select Layer Key, select a layer key, and click OK. You can also enter a layer name for Layer Key.

#### 7 Click Next.

#### 8 Enter a name for File Name, or click Browse. If you want to save the current drawing as the content file, select Current Drawing.

#### 9 Select an image for Icon to represent the drawing in DesignCenter:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an existing bitmap image</td>
<td>click New Icon, select an image, and click OK.</td>
</tr>
</tbody>
</table>
Creating an AEC Content Multi-View Block for DesignCenter

Use this procedure to create an AEC multi-view block and add it to DesignCenter™. You define the multi-view block from view blocks created in your drawing that represent different views of your custom object. The block is saved in a new drawing that can be accessed from DesignCenter. For more information, see Creating View Blocks on page 2893.

1 On the command line, enter AecCreateContent.

2 Select Multi-View Block for Content Type.
   All the defined blocks in the current drawing are displayed in Current Drawing.

3 Select a multi-view block under Current Drawing, and click Add.
   Only one block at a time can be selected for Current Drawing and added to Content File.

4 Click Next.

5 Specify an insertion method for Insert Options:
   **If you want to…** | **Then…**
   --- | ---
   explode the multi-view block when you add it to your drawing | select Explode on Insert.
   have the multi-view block remain a block when you add it to your drawing | clear Explode on Insert.
   specify an elevation for the multi-view block when you add it to your drawing | enter a value for Preset Elevation.
If you want to... | Then...
---|---
specify an anchor type to use when you add the multi-view block to your drawing | select a type of anchor for Anchor Type.

6 Specify an insertion scale factor for Scale:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
</table>
scale the multi-view block instance using a coordinate \((X, Y, Z)\) direction | enter values for \(X\), \(Y\), and \(Z\) for Scale. |

apply no additional scaling method to the multi-view block instance | select None for Additional Scaling. |

scale the multi-view block instance by the annotation scale of the drawing you are adding the block to | select Annotation for Additional Scaling. |

scale the multi-view block instance by the drawing units of the drawing you are adding the block to | select Drawing for Additional Scaling. |

scale the multi-view block definition by the drawing units of the drawing you are adding the block to | select Enable AEC Unit Scaling. |

7 If the block has attributes, specify a text style for Attribute Text Style:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
</table>
use the default text style of content in the current drawing | select As Defined by Content. |

use the text style of the target drawing | select Target Drawing Text Style. |
8 If the block has attributes, specify an angle for Attribute Text Angle:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the rotation angle of the multi-view block as the attribute text angle</td>
<td>select As Inserted.</td>
</tr>
<tr>
<td>set the angle of the attribute text to zero</td>
<td>select Force Horizontal.</td>
</tr>
<tr>
<td>be able to read the attribute text from the right direction</td>
<td>select Right Reading.</td>
</tr>
</tbody>
</table>

9 Click Select Layer Key, select a layer key, and click OK. You can also enter a layer name for Layer Key.

10 Click Next.

11 Enter a name for File Name, or click Browse. If you want to save the current drawing as the content file, select Current Drawing.

12 Select an image for Icon to represent the multi-view block in DesignCenter:

<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an existing bitmap image</td>
<td>click New Icon, select an image, and click OK.</td>
</tr>
<tr>
<td>specify the default image of the multi-view block itself</td>
<td>click Default Icon.</td>
</tr>
</tbody>
</table>

13 Enter a description for Detailed Description.

14 Click Finish.

Creating an AEC Content Masking Block for DesignCenter

Use this procedure to create a custom AEC masking block that you can add to your drawing using DesignCenter™. You create the new masking block from an existing masking block in the current drawing. The masking block is
saved in a new drawing that can be accessed from DesignCenter. For more information about using masking blocks, see Mask Blocks on page 2867.

1 On the command line, enter **AecCreateContent**.
2 Select Masking Block for Content Type.
   All the defined blocks in the current drawing are displayed in Current Drawing.
3 Select a masking block for Current Drawing, and click Add.
   Only one block at a time can be selected for Current Drawing and added to Content File.
4 Click Next.
5 Specify an insertion method for Insert Options:
   **If you want to**... **Then**...
   specify an elevation enter a value for Preset Elevation.
   specify an anchor type select a type of anchor for Anchor Type.

6 Specify an insertion scale factor for Scale:
   **If you want to**... **Then**...
   scale the masking block instance using a coordinate \((X, Y, Z)\) direction enter values for \(X, Y,\) and \(Z\) for Scale.
   apply no additional scaling method to the masking block instance select None for Additional Scaling.
   scale the masking block instance by the annotation scale of the drawing you are adding the block to select Annotation for Additional Scaling.
   scale the masking block instance by the drawing units of the drawing you are adding the block to select Drawing for Additional Scaling.
   scale the masking block definition by the drawing units of select Enable AEC Unit Scaling.
If you want to... Then...
the drawing you are adding the block to

7 If the block has attributes, specify a text style for Attribute Text Style:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the default text style of content in the current drawing</td>
<td>select As Defined by Content.</td>
</tr>
<tr>
<td>use the text style of the target drawing</td>
<td>select Target Drawing Text Style.</td>
</tr>
</tbody>
</table>

8 If the block has attributes, specify an angle for Attribute Text Angle:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>use the rotation angle of the masking block as the attribute text angle</td>
<td>select As Inserted.</td>
</tr>
<tr>
<td>set the angle of the attribute text to zero</td>
<td>select Force Horizontal.</td>
</tr>
<tr>
<td>be able to read the attribute text from the right direction</td>
<td>select Right Reading.</td>
</tr>
</tbody>
</table>

9 Click Select Layer Key, select a layer key, and click OK.
You can also enter a layer name for Layer Key.

10 Click Next.
11 Enter a name for File Name, or click Browse.
If you want to save the current drawing as the content file, select Current Drawing.
Select an image for Icon to represent the masking block in DesignCenter:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an existing bitmap image</td>
<td>click New Icon, select an image, and click OK.</td>
</tr>
<tr>
<td>specify the default image of the drawing itself</td>
<td>click Default Icon.</td>
</tr>
</tbody>
</table>

Enter a description for Detailed Description.

Click Finish.

Creating an AEC Content Custom Command for DesignCenter

Use this procedure to create a custom command that you can add to your drawing environment using DesignCenter™. In the AEC Content Wizard, select one or more content blocks, specify a command string, and save a new drawing that contains all the content of the current drawing. When the custom command is added to a target drawing from DesignCenter, the set of content blocks is copied into the target drawing and the routine is executed, enabling the custom command.

Following is a detailed example of a custom command that you can create in the AEC Content Wizard. This custom command string adds a schedule tag to a room symbol and creates the leader and tag with the desired style.

```
AecAnnoScheduleTagAdd "C:\ProgramData\Autodesk\ACA 2012\enu\Styles\Imperial\Schedule Tables (Imperial).dwg" _symbol aec3_room_tag _leader _none _dimstyle _current
```

The equivalent prompts on the command line are as follows; however, entering text for custom commands on the command line is not recommended. Custom commands should be created with the AEC Content Wizard.

```
AnnoScheduleTagAdd

Property set definitions drawing <C:\ProgramData\Autodesk\ACA 2012\enu\Styles\Imperial\Schedule Tables (Imperial).dwg>

Select object to tag
[Symbol/Leader/Dimstyle/Edit/Constrain/Rotation]:Symbol

Enter tag symbol name <>: Aec3_Room_Tag
```
Select object to tag
[Symbol/Leader/Dimstyle/Edit/Constrain/Rotation]:Leader

Enter leader type [None/Straight/Spline] <None>:None

Select object to tag
[Symbol/Leader/Dimstyle/Edit/Constrain/Rotation]:Dimstyle

Enter leader dimstyle CURRENT <Aec-Arch-I-96>: Current

Select object to tag [Symbol/Leader/Dimstyle/Edit]:

1 On the command line, enter **AecCreateContent**.
2 Select Custom Command for Content Type.
   All the defined blocks in the current drawing, regardless of type, are displayed in Current Drawing.
3 Select one or more blocks for Current Drawing, and click Add.
4 Enter the command string for Custom String.
   You can also click Expand to display the Custom Command String dialog box, and enter the command string.
   The command string is limited to 255 characters.
5 Click Next.
6 Specify an insertion method for Insert Options:
   
<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>specify an elevation</td>
<td>enter a value for Preset Elevation.</td>
</tr>
<tr>
<td>specify an anchor type</td>
<td>select a type of anchor for Anchor Type.</td>
</tr>
</tbody>
</table>

7 Specify an insertion scale factor for Scale:
   
<table>
<thead>
<tr>
<th>If you want to…</th>
<th>Then…</th>
</tr>
</thead>
<tbody>
<tr>
<td>scale the drawing instance using a coordinate (X, Y, Z) direction</td>
<td>enter values for X, Y, and Z for Scale.</td>
</tr>
<tr>
<td>apply no additional scaling method to the drawing instance</td>
<td>select None for Additional Scaling.</td>
</tr>
<tr>
<td>scale the drawing instance by the annotation scale of the drawing you are adding the block to</td>
<td>select Annotation for Additional Scaling.</td>
</tr>
</tbody>
</table>
If you want to... Then...

scale the drawing instance by the drawing units of the drawing you are adding the block to select Drawing for Additional Scaling.

scale the drawing definition by the drawing units of the drawing you are adding the block to select Enable AEC Unit Scaling.

8 Specify an angle for Attribute Text Angle:

If you want to... Then...

assign the angle of the attribute text to be the same as the rotation angle of the drawing select As Inserted.

set the angle of the attribute text to zero select Force Horizontal.

be able to read the attribute text from the right direction select Right Reading.

9 Click Select Layer Key, select a layer key, and click OK. You can also enter a layer name for Layer Key.

10 Click Next.

11 Enter a name for File Name, or click Browse. If you want to save the current drawing as the content file, select Current Drawing.

12 Select an image for Icon to represent the drawing in DesignCenter:

If you want to... Then...

specify an existing bitmap image click New Icon, select an image, and click OK.

specify the default image of the drawing itself click Default Icon.

13 Enter a description for Detailed Description.

14 Click Finish.
Editing AEC Content

You can edit AEC content that was added to the drawing from DesignCenter™. For information about editing tools in the Content Browser, see Customizing a Tool on page 166.

Modifying DesignCenter Content with the AEC Content Wizard

Use this procedure to edit DesignCenter content with the AEC Content Wizard.

1 Click Insert tab ➤ Content panel drop-down ➤ Design Center.
2 Click the AEC Content tab.
3 Under Custom Applications, expand AutoCAD Architecture, and expand Imperial or Metric.
4 Expand the folder containing the content you want to edit.
5 Select the content item you want to modify, right-click and click Edit.
   The AEC Content Wizard opens and the content type is displayed.
6 Follow the screens in AEC Content Wizard to make your modifications.

Modifying Fixture Layouts

Use this procedure to modify the components of fixture layouts with the Edit Block in-place option. This method is more efficient than exploding the layout. For example, if you drop a toilet stall into your drawing and then explode it, the stall walls are wall objects, the door to the stall is a door object, and the toilet is a multi-view block. When you use Edit Block in-place, the layout remains a single piece of content. You can also drag the fixture layouts onto a tool palette to create custom tools.

NOTE After you create your custom fixture layout, save the layout as Custom Design Content for easy placement in future drawings.

For more information about fixture layout content, see Fixture Layouts in DesignCenter on page 3911.

1 Select a layout.
2 Click Insert tab ➤ Reference panel ➤ Edit Reference. The Reference Edit dialog box opens.

3 Click OK. The components can now be edited separately.

For more information, see “Reference Edit Dialog Box” in AutoCAD Help.

**TIP** The quickest way to locate and view an AutoCAD topic is to click the Search tab in the Help window, select the Search titles only option, and then copy and paste or type the AutoCAD topic name, and click List Topics.

### Turning Off the Dimension Scale Override

Use this procedure to prevent the software from automatically applying an override to the current dimension scale style in the drawing. This control is on by default, and it overrides the active dimension scale style. With the override on, dimensions added to the drawing are scaled based on the current drawing scale. For more information, see “Set Plot Scale” in AutoCAD Help.

If you want to make the dimension scale match your drawing scale, leave Automatically Create Dimscale Override selected. The override applies a scale factor to the dimension style properties.

**WARNING** Any time you close the Drawing Setup dialog box by selecting OK or Apply, an override is applied if Automatically Create Dimscale Override is selected, regardless of the tab that was originally opened.

AEC dimensions added with tools are not affected by the dimension scale override because an AEC dimension style depends on which display representation is active. For more information about AEC Dimensions, see Dimension Options and Uses on page 3389.

1 Click ➤ Utilities ➤ Drawing Setup.
2 Click the Scale tab.
3 Clear Automatically Create Dimscale Override.
When you clear this setting, you can adjust the dimension scale independently of the drawing scale.

4 Select Save As Default if you want subsequent drawings to use these settings, or clear Save As Default to save your settings in the current drawing only.

5 Click OK.
Other Utilities
Cameras

The camera is a visualization tool, modeled after a real camera. It uses a point-and-shoot process to help you view the drawing as if you were standing within the building model. You can add any number of camera views to your drawing and create a video dry run of your design with a camera. For more information about working with cameras, see “Overview of Cameras” in the AutoCAD Help.

You can save perspective views of your drawing using a camera. By adjusting the position of your camera, you can change these views incrementally.

Adjusting the Camera Position

Use this procedure to incrementally change the position of the camera. This changes your views.

1 Click Render tab ➤ Camera panel ➤ ➤ Adjust.
2 Select the camera to adjust.

3 Click the appropriate button to adjust the view.
   ■ Change the Step value: This value controls how far each click of the following buttons moves the camera: Forward, Back, Left, Right, Up, and Down.
Change the Angle value: This value controls how far each click of the following buttons moves the camera angle: Turn Left, Turn Right, Look Up, and Look Down.

Change the Zoom percentage: This value controls how far each click of the button zooms the camera for Zoom In and Zoom Out.

Click Hide to view the drawing with hidden lines removed. If the view in the drawing wasn’t the camera’s view, then the first selected button places the drawing into the camera’s view. As you click each button, the view changes in increments determined by values in the Adjustment Increments section. If Auto View is selected, you can see the change after you click each button. If Auto View is cleared, click View to see the changes.

4 Click OK.
Converting Objects to 3D Solids

You can convert objects to 3D solids when preparing to use CNC machining applications to create a physical building model from a computer-generated building model. You may also want to convert objects to 3D solids if the objects are to interact with other 3D solids.

You cannot convert the following objects or blocks:

- Objects with no integral 3D presence, such as building grids or cameras
- 3D sections
- Objects in a block or an external reference
- Custom display blocks created from 3D solids

For more information, see “Create 3D Solids” in AutoCAD Help.

Converting Objects to 3D Solid Objects

Use this procedure to convert objects such as walls, doors, and mass elements into three-dimensional (3D) solid AutoCAD objects.
TIP Convert custom display blocks to Free Form mass elements, and then convert the mass elements to 3D solids.

1 Open the tool palette that contains the Convert to 3D Solid tool you want to use, and select the tool.

A default Convert to 3D Solid tool is located with the Modeling Tools in the AutoCAD Architecture Stock Tools catalog. You can add this tool to any tool palette. For more information, see Content Browser Overview on page 129.

2 Select the objects to convert, and press ENTER.

3 Enter y (Yes) to erase the selected geometry after conversion, or enter n (No) to keep the geometry in the drawing

Any selected objects that cannot be converted are filtered out during the conversion. Highly-faceted objects, such as curved railings and stairs, may take a longer time to convert.

After you convert an object to a solid, you can convert it to a Free Form mass element and modify it using grips or the Properties palette. You can then convert the Free Form mass element back to a 3D solid. For more information, see Using the Model Explorer to Create Mass Models on page 1087.
Visual Audit is a utility that helps you manage the integrity of your design data by identifying non-AEC objects, such as AutoCAD® objects and exploded AEC objects, in your drawings.

Working with Visual Audit

When you perform a visual audit, all of the AEC objects in the drawing are temporarily removed from the display, leaving only non-AEC objects in view. You can inspect the remaining objects more closely to see if they should be replaced with AEC objects.

To add clarity to the audit, a visual audit also removes single and multi-line text, leaders, and dimension objects from the display. Attribute text remains visible in the drawing. All objects are displayed again when you end the visual audit.

In the following illustration, the railing, door, and the framed opening are exploded AEC objects.
Performing a Visual Audit

Use this procedure to perform a visual audit on your drawing.

**NOTE** For best results, perform a visual audit in a 2D wireframe view.

1. Click Home tab ➤ Inquiry panel ➤ Show AutoCAD Entities.
2. All AEC objects are removed from the display. Attribute text remains visible in the drawing.
3. Pan and zoom to inspect the drawing:

<table>
<thead>
<tr>
<th>If you want to...</th>
<th>Then...</th>
</tr>
</thead>
<tbody>
<tr>
<td>access zoom options</td>
<td>enter ‘z (Zoom). You can use real time zoom or right-click to access additional zoom options.</td>
</tr>
<tr>
<td>access pan options</td>
<td>enter ‘p (Pan). You can pan or right-click to access pan options.</td>
</tr>
</tbody>
</table>

4. Press ENTER.
   All objects are restored to the display.
Reference AEC Objects

You can create reference copies of objects that are updated automatically when you change the original object. You can add identical objects, such as columns, to your drawing.

Creating an AEC Entity Reference

An AEC entity reference is a reference copy of an object. These entity references update when you change the original object. When you select an object to reference, you must specify a point on the original object as an insertion point for the marker of the entity reference. A reference marker is displayed in the drawing to mark the insertion point.

You can place the entity reference in the drawing at any location or rotation angle. The distance between the entity reference and the reference marker remains equal to the distance between the original object and the insertion point specified. You can change this distance by specifying a new insertion point at a new location in relation to the original object.

When you change the properties of the original object or edit it with grips, the reference object reflects the changes. For example, if you want to add custom-shaped mass elements to a drawing, you can add one mass element and reference it. If you make changes to the original, the entity reference is updated.

Adding a Reference to an Object

Use this procedure to create an entity reference from another object.

1. Open the tool palette that you want to use, and select an AEC entity reference tool.
An AEC entity reference tool is located in the Helper Tools category of the AutoCAD Architecture 2012 Stock Tool catalog. For more information, see Content Browser Overview on page 129.

2 Enter ad (Add), and press ENTER.
3 Select the object that you want to reference.
4 Specify a point on the original object to use as the insertion point for the entity reference marker.
5 Specify a location for the entity reference in the drawing.
   The distance between the entity reference and the reference marker is equal to the distance between the original object and the insertion point that you specified.
6 Enter a rotation angle for the entity reference, or press ENTER for zero rotation.
7 Press ENTER.

The entity reference and reference mark are placed in the drawing at the specified location and rotation angle. If you edit the original object, the same changes are made to the entity reference.

**Attaching an Object to an Existing Entity Reference**

Use this procedure to attach an object to an existing entity reference.

1 Open the tool palette that you want to use, and select an AEC entity reference tool.
   An AEC entity reference tool is located in the Helper Tools category of the AutoCAD Architecture 2012 Stock Tool catalog. For more information, see Content Browser Overview on page 129.

2 Enter at (Attach), and press ENTER.
3 Select the reference marker that you want to use.
4 Select the new object that you want to use to replace the entity referenced, and press ENTER.

The new entity reference replaces the former entity reference. The original object is unchanged.
Attaching Hyperlinks, Notes, and Files to an Entity Reference

Use this procedure to attach hyperlinks, enter notes, or attach reference files to an entity reference in a drawing. You can also edit notes and edit or detach reference files from an entity reference.

1 Double-click the entity reference to which to attach information.
2 On the Properties palette, click the Extended Data tab.
3 To add a hyperlink, click next to Hyperlink, and specify the link.
   For more information about adding hyperlinks, see “Add Hyperlinks in a Drawing” in AutoCAD Help.
4 To add or edit a note, click next to Notes, enter text, and click OK.
5 Click next to Reference documents, and attach, detach, or edit a reference file:

<table>
<thead>
<tr>
<th>If you want to …</th>
<th>Then …</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach a reference file</td>
<td>click , select a file, and click Open.</td>
</tr>
<tr>
<td>edit the description of a reference file</td>
<td>enter text under Description.</td>
</tr>
<tr>
<td>edit a reference file</td>
<td>double-click the reference file name to start its application.</td>
</tr>
<tr>
<td>detach a reference file</td>
<td>select the file name, and click .</td>
</tr>
</tbody>
</table>

6 Click OK twice.

Changing the Location of an Entity Reference

Use this procedure to relocate an existing entity reference by changing the coordinate values of its insertion point. The entity reference also has an orientation with respect to the world coordinate system (WCS) or the current
user coordinate system (UCS). For example, if the top and bottom of the reference object are parallel to the $XY$ plane, its normal is parallel to the $Z$ axis. You can change the orientation of the entity reference by aligning its normal with another axis. You can also rotate the entity reference on its plane by changing the rotation angle.

For more information about the world coordinate system and the user coordinate system, see “Use Coordinates and Coordinate Systems” in AutoCAD Help.

1 Double-click the entity reference you want to relocate or reorient.
2 On the Properties palette, click the Design tab, expand Basic, and expand Location.
3 Click Additional information.
4 Specify the location of the entity reference:

<table>
<thead>
<tr>
<th>If you want to ...</th>
<th>Then ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>relocate the entity reference</td>
<td>enter new coordinate values under Insertion Point.</td>
</tr>
<tr>
<td>locate the entity reference on the $XY$ plane</td>
<td>make the normal of the entity reference parallel to the $Z$ axis: under Normal, enter 1 for $Z$, and enter 0 for $X$ and $Y$.</td>
</tr>
<tr>
<td>locate the entity reference on the $YZ$ plane</td>
<td>make the normal of the entity reference parallel to the $X$ axis: under Normal, enter 1 for $X$ and enter 0 for $Y$ and $Z$.</td>
</tr>
<tr>
<td>locate the entity reference on the $XZ$ plane</td>
<td>make the normal of the entity reference parallel to the $Y$ axis: under Normal, enter 1 for $Y$, and enter 0 for $X$ and $Z$.</td>
</tr>
<tr>
<td>change the rotation of the entity reference</td>
<td>enter a new value for Rotation Angle.</td>
</tr>
</tbody>
</table>

5 Click OK.
Customizing and Adding New Content for Detail Components

The details feature in AutoCAD Architecture has a framework for content that can be customized and extended in several different ways. Detail components are stored in Microsoft® Access databases, which end users can modify or even create using the Detail Component Manager, as described under Creating and Modifying Detail Component Databases on page 3553.

Developers may prefer to work on detail component databases using Microsoft Access directly, in which case they will definitely need to refer to the descriptions and code samples in this appendix. However, it is recommended that any user be familiar with this information before attempting to create or customize a detail component database.

Introduction

AutoCAD Architecture detail components are not custom objects in AutoCAD. They are made up of simple entities like line, arc, polyline, block, and hatch. Usually, the various entities that make up a detail component are grouped as an anonymous block so that they can easily be copied or moved like a single entity. But a detail component can also be as simple as a polyline boundary with a hatch interior. This accommodates the type of component for which it is natural to use the STRETCH command. The exact makeup of the component is left to the discretion of the developer.

Each Detail Component is also stamped with “Xdata” (Extended Entity Data) that identifies where it came from in the original database of components. This data can be used later to retrieve additional information or create another component of the same type.
Detail components are integrated with the Property palette and Tool palette systems. However, the details framework handles this interaction automatically, and an author of a new detail component only has to provide a simple description of what type of data should appear.

The details framework includes four main components:

- Database of Components and Sizes
- Recipe Specification
- Recipe Implementation
- Framework Utilities

These framework components are described individually in the following sections.

**Database of Components and Sizes**

The AEC Detail Component database is a Microsoft® Access database, which contains a size table for each available component, as well as several related tables that support the overall structure of the database. End users can add or modify existing component tables through the user interface provided by the Detail Component Manager dialog box, but more advanced customization requires Microsoft Access.

**Recipe Specification**

A Recipe Specification (RecipeSpec) is an XML file that describes the different Recipes that can be used to create a particular component in AutoCAD. For each Recipe, it identifies the types of controls (prompts) that should appear in the Properties palette and specifies how to call the function that implements the given Recipe. The RecipeSpec also provides view-specific information such as the layers and hatch patterns to use when creating the component.

**Recipe Implementation**

A Recipe Implementation is (usually) a small piece of code that creates the component in AutoCAD. The Recipe Implementation can be written in ObjectARX C++, VBA (Visual Basic for Applications), or any Microsoft .NET language (such as C# or Visual Basic .NET). The Recipe can be as easy as a simple block insert, or it can involve more complex operations, such as bringing up a dialog box with many choices.
Framework Utilities

The Framework utilities make the job of implementing a Recipe much easier. They provide many of the common functions to look up data from the database and from the user controls that populate the Properties palette. These utilities also provide a number of common “Jigs” that help place the component once it is created. For more information on Jigs, see Jigs and JigEnts on page 3979.

A Walkthrough of the Process

As with a real recipe, the ingredients for a detail component Recipe can come from many places. As the recipe author, you have the freedom to put the ingredients together however you choose. Nonetheless, the following walkthrough of the process the user goes through to insert a detail component in a drawing should help give you a better understanding of how all the pieces fit together.

1 The user chooses a detail component to create, either by selecting one from the Detail Component Manager dialog box, or by clicking on a tool that has been configured to insert that component.
The RecipeSpec that is assigned to the selected detail component is read, and the information within it is displayed on the Properties palette, as shown below. The Category, Type, and Description values all come from the user’s selection of the component. The Recipe can then retrieve other information it needs directly from the database. The user can change any of the values displayed on the Properties palette to affect the currently running Recipe.

The RecipeSpec may have one or more Recipes defined within it, each associated with a different View setting on the Properties palette. By selecting a View (or accepting the default) the user in effect selects the Recipe that is responsible for creating that view of the component. When a particular Recipe is selected, the Recipe Implementation function described in the XML RecipeSpec is called.

The three controls shown under Specifications (Hatch block, Grout fill cores, and Show mortar) are defined by the <Controls> section of the RecipeSpec. Their values can be retrieved by the Recipe function and used to control the basic parameters of the component.

In this example, Mortar is a subcomponent of the CMU component, as specified in its RecipeSpec. Values and options for all mortar components are retrieved from the database and displayed on this section of the Properties palette. The final three controls under Mortar (Left joint type, Right joint type, and Hatch mortar), are specified in the subcomponent's
RecipeSpec, and their values can be retrieved by the subcomponent’s Recipe function.

4 The Recipe Implementation then does whatever it needs to in order to create the component. It has access to the size data in the database, the data in the RecipeSpec, and user input provided through the Properties palette. It also has access to a host of utility functions that can help create and place the component.

The layering and hatch properties for the component come from the <Data> section of the RecipeSpec. Specific options for the Jig to use come from the <Options> section of the RecipeSpec.

**Component Databases**

A detail component database contains a size table for each available component and several related tables that support the overall structure of the Microsoft® Access database. A component database has references to external files, such as Recipe Specifications and preview image files. For this reason, it is suggested that the database and all of its external references be located in the same tree structure of the file system. For example:

```
MyContent/
    MyComponentDb.mdb
MajorComponentGroup1/
    *.xml, *.dwg, *.png, etc. supporting this group of components
MajorComponentGroup2/
    *.xml, *.dwg, *.png, etc. supporting this group of components
```

Such a structure makes installing or moving the content a much easier task because all of the external content can use relative paths from the main database.

**Database Schema**

Several tables must be present in order for the Recipe system to function correctly. When creating a new database, you should start with either the standard database (AecDtlComponents.mdb) or with the empty template database (AecDtlComponents-Template.mdb).

**Fingerprint Table**

This table uniquely identifies a component (or keynote) database with a Global Unique IDentifier (GUID). It also provides information that can be displayed
in the user interface. All detail components placed in a drawing, and all detail component tools used in Tool palettes record this database GUID. If your database changes location in the directory structure, the tools and components can still find the database using the unique GUID.

The Type field should contain either the string “Component” or “Keynote” depending on which type of database you are creating.

To obtain a GUID for your database, simply delete the existing GUID from the database you are using as a template, and a new GUID will be generated automatically.

**Groups Table**

The Groups table defines the hierarchical organization of components within the database. This hierarchy determines the order in which component groups are displayed in the tree view of the Detail Component Manager dialog box. To set up this table, you simply need to make a Group entry for each collection of like components, and then, for each Group, define its Parent, which is either another Group or the root node (\ - *). The following fields apply to each row in the table:

**ID** A unique number within the given table that identifies the particular row in the table used to create a component. Once created, this number should never change. Components that have already been placed in the drawing are stamped with this ID and must be able to consistently reference this row in the database.

**Parent** The group that is the parent of the group identified in the Group field.

**Group** The text string used to display the name of this group.

**PathKey** An entry from the DirKeys table (described later in this section). DirKeys tell the system where to find the files external to the database for this given component.

**SearchKey** A comma-delimited list of keywords used by the Detail Component Manager to search for components. When a keyword is specified for a group, any component within that group is considered a match for a search on that keyword.

**MODIFIED** A Boolean flag indicating whether this row has been changed since it was originally created. If the user modifies the row using the Detail Component Manager dialog box, this field is marked so that future versions of the database can merge in the changes. The notion of “modified” is relative to the version of the database. For instance, if you are copying an existing
database and changing all the values, it would be considered the first version of the new database, and all MODIFIED fields should be set to FALSE.

**PICTURE** This column allows you to specify a unique picture when this Group node is selected in the Detail Component Manager. It is recommended that you use an image file of type PNG. The location of the image file is usually specified by appending the filename to the path assigned to the DirKey for this Group.

**Components Table**

The Components table is the main “map” of how all the information about a given component is tied together. The following fields apply to each row in the table:

- **ID** A unique number within this table that identifies the particular component within this database. Once created, this number should never change. Components that have already been placed in the drawing are stamped with this ID and must be able to consistently reference this row in the database.

- **GroupName** The parent Group of this component. This establishes the place of the component in the overall hierarchy of components.

- **Name** The text string used for display purposes in the Detail Component Manager and on the Properties palette.

- **TableName** The name of the size table for this component (Component Size Tables are described in the following section).

- **Keynote** This value references an entry in a keynotes database. This is the default keynote to be used for all sizes of this component, but it can be overridden if a size-specific keynote is defined in the size table.

- **SubComponentKey** This value identifies the component as a valid subcomponent for the context specified. For example, the Recipes for Brick and CMU allow for a subcomponent of mortar. The Recipe system will search for all components in the database that identify themselves as being valid subcomponents for mortar.

- **RecipeSpec** This value specifies the XML file to use as the RecipeSpec for this component. The RecipeSpec has instructions for how to actually create and place the component in the drawing. The RecipeSpec is found by searching in the directory specified by the PathKey for the Group in which this component resides. For more information, see the subsequent section on Recipe Specifications.
SearchKey A comma-delimited list of keywords used by the Detail Component Manager to search for components.

Units This value specifies the unit of measure for the size table for this component.

MODIFIED A Boolean flag indicating whether this row has been changed since it was originally created. If the user modifies the row using the Detail Component Manager, this field is marked so that future versions of the database can merge in the changes. The notion of “modified” is relative to the version of the database. For instance, if you are copying an existing database and changing all the values, it would be considered the first version of the new database, and all MODIFIED fields should be set to FALSE.

PICTURE This column allows you to specify a unique picture to display when this particular row is selected in the Detail Component Manager. If the field is left blank, then the picture specified at the Component level is used. If no picture is specified in the Components table, the picture specified for the component’s Group is used.

It is recommended that you use an image file of type PNG.

Component Size Tables

For each component in the database, there should be a corresponding size table. A size table can be named anything you desire, but must include the following columns:

Description A textual description of the item, which is used as a display string in the Properties palette.

ID A unique number within the given table that identifies the particular row in the table used to create a component. Once created, this number should never change. Components that have already been placed in the drawing are stamped with this ID and must be able to consistently reference this row in the database.

MODIFIED A Boolean flag indicating whether this row has been changed since it was originally created. If the user modifies the row using the Detail Component Manager, this field is marked so that future versions of the database can merge in the changes. The notion of “modified” is relative to the version of the database. For instance, if you are copying an existing database and changing all the values, it would be considered the first version of the new database, and all MODIFIED fields should be set to FALSE.

PICTURE This column allows you to specify a unique picture to display when this particular row is selected in the Detail Component Manager. If the field
is left blank, then the picture specified at the Component level is used. If no picture is specified in the row of a given size table, the picture specified for the Component in general is used.

It recommended that you use an image file of type PNG.

The location of the image file is usually specified by appending the filename to the path assigned to the DirKey for this component’s Group.

If the component is created by doing a simple Block insertion, you can have the preview image created dynamically by drawing the referenced block. For these types of components, set the Picture value to _blockthumbnail_.

**Keynote** This value references an entry in a Keynotes database. As with the PICTURE column, if no value is specified here at the Size level, the one specified at the Component level is used.

**Units Table**

This table defines the units of measure available to assign to individual component size tables. It currently includes only inches and millimeters. However, centimeters, meters, and feet should also work. In the Components table, each entry must specify the unit in which the assigned size table is defined.

**DirKeys Table**

This table defines directory keys, which are shortcut aliases to use in identifying the directory structure of the user’s file system. Typically, there is one directory for each major division in your component hierarchy. You can match the component hierarchy in the database with the external files stored on the file system.

DirKeys are referenced in the PathKey field of the Groups table and from the XML RecipeSpec files. They are intended to allow you to easily reorganize the internal hierarchy, the external hierarchy, or both.

**ColumnDisplay Table**

Column names used in component size tables cannot be localized in other languages because these names are referenced programmatically. However, these column names also need to appear in the user interface. The ColumnDisplay table serves as a lookup for user interface components, so that user-friendly, localized names for the columns can be displayed.

**GlobalName** This is the fixed name of the column in a given component size table. It is the lookup key used to find the local name.
**LocalName** This is the translated, user-friendly display string to use for a column of this global name.

**TableId** If left blank, then any column with the given GlobalName uses the LocalName for display purposes. In some cases, however, the same column name may have two different translations depending on its context. Specify a size table if the translation only applies to a specific context.

**Hidden** Some columns, such as ID and MODIFIED, are not intended to be seen by the user in the Detail Component Manager. These can be hidden by checking this box. Note, however, that this only applies when the database is marked as read-only. A database that is being edited from the Detail Component Manager must show all columns so that a valid row can be entered.

**Modified** A Boolean flag indicating whether this row has been changed since it was originally created.

**Hatches Table**

This table defines a set of hatch aliases. Individual components that create hatches can reference an alias instead of specifying the pattern, scale, and angle directly. This allows you to standardize the look of certain materials across the entire database. For instance, you can have all components that are made of concrete use the “concrete” alias. If you want to change the look of all concrete components, simply edit the entry in the Hatches table to change the look of any component that references that alias.

**NOTE** For a description of the database schema for keynotes, see Keynote Database Schema on page 3649.

**Recipe Specifications**

A Recipe Specification (RecipeSpec) is an XML file that describes which views (section, elevation, and so on) are available for a given detail component and how those views are to be created and placed within the drawing.
Here is a simple example of a RecipeSpec.
3956 | Chapter 56  Customizing and Adding New Content for Detail Components
A RecipeSpec is composed of one or more Recipes. Each Recipe is responsible for creating a single view of the component. In the example above, the first Recipe creates a side view of the drawing, and the second creates an end view. When the component is inserted in a drawing, the user-configurable View setting on the Properties palette determines which recipe is used.

Each Recipe contains the following four major sections:

- **Implementation**: This section identifies the function to call and includes information specific to the particular language in which it is implemented. In short, it specifies how to call the Recipe function (RcpFunc).

- **Controls**: This section defines controls that will be added to the Properties palette. The control can be defined directly here, or it can reference a globally defined control in the `<ControlDefs>` section that is part of the overall RecipeSpec.

- **Data**: This section has customization data that the Recipe function can retrieve to help control how the component is drawn, such as layer and hatch pattern information.

- **Options**: This section specifies options for the Jig or JigEnt that is used to place the component.

In short, the `<Data>` and `<Controls>` sections help define what the basic component looks like, and the `<Options>` section helps define how the component is placed. In many cases, you will not need an `<Options>` section, because the default behavior of the Jig is sufficient.

Each of these sections is described in more detail further on in this section.

**Id Strings**

Everything in the RecipeSpec that needs to be identifiable programmatically has an idStr attribute. The idStr value should never change and should be unique within the file (or at least within a given element type). The Rcp function will be expecting ID strings with certain values, so when writing a RecipeSpec, you need to know the implied contract from the Rcp function.
NOTE One way to find out the implied contract of the Rcp function is to turn on logging. For more information, see Recipe Logging on page 3987.

**Display Strings**

Elements with the tag `<Label>` or `<Description>` are intended to be translated. These will be displayed in the Properties palette and other user interface constructs, but will never be used to refer to anything and will never be referenced from the code (that is the job of the idStr).

**References**

Within the Recipe Spec, the value of an item appears between the element tags. It is taken as a literal value unless the ref attribute is specified. In this case, the value between the element tags is considered a lookup value and is used to retrieve the actual value.

*ref* [Optional]

Specifies that the value between the element tags is to be used as a lookup key. It can have one of the following values:

<table>
<thead>
<tr>
<th>ref</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>layerKey</code></td>
<td>(AutoCAD Architecture LayerKey)</td>
</tr>
<tr>
<td><code>dbTable</code></td>
<td>(Column in the table from component database)</td>
</tr>
<tr>
<td><code>control</code></td>
<td>(idStr of a <code>&lt;Control&gt;</code>)</td>
</tr>
</tbody>
</table>

*NOTE* The layerKey reference type is only valid within the element `<Layer>`. 
The dbTable reference will use the value as the column name within the size table for the current component. Consider the following two examples.

```xml
<Data>
  <Item idStr="block">
    <AcadBlockProps>
      <BlockName dwgLib="dwgs/AecDtlLib_BlockTest.dwg">Jimbo</BlockName>
      <Scale>6.0</Scale>
    </AcadBlockProps>
    <AcadEntityProps>
      <Layer>DOOR</Layer>
    </AcadEntityProps>
  </Item>
</Data>
```

In the first case, the <Scale> and <Layer> values have been specified literally. This component, regardless of what row was selected in the database, will have a scale factor of 6.0. Likewise, regardless of what Layer Key style is current within AutoCAD Architecture, this component will go on the DOOR layer (not the layer assigned to the LayerKey “DOOR”).

```xml
<Data>
  <Item idStr="block">
    <AcadBlockProps>
      <BlockName dwgLib="dwgs/AecDtlLib_BlockTest.dwg">Jimbo</BlockName>
      <Scale ref="dbTable">SCALE</Scale>
    </AcadBlockProps>
    <AcadEntityProps>
      <Layer ref="layerKey">DOOR</Layer>
    </AcadEntityProps>
  </Item>
</Data>
```

In this example, references were used to look up the values dynamically. The <Scale> will be set to the value in the SCALE column of the current row in the component’s size table. Likewise, the reference “DOOR” is the Layer Key to use to look up the Layer, not the actual Layer name itself. There is also a reference of type “control,” which lets you use the idStr of a control defined within the Recipe. The value of that control is then used as the actual value of the Element.
Units

Each Recipe Spec has a default unit that applies to the entire XML file. Any unit-dependent value that appears within the XML file is automatically converted from the default unit to the current drawing unit when the value is retrieved from XML.

To specify the default unit, use the following syntax in the root node of the RecipeSpec.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<AecRecipeSpec defaultUnit="mm">
  <Recipe idStr="section">
    ...
  </Recipe>
</AecRecipeSpec>
```

The defaultUnit attribute must be one of the values: in, ft, mm, cm, dm, or m. If no value is specified, “in” is used by default.

In some cases, a simple hard conversion from Metric to Imperial (or vice versa) is not good enough. For instance, the <GapSpacing> between paver bricks should be a logical distance for each measurement system instead of an
arbitrary distance created by a hard conversion. You can specify a unit-specific element by including the “unit” attribute, as in the following example.

```xml
<Data>
  <Item idStr="block">
    <AcadEntityProps>
      <Layer ref="layerKey">THIN</Layer>
    </AcadEntityProps>
  </Item>
  <Item idStr="head">
    <Params>
      <Overhang unit="in">0.25</Overhang>
      <Overhang unit="mm">6.5</Overhang>
      <Depth unit="in">0.375</Depth>
      <Depth unit="mm">10.0</Depth>
    </Params>
  </Item>
  <Item idStr="tip">
    <Params>
      <Depth unit="in">0.0625</Depth>
      <Depth unit="mm">1.5</Depth>
    </Params>
  </Item>
  <Item idStr="shaft"/>
  <Item idStr="hidden">
    <AcadEntityProps>
      <Linetype>HIDDEN2</Linetype> <!-- override the Linetype for hidden components -->
    </AcadEntityProps>
  </Item>
</Data>
```

In this case, different values are given depending upon whether the current drawing is Imperial or Metric.

**NOTE** if you have unit-specific values, you must include an element for both Imperial and Metric. You cannot include two entries from the same unit system (for example, “mm” and “cm”). A hard conversion will be done for any units specified within the same unit system.

**<Implementation> Section**

The Implementation section can look like any of the following examples (<ObjectARX>, <VBA>, and <ManagedDotNet>):
<ObjectARX>
  <Implementation>
  <ObjectARX>
    <AppName>AecDt150</AppName>
    <RcpFunc>AecDt1RcpColumnCapCCSide</RcpFunc>
  </ObjectARX>
  </Implementation>

Where... Is...

AppName the logical appname that appears in the Registry for an ObjectARX application.

<RcpFunc> the name of a Recipe function that is implemented within the ObjectARX module and is registered using the AecRcpBase framework object AecRcpFuncTable. The function signature should take no arguments and must return a value of type RcpStatus

<VBA>
  <Implementation>
    <VBA projectName="M:/Juneau/bin/TestDtl_VBA.dvb" macroName="DrawRectangle"/>
  </Implementation>

Where... Is...

projectName the pathname of the VBA project file that contains the macro. This can be a full pathname, a partial path relative to the location of the XML file, or it can use the "dirKey" attribute to specify a path from the DirKeys table in the component database.

macroName The VBA macro name to call. This macro should take no arguments and returns no value. It needs to call the function aecDt1SetRcpReturnStatus() before returning.
<ManagedDotNet>
  <Implementation>
    <ManagedDotNet moduleName="M:/Juneau//bin/TestDtl_VB.dll" funcRcp="DrawRectangle"/>
  </Implementation>
  
  Where... Is...
  
  moduleName the DLL pathname where the function exists. This can be a full pathname, a partial path relative to the location of the XML file, or it can use the “dirKey” attribute to specify a path from the DirKeys table in the component database.
  
  funcRcp the name of a Recipe function that is implemented within the ObjectARX module and is registered using the AecRcpBase framework object AecRcpFuncTable. The function signature should take no arguments and must return a value of type RcpStatus

<Controls> Section

The Controls section contains a list of control definitions that will be added to the Properties palette, or prompted for on the command line. All controls must have an idStr attribute that the program can use to reference it. It must also have a <Label> element to display in the Properties palette. Optionally, controls can have a <Description> element to use as a “tip” string in the bottom of the Properties palette when this control has focus. If no <Description> element is present, the <Label> element will be used.

Each specific type of control is listed below.

<ComboBox>
This type of control is used to present a list of choices. It is a simple single-selection list.

```xml
<ComboBox idStr="head">
  <Label>Head type</Label>
  <Description>Head type to use for bolt</Description>
  <ComboBoxValue idStr="blkHeadHex">
    <Label>Hex</Label>
  </ComboBoxValue>
  <ComboBoxValue idStr="blkHeadSq">
    <Label>Square</Label>
  </ComboBoxValue>
  <ComboBoxValue idStr="blkHeadRnd">
    <Label>Round</Label>
  </ComboBoxValue>
  <Default>blkHeadHex</Default>
</ComboBox>
```

A ComboBox has a list of `<ComboBoxValue>` nodes that simply specify an idStr used to uniquely identify that item in the list. Each `<ComboBoxValue>` must also have a `<Label>` element to display within the list.

If the `<ComboBox>` has a `<Default>` element, the listed idStr will be used as the default `<ComboBoxValue>`. If no `<Default>` element is present, the first `<ComboBoxValue>` will be used as the default.

`<Default>` [Optional]
The `<ComboBoxValue>` idStr to use as the default selection in the list.

```xml
<CheckBox idStr="doStagger">
  <Label>Stagger columns</Label>
  <Default>0</Default>
</CheckBox>
```

This type of control is used for Boolean values.

It can have the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Default&gt;</code></td>
<td>The default Boolean value. It can be specified as any of the following values: “1”, “0”, “true”, or “false.”.</td>
</tr>
</tbody>
</table>

```xml
<EditBoxAngle>
```

3964 | Chapter 56  Customizing and Adding New Content for Detail Components
This type of control corresponds to the AecEditBoxAngle class in AutoCAD Architecture and has the same basic options.

```xml
<EditBoxAngle idStr="slope">
   <Label>Slope angle</Label>
   <Default>0.0</Default>
   <Validation>range</Validation>
   <RangeLow>-45.0</RangeLow>
   <RangeHigh>45.0</RangeHigh>
</EditBoxAngle>
```

It can have the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Default&gt; [Optional]</td>
<td>The default angle value. This value is specified in degrees:</td>
</tr>
<tr>
<td>&lt;Validation&gt; [Optional]</td>
<td>Specifies what type of validation rule is used. Possible values are: &quot;Any&quot;, &quot;NoZero&quot;, or &quot;Range&quot;. If not specified, &quot;Any&quot; is used by default.</td>
</tr>
<tr>
<td>&lt;RangeLow&gt; [Optional, except when validation=&quot;Range&quot;]</td>
<td>The lower end of the range of allowable values.</td>
</tr>
<tr>
<td>&lt;RangeHigh&gt; [Optional, except when validation=&quot;Range&quot;]</td>
<td>The high end of the range of allowable values.</td>
</tr>
</tbody>
</table>

**<EditBoxDistance>**

This type of control corresponds to the AecEditBoxDist class in AutoCAD Architecture and has the same basic options.

```xml
<EditBoxDistance idStr="rowSpacing" unitDep="true">
   <Label>Y-Axis</Label>
   <Description>Spacing between bolts in Y direction</Description>
   <Default>2.0</Default>
   <Validation>NoNeg</Validation>
</EditBoxDistance>
```
It can have the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unitDep [Optional]</td>
<td>This attribute indicates whether the value of this control needs to be scaled to the current unit in the drawing. A value of “1” or “true” will cause the value to be scaled. A value of “0” or “false” will leave the value as specified.</td>
</tr>
</tbody>
</table>

The `<EditBoxDistance>` control can have the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Default&gt; [Optional]</td>
<td>The default distance value.</td>
</tr>
<tr>
<td>&lt;Validation&gt; [Optional]</td>
<td>Specifies what type of validation rule is used. Possible values are: &quot;Any&quot;, &quot;NoNeg&quot;, &quot;NoZero&quot;, or &quot;Range&quot;. If not specified, &quot;Any&quot; is used by default.</td>
</tr>
<tr>
<td>&lt;RangeLow&gt; [Optional, except when validation=&quot;Range&quot;]</td>
<td>The lower end of the range of allowable values.</td>
</tr>
<tr>
<td>&lt;RangeHigh&gt; [Optional, except when validation=&quot;Range&quot;]</td>
<td>The high end of the range of allowable values.</td>
</tr>
</tbody>
</table>

`<EditBoxInt>`

This type of control corresponds to the AecEditBoxDist class in AutoCAD Architecture (with precision set to “0”) and has the same basic options.

```
<EditBoxInteger idStr="cols">
  <Label>Columns</Label>
  <Description>Number of bolts in Y direction</Description>
  <Default>2</Default>
  <Validation>NoNegNoZero</Validation>
</EditBoxInteger>
```

It can have the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Default&gt; [Optional]</td>
<td>The default integer value.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>&lt;Validation&gt;</code> [Optional]</td>
<td>Specifies what type of validation rule is used. Possible values are: “Any”, “NoNeg”, “NoZero”, “NoNegNoZero”, or “Range”. If not specified, “Any” is used by default.</td>
</tr>
<tr>
<td><code>&lt;RangeLow&gt;</code> [Optional, except when validation=”Range”]</td>
<td>The lower end of the range of allowable values.</td>
</tr>
<tr>
<td><code>&lt;RangeHigh&gt;</code> [Optional, except when validation=”Range”]</td>
<td>The high end of the range of allowable values.</td>
</tr>
</tbody>
</table>

### Picture

A Picture control is used to display a static image in the Properties palette. It has a list of `<PictureValue>` elements that may be used to fill the Picture control under certain conditions.

```xml
<Picture idStr="end_conditions_illustration" rowHeight="5">
  <Label>End conditions illustration</Label>
  <Default>plain_plain</Default>
  <Varies>plain_plain</Varies>
  <PictureValue idStr="regular_regular" idFile="Images/cmu_regular_regular.png">
    <ParentControl idRef="leftEndStyle" idStr="regular"/>
    <ParentControl idRef="rightEndStyle" idStr="regular"/>
  </PictureValue>
  <PictureValue idStr="regular_plain" idFile="Images/cmu_regular_plain.png">
    <ParentControl idRef="leftEndStyle" idStr="regular"/>
    <ParentControl idRef="rightEndStyle" idStr="plain"/>
  </PictureValue>
</Picture>
```

A Picture control can have the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowHeight [Optional]</td>
<td>The number of rows that this control should occupy in the Properties palette. The default value is 3.</td>
</tr>
</tbody>
</table>
A Picture control can have the following elements:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Default&gt; [Optional]</td>
<td>The idStr of the &lt;PictureValue&gt; to show by default.</td>
</tr>
<tr>
<td>&lt;Validation&gt; [Optional]</td>
<td>The idStr of the &lt;PictureValue&gt; to show under a multiple selection condition in the Properties palette. If not specified, the &lt;Default&gt; is used.</td>
</tr>
</tbody>
</table>

**Specifying Controls**

When the same control is used by different Recipes within the same RecipeSpec, you can define them in the <ControlDefs> section and then reference them within the <Controls> section of a specific Recipe.

```xml
<ControlRef idRef="head"/>
```

Simply use the idRef attribute to refer to the idStr of the Control that is defined in the <ControlDefs> section.
The following example shows a control defined at the <RecipeSpec> level that can be referenced from any <Recipe>. It also shows a control that is defined local to a specific <Recipe>.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<AecRecipeSpec defaultUnit="in">
   <ControlDefs>
      <CheckBox idStr="hatchBlock">
         <Label>Hatch block</Label>
         <Description>Specifies whether to hatch the block.</Description>
         <Default>1</Default>
      </CheckBox>
   </ControlDefs>
   <Recipe idStr="section">
      <Label>Section</Label>
      <Implementation>
         <ObjectARX>
            <AppName>AecDtl50</AppName>
            <RcpFunc>ConcreteUnit2CoreSection</RcpFunc>
         </ObjectARX>
      </Implementation>
      <Controls>
         <ControlRef idRef="hatchBlock"/>
         <CheckBox idStr="hatchCores">
            <Label>Grout fill cores</Label>
            <Description>Specifies whether to hatch the cores solid with grout.</Description>
            <Default>0</Default>
         </CheckBox>
      </Controls>
   </Recipe>
</AecRecipeSpec>
```

<Data> Section

This section has customization data that is used by the Rcp function. This includes things like simple Layer/Color/LineType properties, hatch pattern information, spacing parameters, and so on. It is the Rcp function’s responsibility to look back to this section and find any data that may be relevant.

There is an implicit contract between the Rcp function and the RecipeSpec. The Rcp function can decide what is allowed to be in the <Data> section, but it will usually contain a set of commonly seen elements. You can put virtually anything in the <Data> section, but if the Rcp function is not expecting it, it will be ignored.
The data within this section is divided into <Item> sections. Each Item section can contain virtually anything that the Recipe dictates. An Item section usually defines the data for a portion of the overall component, such as “boundary”, “infill”, and “hidden”.

The following standard types of information appear regularly within an Item section:

- <AcadEntityProps>
- <AcadBlockProps>
- <AcadMInsertProps>
- <AcadHatchProps>
- <Params>

These standard information elements are described individually in the following sections.

<AcadEntityProps>

This Element specifies the Layer/Color/Linetype properties of an entity. All the items are optional and are only used if specifically listed. If they are not
listed, the Rcp function should use either ByBlock or ByLayer (or whatever the appropriate setting is) as the default. Here are four examples:

```xml
<AcadEntityProps>
  <Layer ref="layerKey">FINE</Layer>
  <Linetype>HIDDEN</Linetype>
</AcadEntityProps>
<AcadEntityProps>
  <Layer>Jimbo</Layer>
  <ColorIndex>1</ColorIndex>
  <Linetype>DASHED</Linetype>
  <LinetypeScale>3.0</LinetypeScale>
  <Lineweight>53</Lineweight>
</AcadEntityProps>
<AcadEntityProps>
  <Layer>Jimbo</Layer>
  <Color>
    <Red>73</Red>
    <Green>179</Green>
    <Blue>157</Blue>
  </Color>
  <Linetype>DASHED</Linetype>
</AcadEntityProps>
```

The following Elements can be specified within `<AcadEntityProps>`:

- `<Layer>` [Optional]
- `<ColorIndex>` [Optional]
- `<Color>` [Optional]
- `<Linetype>` [Optional]
- `<LinetypeScale>` [Optional]
- `<Lineweight>` [Optional]

**NOTE** Either `<Color>` or `<ColorIndex>` can appear, but not both. If `<Color>` is used, it should have `<Red>`, `<Green>`, and `<Blue>` sub-elements, as in the example above.

```xml
<AcadBlockProps>
```
This Element specifies the properties of a block reference. Here are a few examples:

```
<AcadBlockProps>
  <BlockName dwgLib="dwgs/AecDtlLib_BlockTest.dwg" remapLayers="true">Jimbo</BlockName>
  <ScaleX ref="dbTable">SCALE_X</ScaleX>
  <ScaleY ref="dbTable">SCALE_Y</ScaleY>
  <ScaleZ ref="dbTable">SCALE_Z</ScaleZ>
</AcadBlockProps>

<AcadBlockProps>
  <BlockName dwgLib="dwgs/AecDtlLib_BlockTest.dwg" remapLayers="true">Jimbo</BlockName>
  <Scale>6.0</Scale> <!-- This one uses uniform scale-->
</AcadBlockProps>

<AcadBlockProps>
  <BlockName dwgLib="dwgs/AecDtlLib_TrenchDrains.dwg" remapLayers="true"
            ref="dbTable">R_BLOCK</BlockName>
</AcadBlockProps>
```

The following Elements can be specified within `<AcadBlockProps>`:

- `<BlockName>`
- `<Scale>` [Optional]
- `<ScaleX>` [Optional]
- `<ScaleY>` [Optional]
- `<ScaleZ>` [Optional]
- `<Rotation>` [Optional]

The `<BlockName>` element tells the name of the block definition to use and can include the following attributes providing instructions on how to load the block if it is not found in the current drawing:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dwgLib [Optional]</td>
<td>The pathname of the library DWG file where the block is defined. If a relative path is specified, it is relative to the XML RecipeSpec’s location.</td>
</tr>
</tbody>
</table>
A directory key to look up in the detail component database. The `dwgLib` attribute value is then appended to the `dirKey` value to form the full pathname.

A Boolean value specifying whether the layers for entities within the block are to be searched for LayerKeys. If a LayerKey is found as the value of the Layer, the Layer is remapped to that LayerKey. This value should only be specified as true if you know for certain that there are LayerKeys defined within the block.

If specified, the block name is a lookup value to find the real block name.

If `<Scale>` is used, it is a uniform scale for each axis of the block reference.

**<AcadMInsertProps>**

This element specifies the additional values that an MInsert can have above and beyond a Block Reference. Anything common to both MInserts and Block References will thus appear in the `<AcadBlockProps>` section.

```
<AcadMInsertProps>
  <Rows>2</Rows>
  <RowSpacing>5.0</RowSpacing>
  <Columns>3</Columns>
  <ColumnSpacing>6.0</ColumnSpacing>
</AcadMInsertProps>

<AcadMInsertProps>
  <Rows ref="dbTable">ROWS</Rows>
  <RowSpacing>5.0</RowSpacing>
  <Columns ref="dbTable">COLUMNS</Columns>
  <ColumnSpacing>6.0</ColumnSpacing>
</AcadMInsertProps>
```

The following Elements can be specified within `<AcadMInsertProps>`:

- `<Scale>` [Optional]
- `<Rows>` [Optional]
This Element specifies the properties of a hatch. Here are a few examples:

```xml
<AcadHatchProps>
  <HatchAlias>brick</HatchAlias>
</AcadHatchProps>
```

```xml
<AcadHatchProps>
  <HatchAlias ref="dbTable">PAT_ALIAS</HatchAlias>
</AcadHatchProps>
```

```xml
<AcadHatchProps>
  <PatternName>Escher</PatternName>
  <PatternScale>4.0</PatternScale>
  <PatternAngle>45.0</PatternAngle>
</AcadHatchProps>
```

The following Elements can be specified within `<AcadHatchProps>`:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;HatchAlias&gt;</code></td>
<td>The name of an Alias from the Detail Component database's Hatches table. This table is used so that you can centrally define the Pattern, Scale, and Angle for representative materials used throughout the database. Most RecipeSpecs will use a Hatch Alias to define all the parameters of the Hatch. However, you can specify these values directly by using the other elements.</td>
</tr>
<tr>
<td><code>&lt;PatternType&gt;</code></td>
<td>Possible values are: &quot;PreDefined&quot; (the default), &quot;User&quot;, or &quot;Custom&quot;.</td>
</tr>
<tr>
<td><code>&lt;PatternName&gt;</code></td>
<td>If the <code>&lt;PatternName&gt;</code> specified (or indirectly referenced from <code>&lt;HatchAlias&gt;</code>) does not exist, the pattern &quot;ANSI31&quot; is used.</td>

</tr>
</tbody>
</table>

**<Params>**

This Element specifies the parameters specific to this particular Recipe. These are typically values that the Recipe needs, but that are not hardwired into the code, and thus are customizable. Here are a few examples:

```xml
<Item idStr="boundary">
  <Params>
    <Tongue>0.125</Tongue>
    <GrooveSpacing>0.03125</GrooveSpacing>
  </Params>
</Item>
<Item idStr="boundary">
  <Params>
    <Chamfer>0.5</Chamfer>
  </Params>
</Item>
```

The Element names are defined by the Rcp function itself and must be known in advance of editing them in the Recipe Spec.

**NOTE** One way to find out the implied contract of the Rcp function is to turn on logging. For more information, see Recipe Logging on page 3987.

**<Options> Section**

This section provides customization data that is used by the placement phase (jig) of the Rcp function. In most cases, Recipe functions divide their labor into two phases:

1. Creation of the component
2. Placement of the component
The job of placing the component is usually handled by a standard Jig that may be controlled by elements specified in the <Options> section. You must, of course, have advanced knowledge of which Jig and JigEnt are used by a Recipe function in order to take advantage of this.
The example below is from the Brick Pavers component group. It uses the LinearArrayJig to repeat a row of blocks at a specified spacing.
<xml version="1.0" encoding="UTF-8"?>
<AecRecipeSpec defaultUnit="in">
<Recipe idStr="section">
<label>Section</label>
<Implementation>
<ObjectARX logicalAppname="AecDtl50" funcRcp="AecDtlRcpUnit
Paver"/>
</Implementation>
<Controls>
<CheckBox idStr="doHatch">
<label>Hatch item</label>
<Default>1</Default>
</CheckBox>
</Controls>
<Data>
<Item idStr="block">
<AcadEntityProps>
<Layer ref="layerKey">MED</Layer>
</AcadEntityProps>
</Item>
<Item idStr="boundary">
<Params>
<Chamfer>0.0</Chamfer>
</Params>
</Item>
<Item idStr="infill">
<AcadHatchProps>
<HatchAlias>brick</HatchAlias>
</AcadHatchProps>
<AcadEntityProps>
<Layer ref="layerKey">HATCH</Layer>
</AcadEntityProps>
</Item>
</Data>
<Options>
<JigEnt>
<GapSpacing>0.25</GapSpacing>
</JigEnt>
<Jig>
<PromptCount>Number of courses</PromptCount>
</Jig>
</Options>
</Recipe>
</AecRecipeSpec>
In the <Options> section, it tells the JigEnt to put a ¼” spacing between each paver, and it changes the prompt string for one of the prompts issued by the Jig.

For more information about which options are available for specific Jigs and JigEnts, see Jigs and JigEnts on page 3979.

**Jigs and JigEnts**

A “Jig” is a programming construct that defines how the user adds objects to the drawing. You can think of it as an “Add” command that gives visual feedback as you are specifying what the object looks like. For instance, the simple Arc Jig in AutoCAD dynamically sketches out the potential arc while you input various values.

A “JigEnt” is the object used to draw the visual feedback. In AutoCAD and AutoCAD Architecture, this is usually the same type of object that is being created (for example, the Wall Jig would use a Wall object). In the Recipe framework, most components are not represented by an object type, but by a collection of AutoCAD primitive objects such as hatch, polyline, and block. In this case, a JigEnt is a temporary in-memory object that is used to draw during the lifetime of the Jig, but is then thrown away when the real objects are added to the drawing.

The Recipe framework uses a system that plugs specific JigEnts into common Jigs. This allows a single Jig that is responsible for linear components (that is, one that prompts for “Start point” and “Endpoint”) to look completely different depending upon the JigEnt being used (for example, a row of bricks vs. a metal joist).

Although development of new Jigs and JigEnts is currently available only to ObjectARX programmers, many aspects of the existing Jigs and JigEnts can be controlled via lightweight customization techniques. In order to understand this, it is helpful to have an idea of how the existing Jigs and JigEnts are programmed.
Hierarchy of Jigs

AecEdJigRcp
AecEdJigCircle
AecEdJigLine
AecEdJigLineBlockBased
AecEdJigLinearArray
AecEdJigStretch
AecEdJigLineOriented
AecEdJigLineExtend
AecEdJigSurface
AecEdJigRectangle
AecEdJigStamp

NOTE  The level of indentation shows the inheritance. For example, if you want to know the behavior and options for AecEdJigLinearArray, you can see that it inherits all the behavior and options for AecEdJigLineBlockBased, AecEdJigLine, and AecEdJigRcp.

Hierarchy of JigEnts

AecEdJigRcp
AecEdJigEntCircle
AecEdJigEntLine
AecEdJigEntLineBlockBased
AecEdJigEntLinearArray
AecEdJigEntStretch
AecEdJigEntLineOriented
AecEdJigEntLineExtend
AecEdJigEntSurface
AecEdJigEntSurfaceHlines
AecEdJigEntMeasure
AecEdJigEntRectangle

As you can see, Jigs and JigEnts correspond pretty closely at the upper levels. However, there are extra JigEnts that can re-use the same Jig. The ones listed here are only the common JigEnts. There are many specific JigEnts derived off of these. For example, there is a specific JigEnt for each type of wood and metal joist, all derived off AecEdJigEntLineExtend to get the majority of their behavior. No special Jig is needed for each of these, because they all ask for the same sequence of information. If all the internal programmed objects for detail components were listed, you would see many more JigEnts, but not many more Jigs.
Common Jigs

The common Jigs and JigEnts listed in the hierarchy above have options that can be specified in the <Options> section of the Recipe Spec, and in some cases, they have common Recipes that can be utilized without writing any new code.

Brief descriptions for some of the common Jigs are provided below, along with information on the <Options> or Recipe func that can be used with each one, if applicable.

**Stamp Jig**

The Stamp Jig is similar to the INSERT command in that it does a basic block insertion (with a few extra controls). Here is an example showing how the Options section is used to control the Jig’s behavior.

```xml
<Options>
  <Jig>
    <AllowScaling>false</AllowScaling>
    <AllowRotation>true</AllowRotation>
    <AllowXFlip>true</AllowXFlip>
    <AllowYFlip>true</AllowYFlip>
    <AllowBasePt>true</AllowBasePt>
  </Jig>
</Options>
```

In each case, the value listed is the default, which would be used if nothing was specified.

The following table lists the options for Stamp Jigs

<table>
<thead>
<tr>
<th>Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;AllowScaling&gt;</td>
<td>Boolean value specifying whether the common command line options of the Jig are valid options for this Recipe.</td>
</tr>
<tr>
<td>&lt;AllowRotation&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;AllowXFlip&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;AllowYFlip&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;AllowBasePt&gt;</td>
<td></td>
</tr>
</tbody>
</table>
To use this Jig directly from a common recipe function, use the following section of RecipeSpec:

```xml
<Implementation>
  <ObjectARX>
    <AppName>AecRcpBase40</AppName>
    <RcpFunc>Stamp</RcpFunc>
  </ObjectARX>
</Implementation>
```

**Linear Array Jig**

The Linear Array Jig puts multiple copies of a block reference in a line, oriented in either the X or Y direction, with a specified spacing between each instance. Here is an example showing how the Options section is used to control the Jig's behavior.

```xml
<Options>
  <Jig>
    <IsOrientedX>true</IsOrientedX>
    <PromptStart>Start point</PromptStart>
    <PromptEnd>End point</PromptEnd>
    <PromptCount>Count</PromptCount>
    <AllowXFlip>true</AllowXFlip>
    <AllowYFlip>true</AllowYFlip>
    <AllowCount>true</AllowCount>
  </Jig>
  <JigEnt>
    <IsOrientedX>true</IsOrientedX>
    <Width>0.0</Width>
    <GapSpacing>0.0</GapSpacing>
  </JigEnt>
</Options>
```

In each case, the value listed is the default and would be used if nothing was specified.

The following table lists the Jig options for Linear Array Jigs

<table>
<thead>
<tr>
<th>Jig Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;IsOrientedX&gt;</code></td>
<td>Boolean value specifying whether items along the line are oriented in the X direction or the Y direction.</td>
</tr>
</tbody>
</table>
### Jig Option

<table>
<thead>
<tr>
<th>Jig Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;PromptStart&gt;</td>
<td>Text string to use for the start point prompt.</td>
</tr>
<tr>
<td>&lt;PromptEnd&gt;</td>
<td>Text string to use for the endpoint prompt.</td>
</tr>
<tr>
<td>&lt;PromptCount&gt;</td>
<td>Text string to use for the count prompt.</td>
</tr>
<tr>
<td>&lt;AllowXFlip&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;AllowYFlip&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;AllowCount&gt;</td>
<td>Boolean value specifying whether the common command line options of the jig are valid options for this Recipe.</td>
</tr>
</tbody>
</table>

The following table lists the JigEnt options for Linear Array Jigs

<table>
<thead>
<tr>
<th>JigEnt Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IsOrientedX&gt;</td>
<td>Boolean value specifying whether items along the line are oriented in the X direction or the Y direction.</td>
</tr>
<tr>
<td>&lt;Width&gt;</td>
<td>Specifies the exact width of the Block Reference being arrayed. If you do not know this value and leave this element out, the extents of the block will be dynamically measured. If you know this value, you should specify it, because measuring the extents dynamically can sometimes introduce rounding errors that can affect the overall dimensions of the array.</td>
</tr>
<tr>
<td>&lt;GapSpacing&gt;</td>
<td>The distance between each arrayed item. You can use a negative value to get items to overlap.</td>
</tr>
</tbody>
</table>
To use this Jig directly from a common recipe function, use the following section of Recipe Spec.

```xml
<Implementation>
  <ObjectARX>
    <AppName>AecRcpBase40</AppName>
    <RcpFunc>LinearArray</RcpFunc>
  </ObjectARX>
</Implementation>
```

When using this function, you can also specify an `<RcpFunc>` directive that will allow you to package all the individual blocks in the array into a single block reference. By default, this value is set to “false” and each item in the array will be its own block reference.

```xml
<Options>
  <RcpFunc>
    <PackageAsBlock>true</PackageAsBlock>
  </RcpFunc>
</Options>
```

**Bookends Jig**

The Bookends Jig is similar to the Linear Array Jig, but allows for a different block on each end as well as a block that is arrayed to fill the gap between the two ends. The “start” and “end” blocks are used once, and the “repeat” block is used however many times it needs to be in order to fill the space between. Here is an example usage:

```xml
<Options>
  <Jig>
    <IsOrientedX>true</IsOrientedX>
    <PromptStart>Start point</PromptStart>
    <PromptEnd>End point</PromptEnd>
    <AllowXFlip>true</AllowXFlip>
    <AllowYFlip>true</AllowYFlip>
  </Jig>
  <JigEnt>
    <IsOrientedX>true</IsOrientedX>
    <WidthStart>0.0</WidthStart>
    <WidthRepeat>0.0</WidthRepeat>
    <WidthEnd>0.0</WidthEnd>
    <GapSpacing>0.0</GapSpacing>
  </JigEnt>
</Options>
```
In each case, the value listed is the default and would be used if nothing was specified.

The following table lists the Jig options for Bookends Jigs

<table>
<thead>
<tr>
<th>Jig Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IsOrientedX&gt;</td>
<td>Boolean value specifying whether items along the line are oriented in the X direction or the Y direction.</td>
</tr>
<tr>
<td>&lt;PromptStart&gt;</td>
<td>Text string to use for the start point prompt.</td>
</tr>
<tr>
<td>&lt;PromptEnd&gt;</td>
<td>Text string to use for the endpoint prompt.</td>
</tr>
<tr>
<td>&lt;PromptCount&gt;</td>
<td>Text string to use for the count prompt.</td>
</tr>
<tr>
<td>&lt;AllowXFlip&gt;</td>
<td>Boolean value specifying whether the common command line options of the Jig are valid options for this Recipe.</td>
</tr>
<tr>
<td>&lt;AllowYFlip&gt;</td>
<td>Boolean value specifying whether the common command line options of the Jig are valid options for this Recipe.</td>
</tr>
</tbody>
</table>

The following table lists the JigEnt options for Bookends Jigs

<table>
<thead>
<tr>
<th>JigEnt Option</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;IsOrientedX&gt;</td>
<td>Boolean value specifying whether items along the line are oriented in the X direction or the Y direction.</td>
</tr>
<tr>
<td>&lt;WidthStart&gt;</td>
<td>Specifies the exact width of the Block Reference at the beginning of the array. If you do not know this value and leave this element out, the extents of the block will be dynamically measured. If you know this value, you should specify it, because measuring the extents dynamically can sometimes introduce rounding errors that can affect the overall dimensions of the array.</td>
</tr>
<tr>
<td>JigEnt Option</td>
<td>Comment</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------</td>
</tr>
<tr>
<td>&lt;WidthEnd&gt;</td>
<td>Same as above, but for the ending block of the array.</td>
</tr>
<tr>
<td>&lt;WidthRepeat&gt;</td>
<td>Same as above, but for the repeating block of the array</td>
</tr>
<tr>
<td>&lt;GapSpacing&gt;</td>
<td>The distance between each arrayed item.</td>
</tr>
</tbody>
</table>

To use this Jig directly from a common recipe function, use the following section of RecipeSpec.

```xml
<Implementation>
  <ObjectARX>
    <AppName>AecRcpBase40</AppName>
    <RcpFunc>Bookends</RcpFunc>
  </ObjectARX>
</Implementation>
```

When using this function, you can also specify an `<RcpFunc>` directive that will allow you to package all the individual blocks in the array into a single block reference. By default, this value is set to “false” and each item in the array will be its own block reference.

```xml
<Options>
  <RcpFunc>
    <PackageAsBlock>true</PackageAsBlock>
  </RcpFunc>
</Options>
```

**Surface Jig**

This Jig creates a basic rectangular boundary of a given depth, where the user is asked for an arbitrary start and endpoint (similar to adding Walls in AutoCAD Architecture). Here is an example usage:

```xml
<Options>
  <Jig>
    <PromptStart>Start point</PromptStart>
    <PromptEnd>End point</PromptEnd>
    <AllowXFlip>true</AllowXFlip>
    <AllowYFlip>true</AllowYFlip>
  </Jig>
</Options>
```
In each case, the value listed is the default and would be used if nothing was specified.

To use this Jig directly from a common recipe function, use the following section of RecipeSpec.

```xml
<Implementation>
  <ObjectARX>
    <AppName>AecRcpBase40</AppName>
    <RcpFunc>Surface</RcpFunc>
  </ObjectARX>
</Implementation>
```

**StampMInsert Jig**

The StampMInsert Jig is the same as the Stamp Jig, except that it uses an MInsert instead of a simple Block Reference.

**SurfaceBound Jig**

The SurfaceBound Jig is the same as the Surface Jig, except that it keeps only the top three edges of the rectangle. It is used for components that are poured onto or bounded by another entity that provides the bottom edge of the rectangle. For an example, see Concrete Topping.

**SurfaceLtype Jig**

The SurfaceLType Jig is the same as the Surface Jig, except that it fills with a wide polyline of a given linetype, instead of a hatch.

**ApplyToLinework Jig**

The ApplyToLinework Jig is used when you simply need to “brand” existing linework geometry as a specific component. For example, you could draw a detail using basic AutoCAD commands and then use this Jig to apply the Xdata and keynote for a particular component in the database. It will move the selected geometry to a new layer, if specified, but will not create any geometry of its own.

**Recipe Logging**

Without knowing the implied contract of a Recipe function, it is hard to know (or debug) where all the values are supposed to come from. In some cases, there may be values for an existing Recipe that you could customize if you just knew they were there (and currently not specified).
Recipe Logging is a mechanism that will print to the command line every piece of data that is being retrieved by the Recipe. It will give the source of the data (for example, the component database, the Recipe Section, the Properties palette prompt), and whether the value was found or not. Using this information, you can reverse-engineer what data is expected by the Recipe.
The following is an example produced by running the 02/Brick Paver Recipe with Recipe Logging turned on.
Command: dtlcompmanager
RCP LOG > Source: Database
  Field: WIDTH
  Type: double

To turn Recipe Logging on, use the REGEDIT program to change a value in the Win32 Registry. The entry can be found in:

HKEY_CURRENT_USER\Software\Autodesk\AutoCAD\R17.1\ACAD-XXXX\Pro files\AutoCAD Architecture\Preferences\AecRcpBase50\RecipeLog

Change this value to "1" to turn it on.
Change this value to "0" to turn it off.
Blocks and Block Libraries

Libraries of block content for detail components should be created and stored according to the following guidelines, each of which is discussed in more detail subsequently.

- Block content should be drawn with the current style of geometry. (See Using Optimal Geometry on page 3995.)
- Blocks should have namespace prefixes. (See Naming Blocks on page 3997.)
- Base points for inserting blocks should be positioned logically. (See Base Points for Blocks on page 3997.)
- Similar blocks should be stored in the same DWG file. (See Collecting Similar Blocks on page 3997.)
- Properties of block entities should be set to ByBlock. (See Block Properties on page 3998.)
- All unnecessary objects should be removed from block library drawings. (See Removing Unnecessary Objects on page 3999.)

Using Optimal Geometry

Many block libraries that were created in legacy versions of AutoCAD contain geometry that is non-optimal in that it can result in performance problems, incorrect snap points, or tolerance discrepancies that cause errors when Aec Modify tools or other AutoCAD editing commands are used. You should avoid using this old-style geometry when creating new blocks, and you should remove or replace it whenever you encounter it in existing block content.

The following sections describe five main areas in which you should strive to use optimal geometry.

Polylines

Prior to AutoCAD Release 14, the polyline entity consisted of multiple vertex entities and was not stored in a compact form. You can identify these old-style polylines by running the LIST command, which identifies them as type POLYLINE. Any such entities should be recreated as new-style polylines by tracing over them manually with the Polyline tool. The LIST command identifies new-style polylines as LWPOLYLINE.
Hatch Patterns

Be sure to use actual hatch entities when creating blocks that require hatch patterns. Prior to AutoCAD Release 14, hatches were anonymous blocks with all of the entities comprising the pattern stored in the drawing. If you run the LIST command on an entity that appears to be a hatch, and the entity is identified as a BLOCK REFERENCE and has a name beginning with *X, then it is an old-style hatch. Remove and replace with a new, equivalent HATCH entity.

NOTE In addition to the old-style hatch patterns described above, some blocks have been found to contain multiple individual line segments repeated so as to simulate an actual hatch. In such cases, the line segments should be erased and replaced with an appropriate hatch at the appropriate scale.

Unjoined Polylines

When the endpoints of line or arc segments that form a boundary coincide, it is vastly more efficient to represent the boundary by using a single polyline. For example, a rectangle made of four separate lines should be converted to a single polyline. To do this, use the following procedure:

1 Run the PEDIT command, and select one of the lines.
2 When prompted to turn the line into a polyline, enter y (for Yes).
3 Enter j (for Join), select the other three lines, and press ENTER. In some cases, the join will fail because the endpoints are not coincident, even though they appear to be. If this occurs, use object snaps to carefully reposition the endpoints so that they do coincide.

Pixelized Line Segments

Some conversion programs create a literal translation of what was on the screen at the time of conversion. This can result in thousands of tiny line segments placed end-to-end, where there should be a single line segment. In such cases, you should trace over the entire course of the end-to-end segments to create a single segment, and then erase all the original pixelized line segments.

Imprecise Geometry

As is the case with unjoined polylines, any endpoints that appear to coincide should actually do so. Small tolerance discrepancies can cause other editing operations to fail. Make sure that geometry that meets visually also meets at a high degree of precision. One way to ensure coincidence is to turn on Nearest,
Endpoint, and Midpoint object snap modes, and then adjust the geometry using its grip points.

**Naming Blocks**

The names of blocks containing detail component content should have a namespace prefix to avoid conflicts with other blocks. For example, all blocks in libraries provided with AutoCAD Architecture use “AecDtl_” as the namespace prefix. If you are creating your own blocks, you should use a unique prefix.

**Base Points for Blocks**

Each block should have a base point that is logically positioned for inserting the block in relation to other geometry in a drawing; that is, the base point location should allow the user to insert the block using an object snap on some other piece of geometry as an insertion point. If possible, the base point location should also facilitate repeated placement of the item. For example, a block representing a paver should not have the base point in the middle of the block, because you would not likely want the middle of the block inserted at any object snap on existing geometry. Likewise, a base point in the upper-left corner only makes sense if the item is to be placed under some other geometry. However, if the base point is at the lower-left corner, the user can snap to the ground plane, and repeated insertions are easy.

**Collecting Similar Blocks**

Similar or closely related block definitions should be collected in a single DWG file. For example, in the details block library supplied with AutoCAD Architecture, the block definitions for all the different sizes of nails are collected in a block library drawing file called `AecDtlLib_Nails.dwg`, and all block definitions detailing carpet accessories are in a file called `AecDtlLib_CarpetAcc.dwg`. As shown below, for each block definition, the drawing should include a block reference inserted on a horizontal line to show how the block's base point is used to position the block in relation to other
geometry. For each block reference, there should also be a text label containing the name of the block.

Setting up block library drawings this way makes it easy for the user to quickly survey the entire library. It also helps you in the process of cleaning up the drawing, which is explained in a subsequent section (see *Removing Unnecessary Objects* on page 3999).

**Block Properties**

In most cases, blocks should be defined to have their component entity properties set as follows:

- **Layer=0**
- **Color=BYBLOCK**
- **Linetype=BYBLOCK**
- **Linetype Scale=1.0**
- **Lineweight=BYBLOCK**

To accomplish this after a block has been defined, right-click the block reference, and click Set Nested Objects to ByBlock.
Layer Keys

You can use a layer key to map specific entities within a block to a layer in the drawing into which the block is inserted. For example, the millwork blocks depicted earlier (see Collecting Similar Blocks on page 3997) have the hatch entity assigned to the layer “HATCH.” If the Recipe Specification (XML file) that references this block library has the attribute “remapLayers” set to true, as shown below, then any layer that matches a layer key in the current drawing will be replaced with the layer that is assigned to that layer key. In the case of a drawing using the standard AutoCAD Architecture template file, in which the HATCH layer key is mapped to the AecDtl-Patt layer, any block library entities that were assigned to the HATCH layer will end up on the AecDtl-Patt layer when inserted into the drawing.

```xml
<AcadBlockProps>
    <BlockName dwgLib="dwgs/AecDtlLib_WoodMillwork.dwg"
        remapLayers="true">AecDtl_millworkBlk1</BlockName>
    <Scale>6.0</Scale>
</AcadBlockProps>
```

Removing Unnecessary Objects

Once you have ensured that a block library drawing conforms to all the previously explained guidelines, the final step is to remove all unnecessary objects (unused layers, text styles, block definitions, and so on) by performing the following procedure.

1. Use the ZOOM, EXTENTS command to display the extents of the current drawing.
2. Enter `wblock` (for Write Block).
3. In the Write Block dialog box, under Source, select Objects.
4. Under Base point, click the Pick point button, and then select a base point in the lower-left corner of the drawing extents.
5. Under Objects, with Retain selected, click the Select Objects button, specify a crossing window over the entire contents of the drawing, and then press ENTER.
6. Under Destination, enter the name of the drawing to be created (for example, enter the name of the current drawing with a “2” appended), and specify the units to be used for automatic scaling when the block is inserted into a drawing that uses different units.
7 Click OK.
8 Close the drawing.
9 Using Windows Explorer, delete the original drawing.
10 Rename the new drawing by removing the “2” you appended.
   The new drawing now contains only the entities you selected and any other entities directly or indirectly referenced by the selected entities. In other words, the drawing contains only the absolute minimum set of objects that it needs.
Migrating Detail Component and Keynote Databases

If you have modified one of the default keynote or detail component databases supplied with a previous release of the software, you can migrate your modifications to the corresponding database in the current release using the Detail Component/Keynote Database Migration utility. As explained in the following topics, use of this utility is not supported if the previous and current databases use different versions of the CSI MasterFormat standard.

Migrating Your Database Modifications

AutoCAD Architecture provides default Microsoft® Access databases for detail components and keynotes. If you have modified either of these databases in a previous release (or created your own databases using the same schema), you can migrate your modifications to the corresponding database in the current release using the Detail Component/Keynote Database Migration utility. Accessed from the CAD Manager menu, this utility compares the modified database (the source) with its counterpart in the current release (the target) and updates the current database to reflect your modifications.
IMPORTANT: Beginning with AutoCAD Architecture 2012, the US detail component and keynote databases supplied with the software use the CSI MasterFormat 2004 standard. Using the Detail Component/Keynote Database Migration utility to migrate your customizations from a database that uses the CSI MasterFormat 95 standard (as in Autodesk Architectural Desktop 2007 and previous releases) is not supported. The utility will not properly migrate custom records from the older database and may errantly overwrite records in the new database with MasterFormat 95 data. If you want to use a MasterFormat 95 database with the current release of AutoCAD Architecture, you can load it as described under Adding a Detail Component Database to Available Databases on page 3583 or Adding a Keynote Database on page 3635. Note that the older database must be located with the previous release content and must maintain that content folder structure to function properly. An older detail component database will not function with 2008 or later US details content. Likewise, an older keynote database will not automatically keynote 2008 or later US details content; it will only keynote detail components inserted using previous version details or details in previous version drawings. The Detail Component/Keynote Database Migration utility can still be used to migrate records from one CSI MasterFormat 95 database to another. Note also that using the Database Migration utility to update an older database with data from a current-release database is not supported. The utility is designed only for migrating modifications in the other direction; that is, from the older database to the database in the current release.

The migration utility operates according to the following assumptions and rules:

- Both the source and target databases must be of the same type (either Component or Keynote), as identified by the first record in their Fingerprint tables. (For more information on the tables and records included in these databases, see Customizing and Adding New Content for Detail Components on page 3945 and Keynote Database Schema on page 3649.)

- Both the source and target databases must use the same version of the CSI MasterFormat standard.

- If a table in the source database has no counterpart in the target database, the table and all its records are added to the target database.
Tables of the same type (as identified by their ID fields) are compared, and source records that differ from their counterparts in the target database (or have no counterparts) are processed as shown in the following matrix.

<table>
<thead>
<tr>
<th>Corresponding target record exists</th>
<th>No corresponding target record exists</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified field in source record = true</td>
<td>source record overwrites target record</td>
</tr>
<tr>
<td>Modified field in source record = false</td>
<td>source record is not migrated; target record is not changed</td>
</tr>
</tbody>
</table>

**NOTE** If you have added a detail component size table or keynote of your own in the previous release, and it happens to have the same table name or keynote key as a new table or keynote supplied in the current release, it will not be processed by the migration utility, because its ID will differ from its namesake in the current release. If this scenario seems likely in your case, it is recommended that you check to see if the name you assigned is present in the current release. If so, you should change the name of your table or keynote key before running the migration utility.

- If a source database record has been modified using the Detail Component Manager or the Keynote Editor, its Modified field value is set to true automatically, and the record will overwrite the corresponding record in the target database, or be added to the target database if there is no corresponding record present.
- If a source database record has been modified using Microsoft® Access directly, and the Modified field value was not set to true manually, the record will be added to the target database if there is no corresponding record present.
- The migration utility processes only tables and records as described above; it does not migrate any associated XML or DWG content files, nor does it migrate default values specified for particular fields in tables. Preserving such information requires manually updating the target database.

**NOTE** If migrated records were created using Microsoft® Access directly (rather than through the Detail Component Manager), and they do not have a valid record ID (equal to or greater than 100000), it may result in a conflict with records in the target database.
Running the Detail Component/Keynote Database Migration Utility

Use this procedure to migrate modifications from a detail component database or keynote database supplied with a previous release of the software to the corresponding database in the current release. Both databases should use the same version of the CSI MasterFormat standard.

**NOTE** Be sure to create a backup copy of the target database before running the migration utility. If the migration process is terminated before completion, the target database may not be usable.

1. On the Start menu (Windows), click Programs ➤ Autodesk ➤ AutoCAD Architecture 2012 ➤ Detail Component - Keynote Database Migration Utility.

2. For Merge from, click..., select the modified detail component or keynote database (the source) you want to migrate, and click Open.
3 For Merge into, click ..., select the database to which you want to migrate your modifications (the target), and click Open.

**NOTE** The target database selected in this step must be the same type (either detail component or keynote) as the source database selected in Step 2.

4 Click OK.

The utility compares the two specified databases and displays the results for each table processed, including which tables have been added and how many records have been modified or added for each table in the target database.
