FileMaker Pro 14

Using a Remote Desktop Connection with FileMaker Pro 14
Chapter 1
Introduction to Remote Desktop Services and Citrix XenApp

This chapter describes Remote Desktop Services (formerly Terminal Services) and Citrix XenApp. For information about the supported versions of Windows Server, Citrix XenApp, and client software, see the FileMaker Pro technical specifications available at http://www.filemaker.com/products.

Where to find FileMaker documentation
To learn about, view, or download additional FileMaker documentation, visit http://www.filemaker.com/documentation.

About Remote Desktop Services
Remote Desktop Services is a component of Microsoft Windows Server that lets you remotely access applications installed on a Windows Server machine from a wide range of machines over most types of network connections.
Remote Desktop Services has three components: the server, the client, and the protocol by which the server communicates with the client.

Remote Desktop Services server
When you are running Remote Desktop Services in application server mode, all applications are run on the server. The Remote Desktop Services server sends only screen information to the client and receives input only from the mouse and keyboard.
The server hardware requirements for Remote Desktop Services depend on how many clients will be connecting at a time and the usage requirements of the clients. See http://www.microsoft.com.
Remote Desktop Services shares executable resources among users, so memory requirements for additional users running the same application are less than the requirements for the first user to load the application.

Remote Desktop Services client (Remote Desktop Connection)
The Remote Desktop Services client, called Remote Desktop Connection (RDC), uses thin-client technology to provide the Windows Desktop to users. The client only needs to make a connection with the server and display the visual information that the server sends.
Remote Desktop Services client software should be installed on every machine that needs to use Remote Desktop Services.
- Windows: The Remote Desktop Connection software is installed by default. You can also use Remote Desktop Web Connection.
Chapter 1 | Introduction to Remote Desktop Services and Citrix XenApp

Remote Desktop Protocol (RDP)
The Remote Desktop Protocol (RDP) is automatically installed when you install Remote Desktop Services. RDP is the only connection you need to configure in order for clients to connect to the Remote Desktop Services server. You can configure only one RDP connection per network adapter.

Benefits of using Remote Desktop Services
- Organizations can deploy Windows-based applications on older systems that may have inadequate resources.
- Users can continue to use their current operating system and applications.
- Organizations can deliver Windows-based applications to a variety of desktop environments and over LANs and WANs.
- Administrators only need to install and update one copy of an application on a server machine instead of on all the computers in their network.
- Networked applications will perform better over slow network connections.

About Citrix XenApp
Citrix XenApp is an application server that runs with Microsoft Remote Desktop Services. Citrix XenApp extends the reach of Remote Desktop Services by providing application access by a wider variety of platforms and clients and supporting a wider range of features such as application transparency, better bandwidth performance, enhanced security, load balancing, and more. Citrix XenApp has three components similar to Remote Desktop Services in Windows Server: the server, the client, and the Citrix Independent Computing Architecture (ICA) protocol by which the server communicates with the client.

Application server
Similar to Remote Desktop Services, when you are running Citrix XenApp, all applications are run on the server. Also like Remote Desktop Services, the server sends only screen information to the client and receives input only from the client mouse and keyboard.

The server hardware requirements for Citrix XenApp depend on how many clients will be connecting at a time and the usage requirements of the clients. See [http://www.citrix.com](http://www.citrix.com).

Remote Desktop Services and Citrix XenApp both share executable resources among users, so memory requirements for additional users running the same application are less than the requirements for the first user to load the application.

Citrix ICA client
The Citrix ICA client uses thin-client technology to provide a Windows desktop or an application to users. Unlike with Remote Desktop Services clients, when a seamless application is published for Citrix ICA clients, the application appears as if it is running locally on the client desktop. For Windows desktops and applications, the client only needs to make a connection to the server; the server displays any needed visual information to the client, while the client sends back keyboard and mouse information to the server. The application processing is done on the server; the application is not actually loaded onto the client.

Clients are available from the Citrix website at [http://www.citrix.com](http://www.citrix.com).
Citrix ICA protocol
The Citrix ICA protocol is installed when you install Citrix XenApp. The ICA protocol transmits data between the Citrix ICA client and Citrix XenApp and is designed for transparent support of Windows applications, low-bandwidth requirements, data compression, and encryption. ICA connections have been tested and are supported with the TCP/IP protocol when FileMaker Pro runs on Citrix XenApp.

Note If you have any Remote Desktop Services clients accessing Citrix XenApp via Remote Desktop Connection, you must enable the TCP/IP protocol on Citrix XenApp.

Benefits of using Citrix XenApp
- Organizations can deploy Windows applications in heterogeneous computing environments regardless of client hardware, operating system, or network connections.
- Users can continue to use their current operating system and applications.
- IT professionals can support specific Windows applications from a single location and manage application deployment, access, performance, security, and reliability.
- Administrators need to install and update only one copy of an application on a server machine and can create a variety of application environments, from complete Windows desktops to application windows.
- Citrix Web Interface working with Citrix XenApp is supported in the FileMaker Pro configuration model and allows organizations to integrate applications into any standard web browser.

Before installing Citrix XenApp

Before installing Citrix XenApp, consider carefully the number of users or clients that will be connecting, the types of applications you will be serving to clients, and how your users will be connecting to Citrix XenApp.

Installing Citrix ICA client software
Citrix ICA client software should be installed on every machine that needs to use Citrix XenApp. Remote Desktop Services clients will be able to access the server but will not have the full feature set that Citrix ICA clients get. See your Citrix documentation for information on installing Citrix ICA clients.
Chapter 2
Using FileMaker Pro with Remote Desktop Services or Citrix XenApp

This chapter describes how to install and use FileMaker Pro on a Remote Desktop Services server or on Citrix XenApp.

FileMaker Pro on Remote Desktop Services

FileMaker Server

Remote Desktop Services client

Remote Desktop Services client

Standard FileMaker Pro client

Remote Desktop Services server network connectivity

FileMaker Pro on Citrix XenApp for Windows Server

FileMaker Server

Windows Citrix ICA client

OS X Citrix ICA client

Standard FileMaker Pro client

Citrix XenApp for Windows Server network connectivity
Installing FileMaker Pro on a Remote Desktop Services server or Citrix XenApp

**Note**  The installations described in the following sections require a FileMaker Pro volume license. Single licensed copies of FileMaker Pro are not supported. FileMaker, Inc. has tested and certified the Worldwide English versions of FileMaker Pro, Remote Desktop Services, and Citrix XenApp. For more information on licenses, visit [http://www.filemaker.com](http://www.filemaker.com).

1. If you are installing:
   - Remote Desktop Services: Make sure Remote Desktop Services is installed and configured on your Windows Server machine and you are logged on as administrator.
   - Citrix XenApp: Make sure Remote Desktop Services is installed and configured on your Windows Server machine, Citrix XenApp is installed, and you are logged on as administrator.

2. Do one of the following:
   - If you downloaded your software electronically, double-click the download file to unpack the files.
   - If you have a FileMaker Pro DVD, insert it into your DVD drive.

3. In the Control Panel, double-click Install Application on Remote Desktop Server.

4. Follow the onscreen instructions to locate the FileMaker Pro installation program and begin the installation.

5. When the installation is complete, click Finish.

For details about installation issues, see *Installation and New Features Guide for FileMaker Pro and FileMaker Pro Advanced*.

**Deployment recommendations**

For Remote Desktop Services and Citrix XenApp servers:

- Estimate more RAM per client if your solution is memory-intensive or if you are serving multiple applications in addition to FileMaker Pro.
- Use a fast, modern processor.

FileMaker supports deployment and development of FileMaker Pro solutions running on Remote Desktop Services and Citrix XenApp clients. However, some aspects of FileMaker Pro development may not function as expected.

**Environments for deploying FileMaker Pro files**

**Connecting to FileMaker Server**

You can use FileMaker Server to host files to the Remote Desktop Services server or the Citrix XenApp server.
Remote Desktop Services

The Remote Desktop Services server that is deploying FileMaker Pro will access FileMaker Server, which hosts FileMaker Pro files to Remote Desktop Services clients as well as local FileMaker Pro clients. When a user opens FileMaker Pro running on Remote Desktop Services, accessing FileMaker Pro files hosted by FileMaker Server is done in the same way as accessing FileMaker Server under normal networking conditions.

Citrix XenApp

FileMaker Server will host FileMaker Pro files to ICA clients via Citrix XenApp deploying FileMaker Pro and will continue to host files to standalone FileMaker Pro clients. When a user opens FileMaker Pro running on Citrix XenApp, accessing FileMaker Pro files hosted by FileMaker Server is done in the same way as accessing FileMaker Server under normal networking conditions.

For information about opening shared files as a client, see the FileMaker Pro Help.

OS X Citrix ICA clients

When an OS X ICA client accesses FileMaker Pro through Citrix XenApp, remember that the client will be accessing a Windows application. The shortcut keys used on the OS X client will be Windows shortcut keys, and the look and feel of the application will be that of a Windows application.

Non-shared files

Remote Desktop Services clients and Citrix XenApp clients can access FileMaker Pro files that are not shared over a network. Non-shared files can be developed and deployed by Remote Desktop Services clients and Citrix XenApp just like any non-shared FileMaker Pro file. Shared files and peer-to-peer hosting (FileMaker Network Sharing) are not supported on Remote Desktop Services clients or Citrix XenApp clients.

Note  To turn off sharing for a specific file, choose File menu > Sharing > Share with FileMaker Clients, select the file, then select No users.

Unsupported FileMaker Pro features

- FileMaker Network Sharing with other FileMaker Pro clients
- ODBC/JDBC sharing
- Third-party plug-ins—plug-in developers must test and certify the plug-ins to run under Remote Desktop Services and Citrix XenApp clients
